**Hypsipyle**, daughter of Thoas of Lemnos, in Gk. legend. She saved her father when the women of the island slew all the rest of the men. When the Argonauts landed and united with the Lemnian women, H. bore Jason twin sons. Driven from Lemnos when her fathers' escape was discovered, she became the nurse of Opheltes, son of King Lycurgus of Arcadia. While directing the heroes of the siege of Thebes to a spring in the Nemean forest, she left her charge, who was killed by a serpent.

**The funeral games instituted for Opheltes were the origin of the Nemean games**

**Hyacotherium**, name of the best known form of Hyacotheriidae, a family of extinct ungulate mammals belonging to the order Perissodactyla and considered to be the ancestor of the horse. The fossil form is confined to the Eocene strata of Europe and N. America, and shows a small animal 3 ft or so in length, with a complete dentition, a well marked coracoid process on the shoulder blade, four digits on the fore limbs, and three on the hind limbs, and orbit, not enclosed by bone. The radius and ulna are separate as also are the tibia and fibula.

**Hyrax**, generic name of certain small species of mammals forming the order Hyracoidea. *Tremax* is an alternative term. The animals are popularly known as conies and somewhat like rabbits in appearance owing to the long, curved, front teeth, adapted for gnawing, the short ears and reduced tail in the structure of the molar teeth, however they are nearer the ungulate than the rodent. Their bodies are covered with short, close, fine, uniformly coloured, and the sharply pointed snout is split, the digits are furnished with hoofs, the exception of the middle toe of each hind foot which has a long curved claw. *H. syriacus*, the coney of the Bible, ranges over Syria, Palestine, and Mesopotamia; it is of a dull yellow or fawn colour, with a small oval spot on the back; it is noted for its wariness and cannot be caught in traps; the nest is of dried grass and fur in which the young are buried like those of a mouse. *H. capensis* the red rabbit damian or klipdas, is confined to Cape Prov. and Natal.

**Hyrcan** 2, incl. dist. of Persia S. and S.E. of the Caspian (*H. anura* More) separated from Luthia by the Sarikhan Mts (S.E.) with Median W. It corresponds to Afridi and Muzandaran.

**Hyrkanus**, name of two Jewish high priests and princes of the Hasmonean family. (1) *Hirsh (Hirshum) Hyrkanus* (c. 175–101 bc) son of Simon Maccabaeus, first won fame as a general against the Syrians under Antiochus. He became high priest in 104 bc, and of Judaea (135) and founded the Jewish monarchy which continued in his family until Herod seized Judaea. There was much warfare during his reign. At first a Pharisee he later joined the ranks of the Sadducees. See *Die Gräz. Geschichte der Juden*, II, III (1854–7), I, 1–2; *Die Geschichte der jüdischen Völker zur Zeit Christi*, I, 187 ff. (trans. 1810).

(2) *Hyrcanus II*, grandson of above, high priest (c. 71-40 B.C.). His brother Aristobulus disputed the throne with him till his death (71 B.C.). Antipater in later Pompey (63) supported H as a less formidable foe, and Judaea lost her independence. In 40 H was captured by the Parthians, and lived in Babylonia till invited back by Herod (36), who had him executed on a charge of treason (30). See I. Jost, *Geschichte des Judenthums und seiner Sekten*, I, 1857-69, A. Holtzmann, *Judenthum und Christenthum*.

**Hyssop**, or *Hyssopus officinalis*, species of Labiate which forms a genus itself and is a native of Europe, Asia, and the Mediterranean shores. It is a hardy plant, with stems which are shrubby near the ground but herbaceous above. The

NY 9501

flowers are blue and were formerly used in medicine when dried, the leaves are oil and luscious, and are used in salads and in the making of absinthe, the whole plant is bitter and aromatic. The herb mentioned in scriptural writings is probably a species of Marjoram, the *Origanum* N. which is found plentifully in Palestine. The twigs formed into a bunch would be a sprinkler. (Levi) 22

**Hystispes**, name of an occurring in the fifth of Darius I (486 B.C.) was named in was a member of the royal house of the Achamenids. He was governor or satrap of Lydia under Cambyses (d. 521) and Darius and is sometimes erroneously confused with Zoroaster (satrap of Satrapy).

**Hysteria.** That form of neurotic illness in which organic disease is ruled out for the sake of some person who has the illness. It is solving the problem, fulfilling the wish of satisfaction, the desire either in reality or in phantasy. The symptoms are almost any organic disease may be simulated but rarely with complete accuracy. The symptoms are psychogenic, occur in the mind and few patients have sufficient self-knowledge to produce symptoms of an organic illness with fidelity. It is exemplified hysterical loss of kinesthetic sense often confined to the glove and stocking area, a distribution which does not correspond to the anatomical arrangement of cutaneous nerves. As medical knowledge spreads, the grosser hysterical manifestations such as faints, widespread paralysis etc. grow less frequent, and less definite complaints such as headache and dizziness are more frequently encountered. Loss of memory is often hysterical and patients may wander from home in trance-like states. The patient is never clearly aware of the motive underlying his illness, but the

extent of the self-deception varies and all transitions between hysterical reactions and malingering occur.

Hysterical reactions are more common in women than in men and often occur at puberty and in adolescence. They may follow accidents, particularly where there is a question of compensation and where the underlying motive, unrecognised by the patient, is financial gain. Since the symptoms are psychogenic, treatment is by psychotherapy, which may be given in various ways. Individual hysterical symptoms can often be removed by suggestion (often effectively given with the help of hypnosis) but unless the underlying psychological problems are tackled, or the environmental stress diminishes similar or different symptoms are likely to recur. It may be necessary to alter a patient's environment, as for example by arranging for a child to go to a residential school, away from over-solicitous and fussy parents. Hysterical symptoms may clear up spontaneously when the patient's problems are solved, e.g., by the satisfactory settlement of a claim for compensation. In many cases manipulation of the environment is not

enough, and a thorough investigation of the patient's life becomes necessary with the aim of helping him to understand and solve the conflicts or problems for which his hysterical symptoms are an unsatisfactory solution. *See also* HYPNOTISM; PSYCHIATRY; PSYCHOANALYSIS. *See* D. K. Henderson and R. D. Gillespie, *A textbook of Psychiatry* (6th ed.) 1944.

The term 'Hysteresis' is not synonymous with H., but is a general term for uncontrolled emotional outbursts, often with screaming, sobbing, laughing, struggling etc. Persons who have such outbursts may or may not be hysterical in the technical meaning described above.

**Hythe** (A.-S. port, haven), seaside town and resort of Kent, England, one of the Cinque Ports, on the S. coast 14 m. W. of Folkestone. It is in the diocese of Canterbury and on the S. Region railway. The market-house was rebuilt in 1794 and an old cruciform church—St. Leonard's—has been restored. The Brit. Army School of Musketry (now the School of Small Arms) has been here for many years. The beach and golf-course are fine, but the sea's encroachments have destroyed the harbour. Pop. 8100.

# I

**I**, ninth letter of the Eng. alphabet, called in Gk. *iota* and in Semitic languages *yodh*. In the North Semitic alphabets and in early Gk. it resembled a Z, later the symbol was straightened to I. In the square Heb. script, the parent of the modern Heb. alphabet, the symbol came to be written with a very small sign, hence our words 'Jot' (cf. Matthew, v. 18) and 'jottings' = 'little notes'. In early medieval Lat. *i* was first written with a dot for the sake of distinction with *m*, *u* or another *i*. As to its phonetic value in the Semitic alphabets which were and still are consonantal scripts, it had the consonant value of *y* as in yet, but in Gk. and in its descendants it had the vowel sound *i*. In Lat. it also denoted the consonant *j* pronounced *y* although in Eng. it received the value of *j* as in judge, other *i* it had two sounds, the long or *sh* *i* as in machine, the former resembling the sound of *i* as in machine, and in the continental *i* often written in Eng. *ee* as in meet. The O.E. short *i* (i) has remained practically unchanged in sound of O.E. *sifian* New I. *sit*. The O.E. *lon* *i* (i) which had the continental value *i* (i) in *min* in machine was later diphthongised and in sixteenth century MSS. is often written *ee* of O.E. *ly* New I. *life* mine.

**Iacchus** (Iakch) solemn title of Bacchus used in the Eleusinian mysteries. As the son of Demeter he is usually distinguished from the older Dionysus (cf. Smith). He was a divinity peculiar to Athens. See *Eleusina*, *Gods in Greece* 1891. See **ELEUSINA**.

**Iambic Verse**, in prosody, is applied to verses consisting of a foot called an *iambus* of two syllables of which the first is short and the second long (—). It is supposed to have been invented by Archilochus. It is particularly suited to the Eng. language which falls naturally into short and long syllables. It has perhaps most frequently been employed in blank verse of five feet, the beauty of the rhythm depending largely upon the caesura which fall in the third or fourth foot.

**Iamblichus, or Jamblichus Chalcidensis** (1) Syrian Neoplatonic philosopher of the third and fourth centuries (c. 283 c. 330 A.D.). But few of his philosophical and mathematical works are extant. The *Life of Pythagoras* and *Exhortation to Philosophy* were ed. by F. Kießling (1813; 1815), A. Nauck (1881), H. Pistelli (1888, 1894), N. Festa (1891), G. Parthey (1857) F. Ast (1817) and J. B. Krieger (1790) also ed. selections from his works. See E. Zeller, *Philosophie der Griechen*, III, 1889; E. Vacherot, *Histoire critique de l'école d'Alexandrie*, II, 1851; A. S. Chaignet, *Histoire de la psychologie des Grecs*, v, 1893; T. Whittaker, *The Neo-Platonists*,

1901. (2) a Syrian Gk. writer of the second century A.D. who flourished under Trajan. He was author of *Baßilika*, describing the adventures of the lovers Rhodine and Sinonis. Photius gives an epitome of the romance which is itself not extant (see *Hibotheca*, chapter xciv). See A. Chassign, *Histoire du Roman dans l'antiquité*, 1862; T. Whittaker, *The Neo-Platonists*, 1901; M. de Wulf, *History of Medieval Philosophy* (trans. by E. C. Meeusinger) 1926.

**Iapetus**, Titan, of Gk. mythology, the son of Uranus and Gaia. He was the father of Atlas and Prometheus, and the grandfather of Deucalion, and was accordingly regarded as the ancestor of the human race. He revolted against the new order under Zeus, and was consequently imprisoned in Tartarus.

**Iapetus**, eighth satellite of Saturn, discovered by Cassini in 1671. It has the peculiarity of always appearing brighter when seen to the W. of the planet than when seen to the E.

**Iapygia**, in anct. geography, the name applied by the Gks to Messapia or Apulia, S.E. Italy.

**Iasi**, see **JASSY**.

**Ibadan**, walled native city of Yoruba country, S. Nigeria, W. Africa, 83 m. N.N.W. of Lagos. Cap. of one of the Yoruba states, it is partly autonomous. There is a Brit. resident and assistant judge, and Hausa troops are estab. here. It is a centre of the cocoa industry and some thirty co-operative societies of native cocoa farmers are now affiliated to the Ibadan Union. Pop. (estimate) 385,000.

(C. K. Meek, *The Northern Tribes of Nigeria*, 1921; H. L. Ward Price, *Land and Nature in the Yoruba Provinces*, 1932, and Lord Hailey, *In Africa*, Survey, 1935).

**Ibagué**, or San Bonifacio de Ibagué, cap. of Tolima dept., Colombia 60 m. W. of Bogotá, in a rich agric. dist. There are warm springs and sulphur and silver mines near Guataquisito, on the Magdalena is its port. It has a rail connection with Guadalupe and Llanos are under construction between Llanos and Armenia and Buenaventura. Pop. 62,000.

**Ibajay**, in on the N. coast of Panay Is., Philippines, in Capiz prov. It is a military station near the mouth of the Rio de Ibañay, which rises in Bacalan Mt. and flows N.W. and N.E. to the sea. Amihor is found near the point of Potoi. Pop. about 18,000.

**Ibañez**, Vicente Blasco (1867-1928), Sp. novelist and politician, was b. in Valencia. An ardent revolutionary reformer and political agitator, he suffered exile and imprisonment for his views, but was nevertheless returned sev. times to the Sp. Parliament. So disliked did he make himself there that, solely to displace him,

attempts were made to dispense with the law that gave protection to members of the Cortes. At one time he founded, and for five years managed, an Amer. colony. The latter part of his life he spent in Paris, the centre of a revolutionary and anti-Royalist group.

His earlier novels are by many considered his best—*Arroz y Tartana* (1891), *Flor de Mayo* (1895), *La Barranca* (1898), *Cañas y Barro* (1902), and *Entre Naranjos* (1902). They are realistic in treatment, and describe life in the tus., farms, and fishing vils. of Valencia; they are full of life, colour, and brute force. His next group of novels—*La Catedral* (1903); *trans.* 1909), *El Intruso* (1904), *La Bodega* (1905), and *La Horda* (1905)—are political and sociological. In his third group—*La Maja Desnuda Sangre y Arena* (1908; Eng. trans. as *Blood and Sand*, 1913), *Los Muertos Mandan* (1909), and *Luna Benamor*—he returns once more to his original style, but does not describe the same locality. His *Four Horsemen of the Apocalypse* (1916), was an immense success abroad, both as a novel and as a film. His later books were *Marc Nostrum* (1918), *La Tierra de Todos* (1922), *Alfonso XIII, Unmasked* (1923), and *A Noblest's Tour of the World* (1927). See C. Pitoulet, *Vicente Blasco Ibañeta, ses romans et le roman de sa vie*, 1921.

**Ibarra**, cap. of Imbabura prov., Ecuador, S. America, about 50 m. N.N.E. of Quito. Founded in 1606, it was almost destroyed by earthquake in 1868. It is a bishop's see, and has woollen and cotton mills. It stands at the N. foot of Imbabura volcano. A railway connects I. with Quito. Pop. about 7000.

**Ibbetson**, *John Caesar* (1759-1817), Eng. painter. Though not of the first rank, he produced a few works of charm, and individuality, as in 'The Ascent of George Buggin in Lunard's Balloon.'

**Ibea**, see KENYA COLONY AND PROTECTORATE.

**Iberia**: (1) Gk. name for Spain, probably derived from Ibtus, the Ebro. (2) Name by which Georgia in the Caucasus was known in ant. times.

**Iberian Sea**, name given to the Mediterranean between Spain and the N. African coast of Morocco.

**Iberis**, see CANDYTUFF.

**Iberville**, *Pierre le Moyne, Sieur d'* (1661-1706), Fr.-Canadian naval and military commander, b. at Montreal. He took part in the destruction of Schenectady (1689). In 1699 he founded Fort Biloxi (afterwards Mobile) at the mouth of the Mississippi in Biloxi Bay, and planted a Fr. colony there.

**Ibex**, name of sev. species of *Capra*, a genus of Bovidae, which includes the goats. The Alpine ibex, *Stenobos*, or bouquetin, was formerly abundant in Europe, but it is now rare, and almost extinct through hunting. *C. ibex*, as it is technically called, is larger than common goats, with no beard, long, thick horns curving backwards, and brown hair. It lives on shrubs and lichens and such vegetation as it can obtain on the hill-sides, and leaps for extraordinary distances. From the milk

butter and cheese are made, the hair is clipped and made into ropes, the horns are used for handles, and the skin is dressed and made into shoes and gloves.

SPANISH IBEX

The I. is very destructive to vegetation and especially to vines, and on this account was freely offered in sacrifice to Bacchus. *C. pyrenaica*, Sp. I., found in the mts. of Spain and Portugal, is characterized by the short black beard and dark shoulder strap.

**Ibiqui**, or **Ibicu**, port in Argentina, S. America, is near the confluence of the Uruguay and Paraná.

**Ibis**, generic name of sev. members of Ibisidae, wading birds related to the storks. They have large bodies with long curved bills, rather blunt at the end, with the

IBIS

upper mandible grooved, long necks and legs, and generally black and white plumage. The most famous species, *I. aethiopica* (or *religiosa*), the sacred I., was formerly worshipped by the Egyptians. It always appeared in Egypt at the rise of the Nile, and was supposed to preserve

the country from plagues and serpents. It could not live out of Egypt, and there it was zealously preserved in temples. Numerous mummified remains of iblises have been found at Thebes and Memphis, wrapped in linen in the ordinary way. *I.* (or *Eudocimus*, *alba*, the white *I.*, is a pure white species found in Florida. *I.* (or *Eudocimus*) *ruber*, the scarlet *I.*, an Amer. species, is brilliant scarlet with a few black patches. *I. fulvifellus*, an African species sometimes strays to Britain and N. America.

**Iblis**, see **EMILIS**.

**Ibn Batûta**, or **Abu Abdullah Mohammed** (1304-78), Arab traveller, *b.* in Tangier. He traversed Persia, Mesopotamia, Arabia, E. African coast, Asia Minor, the shores of the Caspian, Bokhara, Afghanistan, and India, China, Sumatra, and S. Spain. On his return he settled at Fez, and wrote a graphic account of his adventures, valuable for their shrewd, original observations. It was trans. into Eng. by S. Lee (1829), and into Fr. by M. Defrémery and Dr. Sanguinetti (1859). He died at Fez, Morocco. See H. A. B. Gibb, *The Travels of Ibn Batûta*, 1929.

**Ibn Ezra**, or **Abraham ben Meir ibn Ezra** (1092-1167), Jewish scholar and Bible commentator, *b.* at Toledo. He wrote a Heb. grammar, numerous poems used in the Jewish liturgy, a work on Jewish philosophy, and important commentaries on the O.T. He lectured on astronomy and theology. See R. Levy, *The Astrological Works of Ibn Ezra*, 1927.

**Ibn Gabirol**, see **AVICENNON**, **SALOMON BEN GABIROL**.

**Ibn Haukal**, **Mohammed** (d. 976) Arabian geographer and traveller of the tenth century, *b.* at Bagdad. He pub. a *Book of Roads and Kingdoms*, containing an instructive account of Islamic lands accompanied by a map. A MS. copy is in the Bodleian Library.

**Ibn Khallikan** **Abu'l Abbas Ahmed** (1211-82), Arabian historian and scholar, *b.* at Arbela. He travelled in Syria and Egypt, and held the offices of *cadi* at Cairo, grand *cadi* at Damascus, and prof. in one of the colleges, Cairo. He was a poet and compiler. His prin. work is a biographical dictionary, *Deaths of Eminent Men*.

**Ibn Sa'ud**, king of the Hejaz. See **SA'UD**, **ABDUL ASIZ IBN**.

**Ibn Tofail**, **Abu Bakr Mahommed ibn Abdul Malik** (d. 1188), Arabian philosopher, *b.* at the beginning of the twelfth century, at Gundix in Spain. His chief work was a philosophical romance, *Haji ibn Yekdhân*, trans. into Eng. by Percock (1674) and by Ockley (1708).

**Ibn Zohar**, see **AVENZOAR**.

**Ibo**, seaport in Portuguese E. Africa on one of the Querimba Is. Exports ivory, rubber, and wax.

**Ibo**, densely populated country of S. Nigeria. Also the name of the language spoken—a negro-sudanic tongue. Among the Ibo-speaking tribes the earth-goddess, Ala, is regarded as 'the unseen president of the community.' In every vil. she has her shrine, and her priests, as guardians of morality and the public peace,

have political and judicial functions. The land cannot give a living to so large a pop., and large numbers depend on fishing and various trades. Since 1943 the I. of the Udi Div. of Onitsha Prov. have improved their amenities through community development by voluntary labour. See Lord Hailey, *An African Survey*, 1938.

**Ibrahim Pasha** (1789-1848), Egyptian vizier, *b.* at Cavalla, Rumelia, was the adopted son of Mehemet Ali (q.v.) Pasha of Egypt. He reorganised the army on European plans, and helped the Turks against the Gks. In 1831, supporting his father against the sultan, he conquered Syria and became governor of the prov. Mehemet Ali once more revolted against the sultan and Ibrahim inflicted a severe defeat on the Ottoman army at Nezib. The European powers now interfered, and he had to retire before the Brit. troops, losing all he had gained. He went to his private estates at Heliopolis and lived there for six years. In 1848 he was appointed vizier, as Mehemet Ali had become imbecile, but he died shortly afterwards at Cairo.

**Ibrox**, S.W. suburb of Glasgow on the Clyde, Scotland.

**Ibsambul**, see **IPSAMBU**.

**Ibsen**, **Henrik** (1828-1906), *b.* at Skien, a small S. Norwegian timber port. At sixteen he became an apothecary's assistant, intending to study medicine. The

HENRIK IBSEN

E.N.A.

effete puritanism and social prejudices of the Norwegian prov. life, in which his unhappy early years were passed were rich material for the bitter satires on civilisation with which he subsequently stung Europe into fury. His earliest work—*Cathina* (1850), was purely historical, and was inspired by his reading of Salust and Cicero for the examination at Christiania Univ. Whilst continuing his studies

there under the celebrated Heltberg he associated with Jonas Lie, Vinje, Bjørnson, Hotten-Hansen, and others. Thanks to Ole Bull, the violin virtuoso, he became director of Bergen Theatre from 1851 to 1857, and wrote for his productions, but practically all the MSS. have since been destroyed, with the notable exception of the vigorous historical drama, *Lady Inger of Ostrat*. In 1857 he was appointed manager of the National Theatre at Christiania. A year later appeared his first saga-drama, the splendid *Warriors of Helyrland*. The *Prebunders* followed in 1864, and 1873 saw the completion of *Emperor and Galilean*, his greatest historical prose-drama. I., the cynic, pessimist, and iconoclast, made his debut in 1862 with *Lore's Comedy*, cleverly written in epigrammatic verse. In the same style there followed *Brand* (1866), an attack on pietism, and *Peer Gynt* (1867) his most influential and popular dramatic poem, called by many 'the Scandinavian Faust.' It was, however, in the scathing satirical prose dramas which constituted his third period that the I. of European significance found mature expression. In the *League of Youth* (1869), *Pillars of Society* (1877), and *An Enemy of the People* (1882), he attacked the whole fabric of modern politics—as he terms it, 'government by geographical formula.' I.'s studies in feminism are of equal interest and power: *Rosmersholm* (1886) being the best, and the *Doll's House* (1879), in which he discusses the problems of modern marriage, being next in merit. *The Lady from the Sea* (1888) is an elegant poetic conception, essentially the same in idea as the *Doll's House*. In  *Ghosts* (1881) I. exploits to the fullest the possibilities of hereditary disease as a dramatic motif. *The Wild Duck* (1884), an unsatisfactory piece of symbolism, is, like *Brand*, an attack on unpractical idealism. His later works are: *Hedda Gahler* (1890), *The Master Builder* (1892), representing the zenith of his powers, *Little Eyolf* (1894), *John Gabriel Borkman* (1896), and *When We Dead Awaken* (1909), all of which are chiefly developed from the ideas contained in his earlier works. All his writing is pre-eminently suited for the stage, and consummately skilful in technique. See (i) B. Shaw, *The Quinlence of Ibsenism*, 1891; *Skandinaviaerken* (collected works), 1898; G. Brandes, *Ibsen and Bjørnson*, 1899; W. Morison, (trans.) *Correspondence*, 1905; W. Archer and others (ed.) *Collected Works*, 1906-12; E. Gosse, *Henrik Ibsen*, 1907; M. J. Moses, *Henrik Ibsen: the Man and his Plays*, 1908; R. Ellis Roberts, *Henrik Ibsen*, 1912; A. Orbeck (trans.) *Early Plays*, 1921; W. Mohring, *Ibsen and Kierkegaard*, 1928; J. Kroner, *Die Technik des realistischen Dramas bei Ibsen und Galsworthy*, 1935; B. W. Downs Ibsen, *The Intellectual Background*, 1940; P. F. D. Tennant, *Ibsen's Dramatic Technique*, 1948; various plays in Everyman's Library, trans. by R. Farquharson Sharp.

**Ibstock**, vil. in Leicestershire, England, 5 m. N. of Market Bosworth. Archbishop Laud was rector of the par. church. The

inhabs. are chiefly occupied in mining and in manufacturing tiles and bricks. Pop. 3000.

**Ibycus**, Gk. lyric poet of about 540 B.C., b. at Rhegium, Italy, and spent most of his life at the court of Polycrates of Samos. According to tradition he was murdered at sea near Corinthus. The crime was traced by means of cranes which had followed the ship, and 'the cranes of Ibycus' became a proverbial expression for divine revelation of crime. The story is the subject of Schiller's poem *Die Kraniche des Ibycus* (1798); for fragments of his verse, see Diehl, *Anthologica Lyrica Graeca*, ii. (2nd ed.) 1912.

**Ica**, dept. of Peru, bounded N. by Lima, S. by Arequipa, E. by Ayacucho, and W. by the Pacific; covers an area of 9798 sq. m. Much of the surface is sandy desert, but the valleys of the Chincha, Condor, and I. are fertile, and yield fruits, cotton, and indigo. Wine and brandy are made from the fruit, and a considerable amount of copper is mined. The chief tn. is I. (San Gerónimo de I.) which was ruined by an earthquake in 1617. Pop. (dept.) 110,800; (tn.) 21,200.

**Ica**, or Putumayo, riv. in Ecuador, S. America, rises in the Andes, flows S.E., and at São Antonio, in Brazil, joins the Amazon. It is navigable for small craft for 750 m.

**Icarus** (Gk. *Ἰκαρος*). (1), or Icarus, in Gk. legend an Athenian, taught the cultivation of the vine by Dionysus in return for hospitably entertaining him. I. distributed his new gift freely, and the shepherds of the neighbourhood becoming intoxicated, thought they had been poisoned by him and slew him, throwing his body into a well. Erigone, his daughter, hanged herself in despair on learning the news of her father's death. According to tradition, Erigone is the Virgin in the zodiac, Icarus is Bootes, and Icarus's dog, Maira, is Procyon or Canis Minor. (2) Lacedaemonian, was the father of Penelope, whom he tried to dissuade from accompanying her husband, Odysseus, to Sparta. She insisted on carrying out her intention with such modest trimness that her father erected a statue of modesty in her honour.

**Icarus**, see ICEBERG 4.  
**Ice** (a word common to the Teutonic languages), name given to the substance into which water changes when subjected to a sufficiently low temp. It is a colourless crystalline solid, generally assuming forms belonging to the hexagonal system; its habit of twinning is the origin of the 'ice-flowers' and designs assumed by hoar-frost. In the form of hoar-frost, snow, and hail I. is often precipitated. The temp. at which water freezes into I. is very easily determined, and for this reason is employed as one of the standard temps. in the measurement of the scales of a thermometer. In the Centigrade system this temp. is zero, as in the Réaumur, whilst in the Fahrenheit system it is 32°. In the act of freezing, I. undergoes a noteworthy expansion, so that I. at 0° C. is not so dense as water, as is proved by the fact that it floats thereon. In the converse process of melting, I. contracts,

and the water formed contracts under heat till the point of maximum density, about  $4^{\circ}\text{C}$ , is reached. Above this temp the expansion of water is continual, and at no temp is water less dense than  $1$ . The density of  $\text{I}$  at  $0^{\circ}\text{C}$  is  $.917$ , of water at  $0^{\circ}\text{C}$ ,  $.9998$ , at  $10^{\circ}\text{C}$   $1$ , at  $10^{\circ}\text{C}$ ,  $.99976$ , and at  $100^{\circ}\text{C}$ ,  $.95866$ . The coefficient of cubical dilatation of  $\text{I}$  at moderately low temps has been calculated as  $.000105$ , and its specific heat is  $.50$ , or about half that of water. When  $\text{I}$  is melted although no rise of temp takes place a definite quantity of heat is absorbed, namely  $80$  calories per gram, and the same amount of heat is given out when water becomes  $\text{I}$ . This is expressed in the latent heat of fusion of  $\text{I}$ . Since water expands on freezing its

configuration of the land. Many traces, for instance, are left by glacial action, which serve to show that the whole of Europe was at one time much more exposed to such action than now. (See GLACIAL ACTION, DENUDATION, BOULDER CLAY, etc.) In the Upper Provs. of India water is made to freeze at night by being placed in porous vessels, wrapped round with a wet cloth. In Bengal pits are dug  $2$  ft deep and filled for three quarters of the depth with dry straw. The water is then laid on this straw in flat porous jars. It evaporates at the expense of its own heat and the cooling is rapid enough to neutralise the slow influx of heat through the cover above. The use of  $\text{I}$  in many of its applications is allied

THE FORMATION OF ICEBERGS

Movements of the water likely to bring a berg mass at the crack A. At B, rock debris is being brought down by the glacier. It is a terminal moraine in the water.

freezing point must be lowered by an increase of pressure, and it has been ascertained that for every additional atmosphere of pressure, the freezing point of water is lowered  $0.0075$  degrees. This discovery was theoretically worked out by James Thomson in 1851, and verified experimentally by his brother, Wm. Thomson (Lord Kelvin) in the following year. Many of the properties of  $\text{I}$  are explained by this, among others that of regelation, by which two blocks of  $\text{I}$  laid side by side in contact gradually fuse into one. The pressure at the point of contact melts the  $\text{I}$ , but this relieves the pressure and the water at once freezes again, until in time the two surfaces coalesce. The motion of glaciers is also probably due to this process.

$\text{I}$  forms on fresh water if the temp. of the air is below freezing point for sufficient time, but not until the whole mass of water is cooled down to the point of maximum density. Sea water will not freeze, under the most favourable conditions, until a temp. of  $-2^{\circ}\text{C}$  is reached, in the  $\text{I}$  formed four fifths of the salt originally present is rejected, so that water melted from sea ice has less salinity than the surrounding sea.  $\text{I}$  exists on a gigantic scale in the glaciers and snows of mountainous regions, especially in the seas and lands of both Polar regions. From a physiographical point of view,  $\text{I}$  is an important agent in the denudation and

corries is growing.  $\text{I}$  is also largely used by artificial means. For details as to methods, etc., see ILLUMINATING

Ice-Age, see GLACIAL PERIOD

Ice, Anchor, see ANCHOR ICE

Iceberg (Ger. *Berg*, int.) a hill of ice rising often as much as  $270$  ft above the sea. It is a floating mass which has broken away from some great mass of ice sheet in the Polar regions and which drifts away from its frozen base into warmer navigable water. When the  $\text{I}$  first breaks away, the future is green or blue, but when it comes within view of whalers and other vessels, its cliff-like faces and its jagged pinnacles glisten in the sunshine with a dazzling white. During its first flight in  $\text{I}$  strewn is abed with pebbles and rocks and other detritus—the remnant of its glacier days. As it enters warmer zones, it melts, disintegrates, tilts and often overturns. From the sp. gr. of ice it is calculated that only one-ninth of  $\text{I}$  appears above the ocean surface and as their speed is often considerable, it is clear that they are a grave source of peril to passing ships. It was collision with an  $\text{I}$  which caused the wreck of the *Titanic* (1912). Since that time, an International Iceberg Patrol has been maintained jointly by Britain and the U.S., and operated by the U.S. Coast Guard Patrol for the location and destruction of  $\text{I}$ . From Feb., for about three months, the patrol annually plots the

movements of some thousands of icebergs, and radios their positions to shipping. Aircraft are used, too, in the search, and any ship sighting an I. must report the position. The destruction of the Is. cannot be hurried: explosives, gunfire, and even flame-throwers have been tried to hasten their end, but in vain.

**Ice-breaker.** Many of the harbours of N. Europe are frozen over for a great part, or the whole, of the winter, to a depth of sev. ft., so rendering navigation impossible. The only method of keeping a channel open is to prevent the ice from freezing too thickly, and this is done by the continuous passage up and down of a specially-designed vessel. Such vessels are known as Is., and naturally present some peculiarities in construction. They must be both weighty and powerful, of exceptional strength, and capable of travelling at sufficient speed to break the ice by their momentum. In addition to cracking the ice into pieces of some score tons, they are constructed to slide up on to the ice and break it down with their weight. The *Ernak*, built for the Russian Gov. by Sir Wm. Armstrong & Co., was the first important ship of this kind. She had a length of 320 ft., a breadth of 71 ft., her displacement was 8000 tons, and her engines, of 8000 I.H.P., developed a speed of 15 knots. The *Ernak* could break her way through 12 or 13 ft. with ease, and has rammed through 31 ft. She rescued on one occasion eight out of nine vessels which had been caught in the ice, the last one sank before the *Ernak* could reach her. In 1917 yet larger and stronger ships, the *Sriolator* and the *Lenin*, were built by Armstrongs for the Russian Gov. The *Lenin* could get under way in five mins. after being frozen in all night. These Is. are also passenger ships. A smaller I., built on the same lines, the *Sampo*, was built for the gov. of Finland. Many Canadian and Amer. ports are only kept open by the use of ice-breaking ferry-steamers, such as the *Neota*, built by Armstrong, Whitworth & Co. to carry railway trains across the Straits of Canso to and from Port Mulgrave, Nova Scotia. In 1906 the I. *Lady Grey* was built for the Canadian Gov. by Vickers, Maxin & Co., and in 1909 the *Earl Grey*, on the same lines, but modified for extra speed, was built by the same firm. Since these vessels were built many ships that use the Canadian ports and the St. Lawrence R. are built on the ice-breaking principle—that is, with a sharp keel that rises diagonally to the front of the ship, lifting it on to the ice by the sheer force of the drive and cracking the ice by its weight. Is. are built on the watertight compartment principle, as there is always a chance of some part of the bottom or sides being pierced or crushed. The hull of an I. has a very stout frame with the ribs spaced very close together, 12 ins. fore and aft and 10 ins. in the middle, while the plates are of unusual thickness. The outer skin is double right fore and aft along the water-line and to the bottom of the keel, where the friction of the ice is apt to wear away the material. Tanks are fitted in

the fore part which can be filled at the rate of 250 tons an hour in order to give the required weight. The counter is specially strengthened so that she can break ice when going astern, and the rudder is built in the form of the ship to escape injury.

**Ice-flowers.** see FROST FIGURES.

**Ice Hockey.** originated under the name of 'Bandy' in the Fen country round the vil. of Farith over a hundred years ago. Since that time it has been played elsewhere in England, and has been introduced on the Continent, into America and into Canada where it is the national game. For the game of 'Bandy' there were eleven players a side, the stick or 'bandy' was like a hockey stick, and the ball was a rubber lacrosse ball. But the game, developed in America and Canada since 1867, is now played somewhat differently under the name of I. H. In I. H. there are six players a side, using a large broad-bladed type of hockey stick, but instead of a ball the game is played with a vulcanised rubber disk called a puck. Four reserves are allowed to each team. The arena is enclosed by wooden barriers about three ft. high, and this means that the puck does not go out of play frequently. The goals are each 4 ft. high by 6 ft. wide, and stand in goal areas 8 ft. by 5 ft. This fact, coupled with the slippery surface, makes the game exceedingly fast, and it is generally claimed to be the fastest game in the world.

**Ice, see MOUNTAINS.**

**Iceland**, is, a republic situated in the N. Atlantic Ocean. It is 250 m. from the S.E. coast of Greenland and 600 m. W. of Norway. Its area is over 37,700 sq. m., length 298 m., and breadth 191 m. The total length of its coast-line is about 3730 m., about one-third of which belongs to the N.W. peninsula. In shape it is a rough oval, its narrowest point being at the S. The coast-line presents a continued succession of deep bays or fjords, penetrating far inland except for a considerable portion extending along the S.E., which is almost unbroken. I. is an ice-covered plateau or tableland built up of volcanic rocks and pierced on all sides by fjords and valleys. The lowlands cover about one-fourteenth of the whole area, and are almost the only part of the Is. which is inhabited, the central tableland being absolutely uninhabitable on account of the rigour of the climate. The habitable area of I. is about one-fourth, glaciers, lava-streams, and elevated deserts making up the rest. The two bays, Hinnarloi and Breithufjord, separate the N.W. peninsula from the main mass of the Is., thus forming two tablelands—a large and a small. The isthmus connecting the two is scarcely 5 m. wide, but has an altitude of 748 ft. The N.W. peninsula has an elevation of 2000 ft. The interior of the Is. has a wild and desolate appearance and is covered by lofty mt.-masses of volcanic origin, many of them crowned with perpetual snow and ice. The glacier fields cover over 5000 sq. m., and glaciers exist in all the mts. above 4000 ft. In sev. of the mts.

the volcanic agency is still active, and terrible eruptions have repeatedly occurred within the last four centuries. The best known volcanoes are Hekla, Katla, and Askja. A large portion of I. is covered with lava, and the hot springs or geysers scattered throughout the is. are other specimens of volcanic agency. These are especially found in the S.W., where one of the main geysers throws up at intervals jets of water, stones, and mud to a height varying from 100 to 200 ft. In Mt. Hekla (5095 ft. high), which last erupted in March 1917, are best exhibited the general effects of volcanic agency.

The scenery of the is. is of great natural beauty, the climate is mild for the lat., and the weather is extremely variable, storms and hurricanes often occurring. The vegetation is tolerably uniform throughout the is., presenting the characteristics of an Arctic-European type. Heath and bilberry cover large stretches of the surface, and grasses are of great importance to the inhabs., who are dependent on them for supplying their live-stock. The development of forest-trees is insignificant, the birch being almost the only tree found, and this in a very stunted form, 10 to 10 ft. in height. The wild flora of I. is small and delicate, with bright bloom, saxifrages, sedums, and heaths being especially admired. As regards the fauna, species are few. The polar-bear is an occasional visitor, and reindeer were introduced in 1770. The seas abound in seals and whales. Over half of the species of birds are water fowl, of which the most important is the eider-duck on account of its down. The birds of prey are the Icelandic falcon and the eagle. The ptarmigan is the only game bird. Great numbers of sea-gulls, gullmots, and puffins are seen near their breeding places on the cliffs and islets round the coast. The hooper or whistling swan is also found in considerable numbers in I. The cod-fisheries are valuable, trout are plentiful in the lakes and streams, and salmon abound in many of the rivers. The sea round the coast teems with haddock, halibut and basking shark. There are no railways in I.; but in 1910 there were some 2800 m. of completed roads. The national Church and the only one endowed by the State, is Evangelical Lutheran. There is a univ. in Reykjavik. The chief products of I. are fish, fish oils, wool, mutton, and ponies. The chief exports are salted fish, meat, fish oil, and timber, and much of them go to the United Kingdom. Reykjavik has a pop. of 18,900. Other towns are Akureyri (6100), Hafnarfjörður (1100), Vestmannaeyjar (3100), Siglufjörður (2900), Laufjörður (2800), Almannagjá (2300), Nes (1200), Ólafsfjörður (915) and Seyðisfjörður (811).

**History.**—I. received the greatest portion of its pop. from Norway between 800 and 870, when it was colonised by Norsemen or Scandinavian Vikings, though some settlements of Irish monks had been made about the end of the eighth century. The first Norwegian settlement was made in 870 by Ingolf on

the S. coast, and was estab. permanently four years later at what is now Reykjavik. Other settlers soon followed, and in the course of sixty years all the habitable parts of the coast were settled. The gov. was at first in the hands of the overseer of the temple in each settlement, but latterly, when the separate jurisdictions were joined together, a kind of aristocratic republic was formed. Christianity was introduced in 981, and adopted by law in 1000, and schools and bishoprics were estab. I. was a dependency of the Dan Crown from 1380. In 1918 I. again became a sovereign state, but united as a constitutional monarchy to Denmark with one king. Following the annexation of Denmark by the Gers. (April, 1940) the Icelandic ministry assumed control of its own foreign relations. Soon afterwards the is. was occupied by Brit. naval and military forces with the object of protecting Brit. maritime interests, because the is. was of great strategic importance in relation to U-boat warfare and as a potential base for the invasion of the Brit. Isles. In 1911, the Althing decided to estab. a republic; but pending the formal abrogation of the union with Denmark a regent was appointed from year to year. In July 1911, President Roosevelt announced that Amer. forces had occupied I. These forces were not intended to replace the Brit. forces. President Roosevelt, in a message to Congress, said that the U.S. could not permit occupation by Germany of strategic outposts in the Atlantic to be used as air or naval bases for an eventual attack against the W. hemisphere. The Brit. guarantee of the future of I.'s independence was repeated by Mr. Roosevelt, who said that the U.S. Gov. did not wish to see any change in the existing sovereignty of the country. By extending Amer. defences to I., a half-way house between Britain and America, Mr. Roosevelt had taken a step that was of enormous consequences in safeguarding the line between the U.S. and Britain. By plebiscite (May 25, 1944) the Act of Union of 1918 was repealed and a new constitution adopted providing for a republican form of gov. Executive power is in the hands of a ministry at Reykjavik, responsible to the national legislative assembly or Althing (founded in 930 A.D.) of two houses. The membership of the Althing is maintained, under the new constitution, at 32, of whom 14 are elected to form the Upper House.

**Language.**—The Icelandic is the most northerly of all cultivated tongues. It is free from gutturals and excess of hissing sounds, soft and sonorous to the ear, and rich in roots and grammatical forms. There are thirty-three letters in the alphabet, all the Eng. except w, also v, (the German ä and ö), ð, and two characters for the Eng. th. The present-day language is almost precisely the same as that spoken and written at the date of I.'s colonisation in the ninth century.

**Literature.**—Icelandic literature may be divided into two periods, the ant., extending to the fall of the republic, and the modern, from that date to the present

The former was regarded as sacred by the Egyptians, who gave it the name of Pharaoh's rat, the embalmed bodies of Is were often preserved by priests in the temples. They will eat the eggs of serpents and swallow smaller vermin, and are sometimes domesticated for this purpose.

Ichneumon, see also MONGOOSE

ICHNEUMON FLY

CALLED FLY

180

**Ichneumon-flies**, name applied to the Ichneumonidae, a family of insects, containing nearly 5000 species, and belonging to the order Hymenoptera. They are found in almost all parts of the world, and in the larval state are generally parasitic, and occasionally on Lepidoptera and other orders of insects. The Ichneumon flies thus destroy thousands of caterpillars and are even inimical to spiders. The distinguishing features of the Ichneumonidae are the long, jointed antennae, closely computed at the extremities. The genus *Ichneumon* are wingless Ichneumon, and are very common in Britain. *Ichneumon armatus* is a remarkable British species which goes under water for the purpose of depositing its eggs in the larva of Trichoptera.

**Ichor** (Greek *ichor*), which according to Greek mythology flowed in the veins of the gods instead of blood. The word is still used in the poetic sense. In pathology it signifies the watery acid discharge from all contused wounds.

**Ichthyodorulites** (Greek *ichthys*, fish, *dorulites* and *ichthos* stone) fossil spines of sharks, which are often found isolated in ancient strata the rest of the skeleton having rotted away. Over forty genera of I are recognized as *Onchus*, *Ctenacanthus*, *Lepranodus*, *Idodus*, etc.

**Ichthyology** (Greek *ichthys*, a fish), term applied to that branch of zoology which treats of fishes (q.v.).

**Ichthyopteri**, see ICHTHYOSAURUS.

**Ichthyornis** (Greek *ichthys*, fish and *ornis*, bird), name given to an extinct genus of禽inosaur or flying birds with a beaked breast bone which are found only in the Cretaceous strata of N. America. They form a group called Odontornithes, because

of their having rows of reptile teeth fixed in distinct sockets, they were birds of powerful flight, as shown by the construction of their wings. In shape, they resembled modern birds very closely, and they were about the size of a pigeon. Most of the specimens of I are preserved in Yale Univ. and in the Univ. of Kansas.

**Ichthyosaurus**, or **Ichthyopteri** (Greek *ichthys*, fish, *sauros*, lizard), name applied by Konig in 1818 to a kind of porpoise shaped marine reptile, with a fish like body, from its outward appearance. They belonged to the Mesozoic period, becoming extinct after the deposition of the chalk. Nearly complete skeletons have been obtained from the basins of England and Germany. Ichthyosaurs also occur in the Rhetic Jurassic, and Cretaceous strata of Europe, Australia, Africa and America. Those of the latter Cretaceous age being distributed all over the Indies and New Zealand. They varied in length from about 1 ft to 10 yds. The *Ichthyosaurus* from Banz, Bavaria, the largest known, reaches the head measuring over 2 yds. The Eng. *Ichthyosaurus* was about the same size. The commonest Eng. species *Ichthyosaurus intermedius* and *Ichthyosaurus minor* were about 1 to 1 yds long, probably originally descended from land or marsh animals. The earliest known Ichthyosaurs (*Mosasaurus*) were very small and occur in the Trias. They had large heads with a slender, pointed snout, the eyes surrounded by a ring of overlying 'sclerotic plates' and jaws with a row of conical teeth, much of a size fairly set in a continuous groove. As many as 100 teeth have been counted in a

ICHTHYOSAURUS

single mouth. They breathed air and were carnivorous, feeding on fishes and molluscs. Their bones and cartilages have supplied quantities of phosphate of lime for prepaing artificial manures. The reptiles were apparently viviparous. The bones of the skeleton show numerous short vertebrae, deeply biconcave, making the backbone very flexible. There is scarcely any neck, the head passing

directly into the fusiform body, which tapered to a bifurcate tail. Two pairs of paddle-like limbs or swimming flippers enclosed in skin are always found—the pectoral and pelvic fins. The hinder are often small, but never absent altogether. The skin is smooth, forming two triangular median fins, one in the middle of the back (dorsal) and one at the end of the tail. Examples are in the museums of Stuttgart, Tubingen, Budapest and Chicago. The terminal vertebra passed into the lower lobe of the tail fin which was expanded in a vertical plane. Behind the dorsal fin was a row of smaller inner fins, as seen in a specimen from Wurttemberg (1892). The resemblance between the *I* and the whale is a striking example of convergence between two distinct races—reptiles and mammals—resulting from adaptation to aquatic life. The Baplanodon Shasta-aureus and Ophthalmosaurus are allied Ichthyosaurs. See C. A. von Zittel, *Treatise of Palaeontology*, II, 1902; *British Museum Guide to Fossil Reptiles and Fishes*; and *Catalogue* by Dr. Woodward; J. Hawkins, *The Book of the Great Sea Dragons*, 1810; F. von Huene, *Die Ichthyosaurier des Juras*, 1922.

**Icknield Way**, ancient pre-Roman road of the Iceni across S. England. It runs from the Wash in a S.W. direction by way of Cambridge through Ely, Elythworth and Eling in Hertfordshire, making its way over the Thames and following the line of the Berkshire Downs to the source of the Kennet in Wiltshire.

**Icolmkil**, see IONA.

**Icon**, representation of Christ, an angel, or a saint, found in Gk. and Orthodox E. Churches. It is painted on a flat surface, but parts are often covered with gold or silver embossed plates. See also ICONOCLASTS.

**Iconium**, a Phrygian city including Darnaseus in antiquity and important in ancient times. Paul visited it on his first journey, coming from Antioch, and met success among both Jew and Gentiles (Acts, xiii 51–xv 15). Well adapted for defence, it owed its continuance to its central position and its well watered fruitful district. It became a Roman colony, and in later times was the cap. of the Syriac Empire. It is represented by the modern Konya, in the plain of Lycaonia N. of the Taurus (see KONYA).

**Iconoclasts** (Gk. *κονκλαστες*, image-breakers), name applied to the Christian party in the church of the eighth and ninth centuries who refused to tolerate the use of images in places of worship. In the early Christian church only symbols like the fish, palm branch, or dove were used, but by the fourth century sacred pictures were apparently common and denounced by the 5th Council of Ephesus (456). The sixth General (Ecumenical) Council of Constantinople (682) sanctioned the representation of Christ as a Man, and the second council of Nicea (787) allowed sacred images in the churches. Distinction was made between *προσκύπτεις τιμητική* or *δουλεία*, veneration, and *προσκύπτεις λατρευτική* or *λατρεία*, worship due to

God alone. The Byzantine Emperor Leo III (the Isaurian) issued an edict (726) forbidding honours to be paid to images. Another decree of 730, prohibited image worship as idolatrous. Constantine V, Leo IV, and Michael Balbus were also I, while Popes Gregory II and III and Gerimus, patriarch of Constantinople, were like the Empress Irene, supporters of the iconolatri (image-worshippers). One result of the quarrel between the iconolatri and I was the session between E and W. Rome became linked with the Constantinian house, and the Pope crowned Charlemagne in 800. The Roman Church emphasised the utility of pictures and statues for teaching the illiterate (Council of Trent sess. xxv). Image worship was restored in the E under Theophilus and Theodora (842). Records of the reforming I of the seventh century protestant image worship had been practised considerably in Britain. See Acts of the Iconoclast Council of 815. In *Sciences Académiques des Inscriptions*, 1901; I. Marin, *Les Monnes de Constantinople*, iv, 1897; J. Brecher, *La Querelle des images*, 1904; J. Hastings, *Manual of Religion and Ethics* (1911), vol. vii; J. von Veigh, *Die Bildersturm*, 1911; G. Ostrogorsky, *Stellen zur Geschichte des byzantinischen Bilderstreits*, 1929.

**Ictinus**, famous Gk. architect who lived towards the end of the fifth century B.C. and was thus a contemporary of Ictinus and Ictinus. His name will always be associated with the Parthenon at Athens, which he designed in conjunction with Callicrates (447–439 B.C.). I was also the architect for the temple of Eleusis, where the mysteries were celebrated and for the temple dedicated to Apollo Epikourios near Phigalia in Arcadia. Portions of all these buildings still exist.

**Ida** (477 B.C.) first king of Bernicia, was in the prime of life when he assumed power. His rule probably did not extend S. of the Tyne, the kingdom of Deira, between that river and the Humber, being founded after his death. He built a fortress called by the Anglo-Saxons, Bamburgh, six of his sons reigned in succession over Bernicia.

**Ida**, or **Ida**, in W. Africa situated on the N. of the Niger, near the boundary of N. and S. Nigeria. Pop. about 8000.

**Ida** (Turkish *Kaz-Dagh*), mt. range in Asia Minor, which extends through Phrygia and Mysia and commands the ancient plain of Troy. Mt. Gargarus (715 ft.), its highest peak, was the seat of the temple erected to Cybele, the *Idra Mater*.

**Ida**, **Mount**, or **Psilorati**, in Crete, was famous in the worship of Zeus, the god being nurtured, according to mythology, in one of its caverns. This celebrated peak is situated almost in the centre of the island and rises to a height of 8060 ft.

**Ida**, **Mount**, New Zealand, situated in the S. Is., about 70 m. N. of Dunedin, gold fields have been discovered in its neighbourhood.

**Idaho** (Indian, mountain gem), Rocky Mt. state of U.S.A., largely in the basin of Columbia R. It is bounded N. by

Brit. Columbia and Montana, E. by Montana and Wyoming, S. by Utah and Nevada, W. by Oregon and Washington. These limits were fixed in 1868, five years after the formation of the ter., which was admitted to the Amer. union in 1890. Area 83,557 sq. m. The Snake (Shoshone or Lewis) R. is on the W., noted for its cañon and numerous cataracts. Goose Creek and Bear R. Mts. come S. and S.E. of Salmon R. Mts., which divide the state into N. and S. Idaho, and separate Snake R. valley from Great Salt Lake basin. Besides the mountainous regions there are desert and sage-plains and fields of basalt. All geological ages from the Silurian to the Pliocene are represented, especially the Tertiary and post-Tertiary periods. Gold has been found on Pend d'Oreille R. since 1852. The Camur d'Alene mines of gold, silver, copper, and lead are famous. Coal, salt, sulphur, and iron-ore are also found. The land is more suited for grazing than agriculture, but wheat, oats, barley, and potatoes are produced. The ann. mineral production is over 10,000,000 dollars. A great source of wealth is timber, of which nearly a billion ft. are cut each year. An extensive irrigation scheme has been carried out which adds another half-million acs. to irrigated lands. There are twenty-three cos., the chief tns. being Boise (cap.), pop. 26,130; Pocatello, 18,100; Idaho Falls, 15,000; Camur d'Alene, 9000; Lewiston, 9500; Nampa, 9000; Twin Falls, 9000; Moscow (with state univ.), 5000. The state has a governor, a senate of 44 members, and a house of representatives of 59 members, all being elected for 2 years. I. is represented in Congress by two senators and two representatives. The leading religious denomination is the Mormon Church. There are numerous elementary schools, two normal public schools, and denominational colleges. Pop. 521,800. See H. H. Bancroft, *Washington, Idaho, and Montana*, 1890; J. E. Rees, *Idaho Chronology*, 1918; F. E. Lukens, *Idaho Citizen*, 1925; Annie Greenwood, *We Sagebrush Folk*, 1934; Federal Writers' Project, *Idaho, a Guide in Word and Picture*, 1937; M. D. Beal, *A History of South-Eastern Idaho*, 1912.

**Idaho Springs**, banking tn. and resort of Clear Creek co., Colorado, U.S.A., on Colorado and S. Railway, 30 m. W. of Denver. Situated in the plateau regions of the Rockies, it has hot and cold soda-springs, and gold and silver are found. There are concentrating mills, machine-shops and lumber-yards. Pop. 15,200.

**Idaliu** (Gk. Ἰδαλιον), anct. tn. of Cyprus, was situated almost in the centre of the is., on the site now occupied by the vil. Dalin or Idalion. It was sacred to the worship of Aphrodite, who was hence named Idalia. The tn. was destroyed by earthquake before the time of Pliny.

**Idar**, tn. of Oldenburg, Germany, on the Idarbach. Pop. 8000.

**Idea** (Gk. ἰδέα), in Gk. mythology, was the son of Aphareus and Arene, and brother to Lynceus; he wooed Marpessa, daughter of the riv.-god Kuenos, and carried her off from Apollo, who also

sought her favour. They fled in a winged chariot given by Poseidon, but were overtaken by Apollo at Messenia, where god and mortal fought for the nymph. Zeus, interposing, told her to choose between her suitors and she chose I. She became the mother of Cleopatra and Alcyoné, and having incurred the wrath of Apollo, they d. young. I. and his brother both took part in the Argonautic expedition; they were killed whilst engaged in a raid into Arcadia with their cousins Castor and Pollux. Zeus came upon them as they were quarrelling about the plunder and slew I. by lightning.

**Idesleigh**, Sir Stafford Henry Northcote, first Earl of (1818-87), Eng. statesman, began his political life in 1842, when he became private secretary to Gladstone. He succeeded as eighth baronet in 1851, and four years later entered Parliament in the Conservative interest. Disraeli appointed him president of the Board of Trade in 1866, and in the following year promoted him to the India Office. In 1874 he became Chancellor of the Exchequer, and in 1876, when Disraeli went to the House of Lords, he became leader of the House of Commons. Created earl of Idesleigh in 1884, he went to the Foreign Office in 1886. An unselfish man always putting party before himself, he was an admirable and much-loved statesman, though scarcely of the first rank, being lacking in initiative. See Andrew Lang (ed.), *Life, Letters and Diaries*, 1890.

**Ide Languages**, see **INDO-EUROPEAN LANGUAGES**.

**Idea** (Gk. ἰδέα, from ἰδέναι, to see; Lat. *species*), term widely used both in philosophy and in common parlance for a mental image of any external object or for the abstract conception of a class of objects. It is also used in a wider sense for any product of intellectual action. Plato made use of the term in metaphysics to define the absolute realities eternally existing in the mind of God, or the model of which all the objects which can be perceived are made. These vary in detail, but the one archetype or 'Idea' remains constant, and can be apprehended only by the action of the intellect. Empirical thinkers, who insist on the reality of external objects, have never accepted this usage. Locke, at the beginning of his *Essay on the Human Understanding*, defines the term 'idea' as 'whatsoever is the object of the understanding when a man thinks,' including, that is to say, all objects of consciousness—percepts, images, and concepts. Hume limited the term to the mentally reconstructed images of perceptions, while he introduced the term 'impression' for the direct perception. This use of the term is still common in popular language. Kant defined *Is* (called by him Transcendental *Is*.) as the product of the Reason (*Vernunft*), of which they are the highest concepts, transcending the understanding, and therefore incapable of verification by experience. In the language of Hegel and the Idealists, the term almost returned to its Platonic significance, being used for the Absolute, which is the beginning and

end of all things. See A. Schopenhauer, *The World as Will and Idea*, trans. 1883-1886; A. N. Whitehead, *Adventures of Ideas*, 1933; H. Heyse, *Idee und Existenz*, 1935; N. Hartmann, *Zur Lehre vom Eidos bei Platon und Aristoteles*, 1911.

**Idealism**, conception in philosophy which holds that ideas are the only things known. The conception is developed along different lines by various philosophers, among them being Plato, while later systems were evolved by Locke, Descartes, and Spinoza up to Berkeley, but perhaps the most widely known are those of Leibnitz, Hegel, and Kant. Broadly speaking, I. may be discussed under the two main systems of subjective I. (or, as it is sometimes termed, Spiritual Monism or Pluralism) and Spiritual Monism.

Subjective I. was expounded by Leibnitz as a belief that each individual mind exists apart from every other mind as a distinct unit living as it were in a universe of its own, so that nothing happening in another mind's universe is the same as that which happens in its own. We are aware, not of objects themselves, but merely of sensations produced by the objects which bring consciousness of them from our sensory disturbances. We become aware of the sensation rather than the object. Thus we experience not things of the world, but our own feelings, which give us images and representations of the world of objects. This position is known as Representationalism. Berkeley and Hume and perhaps the Itz. Croce and Gentile belong to this school. Berkeley shows that there is, at least to us, no external world, since all we know is our impressions of matter. He says in effect 'its existence consists in its being perceived.' This conclusion is strenuously criticised by Realists (see REALISM). Spiritual Monism differs from this theory, particularly regarding its sense of isolation of the mind. Hegel, with whom may be associated Schopenhauer and Bergson, though each has points of variance, shows that each individual mind is a part of a universal force, fused into the universal embrace of the spiritual force of which it is only temporarily individual, that its very existence depends upon its being part of a greater force, that no object can be said to exist without its having a relationship to other objects. It is a part of another whole, which in turn is a localised part of yet another whole, until, finally, the universal whole is comprehended. This is called by Hegel the Absolute, and is certainly a more congenial conception than the intellectual loneliness of the mind according to the Pluralists. This idea of the Oneness of the Universe is the chief inspiration of theologians who call God what for Hegel is the Absolute, and what Schopenhauer terms the Will. But whereas Hegel's idea of the Universal Whole is purely intellectual, Schopenhauer's Will is of the instincts and is ceaselessly and spiritually striving. Bergson, however, sees in his unity of all things an ending change as its main spring, and claims that there is nothing but change,

and, therefore, matter always in process of change has not existence at any given time.

Kant's Idealism challenges Leibnitz and Berkeley's in that there is no evidence that we know our mind any more intimately than we know objects. We are conscious of ourselves only in knowing something not ourselves. He agrees that all knowledge depends upon perception, but insists further that this knowledge is always limited by the fact that we are finite minds controlled by a particular place and time. Thought can extend the range of perception which reveals an object as a part of a whole which stretches indefinitely beyond in space and time. For further detail of Kant's standpoint the reader is referred to his *Critique of Reason*. Scholastic philosophy groups together all these systems under the term 'transcendental idealism,' to which 'immanent idealism' is opposed by the neo-scholastics. Their position is that the intelligibility of things is immanent in them, and through that intelligibility the mind comes into direct contact with the thing.

The word I. has also taken another meaning, of a purely literary nature—the expression of beautiful or optimistic temperament; in its results, it is analogous to the more general æsthetic Ideology of Cousin and Lessing. In this sense, such writers as Foggazzaro, Maeterlinck, Shelley, etc., are idealists, apart from any consideration of their purely philosophical sympathies. See Fichte, JOHANNES; Hegel, GEORG WILHELM; SPINOZA, BARUCH; etc.

See E. Caird, *Hegel*, 1907; H. Bergson, *Philosophy of Change*, 1911; C. E. M. Joad, *Mind and Matter*, 1925; W. R. Inge, *Personal Idealism and Musicism*, 1921; E. G. Braham, *Ourselves and Reality: Personality in British and American Idealism from the time of T. H. Green*, 1930; J. H. Muirhead, *The Platonic Tradition in Anglo-Saxon Philosophy: Studies in the History of Idealism in England and America*, 1931; G. W. Cunningham, *Idealistic Argument in Recent Philosophy*, 1933; A. Liebert, *Die Krisis des Idealismus*, 1936; H. N. Cross, *Idealism and Realism*, 1915.

**Identity**, term with various connotations according as it relates to questions of logic or of metaphysics. The logical law of I. is usually expressed by the formula  $A = A$ , or  $A$  is  $A$ . It is a necessary law of self-conscious thought, being, in fact, merely the positive expression of the law of contradiction, which states that a judgment cannot be true and untrue at various times, and that the same attribute cannot at the same time be affirmed and denied of the same subject. Without such a law no thinking would be possible. The philosophical question of I. is concerned largely with the various ways in which I. can be predicated, and to the exact connotation of the term. The question as to whether or not I. excludes difference is an important one. Many have held that, so far from excluding difference, it actually implies it; in other

words, that I is not undifferentiated, but differentiated, likeness. The question, however, is one of the conceptions of philosophical atomism (See W. James, *Principles of Psychology*, 1890, and B. Bosanquet, *Lectures and Addresses*, 1889.) The question of personal I that is to say, of 'the continuity of personal experience in the exercise of intelligent causal energy, the results being associated in memory,' was first brought into prominence by Locke (*Essay*, bk. II, ch. XXV), and soon occupied the attention of Hume and Butler. The fact is that which distinguishes each person from other thinking beings, and with which the preservation of unity is closely bound up. See J. MacCrimmon, *Identity and Reality* 1150.

**Ideograph**, sign or symbol representing an idea. Ideography may be considered as the second stage of true writing (see WRITING). In ideography, the use of signs depicting concrete, natural objects (see PICTOGRAPH) is extended to express similar concrete concepts, and analogous abstract conceptions. In other words, the ideograph represents not so much the thing it shows as the underlying idea associated with this thing. Thus for instance, in carrying out writing (*q.v.*), the symbol depicting the star came to represent also 'sky, heaven,' 'god,' the adjective 'high' and so forth, and the pictograph for 'to stand, to bring.' The name of the object or its action is, however, closely identified with the picture. As a system of writing, ideography consists of definite pictures, conventional and simplified, selected by agreement or custom from the many experimental pictures.

**Ideology** the system of political and social ideas upon which a community or state is based. The I. of primitive communities must be vague, but would seem to have rested on a sense of law or tribe as distinct from present day aborigines. An increased awareness of the importance of the individual began with the Greeks, and for example Aristotle's political philosophy depended upon his belief that 'natural man was man in society' and that only in organised society could he find fulfilment. Man, therefore 'is a political animal.' It is, however, noteworthy that Aristotle had to admit of a class of slaves in order to allow citizens the time to lead 'the good life.' The spread of Christianity emphasised the importance of the individual and at the same time evolved the old Law of Nature into the Law of God as the final standard by which the acts of temporal rulers should be judged. The danger of anarchy on the one hand, or of ecclesiastical domination on the other, was met in practice by the emphasis laid upon the absolute power of the ruler. This, in its turn, was countered by the theory of the Social Contract as the basis of security, which, however unhistorical, became a powerful weapon against authoritarian rule in the hands of John Locke and others. The conflict of modern times has been, basically, between those who conceive of the State merely as a machine for carrying-

out the will of the members of a society, and those who, deriving from Hegel, conceive of the State as an organism greater than the mere sum of its members and possessing a personality, the individual finds full satisfaction in sinking his will into that of 'the State.' To the latter group belong totalitarian systems to the former, democracies. The Communist position is somewhat anomalous, the idea that the State should ultimately 'wither away' would seem to be a denial of Hegelism, whereas in practice, an authoritarian system would seem to result from the identification of the will of the people with one political party.

Idea, *see* CONCEPT.

Idfu, *see* IDOT.

**Idiocy** or mental deficiency or extreme stupidity depending upon malnutrition or disease of the brain occurring either before, or before the evolution of the mental faculties in childhood, while imbecility is generally used to denote a less decided degree of such mental incapacity. Thus Idiocy is from insanity in that one in the former condition never has been sane while one in the latter has. Idiots, vary from the having no power of speech, of caring for themselves, of distinction between two persons with no feelings of love or hatred, pleasure or pain who are usually dwarfed, ugly, and misshapen, and who sometimes cannot even talk, to those who are often beautiful and normally developed physically, but who lack some mental faculty or intelligence, affection or control. The large majority of mentally deficient are, however, physically unfit in some way or another, and are liable to certain diseases, such as consumption, rickets and scrofula. Idiot are not all being incapable of education and perhaps the most wonderful of tides in education within recent years have been found in the methods of dealing with mentally deficient children. Dr Maria Montessori (*q.v.*) first gained fame for her system by its astonishing success among such children. Those who created the system of educating and treating idiots and imbeciles are Herd, Howe and Seguin, the first task which she met almost impossible, and the value of their work and of those still engaged upon it is inestimable. It has been classified into ten divisions, and from these, pathological causes would seem to have much to do with the state, but the general cause has yet to be discovered. Undoubtedly in many cases it is hereditary, and in a genuine marriage may cause it, but only in those cases where the stock is bad. It has been suggested that consumption in parents may cause the state to arise, and it is known that fights to mothers when pregnant sometimes result in the birth of an idiot. On the other hand, it does occur in what otherwise appear to be healthy families. In law idiots and imbeciles are regarded as being irresponsible for their actions. See also CRETINISM. See Dr W. Ireland, *Idiocy and Imbecility*, 1877. J. F. MacCrimmon, *Problems in Dynamic Psychology*, 1921; and W. S. Dawson *Guide to Psychiatry*, 1931.

Idiocy, for legal sense see LUNACY.

**Idiosyncrasy**, converse of antipathy (*q.v.*), being a strong disposition towards certain things.

**Idle**, tn. of the W. Riding of Yorkshire, England, situated near the Aire, 9 m. from Leeds. It manufs. woollen goods. Pop. 7873.

**Ido**, or **Revised Esperanto**, is, as its name implies, the offspring of Esperanto (*q.v.*), the international auxiliary language. The origin of I. is, according to its partisans, to be found in the Delegation for the Adoption of an Auxiliary International Language, founded in 1901. I. does not claim to supersede Esperanto as that tongue superseded Volapük, but merely to simplify, regularise, and improve it. The two chief alterations effected are the doing away with all accented letters and the suppression of a few grammatical rules (*e.g.* accusative case, agreement of the adjective) which the partisans of I. consider unnecessary.

**Idocrase** or **Vesuvian**, mineral consisting essentially of silica (37 to 39 per cent), alumina (13 to 61 per cent), and lime (33 to 37 per cent), together with a small percentage of oxide of iron, magnesia, and water. It occurs in the form of short tetragonal crystals, which show a large number of faces (sp. gr. 3.4, h. 6.5). The mineral has a vitreous lustre and varies in colour from brown to green. It was first found in dolomitic blocks ejected from Vesuvius, but occurs also in granular limestone, serpentine, gneiss, and other metamorphic rocks. The finest specimens come from Siberia, Piedmont, and Norway, and are cut, polished, and sold as chrysolite or jacinth.

**Idolatry** (Gk. *eidolon* and *latreia*, idol-worship), worship paid to images or other objects supposed to be the abode of a superhuman personality. The term is sometimes used generically to denote all forms of worship of visible and concrete, as opposed to unseen, existences, thus including litholatry, pyrolatry, zoolatry, and the like. St. Paul uses it to express worship of false gods, and the whole heathen cultus (see Gal. v. 20: 1 Cor. x. 14: 1 Pet. iv. 3). Regarded by the early church as a degeneration from a higher primeval faith, it has since been shown rather to mark a stage of upward movement and progress in religious growth. While absent among Hottentots, Fuegians, Veddas, Bushmen, and others, I. was extensively practised among the great civilisations of old, by Egyptians, Chaldeans, Indians, Gks., Romans, Mexicans, and Peruvians. Relics of this worship remain in the 'nirgalli' (images of monsters), common outside Chaldean palaces. Into these it was believed that malignant spirits, such as those of disease, would enter. Statues and idols connected with the worship of the dead were common among many peoples. The Maori 'atua,' or ancestral deity, was supposed to enter his carved wooden image on the incantations of a priest, and to deliver oracles. The earliest stages of I. are Naturalism and Animism. Fetichism, a degraded form of the latter, is often the direct antecedent of I. Private and personal idols or

fetiches, like the Heb. teraphim (see Gen. xxxi. 19, 31: 1 Sam. xix. 13), are early adopted; but public, tribal, and national idols are a late development. The human figure came to be the predominant model. Images were probably introduced among Christians in the second century, and are often found in Christian tombs in the Rom. catacombs. In the sixth and seventh centuries abuses crept in. A reaction arose against I. in the E., culminating in Iconoclasm (c. 726). A characteristic of I. is its tendency to revive even after the introduction of purer spiritual ideas. Thus the Israelites were often in danger of relapsing from monotheism (see Exod. xxxii.; 1 Kings xi. 3: xii. 24: xiv. 15, 23: xvi. 32). The Rom. Catholic and Gk. Churches still revere images of the Virgin and saints, though of course this subject should hardly be dealt with under I. The Reformers and Calvinists repudiated this practice, but Luther allowed images as possibly helpful to devotion. See also **IMAG-WORSHIP**; **RELIGION**. See the works of J. Voss, A. van Dale, H. Spencer, Sir R. Taylor, T. Waltz, V. Schultze, A. Réville. See also K. Kraus, *Roma Sotterranea*, 1879; G. D. Alviella, 'Les Origines de l'Idolatrie' in *Revue de l'Histoire des Religions*, xii, 1885; J. Lippert, *Culturgeschichte*, 1886; A. B. Labbock, *Origin of Civilisation*, 1902; J. Hastings, *Encyclopaedia of Religion and Ethics* (vol. vii.), 1914.

**Idomeneus**, son of Deucalion, king of Crete, and grandson of Minos. As king of Crete, he led eighty ships to Troy and played a leading part in the battle, being described in Homer's *Iliad* as one of the mightiest of the heroes. In later writers he is represented as vowing in a storm, provided he arrived safe home, to sacrifice to Poseidon whatever he first met on landing. The victim was his son, whom he accordingly sacrificed, and his subjects, in consequence, drove him forth. He wandered in Calabria and Italy, where he established a shrine of Apollo near Colophon when he died and was buried.

**Idria**, or **Idrija**, tn. and com. of Istria, Yugoslavia, 26 m. N.N.W. of Trieste. There are quicksilver mines in the vicinity which have been worked since the sixteenth century and lace manuf. Pop. 10,500.

**Idris**, mythical figure in Welsh tradition who had his rock-hewn chair on the summit of Cader Idris. He was supposed to have the power of conferring poetic inspiration, and of inducing madness or death.

**Idris**, see **ENOCH**.

**Idrisi**, Abu Abdallah Mohammed El-, see **EDIRI**.

**Idumaea**, see **EDOM**.

**Idun**, or **Iduna**, name of a goddess in Norse mythology. She was the daughter of the dwarf Svald, and became the wife of Braut. She personified the reviving year, being imprisoned in the nether world by Thiazi (winter), from whom she escaped, and appeared again in the shape of a bird in the springtime.

**Idyll** (Lat. *idyllum*, a little image), word used to describe a species of poem repre-

senting simple scenes of a pastoral life, not, however, exclusively used for poems of a pastoral character. Tennyson, for example, in his *Idylls of the King*, presents an epic style and treatment, the incidents portrayed being of a romantic and tragic nature. Theocritus, too, in his *Idyllia* (thirty in number), wrote less than half in the pastoral form.

Ieper, see YPRES.

Ierne, see HIBERNIA.

Ierugena, Johannes Scotus, see ERI-GENA.

Iesi, or Jesi, tn. of Italy in the prov. of Ancona, situated on the l. b. of the Esino, 17 m. S.W. of Ancona. It is noted as the bp. of the Emperor Frederick II., and possesses a fine cathedral. Pop. about 16,000.

If, islet of Bouches-du-Rhône dept., off the S. coast of France, opposite Marseilles in the gulf of Lyons. It was once covered with yew ('ifs'). Its fortress, Chateau d'If, built by Francis I. (1529), is famous. It was used as a state prison later, Mirabeau and Philippe Egalité being imprisoned there. In Dumas's *Count of Monte Cristo* the hero is confined there.

Ifland, August William (1759-1814), Ger. actor and dramatist, b. at Hanover, and educated for the ministry. In 1796 he became director of the Berlin National Theatre, and subsequently superintendent of all the royal theatres, the Berlin stage reaching its highest point under his management. Among the best of I.'s plays are (titles trans.), *The Bachelors* (1799), *The Foresters* (1799), *The Lawyers* (1799), *The Nephews* (1800), *Crime from Ambition* (1800), and *Conscience*. His dramatic criticism is to be found in his *Almanach für Theater und Theaterfreunde* (1815), and his *Theorie der Schauspielkunst* (1815). See his collected dramatic works, 1844; Duncker (ed.) *Ifland in seinen Schriften*, 1859, and *Ifland's Berliner Theaterleitung*, 1896, and monograph by E. Kliever, 1937.

Ifni, seaport tn. and dist. of W. Morocco, Africa, 35 m. from Azulon, opposite the Canary Is., ceded to Spain by Morocco in 1860. By the Franco-Sp. agreement of 1912 it extends along the W. coast of the N. of Wadi Draa and a distance of 15 m. inland from the coast. Pop. chiefly engaged in fishing and cultivating garden produce. Area 965 sq. m.; pop. 20,000.

Ifrut, Ifreet, Afrut, or Afreet, in Arabic folklore, ogre of an evil disposition.

Igel, vil. of Rhineland, Germany, 3 m. S.W. of Trier. It contains the celebrated I. obelisk, or Heidenthurm, a sandstone monument 75 ft. high, one of the most remarkable Rom. relics N. of the Alps. This was a funeral monument of the Secundina family. Pop. 700.

Iggdrasil, see YGGDRASIL.

Iglau (Jihlava), tn. on the Bohemian frontier of Moravia, Czechoslovakia, 123 m. N.N.W. of Vienna, on the Iglawa. Manufs. include tobacco, plush, woollens, cloth, glass, and pottery. It was a mining centre in the Middle Ages, silver being worked from the eighth century. A treaty ending the struggle between Sigismund and the Hussites was signed here (1436).

In 1805 the Austrians defeated the Bavarians here. Pop. 23,400.

Iglesias, tn. and episcopal see of Cagliari prov., W. Sardinia, Italy, 32 m. from Cagliari. The chief mining centre of Sardinia, it has zinc and lead mines. There is a cathedral (1285), an old castle, and a bishop's palace. The tn. is partly surrounded by walls, and its citadel dates from 1325. Malaria is prevalent. Pop. 21,800.

Iglesias de la Casa, José (1748-91), Sp. poet, a native of Salamanca. He first wrote satiric ballads, epigrams, and 'letrillas' directed against contemporary society and morals. He entered the church (1783), becoming priest of Larodrigo, and then of Carbayosa de la Sagrada. His later works contained much theological discussion. I. is often ranked with Quevedo (1580-1615). His *Collected Poems* first appeared in 1798. In 1802 some of them were put on the Index. See G. Ticknor, *History of Spanish Literature*, 1849; H. W. Longfellow, *Poets and Poetry of Europe*, 1819; C. Real de la Iruya, *Iglesias in Salamanca*, 1931.

Iglo, tn. of Hungary, in the co. of Zips, situated on the Hernád. It has iron and copper smelting works, and a trade in linen and flax. Pop. 9000.

Igloo, Fekimo hut. Built for temporary habitation during the winter season, the huts are frequently constructed merely of blocks of ice piled high in a dome.

Iglolik, small is. of N. Canada, situated in the Arctic Ocean, in Fury and Hecla Strait, in lat. 69° 21' N., and long. 81° 53' W.

Ignatiev, Nikolai Pavlovitch (1832-1906) Russian general and diplomatist, b. in St. Petersburg, and the son of Gen. Paul I., a favourite officer of Alexander II. He was educated in the corps of pages and exchanged from the military to the diplomatic service in 1856, having served in the Crimean War and been made a colonel and major-general. In 1858 he was made diplomatic attaché to Gen. Muraviev, governor of E. Siberia, and negotiated the treaty of Alghun with China, by which the region of the Amur came into the possession of Russia. Two years later, he was sent as plenipotentiary to Peking. In 1863 he was placed at the head of the Asiatic dept. of the ministry of foreign affairs, and made adjutant-general of the Czar. He was an active agent at the outbreak of the Russo-Turkish War in 1877, and the treaty of Stefano was largely his work. At the close of the war he fell into disfavour and retired from office. On the accession of Alexander III., however, he was made minister of the interior, but was dismissed in 1882 for permitting the persecution of the Jews.

Ignatius, bishop of Antioch, one of the Apostolic Fathers, perhaps the most remarkable of all the figures of the century immediately following the Apostles. Very little, however, is known about his life, and about his birth and parentage nothing is known. A late tradition says that he was the little child whom Our Lord placed as a pattern in the midst of the disciples. More reliance is to be placed on the earlier

tradition which speaks of him as the disciple of St. John the Apostle. Eusebius also tells us that he was the second successor of St. Peter in the see of Antioch. Later traditions are so untrustworthy that we are forced to rely entirely on the internal evidence of the letters which I. wrote. These were sent from various cities at which the saint stopped as he was being hurried to Rome for martyrdom (A.D. 115-117) during a persecution which arose at Antioch in the reign of Trajan. The letters themselves present a most difficult critical problem, which now, however, after the labours of Zahn, Lightfoot, Harnack, and others, seems to have reached a satisfactory solution. The difficulty is brought about by the fact that three widely-different recensions of the letters exist. The short or Vossian recension consists of seven letters, the number which Eusebius ascribes to I. They are written to the Ephesians, Magnesians, Trallians, Romans, Philadelphians, Smyrnaeans, and to Polycarp, respectively. This recension occurs in Gk., Lat., Armenian, and fragments in Syriac and Coptic forms. The long recension contains these seven in an expanded form and sev. others in addition, six in the Gk. form, and ten in the Lat. Finally there is the Syriac or Curetonian recension, containing only three epistles, viz. those to the Romans, the Ephesians, and Polycarp, all in a shortened form. Much controversy has taken place as to which of these recensions was to be regarded as the genuine work of I. The arguments against the long recension are conclusive, and scholars are now generally united in upholding the claims of the Vossian recension. The Syriac recension is to be regarded as an abbreviated ed. of the seven epistles, and not as the original and unexpanded form. The letters are directed against Gnostic and Docetic heresy, laying great stress on the duty of adherence to episcopal authority, and the essential nature of the episcopal office. See works by T. Zahn, J. Lightfoot, F. Funk, A. Harnack; M. de Wulf, *History of Medieval Philosophy* (trans. by E. C. Mossner), 1926; H. W. Bartsch, *Gnostisches Judentum und Gemeinde tradition bei Ignatius von Antioch*, 1940.

**Ignatius, Father** (1837-1908), name, as a religious, of Joseph Leicester Lyue, an Englishman who devoted his life to an attempt to revive the Benedictine life in the Church of England. In 1870 he founded a community at Llanthony Abbey, near Abergavenny, but his attempt having been made without any reference to eccles. authority, it came to an end after his death, the property passing to the Benedictine community of Caldey, of which the greater number succeeded in 1913 to the Church of Rome. F. I. was a great preacher, and his mission sermons in London attracted large numbers.

**Ignatius, Saint** (c. 800-878), Patriarch of Constantinople, was the son of Michael I., emperor of the E. He was compelled to enter a monastery, whence he rose to the patriarchate through the favour of the

Empress Theodora. He was an opponent of the Iconoclasts. The influence of his brother Bardas, whom he had excommunicated, led to his being forced to abdicate in 866, but he was restored in the following year.

**Ignatius de Loyola**, see LOYOLA, IGNATIUS DE, and JESUITS.

**Igneous Rocks** include all those which at some time in their hist. have been in a molten condition. Their differing physical characters, which are largely dependent on their rate of cooling, suggest one form of classification into: (a) Volcanic, in which the rate of cooling has been comparatively rapid, so that the crystallisation is by no means perfect, hence this kind contains large quantities of glassy material; (b) plutonic, in which the cooling has been extremely slow, so that the crystallisation is almost perfect, hence there is little, if any, glassy material present. Between these two in nature there is seldom any strongly marked line of separation, for they merge into one another, and the dyke rocks may be defined as of the intermediate type. In the diagram, P represents the deep-seated

plutonic rocks. D the intrusive dyke rocks, later in age than the rocks they penetrate, and forming dome-shaped laccoliths. L in certain areas. V indicates the volcanic lavas, effusive or eruptive rocks. These form sills which are contemporaneous with the sedimentary rocks they overlie. Examples of such sills occur in the N.W. tets. of N. America, in Iceland, the Faroe Is., the Deccan, Abyssinia, and fragments in Ireland and Scotland. Large shapeless masses (blosses) of plutonic rocks become exposed through the denudation of overlying rocks. These outstanding masses may be sev. m. in diameter. Other prominent rock-masses may be left by the weathering removal of surrounding material from the solidified lava in the neck of a volcano. Many such necks or cores remain, e.g. in Scotland, as relics of past volcanic activity. I. R. are chiefly composed of oxides, as silica, alumina, iron oxide, lime, magnesia, etc.; in consequence a frequent classification of such rocks depends on their chemical composition and more particularly on the percentage of silica present. A brief summary of such a grouping follows:

1. **Acid igneous rocks**, containing from 66 to 80 per cent. of silica. The plutonic example is granite, a holocrystalline rock

containing the essential minerals, quartz, feldspar, and mica (generally muscovite). The glassy, rapidly-cooled, volcanic representative is obsidian, which resembles bottle glass in appearance. The hemi-crystalline variety is called rhyolite. The two latter have roughly the same chemical composition as that of granite.

2. *Sub-acid intermediate rocks*, containing from 60 to 66 per cent of silica. The essential constituents of these are orthoclase and hornblende, the latter of which may be replaced partly by augite or mica. Representatives in the same order as those of the first group are syenite, trachytic pumice, or trachyte glass, and trachyte. The trachytes bear much the same relation to the syenites that the rhyolites do to the granites.

3. *Sub-basic intermediate rocks*, containing from 55 to 60 per cent. of silica. The essential mineral constituents are plagioclasic feldspar (usually oligoclase or labradorite) and hornblende, which may be replaced by augite or mica as in the case of the syenites. Representatives in order are diorite, andesite glass, and andesites. The andesites occur in enormous masses in the Andes Mts., and are perhaps the most abundantly found of all the I. R.

4. *Basic rocks*, containing from 45 to 55 per cent of silica, i.e. the acid-forming oxide is less in amount than the basic oxides. In this case the essential mineral constituents are plagioclasic feldspar (usually labradorite or anorthite), augite, and olivine. Magnetite is always present as an accessory. Gabbro is the holocrystalline plutonic representative. The glassy example is tachyte or basalt glass, while the hemi-crystalline rock is basalt. In this group rocks called dolerites are intermediate in position between the gabbros and basalts.

5. *Ultra-basic rocks*, containing only 35 to 45 per cent of silica, are very rich in olivine, which readily decomposes and causes the rocks to change quickly into some variety of the serpentines. Members of this class of ultra-basic rocks are also called Peridotites, e.g. Pierites, Chertolites, and Dunite. Chemical analysis is, of course, impossible in the field, so that if it be necessary to classify the rock on the spot, it is usual to adopt some form of mineralogical grouping. Sov. systems have been proposed; one which is worked out very fully by J. J. Harris Teall is described in his *British Petrography* (1888); a very brief summary of crystalline rocks would include: (a) Rocks of ferro-magnesian minerals, e.g. olivine, augite, hornblende, biotite. Feldspar is not present as an essential. (b) Rocks in which the feldspar is essentially plagioclasic. (c) Rocks in which orthoclase is abundant. (d) Rocks containing nepheline and (or) leucite, both of which are absent in classes (b) and (c). (e) Other rocks not in the above four classes. Special classes are reserved for vitreous or glassy rocks, and also for fragmental volcanic rocks which may vary in texture from fine dust to large masses of scoriae.

*Distribution of igneous rocks.* The

older I. R. occupy but a small aliquot part of the whole surface of the earth, nor are the existing masses of great extent. This will be more readily understood when it is remembered that the exposure of plutonic rocks can only be brought about by immense earth movements and fractures, or by denudation removing the overlying strata so that the crystalline rocks may be exposed. In the case of the younger I. R. of the lava and fragmental types, these are being produced at the present day along the lines of volcanic activity, as, for example, in the Pacific girdle. Regions of extinct volcanoes also contain varying amounts of eruptive rocks, as in the case of the Auvergne plateau of France and the Eifel mts. of W. Germany. By reference to a geological map the reader will readily identify the very numerous and widely scattered small masses of these rocks which exist on the surface of the globe.

*Disintegration of igneous rocks.*—Notwithstanding the hardness and compact character of these rocks, they are particularly subject to the weathering agencies. Chemical and mechanical analysis proves that all the materials building up the sedimentary rocks can be produced by the disintegration of the I. R., and, undoubtedly, many of the sedimentary rocks have been formed from such disintegration products. Chemical action takes place between the carbon dioxide of the atmosphere and certain compound silicates which results in the production of soluble carbonates and free silica, which latter may also be in a soluble form. Rain-water removes these products, and a mechanical disintegration follows. In the case of granite, the quartz is a simple compound, insoluble and consequently but little altered; on the breaking up of the granitic mass it is generally removed bodily by weathering agencies, and re-deposited to give a series of siliceous sedimentary rocks, e.g. sands, gravels, sandstones. The feldspar is subject to the chemical changes outlined above, which is termed kaolinisation on account of the product kaolin or China clay which is composed of hydrated aluminium silicate separated from the feldspar. The decomposition of the feldspar results in the production of argillaceous sedimentary deposits, e.g. muds, clays, shales, together with soluble silica, which may be extracted by plants and animals, e.g. diatoms and radiolaria, to build up their framework; the resulting carbonate in each case will be dependent on the particular feldspar which is decomposing; anorthite will yield calcium carbonate, which in its turn may be extracted from its solution, and deposited to form new strata of corals, chalk, limestone, etc. The mica suffers but little decomposition, and is usually re-deposited almost unaltered.

*Ignis Fatuus* (Lat., foolish fire), luminous appearance occasionally seen in marshy places and churchyards. It is usually visible shortly after sunset in autumn, and has been recorded in many countries. The light, which resembles a flame, is seldom pure white, and may be

red, green, blue, or yellow. Accounts differ greatly: some observers speak of it as being fixed and others as moving. Experiments have proved that it is not due to true combustion. Theories explaining its occurrence have been in turn discredited. These include the burning of methane or marsh gas, phosphuretted hydrogen, and phosphorescent vapour. Many local names are given to the phenomenon, e.g. Will o the Wisp, Jack a Lantern etc. and its manifestations have given rise to a wealth of story and legend.

**Ignoramus** (1) Word formerly written on a bill by a grand jury (see *IGNORAMUS JURIS*) to signify that they ignored the bill on the ground that there was not sufficient evidence to authorise them in finding a 'true bill'. Later they indorsed the bill in the words 'Not found', 'No Bill' or with similar words. (2) Ignorant person, especially an ignorant pretender to knowledge. In this connection the word was probably an extension of its appropriate legal meaning. Many writers, notably Beaumont and Carlyle, are fond of using the word in a personified sense. Dryden in his *Duke of Guise* puns on the legal sense, thus: 'Let ignoramus juries find no traitors, and ignoramus poets scribble satires'. The idea of Dryden's satire called *The Medal* which appeared in 1682, is said to have been suggested to him by Charles II. as a reply to the striking of a medal in honour of the 1 of the grand jury in throwing out a bill against Shaftesbury, always a butt of the poet laureate.

**Ignorance, in law** It is a legal maxim that 1 of a law cannot excuse for breaking it, however praiseworthy the motives of the lawbreaker. This maxim is said to rest on the legal presumption that every man knows the law. It would be truer to say that grounds of public policy have dictated the necessity of adhering to such a maxim. 1 of fact is different. For example, if a man whose wife was living left her and married another woman under the impression that it was lawful in certain circumstances to have two wives, he would be guilty of bigamy, but if he did so under the impression that his first wife was dead, he would in all probability be excused. There are however dicta to the effect that the rule is not universally applicable at all events where no crime has been committed or damage inflicted, and that a judge in a court of equity will be influenced by a plea of 1.

**Ignorantines**, name of a religious fraternity in the Rom. Catholic Church usually known as the Christian Brother, founded at Rheims (1679) its aim being the gratuitous instruction of poor children in both sacred and secular learning. It was organised (1683) by Jean Baptiste de la Salle. The order has now spread over the whole world. The brethren take vows of chastity, obedience, and poverty, but do not enter holy orders. Their official title is the 'Brothers of the Christian Schools'.

**Igualada**, tn. of Barcelona prov., Spain, on the Noya, 34 m. N.W. of Barcelona. Pop. 10,500.

**Iguana**, genus of tropical Amer. lizards, of the family Iguanidae, comprising about fifty genera and 100 species. Nearly all the genera belong to the New World, occurring as far S. as Patagonia and in a northward direction as far as California and Brit. Columbia and most of them are arboreal though some live on the surface of the sand and stones of the desert. They

IGUANA

I are known mostly from the Wealden are characterised by the peculiar form of their teeth which are round and blade like at the root with serrated edges towards the tip. One of the most common species is the *Iguana tuberculata* with a large dewlap and a high dorsal fringed ridge. Their prevailing colour is green and they differ greatly in size from a few inches to six ft in length. During the warm hrs., they bask on the limbs of trees, when they are easily caught by the natives by means of a net so thrown over the head that the flesh being steamed as food. 1 of the same family belongs to the bushy, and the hind foot. See *ILLUSTRATED GIDOW, Amphibia and Reptiles*, 1901.

**Iguanodon** (*Iguanodon* and *Gekkonodon*) genus of ornithomimid dinosaurs, found in the Jurassic and Lower Cretaceous of Europe. The 1 was described by Mantell in 1825 from specimens found in Kent, England. It was from 1 to 20 ft long, the head large and narrow and the massive body terminated in a long and very strong tail. The forelimbs were small and adapted for grasping the leaves and branches of plants on which it fed. All the bones were hollow. The structure of the skeleton is altogether very remarkable. The front parts of both upper and lower jaws are without teeth, and suggest a hollow, beaklike arrangement. The 1 walked on its hind legs, and sat on a tripod formed by these and its tail after the manner of the kangaroo. Its forefeet had four toes and a spur, and were much shorter than the three-toed hind limbs. It lived in great numbers in the swampy regions of England and Belgium and other parts of Europe, during the Jurassic period. Sev. species of the

and Purbeck beds. Twenty-nine fossil skeletons of the reptile were found at one time in Upper Jurassic sandstones of the coal regions at Bernisart in Belgium. See G. A. Mantell, *Petrifactions and their Teachings*, 1851; A. Woodward, *Outlines of Vertebrate Paleontology for Students of Zoology*, 1898; H. N. Hutchinson, *Extinct Monsters*, 1892; Sir R. Owen, *Fossil Reptiles* (4 vols.), 1849-81, etc.

**Iguassú**, ter. of Brazil, in 1913, a belt of land around Brazil, part of sev. states, was taken over by the Federal Gov. and placed under the direct administration of the President. I., which had a pop. of 109,500, and faced the Misiones prov. of Argentina, was restored in 1916 to its constituent states.

**Iguvine Tables**, see ECGURINE.

**Ihering, Rudolf von**, see JHERING.

**Ilithyia**, see ILITHYIA.

**Ijmuiden**, see YMUIDEN.

**IJssel**, or **Yssel** (anc. **Isala**): (1) Riv. of Holland, Gelderland, and Overijssel provs., the northernmost arm of the Rhine delta, leaving the mainstream near Arnhem and flowing N. into the IJssel Meer (Zuyder Zee) (E.), past Zutphen, Deventer, Zwolle, and Kampen. The upper part was formerly a Rom. canal made (c. 12 B.C.) to unit. the Rhine with the Oude IJssel, which joins the Nieuwe at Doosburg. Length about 70 m., all navigable. There was stubborn fighting on the riv. in 1945, Deventer falling to the Canadian and Brit. forces on April 10 and Zutphen soon afterwards. By the 21st the whole area of N. Holland had been cleared of Gers. as far as the E. shore of the IJssel Meer. (2) Riv. of Utrecht and S. Holland provs., connected by canal at Utrecht with the Oude Rijn, and entering the Nieuwe Maas 3 m. above Rotterdam. **IJsselmeer**, see HOLLAND and ZUYDERZEE.

**IJsselmonde**, or **Ysselmonde**, is. of Holland, in the prov. of S. Holland, between two branches of the Maas and the Oude and Nieuwe Maas, opposite Rotterdam. It is 15 m. long by 5 m. broad. There is a tn. of the name on the is.

**Iizer**, see YSER.

**Ikhmin**, see AKHMIN.

**Ikhmaton**, see AKHMATON.

**Iki**, is. belonging to Japan, lying off the N.W. coast of Kiusiu. There is a harbour at Gionoura in the S.W. Area 57 sq. m.

**Ikuo**, tn. of Iondo, Japan, 3 m. N.W. of Kobé. Its silver mines, the second in size in Japan, are worked by the gov.

**I.**, an administrative div. of Turkey. In 1921 the country was divided into I. (now numbering 63), subdivided into Ilce, and further into Bucak. Each I. has an elective council, and at its head a Vall representing the Gov. The Bucak is an autonomous entity, the Ilce being merely a grouping of these for some general administrative purposes.

**Ilagan**, cap. of the prov. of Isabela, Luzon, Philippine Is., about 200 m. N.N.E. of Manila. It is in a great tobacco-growing dist. Pop. 23,300.

**Ichester**, mrkt. tn. in the S. parli. div. of Somersetshire, England, on the R. Yevo, 5 m. N.W. of Yeovil. It is supposed to be the Ischalis of Ptolemy; was an import-

ant Rom. station and a flourishing Saxon tn. Lytes Cary, a fine fourteenth-century house near I., is owned by the National Trust. Pop. 500.

**Ildefonso, Saint** (807-67), Sp. prelate and theologian, b. at Toledo: was a pupil of St. Isidore, became abbot of Agali, and attended the ninth council of Toledo in 653. In 657 he succeeded his uncle Eugenius as archbishop of Toledo. He added fourteen lives to St. Isidore's *De Viris Illustribus*, wrote sev. theological works, and was responsible for the unification of the Sp. liturgy.

**Ile de Bourbon**, see RÉUNION.

**Ile-de-France**: (1) prov. of France, forming a kind of is. bounded by the Rs. Seine, Marne, Beuvronne, Thèze, and Oise, and with Paris as its cap. Under the Revolution redistribution of provs. it was divided into the dept. of the Seine with the greater part of Seine-et-Oise, Seine-et-Marne, Oise and Aisne, and a small part of Loiret and Nièvre. It is a prov. of forests and plains, fertile and prosperous, with carefully tended mrkt. gardens and orchards. Its prin. industries are wine and the sugar beetroot. In the middle of the ninth century I. was made a dukedom and its second duke, Odo, became king of France in 888, and was the ancestor of Hugh Capet. I. was the former name of Mauritius (q.v.). (2), or **Ile d'Orléans**, is. on the E. coast of Greenland, for the greater part covered with glaciers.

**Ile-du-Diable**, one of the Îles du Salut off the coast of Fr. Guiana, S. America, on which Capt. Dreyfus (q.v.) was imprisoned in 1891.

**Ilerda**, cap. of the Ilgeretes in Hispania Tarraconensis. It stood upon an eminence on the r. b. of the R. Sicoris. It was used by the legates of Pompey as their base against Caesar in the first year of the Civil war (49 B.C.).

**Ilets**, tn. of Orenburg, Soviet Russia, near the confluence of the Ilek with the Ural. It is famous for its mud- and brine baths and koumiss cures. Pop. 7000.

**Ileum**, lower part of the small intestine. The small intestine is a tube about 23 ft. long, the first 10 or 11 m. form the duodenum, the next 9 ft. form the jejunum, and the remainder is the I. There is no definite line of div. between the two main portions, but the jejunum occupies the upper and left part of the abdomen, while the I. occupies the lower and right. It terminates in the ileocecal valve leading to the large intestine.

**Ilex**, cosmopolitan genus of plants in the order Aquifoliales, which consists of between one and two hundred species. *I. aquifolium*, the common holly, is found chiefly in Central Europe; it is valued as an ornamental tree and for its fine-grained, heavy, compact timber; the berries are poisonous and have violent emetic effects. *I. Paraguayensis*, the maté plant, is valued for its leaves, which are dried and used like common tea, under the name of Paraguay tea. The I. so frequently mentioned by classical authors is *Quercus Ilex*, the holm- or holly-oak, a

species of *Fagaceae* found round the Mediterranean.

**Ilford**, (1) (Great), par. and bor. on the Roding in S.W. Essex, 7 m. E.N.E. of London. The hospital of St. Mary and St. Thomas originally founded in the twelfth century as a leper hospital, is now composed of almshouses and a chapel. It has photographic material factories and paper mills. Pop. 130,600. (2) Little I. on the opposite bank of the Roding. Pop. about 15,000.

**Ilfracombe**, seaport, mkt. tn., and popular watering place in N. Devon, England, 11 m. N.N.W. of Barnstaple. The beauty of its scenery and the temperate climate make it a favourite resort both in winter and summer. It has steadily grown in importance of late years and constant improvements have been made,

Balkash, into which it falls by seven months after a total course of 750 m. Its chief tribes are the Kaskh, Chuk, and Charvin. Its valley is rich in coal, gold, and silver. See also KILIA.

**Iliad**, see under **ILIC POETRY**. **HOMER**.

**Iliamna**, volcano in Alaska, N. America, at the head of the Alaska Peninsula. W. of Cook Inlet. It was in eruption in 1901 and 1902. Alt. 12,000 ft.

**Iligan Bay**, on the N. coast of Mindanao, Philippine Is. The R. Iligan flows into it at the S.W. corner and here lies the town of Iligan with a large trade in rice, spices, and hemp. Pop. 6000.

**Ilion**, tn. of Herkimer co. New York, U.S.A. on the S. bank of the Mohawk R., 12 m. S.W. of Utica. Its chief industry is the manufacture of Remington typewriters. Pop. 4900.

British waters

ILFRACOMBE

such as large semi-artificial bathing pools, etc. It is connected by a good steam service with all the sea-side towns of interest in S. Wales and the neighbouring coasts. In the fourteenth century it was a place of importance and supplied six ships and ninety six men for the siege of Calais (1347). It was besieged twice during the Civil War. In 1782 a large timber vessel belonging to the Franco-Spanish fleet taken by Rodney was wrecked in Rappart Cove, and at various times since gold and silver pieces have been washed ashore. In 1797 four Irish ships entered the harbour and sank all the vessels lying there. It has declined as a port since its prosperous days in the fourteenth century. Pop. (1931) 9200.

**Ilhavo**, seaport in the dist. of Aveiro, Portugal, 40 m. S. of Oporto. Its chief industry is fishing, but there are famous glass and porcelain works at Vista Alegre. Salt is also exported. Pop. about 13,000.

**Il**, one of the chief rivers of Russian Central Asia in the Issyk-kul Itation of the Kirghiz S.S.R. It rises at an altitude of 11,600 ft. on the W. slopes of Mt. Kashtatur, E. of Lake Issyk-kul, and flows in a twisted course past Kälja in Sinkiang, through the Frans Ili, Ala-tau, and Borok-boro Mts., to Ilek and thence to Lake

**Iliya**, Battle of, scene of Hannibal's defeat on the Metaurus, 207 B.C. when he was trying to bring Hannibal reinforcements.

**Iliussus**, tributary of Attica flowing into the city near the Lycabettus. It was immortalised for its beauty by Plato in *Phaedrus*. But the beauty has vanished and the country become barren and sun-scorched.

**Ilium**, see **ILIOY**.

**Ilkeston**, mkt. tn. and municipal bor. of Derbyshire, England, 9 m. N.E. of Derby. It is on a hill commanding the fine valley of the Erewash. It manufactures hosiery lace and earthenware. Coal and iron ore found in the neighbourhood, and an alkaline mineral spring. Pop. 31,100.

**Ilkley**, health resort in the W. Riding of Yorkshire, England, on the R. Wharfe, 16 m. N.W. of Leeds. There are sev. hydropathic establishments. It was an ancient Roman station and possesses three curious Saxon crosses. Bolton Abbey (q.v.) is 5 m. N.W. Pop. 9700.

**Ilampu**, or Sorata, peak in the Cordillera Real, a mt. range of Bolivia. Alt. 21,270 ft.

**Illawarra**, dist. of New S. Wales, Australia, extending from a point 33 m. S. of Sydney, along the coast southwards

for 40 m. to Shoalhaven. Industries: dairy produce, collieries. The I. Lake is a salt lagoon where fish are plentiful and fowl abundant. Pop. 12,900.

**Illecillewaet**, celebrated glacier in Brit. Columbia, lying near Glacier House, on the Canadian Pacific Railway, having its origin in the snows and ice of Sir Donald Mt. It is in a condition of recession.

**Ille-et-Vilaine**, maritime dept. of N.W. France, bordering Mt. St. Michel Bay and the Eng. Channel. It formed part of the old prov. of Brittany, and is now bounded W. by the depts. of Côtes-du-Nord and Morbihan, S. by Loire-Inférieure, E. and N.E. by Mayenne and Manche. The Rr. Ille and Vilaine flow from N. and E., uniting at Rennes, the cap. The surface is mostly flat, with forests and marshes in the N. The former forest of Brocéliande in the W. is now represented by the

in some legal systems a marriage would be illegal where the spouses had not first obtained the consent of their parents; while in France, again, the dowry system, lending as it does to the *mariage de convenance*, tends equally surely to a morganatic union. Some have supposed that I. is more rampant among the hot-blooded races of the S. of Europe and S. America, or in other warm climates. But there is little statistical warranty for the assumption, although, so far as mere figures are concerned, two observations are material. First, that in most of those countries whose legal systems are based upon the Civil Law (*q.v.*), subsequent marriage, or even a less formal act, will legitimate offspring otherwise illegitimate; and, secondly, statistics of any reliable kind are not forthcoming for the majority of Oriental races.

Year	Total Births	Illegitimate	Percentage of Illegitimates
ENGLAND AND WALES			
1935 . .	598,756	25,105	4.1
1936 . .	605,292	24,895	4.1
1937 . .	610,557	25,341	4.1
1944 . .	715,318	52,385	7.0
1946 . .	820,719	53,919	6.5
SCOTLAND			
1938 . .	88,627	5,449	6.1
1939 . .	86,899	5,192	5.9
1940 . .	86,389	5,084	5.8
1943 . .	94,682	7,173	7.5
1947 . .	113,117	6,311	5.5

far less extensive forest of Paimpont. The Marsh of Dol is a fertile region once engulfed by the sea. Grain (wheat and barley), tobacco, flax, and potatoes are among the chief crops. Honey, and fruit are plentiful: cider is produced, the amount being equal to nearly 20 per cent. of the total Fr. production. The oyster of Cancale are exported. The chief minerals are granite (round Fougères), slate and argentiferous galena at Bruz. St. Servan and St. Malo are the chief ports. Area 2697 sq. m. Pop. 578,200.

**Illegitimacy**, status of a child born out of wedlock. The status is especially important in all legal systems from the consequences entailed by it in regard to the right to succeed to property. Bastardy in England and Wales has, however, lost much of the stigma traditionally attached to it by reason of the Legitimacy Act, 1926, which legitimates the offspring of unmarried parents under specified conditions (see further under LEGITIMACY, LEGITIMATION).

The greater the number of artificial hindrances to marriage, whether economic or social, the greater, as a rule, will be the I. In some countries, like France, the term of military service must be completed before a man may marry. Again,

In the census period 1871-1901 the percentage of illegitimates in the U.K. was 5.6, and in Scotland, 9.1. For the succeeding census periods these rates have averaged 4.1 and 7.3 respectively. The figures for recent years, in which statistics are available, are shown above.

In Christian nations there can be no doubt that the Christian religion acts powerfully as a deterrent of I., (*e.g.* in Ireland, where the rate as long ago as 1870 was only 2.7) and that chastity is intimately involved in the age-long institution of monogamy. Whether religion or utilitarian considerations had more to do with the difference between the status of legitimate and illegitimate offspring is open to doubt. Most Aryan nations acknowledged illegitimate children as part of their families, and gave them a right to share in the patrimony, though in the Rom. law of succession illegitimate children were in a less favourable position in this respect than legitimate. According to Westermarck, (*Origin and Development of the Moral Ideas*), it was nothing less than monogamy that gradually deprived the bastard of nearly all proprietary rights, and led up to the universal maxim that the bastard was *filius nullius* and *filius populi* (the son of no man, or the son of

the people). Christianity may well have done no more than throw the axis of religion over what had long been a social commonplace; but the stigma it attached to infidelity to the marriage vow, and its doctrine that monogamous marriage was the only form of marriage that could exculpate intercourse, may well have gone far to stereotype the unenviable position of the bastard. Although eccles. ideas of marriage and legitimacy were slow in permeating the ruder Celtic nations, they soon induced the A.-S. law-giver to deny to the bastard any claim of blood relationship with the *Mægth* or family. Some have even attributed the curious custom of Bor.-Eng. (*q.v.*) to the doubts that were supposed to surround the birth of older

*Illicium*, small genus of Magnoliaceae, flourishes in Asia and America. *I. verum* is the star-anise, which occurs in China and contains an aromatic oil used in flavouring.

Illimani Mountain, one of the loftiest mts. of the Bolivian Andes, in the E. Cordillera Range, S. America.

Illium, supposed metal (atomic number 61) of the rare earth group. Its substance is still doubtful.

Illinois (*Illini*, men), group of N. Amer. Indian tribes of the Algonquin linguistic family. They lived formerly in I. and the adjacent parts of Wisconsin, Iowa, and Missouri. The chief tribes were Cahokia, Peoria, Kaskaskia, Tamaroa, Michigamea, and Mowwagena. As allies of the Fr. they

children. The loss of social caste does not seem to have attached to the degradation of status incident to it until somewhat later. Some medieval heroes of aristocratic if spurious birth appear to have prided themselves on their title of 'bastard.' The Conqueror was known as *Wm. the Bastard*, without any connotation of shame, but rather as a distinctive appellation. But apart from exceptional instances, social inferiority gradually followed as a necessary corollary to deprivation of proprietary rights.

From an examination of the ann. reports of the Registrar of births and deaths, it will be found that in England the percentage of illegitimate births is comparatively high in the E. cos. of Suffolk, Norfolk, and Lincolnshire. It may be taken generally that the percentage is higher in agric. areas than in industrial cos.

The table above gives the illegitimate births per 1000 births for various countries for the year shown against each.

See also LEGITIMATION. See *Annual Reports of Registrar of Births and Deaths*; *International Health Book of League of Nations*.

came into conflict with the Iroquois (1678). They now number under 200, and are situated on a reservation at the Quapaw Agency, Indian Ter. See J. B. La Salle's account of his explorations (1670-82); G. Catlin, *North American Indians* 1842.

Illinois, riv. of U.S.A., formed by the union of the Kankakee and Des Plaines Rrs. in Grundy co., about 10 m. from Morris, Illinois. Rising near Lake Michigan, it flows S. and S.W. through La Salle co., entering the Mississippi about 20 m. above Alton and the Missouri's mouth. Length about 500 m., navigable for steamers 250 m. to La Salle, whence a ship canal connects it with the Chicago R. and the Chicago Drainage Canal, and hence with the Great Lakes. Ottawa and Peoria are the chief cities on its banks.

Illinois, one of the N. central states of the U.S.A. known as 'the Prairie State,' situated in the valley of the Mississippi and the basin of the Great Lakes. It is bounded N. by Wisconsin, E. by Lake Michigan and Indiana, S.E. by Kentucky, S.W. by Missouri, W. by Missouri and Iowa. The Mississippi R. is on the W. the Ohio on the S., and the Wabash on the E. frontier. The surface is a vast plain,

with an average elevation of 500 ft., sloping slightly towards the S. and S.W. Cairo is the lowest point (267 ft. above the gulf of Mexico), Silver Creek one of the highest (1145 ft.). There is a low, fertile plateau in the S. known as Egypt. The Great Prairie (200 m. long) is in the centre. The Illinois is the chief riv., and there are saline, sulphur, and chalybeate springs in the S. The Illinois and Michigan Canal, connecting Lake Michigan and the Great Lakes with the Mississippi was constructed between 1830 and 1850. There is a difference of about 11° F. in the temps. of N. and S. The soil is very fertile, but an underlying stratum of clay, which retains the rainfall, necessitates elaborate drainage systems. Trees have been extensively planted, and I. ranks next to Iowa as an agric. state. Wheat, corn, hay, and various other cereals are grown. Fruit, especially apples, pears, and peaches, is much cultivated, particularly in the lilly belt of the S. Here cotton is also grown successfully. There are good vineyards, the centre of the liquor industry being Peoria. Livestock are reared and fine dairy produce is obtained. Slaughtering and meat-packing is the most important industry, centred at Chicago. Fisheries are also carried on largely, pike, bass, salmon-trout, carp, sturgeon, and paddlefish being plentiful in the rivers and lakes. Bituminous coal is the chief mineral, the coal-field covering about 37,500 sq. m. In 1917 the coal output was 73,446,930 tons. Pig-iron, petroleum, natural gas, sandstone, and limestone are also valuable. Building-stone is quarried chiefly in Monroe, Lawrence, and Decatur cos. Zinc, fluor-spar, Portland cement, gypsum, and marble are found. I. ranks third in mineral output in the U.S. The last figures on agriculture show that in 1916 the chief cereal crops were maize 514,268,000 bushels; wheat, 19,533,000 bushels; oats, 168,693,000 bushels; barley, rye, and buck wheat are also grown. The output of soya beans at 75,036,000 bushels (1916) amounted to more than one-third of the country's entire output. Soap, candles, and pottery are among the chief manufs. I. ranks as the third manufacturing state in America, giving precedence only to New York and Pennsylvania. Some of the most important tns. are Chicago 3,396,800; Springfield (State cap.), 75,500; Peoria, 105,000; Rockford, 81,600; E. St. Louis, 75,600; Oak Park Village, 66,000; Evanston, 65,300; Cicero, 61,700; Decatur, 59,300; Berwyn, 48,400; Aurora, 47,100; and Joliet, 42,300; other tns. are Quincy, Galesburg, Jacksonville, Freeport, LaSalle, and Ottawa. There are 100 cos. Communication is excellent both by rail and water. There are well over 12 thousand m. of railroad track in use. The railway transport is the greatest in the U.S. and Chicago is the largest railway centre in the world. The transport by rail is so cheap that it has brought down the freightage cost on the Ohio and the Mississippi. The Sangamon and Morgan Railway was the first opened (1839). The N.W. Univ. at Evanston was

founded about 1851. The State Univ., founded in 1867, is situated at Urbana and Champaign; Chicago Univ. (q.v.) was founded in 1892. There are many other fine educational and charitable institutions in I., including the Armour Institute of Technology and the Rush Medical College of Chicago, the Knox College at Galesburg, and Illinois Wesleyan Univ. at Bloomington. The area is 56,400 sq. m. (including 453 sq. m. water). Pop. 7,897,290.

*History and constitution.*—In 1673 Joliet explored I., and in 1675 Father Marquette founded a Jesuit mission among the Kaskaski Indians. La Salle (q.v.) gave the state its present name (1679), from the Indian tribes settled there, and built Fort Crèvecoeur. Tonty continued his explorations. Fr. traders settled in I. between 1683-90. In 1763 I. passed to England on the cession of Canada. It became part of the N.-W. Amer. Ter. in 1787, and of Indiana Ter. in 1800. In 1818 it was admitted to the Union. The Mormon troubles culminated here (1840-44). The present constitution was adopted in 1870. There is a Senate of 51 members, and a House of Representatives of 133 members, elected for four and two years respectively. Twenty-six representatives are sent to the Lower House of the Federal Congress. See I. F. Mather, *The Making of Illinois*, 1900, 1912; C. W. Alvord, *Centennial History of Illinois*, 1920; W. F. and S. H. Dodd, *Government in Illinois*, 1925; E. F. Dunne, *Illinois: the Heart of the Nation*, 1933; D. C. Peattie, *A Prairie Grove*, 1938; Federal Writers Project, *Illinois: a Descriptive and Historical Guide*, 1947.

*Illinois, University of*, was started by the state of Illinois. Under the Federal Gov.'s Land Grant Act, the state secured big tracts in 1862 and in 1867 gave the univ. 2293 acs., of which two-thirds are devoted to agriculture. The univ. has a teaching staff of over 1000 and about 14,000 students.

*Illiterates, Illiteracy.* It is not easy to obtain reliable returns either in England or elsewhere of the average number of persons who are unable to read or write. Although the census returns suggest themselves as the natural mode of getting the information, there can be, even through this channel, no means of compelling persons to disclose their I., nor, unless they ought to sign the returns themselves and only do so by a mark, any direct evidence of such I. In countries where universal conscription is in vogue it is easy to get at the percentage of I. from the registration of recruits. In Germany, Sweden, and Switzerland over 99 per cent. are able to read and write; in Holland somewhat over 1 per cent are I., and in France and Belgium the percentages of I. are about 5 per cent. and 10 per cent. respectively. Nearly one-third of the Gk. and It. conscripts are I. The marriage registers, where they exist, betray the proportion of I. spouses, and in Italy the proportion of I. husbands corresponds to that of the conscripts,

while of the number of women married annually nearly one-half are I. From these registers it appears that the lowest percentage of I. is to be met with in England and Wales, Scotland, Germany, and Australia, and the highest, excluding Italy, in Ireland and S. Africa. With the general spread of education throughout the masses which took place in advanced countries during last century, there was naturally a very marked drop in the percentage of I. in these countries. Russian statistics show a creditable decline in I. in the last forty odd years from 75 per cent in 1895 to only 10 per cent in 1942. A still more striking improvement is found in Turkey, under the impulse of Kemal Atatürk's educational reforms, the drop being from over 90 per cent in 1927 to 35 per cent in 1931. Spain and Portugal are more backward than the

during the seventeenth, and lasted in isolated bodies till the end of the eighteenth. The Rosicrucian Illuminati are quite distinct; their tenets are mixed with alchemy and occultism (see ROSICRUCIANS). Finally, in 1776 a secret masonic society with republican and free-thinking views was formed by Adam Weishaupt, prof. of Canon Law at Ingolstadt, Bavaria, who had been educated by the Jesuits, but became a freethinker. It was anti-Jesuit, and was suppressed in 1785.

Illumination (or Illuminism) term used in connection with the 'Enlightenment' period of philosophy. Scientific reason, or the appeal to reason as opposed to the reliance on external authority, marked the metaphysical systems from Descartes to Leibnitz. The evolution of existing beliefs and institutions was completely

Country	No. of Illiterates	Percentage of population
Egypt (1927)	8,817,000	83.7
India (1931)	268,000,000	84.0
(1941)	284,700,000	73.0
Brazil (1920)	23,127,000	67.0
Mexico (1930)	9,000,000	59.5
Turkey (1934)	7,500,000	55.1
Greece (1935)	1,500,000	32.0
Portugal (1940)	5,881,000	49.0
Spain (1940)	6,514,000	27.0
Poland (1939)	3,875,000	21.0
Italy (1935)	6,112,000	19.0
U.S.S.R. (1942)	17,000,000	10.0
Canada (1931)	309,300	3.79

Illiteracy is practically unknown in the U.S.A. The rate for the whole pop., white and coloured (1917) was only 2.7 per cent of those over fourteen years of age.

rest of Europe, a fact which has its influence on I. in the S. Amer. states. Newfoundland, owing to its scattered pop., has a high degree of I. The above table gives the most recent percentages.

**Illkirch-Grafenstaden**, vil. of the Fr. dept. of Bas Rhin (Alsace), 5 m. S. of Strasbourg. Pop. 6400.

**Ilorin**, walled native tn. of Nigeria, cap. of an administrative prov., and former cap. of an association of states of the Yoruba country, W. Equatorial Africa, about 170 m. N.N.E. of Lagos. It has on the Asa, a trib. of the Niger. Pop. about 90,000.

**Illuminants (engineering)** See LIGHTS, ARTIFICIAL. **LIGHTHOUSE**—*Illuminating Agents*, S. SEARCHLIGHT, L. L. A. VIOLET LIGHT, N. LAYS, etc.

**Illuminati**, enlightened ones, the name assumed at various times by religious sects and secret societies. The sp. 'Illuminati' (*iluminados*) seem to have been in origin akin to the various mystic Gnostic heresies which flourished in the early Middle Ages, though their appearance in Spain is later. They were suppressed by the Inquisition during the sixteenth century; they also estab. themselves in Piedmont and elsewhere in France

Ignored and their value denied, save in so far as they were consistent with abstract principles set up by the rationalists as the ultimate criterion of truth. With the rationalists the pure reason became opposed to all emotions and enthusiasms which failed to satisfy its dogmatic tests, and the net result of rationalist inquiry was the truly barren substitution of a natural deism for revealed religion of all kinds. This sterile and unimaginative philosophy was paradoxically, as it must seem to us, known as the Enlightenment, but the success that the scepticism of Pascal and others might well have had in confounding the principle of pure *a priori* reason was checked for a time by the remarkable progress of science. It was the shifting of metaphysical inquiry from the exclusive ground of deism to the analysis of knowledge that eventually sounded the death knell of rationalism. Locke taught that knowledge was wholly empirical, and denied the existence of those innate ideas of reason upon which the rationalists had consciously or unconsciously rested their theories; and later Rousseau's emotional polemics swung back the pendulum in favour of the feelings as against the intellect in the

realms of speculative inquiry. Before the period of the Enlightenment had closed and long before Rousseau, Spinoza had checked the tendency of rationalism to remove God to the position of a mere far-off observer and cut him off unrelated to the mundane, by his insistence on a religious and ethical requirement on the essential unity of things. Voltaire introduced the results of the first Enlightenment into France, and the first Enlightenment took the form of a thoroughgoing materialism in which truth and religion were diametrically opposed. Within this circle shined the light of Rousseau who beginning as an Encyclopédiste of the first Enlightenment ended by being bitterly hostile to the whole principle of the rationalists which in its grotesqueness of the logical reason and condemnation of mysticism affirmed the conception of man as a self-centred unit entirely independent of the arbitrary environment in which he found himself.

The cardinal fact in the Enlightenment is individualism and its corollary the assumption that institutions could be cast off at will and a fresh start made. It ignored the fact that all institutions have their roots in the depths of time and though this error was immensely favourable to the aims of the leaders of the first Revolution Rousseau's doctrine however unambiguously they may be susceptible of pure expression in terms of rationalism deputed from rationalism in that they denied the value to human welfare of all the sciences. Later it was the German empiricism begun by Lessing and Herder continued in the idealism of Hegel, Kant and others that swept the so-called Enlightenment from the field of philosophy. Rousseau's demand for a return to nature ignored the social life in a way inconsistent with practical experience, and even with his own mature views. The German philosophy also claimed the realisation of the abstract freedom of man, but in the end is our to find again the value of the inner life of the individual insisted on shaping that freedom in forms of real worth and beauty. In some ways commensurate with the obvious potentialities of life and feeling. With the earlier German empiricists God ceases to be a cold intellectual abstraction and is regarded as immanent in nature, human affairs and all spiritual experience. The smallness of the ambit of reason and expression in Kant's transcendentalism which looks upon it as an instrument utterly useless to fathom the realities of God and the soul. Perhaps Kant's critical philosophy is the last word on the subject when it denies the claims of rationalism to comprehend reality on the ground that thought and the material of sense are indissolubly connected and that so sense experience can possibly be an ultimate reality. See L. Brunschwig, *Spinoza and his Contemporaries*, 1921; L. Roth, *Spinoza, Descartes, and Maimonides*, 1921; G. D. Hicks, *Critical Realism*, 1938.

**Illumination of Manuscripts.** The art of embellishing MSS. either by pictorial ornamentation or with decorated letters and designs in gold and colours was much

practised in the Middle Ages, and especially applied to devotional works. The art appears to have been evolved from the classical methods of decorating or illustrating the books of the second and third centuries with pictures either in outline or with gilt shading to enhance the light effects, and intended to represent scenes spoken of in the text, through the solid Byzantine art of adorning MSS. of the Gospels with brilliantly painted ornamental designs, gilt or silver lettering, and finely executed miniatures enhanced by highly gilt backgrounds, to the ornamentation of the Franco-Lombards of the so-called Carolingian school the characteristics of which were a liberal use of gold and large and profusely embellished initials. It is on most of the pages. A fragmentary copy of the *Book of Hours*, now

A REPRODUCTION OF A PAGE FROM AN ILLUMINATED MANUSCRIPT

in the Ambrosian Library at Milan, is said to be the earliest extant example of an illuminated MS. Its brevity of decoration is in striking contrast with the brilliant miniatures (a technical term from Latin *minio*, to colour with red lead, meaning a picture in an illuminated MS. and not a small portrait) of such MSS. as the homilies of Chrysostom and various fragments of the Visitation canons to be seen in the Brit Museum. The faults in the Byzantine art appear to be that, while the inherited Oriental splendour of colouring in gold and vermillion gave character to the general scheme of decoration the drawings themselves, or miniatures, though classical in style, are not only dull and flat in colouring but the whole form of the figures of the saints or other personages represented is constrained and

unprepossessing. The reaction set in with the development of the art in Italy in the ninth and tenth centuries, and later in the Frankish empire. The Carolingian or Frankish art owed its attractiveness largely to the independent 'Celtic' element originating in Ireland. The Irish art dispensed almost entirely with the use of gold, and relied for its effect on its designs and borders of intertwined ribbons, tangled knots, and intricate patterns and spirals, and legendary animals, the whole being executed with marvellous precision and minuteness. The celebrated Lindisfarne Gospels in the Cotton Collection in the Brit. Museum form one of the finest examples of the Celtic style, though these were really productions of Scottish monastic settlements. The colouring of the Celtic style is less bizarre than the Byzantine, but the drawing of figures and objects is crude probably because, being native-born, it proceeded independently of all classical models. The Franco-Lombard art combined the best elements of the Celtic and Byzantine; a return was here made to the abundant use of gold. The pure ornament outweighs the illustrations or miniatures, which latter, as before, generally relate to scenes or characters from the Gospels, and are executed in free-hand in the later Roman, or so-called 'debased classical' style. Examples of Carolingian art are Lothair's Gospels, Charles the Bald's bible, and an evangelarium among the Brit. Museum Harleyan MSS. A radical change came over the art of illumination at the end of the twelfth century, and the conventional style then elaborated subsisted for something like 300 years. Almost the chief feature of bibles of this period is the border, which generally takes the form of a frame of fanciful foliage or other device. Greater prominence is given to the characters or MS. itself during this period, and in consequence the double-column pages are occupied mainly with the closely written characters, the 'miniatures' having become nothing more than large initials containing in actual miniature a pictorial representation of some act or scene relating to the corresponding text. Numerous examples may be found in the small bibles of the period. By the fourteenth century greater skill had been attained, not only in the more agreeable delineation of the human form, but in the representation of ornamental foliage. Scenery begins to appear, and the stiff and even grotesque contortions of the Byzantine figures yield to a free and dramatic arrangement or grouping, while the tawdry gold background disappears altogether. Skill in realistic drawing, however, tended to the destruction of illumination as an art in itself, and from the perfection attained in the Middle Ages the decorative execution declined to a style characterised by miniatures treated with admirable skill, bordered with gold, and interspersed with cleverly painted flowers and insects, while the text assumes a place of merely secondary importance. One of the best examples of fifteenth century illumination is the *Bedford Book of Hours*, now in the

Brit. Museum. With the Renaissance and the return to classic models the art of illumination attained its zenith in minute delicacy of colouring and perfection of drawing, and, furthermore, an official recognition by both the republican princes and the various popes and doges. Ultimately, however, it was the invention of printing that destroyed the art and reduced it to the mere pastime of painting miniatures in spaces left for the purpose, rather by way of subsequent adornment than as an art in itself.

The Brit. Museum has no true classical illumination, the few surviving specimens of which must, according to Dr. Arundell Eddalle, be sought in Italy; while the remains of the Cotton Genesis, fifth or sixth century, belong to the Byzantine School. But 'in work of all the later schools, down to the decay of the art upon the rise of printing, the museum is abundantly rich, not only by grace of the foundation collections, but by gifts, bequests etc.' Fine examples of the Eng. school of I. M. recently acquired include: *The Apocalypse of the Abbey of Abdington* (thirteenth century), acquired in 1931; *The Psalter of the Abbey of Evesham* (thirteenth century) purchased and presented in 1936 by the National Art Collections Fund; *The M. R. James Psalter* (fourteenth century) written for use in Durham diocese, and presented in 1937; *The Luttrell Psalter* (q.r.) acquired in 1929; *The Bedford Hours and Psalter*, a book by an Eng. artist and not to be confounded with the more famous Hours (Add. MS. 18450) also executed for John, Duke of Bedford, and of Fr. workmanship. It is, says Dr. Eddalle, one of the finest examples of the school which arose and flourished for a time after the Black Death and was the end of Eng. illumination; and it is unique in containing over 300 exquisite miniature heads, which may be portraits. The Museum secured it, when auctioned, for £33,000 (see A. Eddalle, *The British Museum Library*, 1946).

Illuminations, see PYROTECHNICS.

Illuminism, see ILLUMINATION.

Illusion, term loosely applied both to delusions and hallucinations, or, in other words, to perversions of the senses and perverted ideas. Psychologists differ as to the more appropriate application of the term. Esquirol, the celebrated Fr. alienist (1772-1842), in classifying mental diseases, distinguished the two states by referring hallucinations to an excited state

of the brain affecting the remembrance of the sensations of sight and causing the subject to see what are commonly termed visions or apparitions, and defining I as the false interpretation of a sensation actually perceived. Dr. Ferrier, while including both under the generic name of Is., differentiates between an I. of the senses and a delusion of the mind. He defines Is. generally as sensations without a corresponding external object, giving the names *spectral illusion*, phantom, or phantasm where the eye is or seems to be the seat of sensation, and the term *irrid idea* or *conception* when the I. is due to an act of ideation. The whole distinction is sharply drawn by regarding an I. as a mockery, false show, or deceptive appearance, and an hallucination, delusion, or 'illusivo transformation' (Ferrier) as a chimerical thought. Popularly, any transformed appearance of a real object, any appearance without a corresponding physical or external object, and any distorted, exaggerated, or misconceived notion or idea constitute Is. The distinction is important according to Dr. Tuke in regard to insanity, because, while the same may easily transform a real object into something else, and it is the perception of an object externally projected without the slightest corresponding reality indicates some serious disturbance of the nervous system. Both Is. and delusions, however, are consistent with sanity. A scientist closely concentrating his mind and senses on some experimental work may well have visual and auditory Is. conjured up by a subtle interaction of some external object upon strained or expectant senses, without thereby being mentally diseased. Is. may occur quite early in life, and are more common in males than females. According to Dr. Ferrier, some who have experienced Is. have been remarkable for active memories, great ability, and extreme sensitiveness, while others were by no means so endowed, and, again, some are in perfect health, while others are suffering at the time from either trifling indispositions curable by dieting or from serious inflammatory and febrile diseases. In the criminal law (q.r.), the term delusional insanity appears to embrace Is. and hallucinations indifferently, provided the reason is involved. See D. Tuke, *Dictionary of Psychological Medicine*, 1832; T. and J. Beck, *Medical Jurisprudence*, 1838; W. Guy and D. Ferrier, *Principles of Forensic Medicine*, 1881.

'Illustrated London News,' founded by a small printer and newsgiver of Nottingham named Herbert Ingram, and generally said to be the first illustrated newspaper ever pub. The first number was brought out in May 1842, and among the earlier of its artists were John Gilbert, John Leech, and Birket Foster. Its first notable editor was Charles Mackay and among its most distinguished contributors have been Mark Lomon, George Augustus Sala, Clement Scott, and Andrew Lang.

Illustration is as old as art itself. Two or three thousand years before Christ, and earlier still, the Egyptians adorned the

walls of sepulchral chambers and the pillars of temples with the exploits of their kings, and the Assyrians told the story of their great wars and sieges on the friezes of their monuments; but in the modern sense I. may be defined as the pictorial presentation of an idea expounded in an accompanying text. It is thus an accessory to the printed word, although in the hands of a skillful artist the two may often be aesthetically indivisible. This article attempts to deal only with book I. (For the medieval illuminated MSS. see ILLUMINATION OF MSS.).

The earliest I.'s were block prints, such as the *St. Christopher* (1423), which were usually of religious subjects, and which made their first appearance in Europe at about the same time as the invention of printing, although probably independently of it. These blocks were woodcuts, having the design cut with a knife in relief on the plank surface of a soft wood. Any accompanying text was also cut in the same block. At a later date the prints were pasted together to form books, a few of which are still extant, notably the *Biblia Pauperum* (c. 1465). One of the earliest books printed from movable type to contain woodcut I.'s was Aldus's *Hymnolomachia Polifili* (1499) (q.r.), and not long afterwards Botticelli executed his admirable designs for Dante's *Divina*

HANS HOLBEIN THE YOUNGER  
'Death of the Duchess' from *The Dance of Death*, 1538.

*Commedia*. Broadly speaking, I. experienced the same ups and downs as painting, and whenever an important school of the greater art arose then, too, the lesser art flourished. Thus the It. Pollaiuolo and Mantegna not only painted but executed a number of excellent line engravings. In Germany, Dürer and the younger Holbein exploited the method, and the latter's book *Dance of Death* is his most notable

work in this field. In France, fine woodcuts were made for Books of Hours at the end of the fifteenth century.

Copper was first used for engraving about 1477 but the method was not introduced into England until about 1540 when it gradually superseded woodcuts. Unlike the latter it is an intaglio process. The design is cut with a burin, or graver, on to a polished copper plate which is then inked over and the surface wiped clean, leaving the ink in the recessed portions. Under pressure the ink is transferred from the plate to paper. Fine detail may be reproduced by this method and it was widely practised by famous artists for book I up to the nineteenth century, notably by the school of Rembrandt in Holland, and of Watteau and Fragonard in France, and later by Hogarth and Reynolds. The aquatint, also an intaglio process but capable of suggesting tonal variation, was used by Rowlandson to great effect in his *English Dance of Death* (1816) and *Tours of Doctor Syntax* (1812). The drawing was done by the artist himself and the prints from it were then hand-coloured by professional colourists.

WILLIAM BLAKE  
Title page Illustrations of the Book of Job

Etching, another important intaglio process, allows greater freedom than engraving. The surface of a metal plate is made acid resistant by covering with wax which is then worked over with a needle to open up the surface of the copper. It is next etched in acid and may be controlled to produce varying depths of line which will hold more or less ink. William Blake adapted the process to his own ends for his *Illustrations to the Book of Job* (1825)

by etching in reverse so that the design was printed in relief, as in a woodcut. Crankshaw used it as the medium for a large part of his enormous output, and in his time it was the medium for the relationship of author and artist truly welded. For the reproduction of all paintings mezzotint and aquatint were widely used in the hands of professional engravers, both processes being capable, unlike copper engravings and etchings, of rendering subtle gradations of tone.

Thomas Bewick first evolved the technique of wood engraving, as opposed to wood cutting, by working on the end grain of hard woods such as box, and achieved an astonishing range of tone and sense of depth. His love of country life and his genius for depicting character exemplify themselves in his smaller vignettes, though his two works generally acknowledged to be his greatest are the *General History of Quadrupeds* (1790) and the *History of British Birds* (1797). He founded the school of fine wood engraving which has continued with few interruptions down to the present day. Blake's one venture in the field of wood engraving was a number of vignettes for an edition of Virgil's *Pastorals* (1821).

Senefelder's invention of lithography made its first appearance in England at the beginning of the nineteenth century, and gradually became established as a method of book illustration. Its virtues at that time lay in its capacity to interpret faithfully the varying characteristics of pen, pencil or brush, and in the fact that the artist's original work was reproduced without the intervention of the engraver. It was used widely for illustrated works of topography, and to good effect in the original edition of *Johns Look of Vandyke* (1816), but it was in France that it was unsurpassed, notably in the work of Daubigny and Gavarni.

The art of engraving declined in the middle of the nineteenth century, to be revived by the Pre-Raphaelites who were the leading spirits of a new school of fine book engraving. They drew on the wood itself, sometimes setting the engraver an almost impossible task, as is evidenced by the complaints of the Dalziel brothers that Rossetti was quite unable to master the limitations of the medium. Yet they were responsible for that close and ideal union between artist and engraver which in this respect had so largely accounted for the excellence of the work done. Their influence in such contemporary magazines as *Good Words*, *Cornhill*, and the *Lancet* has found a study of these will at once reveal their reverence for bygone eras, their emulation of old masters, their loving attention to detail, their naturalism, and their passion for symbolic interpretation. The material conviction of Millais's designs for Trollope's *Framley Parsonage* links the Pre-Raphaelite brotherhood with Houghton, Pinwell, Frederick Walker, and even Whistler, who represent the 'sixties' period. The most satisfying books were those illustrated by a single artist, such as Millais's *The Parables of Our Lord* (1864), Hughes's

illustrations for Christina Rossetti's *Sing-song* (1872) and of course Tenniel's *Alice* (1869). The broad characteristics of this period were idyllic delineation of the charms of country and home life and delight in open air effects, freedom and movement—a delight expressed partly by large clear spaces, and partly by loose but nervously sensitive outlines.

One of the later schools of illustrators was a group who sketched for the *Dial* (1889-1897). Their magazine was an artistic protest against the indiscriminate issue of books whose cheapness was the single apology for their careless binding, common paper, and inferior art, by means of photographic processes which were then beginning to establish themselves. A much more effectual protest was made by Wm. Morris, when, in 1891, he set up his Kelmscott Press. Print was a secondary consideration, and he printed a series of book covers which are an ornament to the shelves of the most fastidious of book collectors. Like his paintings and his tapestries, his illustrated volumes are one and all imbued with a true decorative sense and the sturdy spirit of romance and medievalism. His influence gave rise to the 'Birmingham school'—a without exaggeration may be said even to-day, to inspire all workers in applied arts. And with Morris must be associated Rackin, who gave such substantial and truly encouraging aid to the struggling artists of the day. His *Mother's Painters and Stories of France* for which the services of the best characterists were engaged still remain models for all who aspire to making beautiful books. In the last decades of the nineteenth century there were many fine illustrations but in their conception of art, in their choice of subject they were too idealistic to make any effort at grouping or composition expedient or even possible. The conventional grace of du Maurier, the clever 'suppliants' of Phil May, sent us to *Punch*, the pen and ink drawings of the Abbey and Harry Furness were all popular and to their imitation. In colour Walter Crane expressed delightful fancy in the decorative designs. Kate Greenaway's studies of charming children in high-collared and long-skirted and Randolph Caldecott's gay hunting scenes were, and are still familiar.

The advent of photography in the last decades of the nineteenth century was a medium for reproducing drawings was to revolutionise the whole field of illustration, planographic and relief. Among the first to exploit its possibilities was Aubrey Beardsley whose brilliant black and white drawings were reproduced by means of fine blocks. The line block is made by printing a photographic negative of the artist's drawing on to a sensitized metal plate which is then etched leaving the lines of the drawing which are acid-resistant in relief. The plate is then mounted and printed in the same way as a wood engraving. In an age of increasing commercialisation this process had the advantage of speed, and from the artist's point of view it had the merit of faithfully

reproducing his original drawing in any desired size, and the original itself was not destroyed in the process. This was soon followed by the arrival of the half-tone process which was a method of reproducing continuous tone subjects such as photographs. In principle it is the same as the line block except that the negative which is to be printed on the metal plate is first broken up, by exposure through a cross-hatched screen into a series of dots of varying sizes creating an illusion of tone. Coloured originals are readily reproduced by the half-tone process by means of colour filters which break down the tones of the original into their three primary elements. Separate half-tone plates are made of each and superimposed in print in to recreate the colours of the original in their true values. The process is capable of reproducing a wide range of subject both in monochrome and colour and is used for newspaper and very widely in books. It can give very fair representations of pencil and crayon drawings by the use of pencil etching techniques. It gives the artist great scope in that the reproduction of his original is mechanical, leaving him with no medium to be considered. Against this must be set the fact that the half-tone screen ultimately gives a flattened and illusory rendering of his original tones, and the mechanism of the process allows the poorest standards of draughtsmanship which may be seen in the popular magazines. In the field of colour the later development has been its use in producing colour-transparent photographs.

The present century has seen rapid development in the old realms of relief and planographic processes. Photogravure (1911) has replaced in book illustration the process of photographing where a softness of tone is desired and to reproducing designs such as themselves. Its chief advantage is to do, however, is in the reproduction of a wide range of illustrated subjects, where by means of rotary printing on paper fed from rolls, high speed and almost colourless results with very little deterioration of the printed image.

Photography, a planographic process, is used to-day in the field of the camera, in the cinema, in the photographic process. While it can interpret a wide range of artistic technique it cannot attain the crispness and clarity of autolithography where the artist is working direct on to the stone. The main reasons for this inferiority are the necessity of intervention of professional copyists and retouchers, and the necessity of the screen to produce variations of line strength. It is rarely used for fine work and in this field has the advantage over process halftone that it can achieve much more delicate effects on a wider variety of print surfaces. Art paper, commonly considered the artistic bughbear of half-tone, need never make its appearance in lithographic work.

One other photographic process which has perhaps more than any other overcome the limitations of the camera must

be mentioned briefly at this stage. Collo-type, like lithography, is a planographic method of printing (i.e. from a flat surface), but unlike any other method it dispenses with a screen for reproducing tones. It can reproduce fine l's with great fidelity both in black-and-white and in colour, but owing to the instability of the printing surface it deteriorates rapidly and is therefore confined to printing small eds. The process excels in the reproduction of works of art, where, with as many as seven or eight printings, a result is obtained which can be achieved by no other process.

In view of the acknowledged limitations of photographic methods it is not surprising to find an antithetic tendency at work among present day artists over the whole field of book I. This manifests itself in a return to earlier craftsmen's methods, notably in the flourishing schools of wood engraving; and much fine work is also being done by autolithography. Earlier in the century the work of various private presses did much to revive and encourage good craftsmanship, and in this connection should be mentioned the work

appeared in Great Britain is E. McKnight Kauffer who has done much imaginative work in the field of advertising as well as in book I. Of the latter his l's for the Nonesuch Press *Don Quixote* should be mentioned. This press has contrived to produce books matching in quality those from the private presses, but, by making the best use of modern mechanical methods, to publish them at comparatively cheaper prices. Other artists who have done fine work in wood engraving are Paul Nash, Douglas Bliss, Clare Leighton, John Farleigh, and many more. Linoleum, too, has proved an excellent medium for either black-and-white or colour I. and two artists who have worked successfully in this medium are Claude Flight and Wm. Kermode. Autolithography has seen a welcome revival, and in this connection should be mentioned the work of Barnett Freedman (especially a series of his coloured l's for Tolstoy's *War and Peace*), John Nash, and John Piper.

The constant development of new processes of book I. (as for example the recent application of plastics to lithography) tends towards a new synthesis of the craftsman and the machine, with the aim of achieving the maximum fidelity of reproduction while allowing the greatest scope to artistic technique. Illyria, name of a vaguely defined mountainous dist. on the E. coast of the Adriatic, running from Durazzo in Albania up to Fiume in Istria. Inland the bog was still more indefinite, but it may be regarded as including the N. parts of Albania, Montenegro, part of Serbia W. of the Morava, Dalmatia, Bosnia-Herzegovina, and part of Croatia-Slavonia. The Rom. prov. of Illyricum varied in area from time to time, and no strict geographical limits can be assigned to it. In early Gk. hist. we only know of the barbarian 'Illyrians', whose legendary ancestor was descended from Cadmus and Harmonia; archaeological research shows that the primitive peoples spoke a Venetic dialect, also Meroanian, akin to modern Albanian. Gk. colonies were settled all along the coast during the whole of the sixth century B.C., and coins and inscriptions have been found at Durazzo (Epidaurum), Split (Salona), Dubrovnik (Epidaurum), etc. The inter-tribal warfare seems to have been checked by Celtic pressure in the fourth century, and a confederation was formed which pressed on Macedonia. Under a chief Bardylis, and his son, Ciltas, Amyntas was defeated, and later Perdiccas, Philip of Macedon finally crushed them. The tribes turned to piracy and harried both Gk. and Rom. trade. Their queen Teuta insolently refused terms, and murdered the Rom. ambas. In 180 B.C. an independent ro-

of Eric Gill and Robert Gibbins at the Golden Cockerel Press. The ed. of *The Canterbury Tales* from this press is a fine example of the work of Gill whose classical spirit combined with great skill as a designer of lettering and typefaces in many instances resulted in a harmonious blending of I. with the printed text. Chaucer, the inspiration of sev. modern illustrators, has also been pub. in a fine ed. with colour plates by Russel Flint, and in America with wood engravings by Rockwell Kent. Another Amer. much of whose output has

puble of Dalmatia was estab., and the kingdom of the Illyrian Genthus was annexed to Rome, 168; Dalmatia continuing aggressive and powerful till A.D. 9, when the whole country became a Rom. prov. It furnished some of the best soldiers for the Rom. armies, and many of the emperors were Illyrian by birth. In A.D. 379 E. Illyricum went to the Byzantine empire. The ethnological character of the dist. was modified by the Hunnish invasion in the fifth century, and in the seventh century by the Slavonic immigration of Croats and Serbs, though the coastns. still remained It. in civilisation. The primitive races remain in Albania alone. In 1809 the Illyrian provs. were formed and ceded to Italy: they were conquered by Napoleon and ceded to Austria in 1813, and till 1849 formed a kingdom of the Austro-Hungarian empire. See also YUGOSLAVIA.

**Illyricus**, see FLACIUS, MATTHIAS.

**Ilmen**, lake of Russia in the region of Novgorod, R.S.P.S.R., 30 m. in length from E. to W. by 24 m. in greatest breadth. Its chief trib. is the Lovat. It discharges its surplus waters by the Volkhov northward into Lake Ladoga.

**Ilmenau**, tn. of Thuringia, Germany. It is situated at the N. foot of the Thuringian Forest on the R. Ilm, 30 m. by rail S. of Erfurt. The tn. is a favourite watering place, and was visited by Goethe, who wrote his *Iphigenia* here. Pop. 16,100.

**Ilmenite**, titaniferous iron ore found in many localities, more particularly at Kragerø in Norway, where good crystals occur, in the U.S.A., and in Canada. It has been found as sand on the banks of the Mersey, and at Helston in Cornwall. The name is derived from the Ilmen Mts. (Ural), where it is found in magnificent crystals. Its formula is generally given as  $\text{FeTiO}_3$ , but in many cases the mineral contains magnesium, so that it may be written  $(\text{Fe}, \text{Mg})\text{TiO}_3$ . It is not isomorphous with hematite, but belongs to the parallel-faced hemihedral class of the rhombohedral system.

**Ilminster**, mkt. tn. of Somerset, Eng., 104 m. from Taunton. Alt. 140 ft. Pop. 2,300.

**Il Obeld**, see EL OBELD.

**Ilobu**, native tn. of Nigeria, in the Yoruba country. Pop. 60,000.

**Ilocos Norte**, mountainous coast prov. of N.W. Luzon, Philippine Is. Its peaks are in part volcanic. The valleys are watered by the Pangasinan and other streams. Cap. Laoag. Pop. 180,000.

**Ilocos Sur**, coast prov. of N.W. Luzon, Philippine Is. Area 644 sq. m. It is rather flat and very fertile. Medicinal plants grow in the mts. Pop. 190,000.

**Iloilo**, Sp. settlement, and the chief port after Manila in the Philippine Is. It is the cap. of Iloilo prov., Panay, in Iloilo Strait, opposite Guimaras Is. It is an open port and exports sugar, rice, tobacco, and coffees. Pop. about 70,000.

**Ilorin**, tn. of the Yoruba tribe, S. Nigeria, some 250 m. from Lagos. Conquered by the N. emirs of Nigeria. It is a busy trading centre in palm-oil products, cocoa, hides, etc. Pop. 42,000.

**Ilseburg**, tn. and watering-place of Saxony, Germany, 16 m. W. of Halberstadt. Pop. 5,300.

**Ilus**, son of Tros and Callirhoë, and great-grandson of Dardanus. He was supposed to be the founder of Ilion, which he called Troy after his father. His son was Laomedon, and he was the grandfather of Priam.

**Iiversgehofen**, tn. of Saxony, Germany, situated in the circle of, and 2m. N. from Erfurt. Pop. 12,000.

**Imac**, see under MALACHI, SAINT.

**Image-worship** (Gk. *ειδωλατρεια*), the use for private or public devotions of graven or painted representations of sacred persons or things, to which honour and reverence are given instead of to the invisible Godhead. The term is sometimes taken for the use, as in the Rom. Church, of pictures or images which are only designed to convey to the worshippers an idea of that which they worship, but it is more often limited to the sense of meaning 'the actual worship of the image itself, not of that which it represents.' It was a comparatively late development of primitive religion, and grew out of the earlier 'fetish worship,' in which a stone or a wooden post was worshipped with the idea that the spirit of a god had entered there to receive sacrifice (cf. Asherah, Ex. xxxiv. 13). The making of images in some definite form marks a great advance in religious thought and shows the birth of conceptions of the Divine character and attributes. Varro affirms that for more than 170 years from the foundation of Rome there was in the city no image of a god either in human or animal form, and historians have proved that neither in Greece, Persia, nor Egypt, were there temples or idols in the earliest times. The Decalogue begins with the command to reverence the one true God and to recognise no other deities, but the lamentations and the denunciations of the prophets show how thoroughly the cults of other deities were rooted in the hearts of the Israelites, how hard it was to root out the idol-worship traditions of their Semite ancestors, and how easy it was for them to adopt the gods and the graven images of their Canaanitish neighbours (1 Kings xii. 8; Jer. xii. 18). The Jewish worship of idols was checked but not eradicated during the Exile, and various passages in the Talmud demonstrate the tendency of the Jews to adopt the gods of the Gks. and Romans, and more especially those of their Oriental neighbours. To prevent such relapses all association of Jews and Gentiles was rendered difficult, and by degrees the former were weaned from idolatrous worship. Neither in the N.T. nor in any genuine secular hist. of the first century of Christianity can any trace be found of the use of images in the worship of the Christians, and though images of Christ, His Mother, and the Apostles are to be found in the Rom. catacombs, it was not until after the estab. of Christianity under Constantine that the practice became common. For the use of images in the Rom. Church, see under ROMAN CATHOLIC CHURCH. See also the series of

articles 'Images and Idols' in J. Hastings, *Encyclopaedia of Religion and Ethics*, 1911, vol. vii.

**Imagist** school of poetry had for its philosopher the Englishman, I. F. Hulme, for its prophet the cosmopolitan Amer., Ezra Pound, and for its expounder the Amer. poetess, Amy Lowell (p. 1). Others who belonged to this school in the period 1912-1917, were the Amers. H. D. (Hilda Doolittle), Harriet Monroe, and John G. Fletcher, and the Englishmen Richard Aldington (and later I. S. Flot, formerly a U.S. citizen) and Harker Read. Like all new schools of poetry, it was a revolt. In this case it was a revolt against excessive romanticism, against loose or sentimental verbal painting, and against the sing-song school. It was Hulme who started the discussion of the image in poetry, and his friend, Pound, who first gave it practical application. All these poets pursued the ideal of order, lucidity, conciseness, and strict objectivity, and they found inspiration in the Chinese, and Japanese poetry. Indeed, it was largely due to the influence of the latter that trans from Chinese verse had such a great vogue some years ago. All the Imagists, according to their temperament, sought to act upon Hulme's theory that the chief aim was to attain accurate and definite description, and that it was essential to prove that beauty might be found in small commonplace things. Most of the experimenters used free verse. See Amy Lowell (ed.), *Some Imagist Poets* (1915), G. Hughes, *Imagism and the Imagists* (1931).

**Imam**, title of the officer who reads the devotions in Arab mosques and who, in Turkey, conducts Muslim marriage and funeral services, as well as performs the ceremonies connected with circumcision. The office was assumed and the title borne by Mahomet, whence it sometimes denotes the head of the faith and it was so applied to the Sultan of Turkey and to day is applied to Yahia, king of the Yemen. Some Mohammedans sets expect the future advent of an Imam the hidden Imam who shall be greater than the prophet himself.

**Imam Yehia**, see YAHIA.

**Imandra**, lake in the Altai region of the R.S.F.S.R., 50 m. S. of Kola. Length 50 m., greatest breadth 10 m., Area 350 sq. m. It drains into the White Sea.

**Imatra Falls**, in inland on the Vuoksen a short distance from its exit from Saima Lake 39 m. N. of Vuopuri.

**Imaus** ancient name for the art of the Himalayas Mts.

**Imbabura**, dept. of Ecuador, with Pichincha to the S., Esmeraldas to the W., and Cacha to the N.E. Lying in the Andes mts., it contains the 15,000 ft. volcano, Imbabura. Stock raising is the prin. occupation. Cap. Ibarra. Area, 2414 sq. m. Pop. 146,200.

**Imbecility**, see CRIMINISM IDIOCY; MENIAL DEFICIENCY ATTS.

**Imbros**, or Imros, is in the N.E. of the Aegean Sea, S. of Samothrace. It belongs to Turkey and is joined with Samothrace to form the administrative dist. of the sanjak of Lemnos. It is the seat of a Greek bishopric. It is extremely fertile. During the Dardanellies campaign in the First World War Gen. Sir Ian Hamilton, commander of the Brit. contingent, had his headquarters at Imros. It was here also that the 11th Div. was concentrated before its attack at Gallipoli. When the withdrawal of the Brit. forces to replace them just went to Imros and one of the other is fear of the peninsula. It was held by the Greeks until 1922 when it was returned to Turkey under the treaty of Lausanne. 11,111. Kastrom. Pop. 9000.

**Immaculate Conception** (Lat. *im*, not, *macula* to stain) dogma of the Roman Catholic Church that the Virgin Mary was conceived without original sin. That is, she was entirely exempt from the stain of sin from the first moment of her existence. The doctrine was the subject of bitter and strenuous controversy in the Church for nearly 600 years. In 1210 St. Bernard protested against the introduction of the new feast into the Calendar of the Church at Lyons without the consent of Rome. In doing so he argues against the doctrine but not conceives the same. In 1478 Domin. Scotus maintained the complete exemption from sin and his school was backed by the Franciscan order. The Thomists or followers of St. Thomas Aquinas and the Dominicans took the opposite view. The Council of Baltimore (1847) without the Pope's sanction declared the doctrine of the Immaculate Conception of the Catholic Church. Pope Sixtus IV in 1483 commended by a constitution that the disputants should observe decency and tolerance towards one another. The way of Imros at the same time closed degrees to those who did not defend the doctrine. The Council of Trent (1546) left the question unsettled and the dispute waxed hotter until the end of the sixteenth century, when the Pope forbade except under certain conditions, all public discussion of the subject and prohibited disputants from attacking each other as heretics. Successive popes were urged to make a decision but beyond administrative matters to the feast of the conception in permitting the word immaculate to be used in connection therewith, the matter was not finally decided until the dogma was proclaimed by solemn decree by Pope Pius IX. on Dec. 8, 1854. The Greek Church celebrates the feast on Dec. 8, under the title of the Conception of St. Anne, the Virgin's mother. J. Hastings, *Encyclopaedia of Religion and Ethics*, 1921, vol. vii., J. Erdmann, *History of Philosophy*, trans. by W. S. Hough, 1890. Elizabeth Saurpe, *The Catholic Doctrine of the Immaculate Conception*, 1931, F. E. Bird, *Explanation of the Immaculate Conception*, 1919.

**Immanence**, or Immanent (Lat. *im*, in, and *manere*, to remain), philosophic term used to denote the conception that the Deity pervades the universe itself, and that His activity and existence are expressed solely by the unrolling of the natural cosmos. It is in opposition to the

doctrine of transcendentalism, which teaches that the Deity has an existence apart from the universe, which is in effect only a subsidiary expression of His activity. Finally *Immanuel* is the term used by Rom. Catholics to denote the modernist theory that religion has its source in man's intimate sense of the divine or need for the infinite (thus N's *Kencyclal Papendi*).

**Immanuel, or Emmanuel**, Heb. proper name meaning 'God (is) with us'. It first occurs in the Bible in the prophecy of Isaiah (vii. 14) to Ahiz, king of Judah, in reference to a child that was to be born as a sign from God that Judah would not be destroyed by Syria and Ephraim. The name occurs again in the Gospel of St. Matthew (i. 23) when it is applied to Jesus the birth of the Messiah being taken as a fulfillment of the prophecy of Isaiah.

**Immermann, Karl Lebrecht** (1776-1810), Ger. poet and dramatist, b. at Magdeburg. Studied law at Halle, fought at Ligny and Waterloo. On his return to Halle his misanthropic friendship with the Countess von Ahlefeldt, first von Lutow, began. He was a judge at Magdeburg (1823) and Düsseldorf (1827). In 1833 he managed the 'Dorf Theatre'. His dramatic success was with the historical tragedy, *Der Kruenispiegel* (1811-12) and *Kaiser Friedrich II.* (1828). In 1831 appeared the mystic poem *Merlin*. Of his novels *Leipziger* (1836) the first imitation of Goethe's romanticism, and his modern realistic satire *Munchhausen* (1838) are the best known. See H. Mayne *Immermann, der Mann und sein Werk* (1921). J. Kayser, *Immermann und die literarische Welt* (1921).

**Immigration**, Act of moving into a country for the purpose of settling there. It is the converse of emigration (*q.v.*) under which he dealing the causes of transference of pop. from one country to another have already been dealt with. In modern times more and more attention has been paid to the subject by govts. Thus the govts. of Brit. colonies, now dominions, have in recent years offered special inducements to attract suitable Brit. subjects to settle in their territories, affording assistance, possessing making grants of land, establishing information bureaus in London, and encouraging their own resources. A great cause of I. in the past as in very recent years has been the flight of certain persecuted classes to an alien land. This extends centuries back beyond the stream of Jews and political refugees from Nazi Germany before the Second World War. The ship *Mayflower* left England carrying to America settlers who fled from religious oppression under James I. in 1620. Another old example of the effect on the dispersion of pop. due to religious severity, was the revocation of the edict of Nantes by Louis XIV. of France, driving thousands of Fr. Protestants from his country. Many of these went to Prussia, and were hospitably received by the Prussian king, and established at Berlin, then new, to the prosperity of which they contributed by their varied skill and industry. Others came to

England, settling at Spitalfields and Bethnal Green, carrying on silk weaving, watch making, etc. There has been a long term general rise of I. in the last century, and indeed (with certain reservations) it is an inevitable sign of social and economic progress throughout the world. Conversely, it is a sign of backward movement and an unwholesome state of the nations when there is too stagnant a watch upon the immigrant.

But there is another side to this matter as long as nations are at so many different stages of development, and the problem of the 'undesirable alien' first faced the United States in the last quarter of last century. From 1880 a great influx of poorer class Jewish immigrants from Eastern Poland and S. Europe came to the United States. They were largely refused from anti-semitic legislation and from competition. Amer. I. Laws in 1882 kept many out on the grounds of poverty or disease and London as a result absorbed some of the poorest and sickest. It was found that these aliens caused the displacement of Brit. workers, lowered the standard of living, and sometimes were housed together in unsanitary conditions. In 1889 a committee of the House of Commons inquired into the question and in 1902 a Royal Commission reported on it. This resulted the Criminal Aliens Bill 1904, and the Aliens Act, 1905. This Aliens Act stated that an immigrant would be held to be undesirable and could be repatriated if he could not show that he was able to support himself and dependent on him if he was an idiot or lunatic or suffering from disabling infirmities.

The country which first coped with the problem on the large scale was the United States. Statistics there had been kept from 1820, and showed an increase from 115,000 in 1821-30 to 216,000 in 1881-90. As stated legislation passed in 1888 and the next decade showed a fall to 184,000 though this was rapidly overtaken for a time. The total for the period 1901-10 was 514,000, or 1911-20 736,000 and for 1921-29, 1,867,500. For 1930-39, the figures are 1,947,481 and 1,703,370. In the earlier years of last century the immigrants to the United States came mainly from Britain and Ireland. Political conditions and the revolution of 1848 caused many Germans to go to America, and the flow continued the development of America's railway system and opening up of farm lands. It was people from all parts of W. Europe towards 1900, income is from S. and E. Europe began to predominate. Austria, Hungary, Italy, and Russia furnished half the total number. This caused an increase among average native Americans who had even objected to the Irish in former years, and had declared that they lowered the standard of living. There is, however, always a tendency in the ordinary citizen to resent the new arrival, and even in modern times the descendants of the old Dutch families affected to despise the newer Eng. settlers. The Act of 1882, already mentioned was followed by

the Undesirable Persons Act of 1891, providing that every person arriving from abroad was to be examined and prohibited from landing if found to be a convict, lunatic, idiot, epileptic, contagiously diseased person, pauper, polygamist, prostitute, or anarchist. Alien Contract Labour Laws of the '80's and '90's prohibited anyone coming to the States to do any work under contract made before arrival. Exceptions were made in certain artistic professions. In 1921 a Quota Law fixed a definite number of immigrants for each nation, and in 1924 this Act was stiffened. In 1929 Britain was given the lead in its quota, but the total was further reduced. During the financial year 1930-31, 97,000 immigrant aliens were admitted into the U.S., against 241,000 in the previous year. For the first time since the Amer. Civil war, the ann. total was under 100,000; and it was evident that the States had abandoned their historic rôle of giving hospitality to the distressed and persecuted the world over. Of these 97,000, nearly 27,000 were from Canada, 9,000 from Britain, and 7,000 from Ireland. 13,000 came from Italy and 10,000 from Germany. Only 51,000 came in under the quota; the rest were from non-quota countries, chiefly Canada. In 1932, only 35,570 were admitted. The increase of Chinese in America was also regarded with jealousy. It grew with the extension of the railway system, the discovery of gold in California, and the development of the Pacific Coast. The Chinese worked for far lower wages than would support a European, and the agitation against them led Congress to suspend all Chinese I., by a series of Acts ranging from 1882 to recent years. In 1882 there were 130,000 Chinese in the States, but by 1920 only 62,000. They occupied mostly domestic situations, or worked in small shops, canneries, and laundries. Jap. I. to the U.S.A. began in 1869. They entered the country freely until 1908, and numbered 30,000; but the diplomatic measures of the Jap. Gov. reduced the figure, and it was further diminished under Alien Laws. By 1921 it was 7878.

In 1938 the Brit. *emigrants* to the U.S.A. are given as 1992, and in 1947 they had risen to 18,555. It is to be noted that such figures are very easily confused, through certain statistics lumping all passenger traffic together. But it can be stated that the total Brit. tourist movement *by sea* to the U.S.A. in 1917 was 40,559. This compares with 51,000 visitors from the U.S.A. to Britain, recorded in the same year, 1917. There were 3000 from Central and S. America in 1947.

Brit. colonies, or dominions, have generally found it necessary to pass Acts to control I. The Australian Act of 1901 imposed similar tests to those mentioned in connection with Britain and the U.S.A. A language or educational test was included, and rigorous laws and regulations were made as to the employment of Chinese coolies, once engaged largely in the cultivation of sugar-cane in Queens-

land. Similar legislation broadly applies to New Zealand. Other old Acts were the Contract I. Act, 1905, and the Restriction Acts of 1906, 1910, and 1912. New Zealand satisfactorily absorbed large numbers from Britain, and its pop., like that of Australia, became 98 per cent Brit. Excess of immigrants over emigrants was 11,219 in 1913, though by 1928 this balance was reduced to 443. Owing to the loss of 60,000 men in the First World War, a plan was formed in 1920 to recruit and assist immigrants, particularly from Britain. The number of Brit. immigrants into Australia was 77,934 in 1913, 70,271 in 1926, 13,851 in 1928. In 1917 it was 13,012; and 5918 to New Zealand. The official handbook, *Known Australia* (1916) stated that Australia was the first of the countries of the Brit. Commonwealth to announce a full policy of planned I. She had set a target of 70,000 new citizens a year, 'thinking first of Britain and then of Allied countries.' S. Africa passed similar laws to those of Australia. The question of the Chinese became of great importance there, because native labour was insufficient to supply the mining industries. The Brit. Gov. in 1904 passed an ordinance allowing the importation of Chinese labour, which was strongly opposed by the Liberal Party. In 1906 55,000 Chinese coolies were employed in the Rand mines, but the Transvaal Parliament abolished the system, and by 1910 had repatriated all the Chinese. By 1938 S. Africa's I. policy was to attract suitable settlers with capital and there was no demand for unskilled labour from abroad. The figures of Brit. I. into S. Africa were 25,855 in 1913; 30,293 in 1928; 26,142 in 1947. The Canadian Gov. in normal times has offered great inducements, especially to farmers, to settle in Canada, and in 1911 185,000 persons went there from Britain. Subsequent measures of discrimination, like the laws of other countries, reduced the numbers to 83,886 in 1926, 89,571 in 1927, and 95,307 in 1928. In 1929, there were 58,880 Brit. immigrants; in 1930, 61,082, and in 1931, 27,584. Many settlers also go to Canada from the U.S.A. The world-depression of 1930-32 resulted in the cutting down of those figures to a very low point. Jap. were limited severely and Chinese excluded from settling in Canada. (See also EMIGRATION; EMPIRE SETTLEMENT.)

I. on a large scale has taken place to the countries of S. America. In the Argentine Republic, the Homestead Law of 1917 aimed at relieving the irksomeness of isolation in remote districts by placing together people having the same language, customs, and traditions. Most of the immigrants were I. and Sp., and the same preponderance has been true of Brazil. In 1916, the Peron Gov. of the Argentine Republic announced a long-term plan for incomers from European countries, envisaging an influx of millions of immigrants. The problems of the whole subject were studied by the League of Nations, and now absorb some of the attention of U.N.O. It is necessary in

closing to stress the vast complexity which has been added to the subject since the mass movements of refugees prior to the Second World War, and the countless difficulties of the present 'melting-pot' state of peoples throughout the world.

The following are some recent statistics:

U.K. PASSENGER MOVEMENT (including pleasure cruises)

	1938		1947

Immingham Dock, 5 m. N.W. of Grimsby, was constructed (1906-12) by the Great Central Railway Company on the S. shore of the Humber. It has a capacity of 1,215,000 cubic ft., and an area with adjoining property, of about 1000 ac.

Immortality (Lat. *in*, not, and *mortalis*, mortal, connected with *mors*, death), the continued existence of the human soul after the death of the body. In some form or other, the belief in human I. is practically universal. In even the most primitive animistic cults its influence is clearly discernible, while in all the higher cults it forms an important section of their philosophy. In the more primitive cults we have the provision made for the journeys and sustenance of the departed 'soul,' the

after-life being looked upon as little more than a continuation of the earth-life. An elaborate philosophy of the after-life is found in Egypt, and lengthy accounts are given in the Book of the Dead, telling of the descent of the spirits to the judgment-hall of Osiris. Reproductions of many of the pictures of these scenes are well known.

Among the Indian peoples of the East a different view of the journey after death gave rise to the belief in the transmigration of souls. After death the soul passed into the body of some fresh being, higher or lower in the social scale, according as the life had been good or bad. Buddhism made no alteration in this doctrine, except that it furnished a final goal in the attainment of Nirvana, which, involving as it does the annihilation of personality, can hardly be described as I. It has been disputed whether the Hebs. had any idea of I. before the exile, and there is much in the biblical books which would lead one to suppose that they had not (for varying conceptions of Sheol, see HELL); it is certain that they considered the after-life as at most only a shadow of this life. Among the Hebs., the Persians, and the other Semitic tribes, the idea of I. is generally associated with the resurrection of the body. To the Gks., while many of them (e.g. Socrates, Plato) held the I. of the soul, the resurrection of the body was entirely foreign to their thoughts. The Christian faith teaches both the I. of the soul and the resurrection of the body. St. Paul (1 Cor. xv. 44, etc. and in the First Epistle to the Thessalonians), teaches this clearly, and he also lays stress on the important fact that the resurrection-body is not carnal, but spiritual. See S. Salmond, *Christian Doctrine of Immortality* (4th ed.), 1901; R. Charles, *Critical History of the Doctrine of a Future Life*, 1897; J. Erdmann's *History of Philosophy* (vol. vi., *Since Hegel*), 1921; J. G. Frazer, *Man, God, and Immortality*, 1927; J. Baillic, *In the Life Everlasting*, 1931; H. Keyserling, *Immortality* (trans. 1938).

Immortality (in law). Corporations (*q.v.*) (including the king, who is legally a corporation sole) are, in law, incapable of dying. This is one of the reasons for the old mortmain statutes which were directed against the conveyance of lands to eccles., corporations, 'being against the policy of the law to allow land so to be tied up in perpetual ownership as to restrict the probability of its free circulation. The death of the reigning monarch is constitutionally merely an event which results in the immediate demise of the crown,

though formerly there was a real interregnum between the death of one king and the election and coronation of his successor; with the result that the state had, in the interval, no one to represent it for the purpose of maintaining order. But this fictitious I. of the king did not get rid of the rule that Parliament was necessarily dissolved by the death of the king, although it was appreciated that the consequences of a sudden and automatic dissolution were highly inconvenient, especially in regard to taxes, the collection of which could not be enforced in the absence of a proper authorisation. It was not till 1837 that an Act was passed providing for the continued existence of Parliament for six months after the death of the king unless sooner dissolved by his successor. For the other legal and constitutional effects of this attribute of I. in the king see CROWN.

**Immortelles**, see EVERLASTING FLOWERS.

**Immunity from Disease**, see BACTERIA—Immunity.

**Imola**, tn. of Italy in the prov. of Bologna, situated on the R. Santerno. It is on the site of the Rom. tn. Forum Cornelia. The cathedral dates from 1187, but was rebuilt in the eighteenth century. There is an anc. citadel and a fifteenth-century palace. It has a considerable trade in wine. In the second World War the cathedral, the church of St. Dominic, the church of S. Maria in Regola, the civic museum and the Paterlini Palace were all slightly damaged by bombardment, but, generally speaking, the tn. did not suffer very severely. Pop. 41,500.

**Imoschi**, Omotski, or Imoski, tn. of Yugo-Slavia, situated in Bosnia and Herzegovina, 30 m. N.W. of Mostar. Pop. about 40,000.

**Impact**, the collision between bodies. The mathematical theory of the subject is not concerned with cases in which the I. results in the destruction of either of the bodies. When two bodies impinge, the time of I. may be divided into two parts—the first known as the time of *compression*, during which even the hardest bodies suffer temporary loss of shape at the point of impact; and the second, the time of *restitution*, during which the natural shape is regained. The more elastic bodies are those which exert a greater effort to recover their shape; hence they rebound further. An *inelastic* body is one which makes no effort to regain its shape, which is permanently altered by I. In actual practice, no perfectly inelastic bodies have been found; but a lump of putty is an approximate example. A common experiment to illustrate this loss of shape in the case of a hard body is made by dropping an ivory ball on to a greased marble surface. A circle of distinct size is found to be made, and a still larger circle if the ball is dropped from a greater height.

Newton found that the relative velocity of two bodies after a direct I. is in a constant ratio to the relative velocity before I., and is in the opposite direction. This ratio has been found experimentally for various pairs of substances in

contact. It is known as the *coefficient of restitution*, and in mathematical formulæ is denoted by  $e$ . Thus for two glass solids  $e = 0.94$ , for two ivory solids 0.8, and for one of iron and one of lead 0.13. The example given first approximates as nearly as anything else in practice to a state of perfect elasticity. The mathematical theory is based in the first place on considerations of the I. of smooth spheres and planes. When the surfaces in contact are rough, and the I. is not direct, rotations are set up, and the results have to be modified. First consider the direct I. of two spheres that is, two spheres which impinge in such a way that their line of centres is the same as the then two lines of motion. Let  $m, m_1$  be their masses,  $u, u_1$  their velocities before I., and  $v, v_1$  their velocities after I. All velocities are measured in the same direction, and if the spheres are moving in opposite directions  $u$  or  $u_1$  will be negative. Since at I. the impulse received by one body is equal and opposite to that received by the other, the momenta received are equal and opposite. Hence the total momentum in either direction in the line of motion is unaltered by I. Hence follows the equation  $mu + m_1u_1 = mv + m_1v_1$ . Again, Newton's Experimental Law states that the relative velocity after I. is equal to  $e$  times the relative velocity before. Hence  $v - v_1 = -e(u - u_1)$ . These two equations are then sufficient to determine  $v$  and  $v_1$ , the velocities with which the bodies move off after I. Thus, in particular, a ball falling to the ground with velocity  $u$  rebounds with velocity  $eu$ . It will rebound a second time with velocity  $e^2u$ , and so on. When the I. is oblique, the components of the initial velocities perpendicular to the line of centres at I. are unaltered. This gives two equations stated above hold equally for the components of the initial velocities resolved along the line of centres, and hence there are four equations which will determine the two new velocities and the new directions after impact. In the former case, the kinetic energy before impact is  $\frac{1}{2}mu^2 + \frac{1}{2}m_1u_1^2$ , and after impact is  $\frac{1}{2}mv^2 + \frac{1}{2}m_1v_1^2$ . The two equations give  $(\frac{1}{2}mu^2 + \frac{1}{2}m_1u_1^2) - (\frac{1}{2}mv^2 + \frac{1}{2}m_1v_1^2) = \frac{1}{2} \frac{m m_1}{m + m_1} (u - u_1)^2$ . Hence this expression represents the kinetic energy lost by the I. It chiefly reappears in the form of heat.

**Impanation**, literally embodiment in bread (Lat. *panis*), a theological or eccles. term adopted by some of the earlier Protestants and used in the controversies in regard to the Real Presence of Christ's body in the bread of the Eucharist. It is applied to a local presence or inclusion of Christ's body in the bread after consecration, 'an hypostatical and personal union of the bread with Christ's body.' It differs from Transubstantiation (q.v.), and has sometimes been used loosely as equivalent to Consubstantiation.

**Impatiens**, large genus of balsaminaceous plants which occurs in warm and tropical countries, and is so called from the sudden and elastic force with which the

species burst their capsules. *I. balsamina*, the common balsam, is well known in Brit. conservatories, and *I. Noli-melangere*, the touch-me-not, is also a common plant. The valves of the capsule roll inwards when touched, or fully ripe, jerking out the seeds, and the plant emits an unpleasant odour.

**Impeachment**, arraignment before the High Court of Parliament of a minister of state for high crimes and misdemeanours. The first recorded exercise of the power was in the reign of Edward III., when Latimer and Neville were impeached for the fraudulent purchase of crown debts and for removing the staple from Calais. It is a judicial proceeding in which the Commons act as accusers and the Lords, in pursuance of the long settled rule that the judicial powers of Parliament are vested exclusively in the Upper Chamber, as Judges. A member of the House of Commons moves the *I.* in the first instance, and if the motion is carried the accused is impeached by a deputation of members at the bar of the House of Lords. Articles of *I.* are drawn up and copies submitted to the lords and to the accused. The bar then arrested and detained in the custody of the Black Rod. The prosecution is conducted by certain of the commoners, who are styled managers. The Lords deliver a verdict 'upon their honour,' and where a verdict of guilty is found sentence is not passed until the accusers demand it. The prisoner may move the court in arrest of judgment. The Act of Settlement provides that no pardon from the crown can be pleaded to an *I.* Where the accused is a peer, the Lord High Steward (*q.v.*) presides, where a commoner, the Lord Chancellor. *I.* is now virtually obsolete. Public opinion has for years been a far stronger inducement to ministers not to abuse their powers than the terrors of an *I.* Formerly, however, it was a valuable weapon in the hands of the House of Commons for controlling the actions of the crown ministers. But there is no doubt whatever that the power was grossly abused. Ministers were often impeached for reasons which in these days would merely form ground for strong party differences. Perhaps the most famous case of *I.* was that of Lord Chancellor Bacon on a charge of receiving bribes. This *I.* was important in that it re-affirmed the right of the Commons to hold ministers responsible for their acts to the nation. The *I.* of George Villiers, duke of Buckingham in 1626, and Thomas Wentworth, earl of Strafford in 1626 and, Archbishop Laud in 1640 seem in modern eyes to do no more than exemplify the varying fortunes of party warfare. One of the specific charges against Buckingham was that of accumulating offices. In these days patronage in one form or another is a frequent subject of hostile party and Press comment, but the law officers of the crown would hardly suggest an *I.* Both Wentworth and Laud were accused of trying to subvert the fundamental laws of the realm, but the comprehensiveness of the charge does not alter the fact that Wentworth's foreign policy and Laud's papist

views and sympathies did not happen to meet with the approval of a stern Puritan parliament. The last *I.* were those of Warren Hastings in 1788 and Lord Melville in 1806 for alleged malversation of office. But even before that time the principle of ministerial responsibility (*see* CABINET; GOVERNMENT) to Parliament had become what it now is—the fundamental safeguard of the whole principle of representation.

The procedure on *I.* is similar in the U.S.A., in which country the most famous case was that of President Johnson, in 1868.

**Impenetrability** is generally accepted as one of the properties of matter, viz. that two different portions of matter cannot occupy the same space at the same time. When a nail is knocked into a piece of wood, it takes up its new position by displacing certain particles of the wood. Many experiments were made to disprove the theory, notably one, in which a metal globe was completely filled with water and then compressed until the outside was seen to be covered with moisture. But this was explained as merely proving that particles of water could be forced between the particles of metal. A pint of water and a pint of alcohol make a mixture of less than two pints, but this is due to the fact that in the mixture the molecules are closer to one another. On the other hand, the many theories recently advanced of the composition of atoms make it doubtful whether they possess the property of *I.*

**Imperator**, passenger and mail steamer of the Hamburg-American Line, launched by the Kaiser Wilhelm II. in 1913, but later called the *Berengaria* (*q.v.*).

**Imperator**, in Rom. hist. the title given, in the republican period, to the victorious general and laid aside with the surrender of the military command; but, in 46 A.D., conferred on Caesar for life. Caesar bore it at first as governor of Gaul in the usual way; but the retention of the title after the termination of his generalship and the celebration of his triumph, was new. Here was laid ground for a distinction between the permanent title, which was subsequently prefixed to the name, and that which was temporary and therefore capable of repetition, which was placed after the name. But Caesar, even when he had been called in the former sense, *imperator* once for all, was yet after the gaining of victories, saluted by acclamation on the battlefield as *imperator*; he never bore the title, however, prefixed to his name, but called himself and made others call him simply *Cæsar imperator*—without adding any sign of repetition (*see* Mommson, *History of Rome*, vol. IV.).

**Imperia** (formerly **Porto Maurizio**) (1) Mountainous prov. of Italy, bounded on the S. by the Mediterranean. It has an area of 455 sq. m., and produces fruit, wine, and olives. Pop. 148,000. (2) A city of Liguria, cap. of the above prov., on the Ligurian Sea, about 46 m. from Nice and 2 m. from Oneglia, with which it forms one commune with a pop. of 28,600. It is famous for its olive oil.

**Imperial Air Routes.** *see* AIR MAIL, etc.  
**Imperial Airways,** the name of the body formed, in 1921, by the four Brit. air-lines—Handley-Page Transport, Instone Air Line, Daimler Airway, and the British Marine Air Navigation Company. The board comprised representatives from the absorbed coys. together with directors appointed by the gov. Under the Brit. Overseas Airways Act the British Overseas Airways Corporation came into being in 1939, with 3 members appointed by the Secretary of State for Air; and in the following year the new corporation acquired the undertaking of I. A. and of British Airways Ltd.

**Imperial Bureau of Mycology,** *see* IMPERIAL MYCOLOGICAL INSTITUTE.

**Imperial Canal,** *see* GRAND CANAL.

**Imperial Chemical Industries, Ltd.** A great combine which controls a large number of other concerns, the chief of which are British Copper Manufacturers; British Dyestuffs Corporation; Brunner, Mond & Co.; Cassel Cyanide Co.; Castner-Kellner Alkali Co.; Excelsior Motor Radiator Co.; Imperial Chemicals Insurance; Kynoch Ltd.; Nobel (Australasia), Ltd.; Nobel's Explosives Co.; Sedgwick Gunpowder Co., and Welsbach Light Co. Its authorised capital is £95,000,000, and its chief productions are acids, alkali, ammonia, artificial leather, chemicals, cycles; and motor cycles, detonators, dyestuffs, explosives, fertilisers, lime, non-ferrous metals, and safety fuses. The first chairman was the late Lord Melchett (q.v.); the present chairman is Lord McGowan. The chief offices are Imperial Chemicals House, Millbank, London, S.W. (present office: North House, Buckingham Gate, London, S.W. 1). Judged by world standards, I.C.I., with a normal estab. of 70,000 employees, is only comparable with similar chemical organisations in the U.S.A., but small indeed compared with the I. G. Farben of Germany and the State Corporation of Russia. The company's achievements in the invention and development of products and processes were of direct importance in the national war effort. Thus the company turned out half a million tons of sulphate of ammonia a year—essential to fertilisers and to the 'grow more food' campaign. During the war almost 400,000 tons of explosives were made in the coy.'s factories besides hundreds of millions of detonators, fuses, and incendiary bombs. I.C.I.'s greatest contribution in the field of special weapons was the Projector, Infantry, Anti-tank Gun, better known as the P.I.A.T. and the most effective weapon of the infantry against tanks or fortifications. Another weapon was the 'flying dustbin,' which, mounted on a tank, helped to blast a way through the West Wall and the fortified vil. of Normandy in 1944. On the coy. fell the burden of producing small arms ammunition until new gov. factories could be built; by the end of 1944 they had turned out over 3500 million rounds. They were also responsible for developing mass-production methods for the small arms incendiary bullet—a weapon which completely surprised the Gers. and caused

them great losses of aircraft at a critical stage in the war. The cupro-nickel condenser tube was a notable contribution to the increased fighting efficiency of Britain in the war and a large number of the bigger warships were fitted with tubes made by the I.C.I. A new factory was built to make metal fuel tanks for aircraft and, later, technicians developed the technique of making the tanks bullet-proof. Plastic materials were in great demand for war in the air; the coy.'s invention of 'Perspex' (*see* CHEMISTRY; PLASTICS) was widely used as a non-splintering glazing material for aircraft. Polyvinyl chloride, another plastic, was useful to replace rubber in flexible cable coverings. An outstanding achievement in the field of plastics was the discovery of polythene or polymerised ethylene. It proved to be a valuable insulating material for high-frequency radio and television. Without polythene, Radar could never have been developed so rapidly or so efficiently.

**Imperial College of Science and Technology,** a federation of three institutions: the Royal College of Science, the Royal School of Mines, and the Central Technical College of the City and Guilds of London (essentially a school of engineering), situated in S. Kensington. In 1906 an official committee proposed that these three institutions should be brought together in such a way as to establish at S. Kensington 'an institution or group of associated colleges of science and technology where the highest specialised instruction should be given and where the fullest equipment for the most advanced training and research should be provided, in various branches of science, especially in its application to industry.' Their report resulted in the creation of the I. C. of S. and T., with the three above mentioned institutions as its constituents, the college as a whole being a school of the Univ. of London. Its predominant function in the sciences, mining, metallurgy, and engineering, is to train students for direct service in industry and agriculture.

The above mentioned institutions were themselves related to yet earlier institutions from which, accordingly, the I.C. can claim descent. The earliest of all was the Royal College of Chemistry, and the Royal College of Science has its origin in the incorporation in 1853 of the gov. School of Mines and of Science applied to the Arts with the still older Royal College of Chemistry. Brit. chem. owes much to the enthusiasm of those who, a century ago, saw their country's need of laboratories like those of Liebig and of Wöhler at Gießen and at Göttingen, and endeavoured to obtain support for a new institution to be named the Davy College of Practical Chemistry. In 1843 they came near to success in an attempt to secure accommodation in the Royal Institution; and in 1845, when that had failed, they organised a campaign of publicity among all classes. Their efforts were successful, for a constitution was given to the college; its first council was elected and Prince Albert became its first president. It was opened, as a private venture to students in Ock.,

1845, in George Street, Hanover Square, and on Dec. 9 its title was changed to The Royal College of Chemistry. The first prof. of this college was August Wilhelm von Hofmann, then a 'privat docent' at Bonn. Hofmann stayed till 1863 when he was appointed prof. of chem. in the Univ. of Berlin. In Hofmann's first year of office the college moved from its temporary quarters in George Street to a new building in Oxford Street. The college was, as stated above, incorporated with the Government School of Mines and of Science applied to the Arts (founded in 1851, by de la Beche, the famous Eng. geologist (*q.v.*), on a site between Jernyn Street and Piccadilly), and later to become the Royal School of Mines and, at S. Kensington in 1881, the Normal School (ultimately the Royal College) of Science. Assisted by Lyon Playfair Prince Albert secured the purchase, with funds at the disposal of the Commissioners of the Exhibition of 1851, of the site in S. Kensington on which the Imperial College now stands. It was Prince Albert's initiative in urging the holding of the great Exhibition, against public opposition and without much initial support from industry, that was largely responsible for the fact that the commissioners had funds to spend on endowing the arts and sciences in this and other ways. The third constituent institution of the I.C., the City and Guilds College, owes its being to the corporation and Livery Companies of the City of London.

But the steps whereby all three constituent institutions came at last to be associated at S. Kensington is a complex one, which may only be disentangled from numerous letters, memoranda, and departmental minutes, many of which are eloquent of divergent aims and interests. The major opposition was that which lasted from 1851 to 1881, between Huxley and the Science and Art Department on the one hand, and the 'mining school party' led by Murchison, Percy and Warrington Smyth on the other. Huxley's party wanted a great metropolitan school covering all branches of applied science, but the other party feared that extensions would hinder the development of de la Beche's school in Jernyn Street and lose its affiliation with his Museum of Practical Geology. But these divergencies were gradually reconciled, particularly as accommodation became more commensurate with the teaching given. The fluctuations of this story are shown in the ceaseless changes in the names attached to the constituent colleges, and it was not until 1907 that the three came to have their present names. The I. C. of S. and T. is a 'peak institution' comparable with the Massachusetts Institute of Technology, and the 'alliance' concluded with that institution in 1944 was a recognition of community of aims and interests. Its Charter estab. it 'as a School of the University of London' and its Visitor is the king.

The Charter of the college provides that, subject to agreement with the authorities of any college or other institution, the

governing body may recognise that college or institution or any dept. of it as being in association with the I. C. for all or any of the purposes of the Royal Charter of 1907, but no such resolution is to be operative until allowed by the King in Council. The Dept. of Metallurgy of the Univ. of Sheffield has been so recognised for the Advanced Metallurgy of Iron and Steel.

The I. C. is organised into these depts.: aeronautics (including aerodynamics); biological depts. (including biochem., botan., and zoology); chem. technology (including chemical engineering, fuel and refractory materials, applied physical chem.); chemistry (including organic chem., inorganic chem., physical chem., agricultural chem., and the chem. of food and drugs); engineering, mechanical and motive power; engineering, civil and surveying (including highway engineering); engineering, electrical; engineering, chem.; geology (including mining geology and oil technology); mathematics and mechanics; metallurgy; mining (including mining surveying); physics (including astrophysics, technical optics, instrument design, meteorology, and applied geophysics).

The administration is vested in a governing body of forty-seven members representing the Crown, India, the self-governing Dominions, the Board of Education, the Univ. of London, the London Co. Council, the City and Guilds of London Institute, the Royal Commissioners for the Exhibition of 1851, the Royal Society, the Professorial Staff of the Imperial College, and the learned societies concerned with industries. The Rector, as chief administrative officer of the I. C., for the time being, is also a member.

**Imperial College of Tropical Agriculture**, incorporated in 1921 as the outcome of recommendations made in their report by a committee appointed by Lord Milner in 1919 (*see* Cmd. 362). The object of the college is to promote the study of tropical agriculture in suitable surroundings, and to create a body of Brit. expert agriculturists well versed in the knowledge of the cultivation of land in the tropics, of chemists, and of scientific advisers possessing an intimate knowledge of the means of combating pests and diseases and to conduct research. The college buildings are at St. Augustine, near St. Joseph, Trinidad. The funds are derived from contributions from colonies and industries participating in the movement and an imperial grant. The Imperial Dept. of Agriculture founded in 1898 was amalgamated with the college in 1922. Post-graduate courses are open to holders of a degree or diploma of any Brit. univ. or other academic institution approved by the governing body of the college. Refresher courses are open to officers of agric. depts. in the tropics, or similar institutions. There is also a three-year diploma course primarily intended to give instruction in W. Indian agriculture, besides a two-year course in sugar technology.

**Imperial Communications Advisory Committee**, constituted in July, 1929, on

the recommendation of the Imperial Wireless and Cable Conference, 1928, to act in an advisory capacity in regard to telegraphic communications. The formation of the Committee may be regarded as the corollary to the merger of cable and wireless interests which took place in 1928. It is composed of eight members representing the Home and Dominion Govts., Colonies and Protectorates, and it is charged with certain responsibilities relating to the activities of Imperial and International Communications Limited—the public utility company which was formed in accordance with the recommendations of the Conference previously mentioned, for the purpose of co-ordinating the telegraphic services (cable and wireless) connecting the various parts of the Brit. Empire. The Committee is concerned with questions of policy regarding, in particular, the institution of new services, the discontinuance of existing services, and the distribution of traffic between alternative routes. In 1944, on the nationalisation of the Cable and Wireless Company, the I.C.A.C. became the Commonwealth Communications Council, its former duties being somewhat extended owing to the nationalisation of the Company. The Council will probably disappear in its turn, to be replaced by the Telecommunications Board.

**Imperial Conference**, constituted by resolution of the Colonial Conference of 1907 to the effect that such a conference should be held every four years for the discussion of questions of common interest as between the Brit. gov. and the govts. of the self-governing Dominions beyond the seas. The Prime Minister of the United Kingdom acts as *ex-officio* president, and the Prime Ministers of the Dominions are *ex-officio* members; the Secretary of State for Commonwealth Relations (formerly Secretary of State for Dominion Affairs) is also an *ex-officio* member and deputy president; and, in addition, such other ministers as the respective govts. may appoint may also be members. Except by special permission of the conferences, each discussion is conducted by not more than two representatives from each gov., and each gov. has only one vote. A resolution was passed in 1917 to allow of India being fully represented. The Irish Free State (later Eire) was first represented at the I. C. of 1923. There is a permanent secretarial staff under the Secretary of State for Commonwealth Relations, appointed to keep the sev. govts. informed during the periods between the conferences in regard to matters which may come up for discussion. The I. C. grew out of the Colonial Conferences, of which there were four prior to that of 1907—three in London and one in Ottawa. At the first, held in 1887, the most prominent question was the organisation of Colonial defence, and an important agreement was arrived at for the augmentation of the Australasian squadron. Other questions discussed were mail service, Imperial penny post, and the enforcement of colonial judgments. The question of trade and communica-

tions between the colonies (they were not then styled 'dominions') and between the colonies and the mother country was considered at the Colonial Conference held at Ottawa in 1891. At that conference the decision was taken to lay a cable between Canada and Australia, work on which was begun in 1902. At the conference of 1897 Imperial preference was the chief question, and Imperial defence also received much attention, Cape Colony contributing money for a first-class battleship. In 1902, the year of King Edward VII.'s coronation, advantage was taken of the presence in London of Colonial Premiers to discuss the political and commercial relations of the Empire and its naval and military defence. Then came the Colonial Conference of 1907 (which passed the resolution mentioned at the opening of this article), in which the Prime Ministers of all the self-governing colonies took part, including the Transvaal, where the first elections under responsible gov. had just taken place. At this conference all the members except the gov. of the United Kingdom re-affirmed the resolutions of the 1902 conference on preferential trade within the Empire; but the gov. of the United Kingdom was unable to admit either the necessity or the expediency of altering the fiscal system of the United Kingdom. In 1909 a Defence Conference was held in consequence of parl. discussions on the naval position, and as a result of the conference various dominions placed orders for cruisers or made financial contributions.

The first conference which was officially styled 'Imperial' was held in May, June, 1911, the chief questions considered being the constitution of the conference, inter-imperial consultation regarding Treaties, migration, naturalisation, the treatment of Brit. Indians in the Dominions, cable communications, and uniform treatment of Brit. shipping. Arising out of this conference a Royal Commission was appointed to report on the natural resources and trade of the Empire, and the work of this Commission has undoubtedly acted as a stimulus in this direction ever since (see also *EMPIRE, MYSTIC AND BOYD*; *IMPERIAL INSTITUTE*; *IMPERIAL ECONOMIC COMMISSION*). During the First World War the normal I. C. was postponed and overseas representatives were temporarily made members of the War Cabinet (see *CABINET, IMPERIAL WAR*). At the Imperial War Conference of 1918, apart from confidential deliberations on the prosecution of the war, the most important resolutions dealt with the future economic policy of the Empire respecting raw materials. At the close of hostilities in 1918 representatives of all the self-governing dominions were immediately summoned to take part in the discussions in London over the peace negotiations, and also in the work of the Peace Conference in Paris. There was also a Conference of Prime Ministers and representatives of the United Kingdom and the dominions and India held in London in 1921 under Mr. Lloyd George. The Conference considered in detail the foreign policy of the Empire with special

reference to the League of Nations, which had not then been formed, and several meetings were devoted to discussing the naval, military, and air defence of the Empire. The I.C. of 1923 reached a common understanding on the main heads of foreign policy, subject (as always) in the case of resolutions by an I.C. to ratification by their respective governments. In that year an Imperial Economic Conference was held to consider in detail the economic relations between the various parts of the Empire and all aspects of Imperial trade, including Imperial preference (q.v.), overseas settlement (q.v.), co-operation in financial assistance to Imperial development, the Imperial Institute (q.v.), and the establishment of an Imperial Economic Committee (q.v.).

A large part of the work of the I.C. of Oct. 1926 consisted of the discussion of questions affecting Inter-Imperial Relations, which were referred to a committee of Prime Ministers and heads of delegations presided over by Lord Balfour (see INTER-IMPERIAL RELATIONS, REPORT). Arising out of this conference a conference on the operation of dominion legislation and merchant shipping was held in London in Oct. 1927 (see COLONIAL LAW). Once again the subject of inter-imperial relations figured prominently in the I.C. of 1930, and discussion was renewed on the Report of the conference on the Operation of Dominion Legislation which had its sequel in the Statute of Westminster, which received the royal assent on Dec. 11, 1931 (see WESTMINSTER STATUTE OF 1931, and also GOVERNMENT GENERAL). In the sphere of foreign affairs the main task before the 1930 conference was the discussion of the means by which the members of the British Commonwealth could best co-operate in promoting disarmament and world peace. On the economic side the conference discussed the methods appropriate to the development of inter-imperial trade, but no statement of policy was made on behalf of the government of the United Kingdom, chiefly because no policy would have satisfied the Dominions which did not involve a radical change in the fiscal policy of the United Kingdom. But by 1932 Britain had reverted to a protectionist system and, thus strengthened, it was able though not without some difficulty to conclude a series of trade agreements with the various dominion delegations who had assembled at the Imperial Economic Conference in Ottawa, 1932 (see OTTAWA CONFERENCE). Advantage was taken of the presence of the Dominion Prime Ministers in London for the coronation of George VI. to hold an I.C., which was opened on May 11, 1937. The Conference adopted a revised form of the Coronation Oath as marking the recognition of the principles underlying the British Commonwealth of Nations. The Conference dealt mainly with foreign affairs and defence—it being obvious that the international situation was rapidly deteriorating. On defence, the conference discussed the ways in which it would be possible for the various governments to co-operate in measures for their own security, including co-operation in the production

and supply of munitions and raw materials as well as of food and feeding stuffs. Detailed consideration on these and other matters was referred to technical committees. Certain constitutional questions were raised by the S. African Gov. (see SOUTH AFRICA, UNION OF, *History*), whose chief representative, Gen. Hertzog (q.v.) sought to carry the Statute of Westminster (q.v.) beyond its implications. It is not without interest to note that, on the outbreak of Second World War Gen. Hertzog soon ceased to be the national leader. A report on treaty procedure, issued through this I.C., recognised that each member of the Commonwealth taking part in a multilateral treaty is in the absence of provision to the contrary, not responsible for the obligations undertaken by any other member. There can be but little doubt that these I.C.s are too slow and far between. This inactivity, combined with remoteness, necessitates that centrifugal tendencies which is implicit in a widely scattered Empire and the existing method of consultation through high commissioners obviously lacks the effectiveness which can come only through publicity and constant use of public opinion. A meeting

of the prime ministers of the various countries of the Commonwealth was held in London in April 1944 to consider the constitutional issues arising from India's decision to adopt a republican form of constitution and her desire to continue her membership of the Commonwealth. An agreement enabling India to continue her membership of the Commonwealth was concluded on April 27. While independent republic India accepted the king as the symbol of the free association of the independent member nations and as such the Head of the Commonwealth. The basis of the membership of the other Commonwealth countries remained unchanged.

**Imperial Defence, College of** formed in London in 1926 to create a basis for co-ordination and co-ordination by training for and in organisation of Imperial Defence. The formation of an Imperial Defence Staff, assisted by a committee of Imperial Defence may be regarded as the basis of this general idea. The college is under the command of a representative officer of the Navy, Army and Air Force in rotation. It has an instructional staff of military graduates and at present takes about 90 students drawn from the Navy, Army, Air Force, Indian Army, and Dominion forces who are trained in Imperial Defence.

**Imperial Defence Committee**, see COMMISSION OF IMPERIAL DEFENCE.

**Imperial Economic Committee**, established in 1926. The functions of the committee were extended by the Imperial Conferences of 1926 and 1930 and again as the result of the Report of the Imperial Committee on Economic Consultation and Co-operation in 1933. Its present functions are to complete investigations into the possibility of improving the methods of preparing for market, and marketing within the United Kingdom the food products of the overseas parts of the Empire, with a view

to increasing the consumption of such products in the United Kingdom in preference to imports from foreign countries, and to promote the interests of both producers and consumers to undertake inquiries into the production for export and marketing in various parts of the world of the raw materials of the Empire to procure preliminary surveys of any branch of empire trade and marketing to report on any economic question which the governments of the Commonwealth may agree to refer to the Committee to undertake services transferred from the Empire Marketing Board (q.v.) viz. periodical market intelligence notes and world surveys of production and trade and to make proposals to governments in regard to other economic services which in their view should be conducted on a co-operative basis. It being understood that this does not give the Committee any power to initiate proposals regarding consultation in respect of economic policy. The Committee consists of twenty members nominated by their respective governments. It is financed by contributions from all the governments of the Commonwealth, and it reports to those governments.

**Imperial Institute.** The I.I. building was erected at St. Kensington as the national memorial of the jubilee of Queen Victoria, by whom it was opened in 1893. The principal object of the I.I. is 'to promote the utilisation of the commercial and industrial resources of the Empire by the chemical and technical investigation of raw materials by the supply of information relating to such materials and their production and by the maintenance of comprehensive exhibits illustrating the economic resources of all the countries of the Empire overseas'. In 1902 the Institute was placed under the Board of Trade by Act of Parliament, in 1907 the Colonial Office assumed the management with the Board of Trade and in 1916 was placed under statutory control by the Imperial Institute (Management) Act of 1916. In 1921 an Act was passed repealing the previous Acts, and transferring the Institute to the control of the First Secretary of the Dept. of Overseas Trade, and providing for its management under that minister by a Board of Governors, and for the amalgamation of the Imperial Mineral Products Bureau with the Institute. The Institute co-operates with the Agric., Mines and other technical departments in the Empire overseas, by undertaking investigations relating to the composition, uses, and commercial value of products which can be more efficiently conducted at home in consultation with merchants and manufacturers, with a view to the local utilisation of the products or their export. It has laboratories for the examination of rubber, cement, and ceramic materials. Samples of raw materials investigated can be inspected by interested inquirers. For the investigation and inquiry work of the Institute two departments have been formed, viz. Plant and Animal Products, and Mineral Resources. A feature of the I.I. is its fine public exhibition galleries. The collections in these galleries are supplied

chiefly through the governments of the countries concerned, and every part of the British Empire is represented. The general public

John H. Stone

THE IMPERIAL INSTITUTE SOUTH KENSINGTON LONDON

of the I.I. include the *Publication of the Imperial Institute*, issued quarterly, a series of handbooks dealing with the commercial resources of the tropics, and various reports.

**Imperial Institute of Entomology.** founded in 1913 to encourage and co-ordinate entomological work throughout the Empire in relation both to human and animal diseases and to agriculture. It was known as the Imperial Bureau of Entomology until 1930. The head office is at the Brit. Museum (Natural Hist.) (Cromwell Road London, S.W.). The Institute absorbed the Entomological Research Committee appointed in 1909 with the object of furthering the study of economic entomology particularly in the Brit. Tropical African Colonies and Protectorates. The Institute publishes a quarterly bulletin entitled *The Bulletin of Entomological Research* and a monthly review entitled *The Review of Applied Entomology* which summarises all current entomological literature bearing on injurious insects.

**Imperialism.** In a general sense it means merely a system of gov. under an

these ideas, and a series of protected nationalities arose. Eventually, the two principles, nationality and I., though strikingly analogous, are arrayed against each other. Britain conquers; 'but by the testimony of men of all races who have found refuge within her confines, she conquers less for herself than for humanity.' It is this, the modern I. which has insensibly but surely taken the place of the anct. or narrower patriotism of England.

The Brit. Empire has certainly shown great stability in tumultuous times. Five empires were involved in the First World War, and only the Brit. empire survived it. After that war the Brit. Empire adapted itself to the post-war age by a process of discussion and agreement and law-making, and by enlarging instead of destroying old freedoms. This is peculiarly exemplified in the development of dominion status (q.v.) through successive imperial conferences.

Left-Wing extremists, who dislike the Empire in the form in which some 'imperialists' represent it regard it as merely the instrument of 'economic imperialism' and all Brit. professions of 'trusteeship' for the backward races as hypocrisy. They used to aver for example that vested interests were the sole obstacle to the prompt concession of absolute independence to India. But extremism is never likely to be a formidable danger, and the risk, such as it is, lies rather in indifference or misunderstanding among men of goodwill as to the meaning of the empire and the value of maintaining it. For many such the cause that fills their hearts in this post-war era is the cause of international friendship and co-operation; and they feel that "imperialism," however transmuted is somehow out of tune with "internationalism."

The fact too that the Brit. flag flies over so great a part of the backward regions of the world is bound to excite the jealousy and cupidity of other nations. The reply to these questionings is that the Brit. Empire serves not only the interests of its own members, but also those of the world as a whole. As the world is at present constituted, no international order can achieve its purpose without sacrifice of national self-determination greater than the tried-out collective system ventured to demand. In the meantime, 'it would be a fatal blunder to dissolve the international unity of our lesser league within the League' (R. Coupland). The course of events in the Second World War confirms the case made for the Brit. Empire by both Professor Cramb and Professor Coupland and by many others. See J. A. Cramb, *The Origins and Destiny of Imperial Britain*, 1915; Sir C. P. Lucas, *The British Empire, 1500-1930*, 1899, 1931; S. Leacock, *Our British Empire*, 1940; Sir R. Coupland, *The Empire in these days*, 1935; R. Muir, *The British Empire: How it Grew and How it Works*, 1940.

Imperial Mycological Institute, founded in 1920 and formerly known as the Imperial Bureau of Mycology. It was

the outcome of a proposal adopted by the Imperial War Conference in 1918, that a central organisation should be estab. for the encouragement and co-ordination of work throughout the Empire on the diseases of plants caused by fungi. Since 1933 the Institute has been under the control of the executive council of the Imperial Agricultural Bureau. Its work on the diseases of plants caused by fungi is broadly on the same lines as that of the Imperial Institute of Entomology (q.v.) in regard to insects. Its primary function is to assist economic mycologists in the overseas Empire by the accumulation and distribution of information on all matters connected with plant diseases and by the identification of specimens.

**Imperial Preference** is the title given to that policy by which the sev. members within the Brit. Commonwealth of nations would impose tariffs to the disadvantage of those countries without the Commonwealth and to their own mutual advantage. The Corn Laws (q.v.) had produced an ardent body of free traders led by Richard Cobden and John Bright, and their efforts led to the repeal of the Corn Laws in 1848. From that time until 1932 Britain was a free-trade country—apart from the levying of the McKenna duties (q.v.) and the tariffs imposed on certain 'key' industries. With the spread of imperialism in the eighties of last century came the spread of this idea of I. P., and in the early years of the twentieth century Joseph Chamberlain led a great but unsuccessful movement for the conversion of his countrymen to the policy of protection, with preference to the various members of the Brit. Empire. This policy was also advocated by Bonar Law both before and during his premiership. The movement was carried on by Lord Beaverbrook (q.v.), who founded and fostered in 1930 an Empire Crusaders Party with the avowed object of making Empire Preference a reality.

Under the Import Duties Act, 1932, a ten per cent *ad valorem* duty was imposed on a wide range of imports, but free entry was given to all Dominion imports, and this freedom of entry was continued under the reciprocal trade agreements made after the Ottawa Conference (q.v.), of July, 1932. These agreements, which have been considerably modified provide for a tariff on a number of foreign primary products for the benefit of similar Dominion products, and reciprocal tariffs against foreign manufacturers for the benefit of the U.K. manufactured goods in the mkt.s. of the dominions. Preferences are also granted to Brit. colonial goods, and also by many colonies to U.K. goods.

**Imperial Service Order**, name of a decoration confined to members of the Brit. Civil Service and consisting of the Sovereign, the Prince of Wales, and Companies to a number not exceeding 700, of whom 250 may belong to the Home Service, 200 to the Indian—100 European and 100 Indian—and 250 to the services of the Dominions, Colonies and Protectorates. Long and meritorious service in either a clerical or administrative capacity is the qualification for the order. King

Edward VII founded the order in 1902, when the number was limited to 425. It was enlarged in 1912.

**Imperial Tobacco Company (of Great Britain and Ireland), Limited**, was formed in 1901, when some of the leading Brit. tobacco manufacturers joined forces to resist an attempt by a powerful association of Amer. manufacturers to capture the Brit. tobacco mkt. The original firms joining the I. T. Co. retained their identity and became branches of the Company. The following is a list of the company's branches today: W. D. & H. O. Wills; John Player & Sons; Ogden; W. A. & A. C. Churchman; Stephen Mitchell & Son; W. & F. Faulkner; Lambert & Butler; Edwards, Ringer & Biggs; Franklyn, Davey & Co.; W. T. Davies & Sons; and Wm. Clarke & Son.

The Company manufactures cigarettes, pipe tobacco, cigars and snuffs for sale in the United Kingdom and Elre. The export business was sold to the British-American Tobacco Company, Limited, in 1913.

It has tobacco leaf buying organisations in the U.S.A., Canada, Nyasaland, S. Rhodesia, Latakia (Syria), and Brit. North Borneo. In addition to the purely tobacco side of the business, the I. T. Co. owns and controls a number of subsidiary Companies engaged in the manu. of materials necessary to the tobacco trade — e.g. cigarette paper, cardboard for making cartons, printing and packing materials, etc. The headquarters of the company and its central administrative offices are at Bristol. It has factories in Bristol, Nottingham, Liverpool, London, Ipswich, Chester, Swindon, Glasgow, and Dublin. The company's authorised capital is £55,000,000, of which £50,120,985 is issued.

**Imperial War Museum**, opened at the Crystal Palace in 1920, removed to the Imperial Institute, S. Kensington in 1921, and to Lambeth Road, London, S.E. in 1936. It contains a large collection of naval and military trophies and relics, ordnance, small arms and ammunition, ships and other models, photographs, prints, books, pamphlets, and works of art.

**Impey, Sir Elijah (1732–1809)**, Chief-Justice of Bengal, India. In 1773 he was made the first chief-justice of the newly-established supreme court of Bengal in Calcutta, and was in close relations with Warren Hastings, the governor-general. In 1775 a native, Nuncomar or Nanda Kumar, who had succeeded Hastings as collector of Burdwan, brought a charge of peculation against the governor-general, supported by Francis's and Hastings' opponents on the Council. Nuncomar was arrested on a charge of forgery, tried by I., condemned, and hanged. In 1777 I. decided in favour of Hastings over the ratification of the governor's resignation. He was recalled in 1783 and impeached for his sentence on Nuncomar, but was acquitted. Macaulay's charges of a conspiracy with Hastings to contrive a judicial murder have been entirely disproved by Sir J. F. Stephen in *The Story of Nuncomar*, 1885.

**Imphal**, cap. of the native Assam State of Manipur (q.v.). It is really a collection of vills., whose combined pop. is 99,800. It was the theatre of the most critical battles in the Burmese campaigns. See BURMA, SECOND WORLD WAR, CAMPAIGNS IN.

**Implement**, in Scots law, the equivalent of performance of a contract or obligation in Eng. law.

**Implements and Machinery, Agricultural**, see AGRICULTURAL MACHINERY AND IMPLEMENTS; PLOUGHS AND PLOWING; TRACTORS.

**Imports and Exports**. Theoretically, the exports of a country exchange for imports at such values that the former will pay for the latter, and it is probably true that exports and imports constantly tend to an equality. But it was long uncertain whether it was more advantageous to have a surplus aggregate value of imports over exports, or vice versa. According to John Stuart Mill this uncertainty arose primarily from the traditional habit of looking rather to the profits of merchants than the price of commodities to the consumer — a habit which, in its turn, rested on the long-discarded belief that money alone was wealth. At the time of Mill it had become generally settled that the profit of foreign trade consisted in the difference between the price at which the goods were bought and carried, and the price at which they were sold. The difference between the gross money-value of the exports and imports of a country will give a rough idea of the amount of this profit. In England in 1863, 1864, and 1865, for example, the ratio of imports to exports was about 5 to 1. This fact would have excited alarm before Adam Smith's time. The assumption would have been that England was buying more than it sold. But, according to Mill, and to Professor Ashley, and others of the 'Free Trade' school of thought ('free imports' would more accurately express the doctrine), the only direct advantage accruing to a country from foreign trade consists in the imports; because, after paying with exports for the things it cannot itself produce, except at a greater expense of capital and labour than the cost of the exports, there is *ex hypothesi* a surplus of labour and capital for the production of other things. Mill expresses this categorically by pointing out that the opposite theories assume that what a country puts forth, and not what it obtains, constitutes its gain; and adversely criticises Adam Smith's doctrine that the benefit of foreign trade was that it afforded an outlet for surplus produce and enabled a portion of the capital of the exporting country to replace itself with a profit. His criticism may be summarised in his deduction: that a country produces an exportable article in excess of its own wants from no inherent necessity, but as the cheapest mode of supplying itself with other things. The inference drawn from this theory is that the only alternative to exporting in excess of wants would be the employment of the capital and labour thus set free in producing things previously imported, with a corresponding loss to consumers by reason of

## Imports

420

## Imports

higher prices. And this strife between the capitalist, or producer, and the consumer is to be observed in all the fiscal arguments of recent times. Of course, the process of interchange of commodities is not necessarily as simple as the statement of its fundamental principle. There is the element of the cost of carriage, and it by no means follows that any particular imports can be allocated as the price of any particular exports, since any one given country trades with so many other countries. Moreover, exchange values are continually fluctuating within the limits of the ratios of the costs of production in each country although they tend

papers and not according to average prices. These invoices have to be produced by the importers and exporters. The prin. commodities (excluding munitions) exported from the U.S.A. to Great Britain to-day are grain and flour, raw cotton and cotton waste, fish (especially salmon and lobsters), tobacco, bacon, ham, lard, iron and steel, hides and skins, refined sugar, fresh fruit and vegetables, raisins, and leather manufactures.

Below is the import and export table of U.S.A. for the years 1925, 1929, 1937-1947, while the prin. articles exported by the Brit. Isles to the U.S.A. consisted of iron and steel, cotton, linen and woollen

Year	TOTAL TRADE (MERCHANDISE)		NET TRADE (MERCHANDISE)

<sup>1</sup> Includes value of imported munitions.

<sup>2</sup> Excludes munitions—£658,446,000 (1943) and £1,062,164,000 in 1944.

<sup>3</sup> Uncorrected figures.

to an ultimate equality in accordance with Mill's law of the equation of international demand.

The most important items of Brit. imports are foodstuffs and raw materials, while about six-sevenths of the total exports are articles wholly or mainly manufactured. After the 1914-18 war, and as a consequence of it, there were extra imports in various countries due to payment of indemnities, and Germany, the prin. loser, was forced to export and thus the Allies to import; while repayment of inter-allied debts was a contributory factor to further theoretical importing and exporting. The value of goods imported is usually that at the port and time of entry, including cost, insurance, and freight (known familiarly as C.I.F.). Foods despatched for sale have their mkt.-value recorded in the returns at the time of leaving this country, the value being based upon a declaration of the exporter. This is checked in the customs dept. Export goods are valued at the port of shipment, while imported goods are valued at the country from which they were consigned, which is not always the place of shipment.

For the years 1913, 1938-40, and 1943-47 the values of imports and exports of merchandise relating to the United Kingdom were as shown above.

In the U.S.A. the values of imports and exports are fixed by invoices or shipping

place goods. The figures represent thousands of dollars :-

Year	General Imports	Total Exports & Re-exports

1947	68,140	30,649

The chief imports (excluding munitions) into the United Kingdom from Canada are dairy produce, particularly cheese and bacon, wheat, timber and wood pulp, motor-cars, and parts, and canned salmon; while Canada imports from Great Britain chiefly cotton manufs., iron and steel goods, clothing, spirits, coal, artificial silk yarn, linen and woollen goods.

The imports and exports excluding gold and excluding foreign produce of merchandise of Canada for the years 1935 to 1947 are the figures representing thousands of dollars:

	Imports	Exports
1935	559,010	721,977
1936	635,191	937,825
1937	808,896	997,367

Loveday, *Britain and World Trade*, 1931; J. Richardson, *British Economic Foreign Policy* 1936. See also CUSTOMS DUTIES; ECONOMICS; EXCISE; FREE TRADE; PROTECTION.

**Impotence**, which may be caused by malformation, by general weakness due to overwork, sexual excesses, old age, anxiety, certain diseases such as diabetes, or by an affection of the spinal cord, is a condition of the male generative organs which either temporarily or permanently prevents sexual intercourse. Quick remedies, if not useless, are irritant and harmful, but as a rule an active open-air life and liberal feeding, sexual rest, tonics, and cold baths will effect a cure. Psychiatric treatment will cure anxiety cases. See MARRIAGE.

**Impound:** (1) To place in a pound goods or cattle distrained for rent due or for damage done respectively. The things impounded are detained until *repleaded* or redeemed. A person at whose instance cattle are impounded is liable if the cattle be not properly tended while in the pound. (As to pound breach see *under* BREACH.)

(2) Where a judge during a civil trial is of opinion that the evidence discloses the

commission of a criminal offence and orders the documents in the case to be retained and sent to the director of public prosecutions, he is said to *impound* the documents.

**Impressionism**, in art, the somewhat vague and indiscriminate name given to a certain type of modern painting which is most strongly represented by the Fr. schools of Edouard Manet on the one hand and Claude Monet on the other. The former is purely realistic in its ideals; the latter, for which the name 'luminism,' or, as Camille Maclair suggests, 'chromatism,' would be more correct, aims at the study of atmospheric effects, the play of light, and similar chromatic values. The term *Impressionism* arose through the exhibition of Monet's 'Impressions,' a sunset which aroused particular ridicule at the Salon des Refuses (1863), and four years later a phrase in the catalogue of the exhibition of Manet's work established it still more firmly. Some, however, think that the term *impressionism* was first used in 1874 when the first 'impressionist' exhibition was held, in Paris, by which time the various tendencies in the works of the protagonists of *Impressionism* were, at the moment, fused into a doctrine common to most of the group. That doctrine may be said to have received its impulse from Courbet, who revealed a new breadth of handling and an interest in contemporary subjects. His exhibition in 1855 stirred up something little short of panic in the ranks of official Fr. art, since it forced them to realise that all the problems of art were not confined to the familiar struggle of Ingres *versus* Delacroix, or drawing *versus* colour, but that a third and more alarming doctrine had arisen: that of Realism. To younger artists like Pissarro, however, Courbet's return to nature and his rejection of conventional subjects opened up exciting new possibilities; and other painters who were deeply influenced by Courbet at this time were Manet, Fauché-Latour and Whistler, though the two latter were afterwards to deny their early master. It was, however, Whistler who introduced the word into Eng. art-vocabulary by his exhibition at the Grosvenor Galleries (1878). Since those days, in the teeth of opposition which is unparalleled in the list of art—except perhaps in the somewhat analogous case of Wagner's music-dramas—the movement has spread over the whole of Europe. The Fr. element is discussed below in some detail; it will be sufficient to mention the chief foreign representatives: (Ger.) Max Liebermann and Kuehl; (Belgian) Van Rysselberghe, Verheyden, and Heymans; (Swiss) Félix Vallotton; (Dutch) Matthys Maris; (It.) Pietro Frascacoma, Boldini, Segantini, and Michetti; (Sp.) Zuloaga, Francisco Pradilla y Batllá, and Rusiñol; (Dan.) Viggo Johansen and Kroyer; (Swedish) Anders Zorn; (Norwegian) Fritz Thaulow; (Russian) Ilya Repin. In Britain, apart from Turner and Constable, the movement is chiefly represented by the Glasgow school, John Lewis Brown, Guthrie, and Lavery; whilst Whistler, Sargent, Harrison, and Mary Cassatt are its representatives in America.

The sources from which I. was evolved are of the widest. It was in spirit akin to the Romantic Movement, as a revolt against the classical or academic schools, but technically it was no less a revolt against Romanticism also. In technique Watteau, Monticelli, and Delacroix are the chief forerunners of I. as far as the div. of tones is concerned, Lorrain, Veret, Ruysdael, and Poussin are its progenitors in the matter of landscape treatment and composition. The movement was also very strongly influenced by the exhibition of Jap. paintings, of Hokusai, Outamaro,

the Luxembourg), Renoir, Desbouts, Bazille, Legros, and Whistler (at that time a student). They also found sympathetic support in Gautier, Maupassant, the Goncourts, Zola, Mallarmé, and other men of letters, at different periods. It is therefore justifiable to regard Manet as the first great painter to lead the revolt of modern art against the symbolists and Romantics. In the realist impressionists as the chief of whom we may name Manet, Combet, Bastien-Lepage, and Degas, we find the artistic criterion of truth or character—*veride verum*—substituted for that of beauty

MONET'S "LA GARE ST LAZAR".

Druck

and Hiroshige at the International Exposition in 1867, both as regards its realism (e.g. Manet) and 'luminism' (e.g. Monet). But it might be claimed with no small degree of truth that I. was chiefly of Eng. origin, although it has made its headquarters in France. According to Wm. Ford Dewhurst, 90 per cent. of the theory of I. was clearly embodied in Ruskin's *Elements of Drawing*. And it was from Turner and Constable that Monet, Pissarro, and the others took their chief inspiration, especially in the matter of landscape treatment—the ideal style of subject for impressionist treatment, and the one in which the greatest results have been achieved.

In the first place I. centred on Manet, who was virtually the president of a little club that used to meet at the Café Guerbois, in the Quartier Batignolles, the circle included Monet, Pissarro, Cézanne, Degas, Jongkind, Berthé Morisot, Fantin Latour (whose life-sized painting of a group of the prin. members now hangs in

But this was only one of the ideals of the new art: there were two others, respectively the study of the mystery and beauty of light and the study of impression, i.e. the catching and reproduction of a momentary, vivid glimpse of a scene, as opposed to the systematic reproduction of the details which are unseen in such glimpses. The impressionists were the first to learn the art of presenting a *total ensemble* wherein details were either deleted or subordinated to the summarised effect of the whole. A blurred vision of things which encircle a central object on which the gaze is focused is correct optically. To a realist painter it is also correct artistically. And not only the focal principle, but brilliant sunlight, mist, or perspective are capable of blurring the definition of objects. Of the luminists, i.e. those whose main concern was the study of the mystery and beauty of light, as mentioned above, Monet was the leader; they may be considered as the direct descen-

dants of Delacroix. Of the other school, Renoir and Degas may be taken as most typical. With Monet and his group, the whole technique of I. is thoroughly investigated for the first time; they ostracised the conventional tonality of brown, and the use of all browns, blacks, and ochres; by the majority all palette mixtures were abandoned and only the pure colours of the spectrum, in addition to white, were accepted.

Side by side with the juxtaposition of touches of pure colour are the principles of: (1) The simplification of light and shade in the presentation of mass rather than outline; (2) the investigation of shadow, which is not absence of light, but light of diminished intensity; and (3) the separation of local colour and reaction. By the employment of these means the impressionists succeed in a marvellous degree in the portrayal of motion—the sway of shadow, the passage of light, the heaving movement of water, the sensation of wind. However much of this may be credited to such painters as Cécile and Fromentin, the combined value of light and of movement in relation to one another reaches its supreme expression on the canvases of A. J. Renoir, Degas, Cézanne, Pissarro, and Sisley. With it we must also associate the visionaries, or spiritualists—Gustave Moreau for his symbolism, Puvis de Chavannes for his fine decorative treatment, and Carrière for psychic insight. The last named, like Whistler, Harrison, and Pointillin, belongs to a distinct school, whose technique differed from that of Monet in so far as, instead of employing the principle of juxtaposition of pure colour, they applied flat tints in a broad style, using not only the pure, radiant prismatic colours, but also palette mixtures. It remains only to refer to the method known as 'Pointillism,' whereby the colour is transferred to the canvas in spots instead of in mass, as in the case of the chromaticists already discussed. The inception of this method, which is associated rather with the Neo I. of which Gauguin, Denis, and Van Rysselberghe are the leaders, is attributed to M. Henry, who conceived the æsthetic expression of the newly discovered scientific theories on colour-waves and spectral analysis in the works of Helmholtz and Chevreul about 1880. The idea concerned itself especially with complementary colours and the reaction of tones. Its chief practical application is ascribed to Georges Seurat. Van Gogh also used this technique, and Van Rysselberghe employs it constantly. But the method is obviously alien to the spirit of art: it is charnelous, devoid of character, too purely theoretical and removed from inspiration.

The first success of I. was the exhibition of Manet in 1884, consisting of some forty pictures—less than ten years after the first public sale, when such frantic hostility was shown that it was necessary to organise police precautions! In 1897 the collection of Callebotte, a wealthy amateur who had befriended I. from the outset and had even gained some small notoriety for his own work, was accepted

with reluctance and after considerable hesitation by the Ministry of Fine Arts and exhibited in the Luxembourg. The same year at the Vever sale, and two years later at the Choquet sale, the once despised canvases changed hands for enormous sums. Manet's portrait of Monet in his studio, for instance, which realised about 150 francs in 1884, went for 10,000 francs, while at the Pellerin, Paris, in 1910, even greater prices were offered. See C. Maclair, *French Impressionists*, 1904; W. Dewhurst, *Impressionist Painting*, 1904, with bibliography; C. Marriot, *Modern Movements in Painting*, 1920; F. Rutter, *Evolution in Modern Art*, 1926; W. Uhde, *The Impressionists*, 1937; J. Rewald, *The History of Impressionism*, 1917.

*Impressionism in Music.*—Term applied more or less loosely, to composers (especially Fr.) contemporary with the school of impressionist painters. Debussy, although he disapproved, was designated as the leader of musical I. One of the chief aims of I. is to interpret artistically a momentary glimpse of things rather than their permanent state.

*Impressment*, act of forcibly taking persons or goods for the public service; but generally restricted to the work of press-gangs in compelling persons to serve as soldiers or sailors in time of war. I. of sailors differed from that of soldiers. It was regarded as a prerogative right of the crown, given by the common law and recognised by statute. This is explained by constitutional historians by the fact that the feudal tenure of land made provision for land but not for sea service. I. of soldiers was declared illegal by the Long Parliament of 1641, but was occasionally resorted to subsequently, e.g. during the Amer. War of Independence, under special parl. authority. I. of soldiers is to be distinguished from conscription, which, although also a statement, applies to all able-bodied persons alike. It may be observed here that during the Boer war of 1900 the I. of goods was commonly known by the term 'commandeering.'

*Imprisonment*, see under PRISONS.

*Impropriation*, the grant of a benefice or parsonage to a layman or lay corporation as opposed to 'appropriation,' or the 'annexing of a benefice to the proper and perpetual use of some religious body politic.' The terms have, however, been used synonymously both in text books and in statutes. Both terms imply the endowment of vicarages consequent on the rise of par. churches by the consent of the bishop, who alone had the care of souls in his diocese, together with the title to all eccles. revenues. But as the practices of appropriation and I. originally prevailed, there was an essential difference; for a layman, not having care of souls, applied the temporalities of the benefice to his own use. Before the Reformation appropriation and I. prevailed extensively, the monasteries furnishing the most numerous examples of the religious corporations that obtained grants of benefices. After the suppression of monasteries the crown was vested with all such rights as related

to the grant of benefices; but the crown freely transferred its rights to laymen. In practice the spiritual duties of rectories, the tithes or whole property of which have descended to laymen, are always discharged by a vicar (Lat. *vicarius*, delegated), who receives a certain portion of the emoluments of the living (see *GLEBE LAND*). See Phillimore's *Ecclesiastical Law*; Blackstone's *Comments*.

**Improvisatori**, or **Improvisation**, the art of composing verses, whether accompanied by music or not, on the spot without preparation, and on subjects suddenly proposed. It is distinctly It. in origin, though the Provencal troubadours, in spite of the elaborate versification of their poems, are credited with the power. Silvio Antonio (1510-1603) was said to have been made a cardinal because of his skill in composing verses on any subject; Peretti (1681-1717), to the accompaniment of a guitar, astonished the whole of Italy by his skill. He was crowned with laurel by Pope Benedict XIII. Corilla Olimpica, Madame de Staël's Corinna, was also crowned. Outside Italy, the Swedish poet, K. M. Bellman (1740-95), the Fr. Joseph Méry (1798-1865), and the Eng. humorist, Theodore Hook (1788-1811) may be mentioned. The art is practised to-day chiefly in music-hall and cabaret entertainments. Many of the great musicians and instrumentalists have exhibited their power of improvisation. See A. Vitagliano, *Storia della poesia estemporanea nelle lettere italiane*, 1905; E. Ferand, *Die Improvisation in der Musik*, 1938.

**Imputation**, attribution to another of some quality or character, especially of a charge of guilt. The term is used technically in theology of the attribution to all faithful believers in Christ of His righteousness, by vicarious substitution of man's sin to Him, and of Adam's sin and its consequences to all mankind as Adam's descendants. The term thus plays a part in the doctrines of original sin, of predestination, and especially of the orthodox view of the Atonement (*q.v.*).

**Imros**, see **IMBROS**.

**Ina**, or **Ine**, king of the W. Saxons, or Wessex, succeeded Ceadwalla in 688. He forced compensation for the death of Ceadwalla's brother from Kent in 691, conquered Geraint of W. Wales in 710, fought in Wiltshire against the Mercians, and in 725 crushed a revolt of the S. Saxons. He drew up a still extant code of laws for Wessex, and having abdicated in 726, and retired to Rome where he died, the date not being known. He is said to have built Glastonbury.

**Inaccessible Islands**, see **TRI-TAN DA CUNHA**.

**Inagua**, Great and Little, two is. in the archipelago of the Bahamas in the Brit. W. Indies, situated at the southern end of the group. Great Inagua has an area of 530 sq. m. and contains salt ponds. Pop. under 2000.

**Inari, Lake**, see **ENARÉ**.

**In Articulo Mortis** (literally, at the point of death). In the Rom. Catholic Church only priests who have received jurisdiction

from the pope, from bishops for their diocese, or higher superiors of religious orders for their subjects may or can absolve penitents from their sins. But a simple priest, even if degraded or apostate, can absolve any penitent in *articulo vel periculo mortis* in all cases, including those of grievous sins which are ordinarily reserved for absolution by some eccles. superior, like the ordinary of a diocese. As to the admissibility in evidence of the declaration of a deceased person relative to the cause of his death, see **under DECLARATIONS OF DECEASED PERSONS**.

**Inca**, in. in the Balearic Islands in the Mediterranean, 17 m. E.N.E. of Palma, Majorca, belonging to Spain. Oil, wine, and almonds are its chief products, and it gives its name to one of the five judicial dists. into which the is. are divided for the purpose of administration. Pop. 9400.

**Incandescence**, the term applied to the state of bodies when they give out light through being highly heated and yet are not undergoing chemical change. It is usually associated with solids, although the oxy-hydrogen flame is an example of its appearance in gases. See **GAS** and **ELECTRIC LAMPS**.

**Incandescent Light** is produced when a 'mantle', consisting of a conical hollow gauze of certain metallic oxides, is placed in a hot but non-luminous flame produced by a burner of the Hussen type. Welsbach was the first to substitute certain metallic oxides for carbon as the incandescent body. The 'mantle' is made by impregnating a cotton or ramie 'stocking' with a solution of various salts, the usual mixture being 99 parts thorium nitrate and 1 part cerium nitrate. On ignition a skeleton of the oxides of the metals remains, giving out a brilliant light by virtue of its incandescence.

**Incandescent Lighting**, see **under ELECTRIC LAMPS** and **ELECTRIC LIGHTING**.

**Incantation** (Lat. *incantatio*, from *incantare*, to enchant; from *in* + *cantare*, to sing repeatedly), the use of a set form of words, spoken or sung, to produce a magical and preternatural effect. The use of the word *incantare* in Lat. is very early, for it appears in a passage quoted by Pliny from the Twelve Tables, and from it is derived, through the Fr., our word 'enchant.' It is almost certain that the use of magic spells must be traced to an Akkadian source, for many ant. examples of Babylonian and Assyrian formulae have been discovered. An interesting sidelight on the important position which the Magi or magicians, generally Chaldeans, held at an E. court, is given in the Book of Daniel. Ultimately we are told that Daniel himself became their head. An almost unbounded power was attributed in ant. times to the power of magic rites, to which the gods and the powers of nature were believed to be subject. Many of these could be used by any individual, but others were the property of the priest or magician, whose influence was due to his supposed power for good or evil. In Christian times, the use of is. has by no means ceased, even in the

countries commonly named Christian. It can easily be traced through the centuries. In the Middle Ages the sacred ceremonies and rites of the Church were often conceived of by the ignorant as charms. An allusion to the use of the first fourteen verses of St. John's Gospel as a kind of incantation is given in Chaucer's *Prologue* in the lines on the Friar beginning 'So pleasant was his In *Principio*.' Many of the old nursery rhymes now dying out were formerly used as incantations against rain and the powers of nature. See F. Lenormant, *Chaldean Magic* (trans., 1878); L. F. Maury, *La Magie et l'Astrologie* (1th ed.), 1877; Sir J. G. Frazer, *The Golden Bough*, 1900.

**Incarnation** (from Lat. *incarnari*, to be made flesh; from *in* + *caro*, flesh), in Christian theology, the act by which the Second Person of the Blessed Trinity assumed human form and human nature. In many other religions, and especially in those of India, there are accounts of the taking of human flesh by the gods in order to secure a fuller revelation to the world; but these differ essentially from the orthodox Christian belief in the I. of Jesus Christ, which lays stress on the fact that the Logos, eternal Divine, then became also essentially human, so that Christ was 'perfect God and perfect Man; one not by conversion of the Godhead into flesh, but by taking of the manhood into God.' See R. W. L. B. *Doctrine of the Incarnation*, 1882; J. Orr, *Christian View of God and the World*, 1893; J. Gore, *Bampton Lectures*, 1891; J. Eck, *Incarnation*, 1902; C. Lattey, *The Incarnation*, 1926; A. E. Rawlinson, *Essays on the Trinity and the Incarnation*, 1928.

**Incas of Peru**, see **PERU**.

**Ince-in-Makerfield** (n. and urb. dist., Lancashire, England, in parli. div. of Ince). It stands on the Leeds and Liverpool Canal, 1 m. S.E. of Wigan. It has collieries, iron and wagon works, cotton mills, etc. Pop. 19,700.

**Incensiarism**, see **ATON**.

**Incense** (Lat. *incensum*, from *incendere*, to burn), perfume arising from the fumigation of resins, gums, balsams, etc., used in public worship from a very early date, and prevailing in many auct. religions; but its use was not generally adopted in the Christian church till the sixth century. In the time of Gregory the Great. There is no regular formula for the preparation, but the ingredients, after having been well mingled, are placed in the censer or thurible and sprinkled over the hot charcoal contained therein, when they at once become volatilised, and diffuse their odour through the building. In the Catholic Church, I. is chiefly used in the eucharistic sacrifice and Benediction (*q.v.*). I. has symbolic significance of zeal, virtue, and the ascent of prayer to God. In the last half-century its use was abolished in the Reformed churches, but has been restored to a certain extent in the Anglican communion.

**Incest**, sexual intercourse between persons prohibited from marrying by reason of kinship or affinity. Formerly I. was not a crime by Eng. law, except in so far

as the spiritual courts took cognisance of the offence. But by the Incest Act, 1908, intercourse by a male with his granddaughter, daughter, sister, or mother, is a misdemeanour punishable with penal servitude. Consent of the female is no defence, and a consenting female is liable to the same punishment. 'Brother' and 'sister' as used in the Act include half brother and half-sister. No prosecution may take place without the sanction of the Attorney-General. The Act does not extend to Scotland, because I. was already a crime in Scots law. Although marriage with a deceased wife's sister is now lawful (see **DECEASED WIFE'S SISTER**), intercourse with a wife's sister will enable a wife to obtain a divorce on the ground of incestuous adultery. In primitive tribes the prohibition of consanguineous marriages is a slow development. Sir James Frazer, in dealing with totemism in relation to exogamy, is too prone to dogmatise on the origin of the aversion to incestuous unions. Whether that aversion sprang from religious or merely ethical sentiments, or from a perception of disastrous effects on racial development, is a question the answer to which depends mainly on conjecture. See L. H. Morgan, *Ancient Society*, 1877; Sir J. G. Frazer, *Totemism*, 1887; and H. Spencer on 'Punaluan Groups,' in the *Principles of Sociology*, 1910.

**Inch**, from the Gaelic word *innis*, meaning a small is., or a land by a riv., found in the geographical names of Scotland and Ireland. It is also used locally of a meadow by a riv., as the 'Inches of Perth,' and sometimes in the sense of rising ground in the midst of a plain.

**Inchbald, Elizabeth** (née Simpson) (1753-1821), Eng. actress, married at the age of nineteen Joseph Inchbald, an actor. She was now able to fulfil her desire and go on the stage. She made her debut in the province as Cordelia to her husband's Lear. Until his death in 1779, they toured the country; but then she secured an engagement in London, where she remained until her retirement in 1789. She never achieved any great fame as an actress. Mrs. Inchbald began writing plays at an early age, but the first piece that was produced was *The Mogul Tale*, at the Haymarket in 1784. In all, she wrote or adapted some twenty plays, but none met with any great success. Better known than these is her romance *A Simple Tale* (1791), which attracted much attention, and is her best work. In 1806 she began to edit *The British Theatre*, in twenty-five vols. and this is a collection of considerable value to students of the drama. There is a biography of I. by James Boudon (1833).

**Inchcape Rock**, see **BELL ROCK**.

**Inchcolm**, or **Island of Columba**, in the frith of Forth, forming part of the par. of Aberdour, Fife-shire, Scotland. It contains a fine Augustinian monastery founded in 1123 by Alexander I.; the church, chapter house, refectory, cloisters, and a square tower being still preserved. There is also an auct. stoneroofed oratory, supposed to have been a hermit's cell. From

the 15th the earls of Murray take their title of Lord St Colme (1611)

**Inchgarvie**, rocky islet in the firth of Forth off the coast of Fife-shire, Scotland. It possessed at one time a fine old castle that was used as a state prison, but the ruins were cleared in order to build one of the piers of the Forth Bridge. It is included in the royal burgh of Inverkeithing.

**Inchkeith**, is in the firth of Forth, forming part of the par of Kinghorn, in Fife-shire, Scotland. It is a barren rock and has now become gov. property and a fine lighthouse has been built which can be seen for a distance of 21 m. Henry VIII fortified it after the battle of Pinkie, but in 1519 it was recaptured by the Scottish and Fr. troops. In 1841 forts were built on the different headlands and linked up by military roads.

**Inchmahome** (the Isle of Rest) is in the Lake of Menteith, in Perthshire, Scotland. It contains the ruins of an early Eng. Augustinian priory, built in 1238 by Walter Comyn, and possesses a fine W. doorway. Queen Mar. is said to have spent some months on the is. when a child before going to France (1418).

**Incidence**, Angle of, term used for the angle made by the direction of a disturbance impinging on the surface of a medium with the normal to the surface.

ABH is the angle of incidence of reflection. CBH is the angle of reflection.

**Inclination of one line to another**, which meets it, but is not in the same straight line, is Euclid's definition of an angle.

**Inclination**, see DIP.

**Inclined Plane**, rigid plane inclined at an angle to the horizon. It is a mechanical instrument used to facilitate the lifting of heavy bodies. In the case of an inclined plane a power of 1 lb. will support a weight of 6 lb. thus giving a mechanical advantage of 6.

**Inclosures**, see COMMONS AND ENCLOSURES.

In *Cena Domini*, papal bull the commencing words of which were *In Cena Domini*, formerly issued every year in Holy Week. Its object was to publish the papal censures of all heresies, schisms, and infractions of papal privileges, and various temporal crimes. It was first pub. in 1361 and was only discontinued in 1770, when the Pope yielded to the opposition of the European kings who objected to the bull as a limitation of their sovereign authority.

**Income Tax**, tax on income from whatsoever source derived graduated according to the amount of income and with a differentiation in certain cases between earned and unearned income. The I. T. as a general tax on property and employments was first imposed by Pitt in 1799 as a war tax. It was a temporary imposition on income from land, personal property, trades, professions, offices, pensions, stipends, and employments, and also upon incomes arising out of Great Britain and was graduated on all incomes ranging from £60 to £200 a year, with a tax of 10 per cent on incomes above £200. When the war with France broke out again in 1803, Addington imposed the tax at the rate of 5 per cent on incomes of £150 a year and over. But the Income Tax Act of 1803 did not require a general return of income from all sources as had the Act of 1799 but only particular returns of income from particular sources. In 1806 Pitt, having returned to power, continued the tax, and added one fourth to all the rates. The coalition ministry after the death of Pitt augmented the rate to 10 per cent and from that year the tax was continued and increased from time to time until its abrogation in 1815. Even in these earlier Acts there was some principle of differentiation e.g. in the Act of 1806 the exemption of incomes not over £10 was only allowed where the income was derived from labour viz. from professions, trades, and offices. The principle of exemption by way of allowance for children was adopted in the earliest Act, but discontinued in 1806. In the first year of its imposition the I. T. produced over £1,000,000, and in 1815 £11,320,000. Regarded at first and even now in theory as essentially a war tax, it was not revived again until 1841 for merely fiscal purposes. In 1842 imposed it at the rate of 7d. in the pound or about 3 per cent, adopting in his Act the groundwork of the Act of 1801. But the limit of exemption rose to £10 and was made more restrictive of the mode of derivation. Farmers were taxed on a lower estimate of their profits and gas, water, and railway companies were brought in. Although in 1842 it was imposed for three years only, it has been continued ever since and has now definitely lost all semblance of a temporary war tax. Gladstone in 1853 extended its operation to Ireland and so made it universal in the kingdom. The principal change has been the demerit of one of granting relief in respect of 'earned income' up to £2000, and imposing a super tax on incomes over £1000.

The provisions relating to the rate, collection and assessment of the I. T. immediately prior to the changes introduced by the Finance Act of 1909 will be conducive to a clearer appreciation of those changes, and may be summarised. For the most part the provisions as to administration and incidence have undergone no alteration. It was divided into five schedules according to the different sources of income. Schedule A formed the charge on the owners of land and houses. B) on the benefit arising out of the

use of occupation of land, which benefit was measured by a proportion of the rent or ann. value; C related to income from any public revenue, imperial, colonial, or foreign; D, income from professions, trades, and other occupations, together with all such incomes as were not included in any of the other schedules; and E was a charge on persons employed by the state or engaged in any other office of profit in a public corporation or company. Incomes not exceeding £160 were totally exempt; real property exempt included public parks and recreation grounds, prisons, public offices, or other crown property, and canals, mines, quarries, etc., from which no income or benefit is derived beyond the general profits of the concern to which they belong. Other exemptions were incomes from property held on trust for charitable purposes in so far as applied to such purposes, the stock dividends or other income of friendly societies (*q.v.*), and of industrial and provident societies (*see under FRIENDLY SOCIETIES*). Incomes of individuals not exceeding £100 were allowed an abatement of £160; not exceeding £500, of £150; not exceeding £600, of £120; and not exceeding £700, of £70. An allowance for premiums for life assurance, not exceeding one-sixth of the income, was also allowed. The relief to 'earned' incomes was a reduction of 3d. in the pound upon the rate paid on unearned incomes. The general rate was 1s. in the pound, and 6d. in the case of earned incomes not exceeding £2000. The tax was granted for a year only, but annually renewed. The assessment and collection of the tax was entrusted for the most part to local commissioners, known as general or district commissioners, appointed by the Land Tax Commissioners out of their own body, and not in any way subject to the control of the gov. These commissioners received no remuneration, although exempted from parochial offices and jury service. Their duties consist in signing and allowing I. T. assessments, and hearing appeals. They also appoint local officers for I. T. purposes. There are also special salaried commissioners appointed by the crown to make assessments under Schedule C, and, where the tax-payer elects, under Schedule D; also to assess railway companies and dividends out of foreign and colonial stocks, funds, or other revenues. Special commissioners may hear appeals from their own or the assessments of local commissioners. The assessments of the salaries under Schedule E are made by the commissioners for public offices. The duty of a collector is to obtain payment of the I. T. from the persons on whom it is imposed, and for this purpose he is supplied with warrants to enforce payment. As indicated above, most of these provisions are re-enacted annually, and to ensure collections in due time these provisions and all enactments relating to I. T., not specifically repealed, have full force as soon as the tax is granted in any Finance Act (*see Section 18 (2) of the Finance Act, 1907*). A Select Committee was appointed in 1906 to inquire

into the question of graduating the I. T., and recommended a partial graduation by an extension of the existing system of abatements, even up to incomes of £1000 or more. They also recommended graduation by a super-tax, and a differentiation between earned and unearned incomes, to be limited to incomes not exceeding £3000 a year. Some of these recommendations found expression in the Finance Act, 1909-10.

The I. T. year is from April 6 to the following April 5. The standard rates of I. T. between 1812-43 to 1854-55 was 7d., in 1855-56, 1s. 2d.; 1856-58, 1s. 4d.; it was then below 1s. until 1900-01, when it rose to 1s.; in 1915-16 it was 3s.; 1916-17 and 1917-18 it rose to 5s., and thereafter was as follows: 1918-19 to 1921-22, 6s.; and ranged between 4s. in 1922-23 to 7s. in 1939-40; 8s. 6d. in 1940-41, 10s. in 1941-42 to 1944-45, and was reduced to 9s. in 1945-46.

The Sur-Tax replaced the super-tax, which was levied up to and including the super-tax year 1928-29. The Sur-Tax is in effect a deferred instalment of I. T. payable on Jan. 1 after the end of the I. T. year. Sur-Tax is at the following rates: — in respect of the first £2000 nil; — chargeable on every £ of income.

In the Finance Act, 1910, power was given to reduce the basic figure for Sur-Tax purposes to £1500; but no action has been taken under the Act, and £2000 remains the basic figure.

The Finance Act of 1920 introduced a new practice in respect of the method of granting relief in I. T. in favour of earned income as compared with investment income. Abatement was also granted in respect of the number of members in the tax payer's family.

The terms 'assessable' and 'taxable' as applied to incomes were employed for the first time in relation to I. T. 'Assessable income,' in the case of earned income, means the amount of such income as computed for I. T. purposes, after deducting the amount of the 'earned' income allowance, and in the case of other income, the actual amount of such income as computed for I. T. purposes. 'Taxable income' means that part of the 'assessable income' upon which I. T. is actually charged, i.e. the 'assessable income' less the various deductions by way of relief.

The differentiation in favour of 'earned' income is made by deducting one-sixth (1917 Finance Act) of the 'earned' income in order to arrive at the assessable income. The deduction is given irrespective of the amount of the total income, but must not exceed £250 for any one

individual. An allowance is also made of one-eighth of the unearned income of persons of the age of 65 years and upwards whose total income does not exceed £500. This allowance is granted, in the case of a married couple, whether either the husband or his wife, living with him, has reached the age of 65 at the commencement of the year of assessment, but the joint total income must in such a case fall within the prescribed limits.

**Deductions from assessable income in order to arrive at taxable income.**—Exemption from tax may be claimed where the total assessable income does not exceed £120. Where the taxpayer is not totally exempt, the following are the deductions that may be claimed from the total assessable income in order to arrive at the 'taxable income' and these deductions may be claimed irrespective of the amount of the taxpayer's total income: *Personal Allowance* may be claimed of £110, or, in the case of an individual whose wife is living with him, £180; *Life's Earned Income*: when a taxpayer's total income includes earned income of his wife, the personal allowance of £180 is increased by a sum equal to seven-eighths of the amount of such earned income, subject to a maximum additional allowance of £110; *Deduction for Children*: a deduction of £60 may be claimed in respect of each child, step-child, or adopted child under the age of 16 or who, if over 16, is receiving full-time instruction at any univ. college, school, or other educational estab. A claim may also be made in respect of children employed in a trade provided the pay (excluding premiums returned) is not over £13 a year. These deductions are not allowable in respect of children enjoying in their own right incomes exceeding £60 a year. There are also other reliefs in the shape of deductions in respect of dependent relatives and of widowed mothers taking charge of children, and in respect of dependent relatives denied unemployment allowance. Allowances may be claimed also on the amount of premiums paid for *Life Insurance* of the taxpayer or his wife, or in respect of contracts for *Deferred Annuities*: this relief or allowance is deducted from the amount of tax and calculated at the following rates: one-half the standard rate in the pound on the amount of the premium paid on policies taken out before the above date, a deduction of tax at one-half the standard rate in the pound is allowed on the premiums paid by a claimant whose income does not exceed £1000, at 5s. 3d. in the pound where his income exceeds £1000 and does not exceed £2000, and at 7s. in the pound where his income exceeds £2000.

All contributions to national insurance, whether paid by employer or employees, are allowed as a deduction from income and not as for insurance premiums.

**Post-War Credits.**—The large increase in the rate of I. T. during the Second World War was to some extent mitigated by the proposal (see White Paper entitled Financial Statement (1941-42) S.O. 73) to treat the additional tax payable by each individual taxpayer in respect of the re-

ductions in earned income allowance and the personal allowances a credit to be made available to him after the war. The total cost of post-war credits at the end of the financial year 1945-48 was £800,000,000. Credits were repaid in 1946 to taxpayers over 65 years of age.

With respect to Dominion I. T. relief is granted to a person who has paid or is liable to pay United Kingdom I. T. on any part of his income and who proves that he has paid Dominion I. T. for the same year in respect of the same part of his income.

Perhaps the greatest change which has occurred since the First World War in relation to I. T. is the abolition of the three years' average in the case of assessments of profits of businesses, professions, etc., under Schedule D and the substitution of an Assessment on the profits of the preceding year (Finance Act, 1926). By the Finance Act, 1922, certain revocable trusts are assumed by the crown as formed for the purpose of avoiding tax, and provision is made that all income arising in these cases is to be regarded for finance purposes as income of the person who has the power to obtain its enjoyment or the maker of the trust, etc. The Finance Act, 1936, also made provision for the prevention of the avoidance of I. T. by trusts and other devices. There are many exceptions to the law made in favour of charities, the general effect of which is that money used or earned directly in connection with charities is free of tax. In respect of the general principles of taxation in so far as they relate to I. T. the decisions of the Courts have established that (1) tax is in respect of income, (2) accretions to cap. are not to be taxed, (3) deductions from income in respect of losses of cap. are not admitted, (4) profits from changing the character of property otherwise than in pursuance of a systematic scheme of profit getting are not chargeable in respect of income, (5) gifts and voluntary allowances or payments are not taxable as income of the recipient, (6) the law leans in favour of the subject, but hardship is no answer to a claim for tax.

It is interesting to compare the amounts paid in I. T. before the First World War with those paid after that war, and equally instructive to compare these figures with those for the years of the Second World War and after. In 1911-12 the total receipts in the U.K. were £11,315,655, while in 1929-30 the total receipts were £293,816,000 (inclusive of £56,390,000 super tax and surtax). In 1937-38 the total net receipts were £297,861,548; in 1938-39, £336,052,321; in 1939-40, £391,592,899; in 1940-41, £530,765,156; in 1941-42, £775,165,319; in 1942-43, £1,007,312,163; in 1943-44, £1,182,827,889; in 1944-45, £1,309,616,833; in 1945-46, £1,361,346,000; in 1946-47, £1,156,233,000; in 1947-48, £1,189,728,000; in 1948-49, (estimated), £1,490,000,000. These figures should not be taken as indicating a great increase in national prosperity, but as indicative of the burden laid upon the subject in the form of taxation.

With regard to the other countries of Europe, it may safely be asserted that I. T. forms a ready but in popular means of raising revenue and in general the same broad principles are laid down as in England, viz. graduated systems with an initial rebate and allowances for families.

The endeavour to impose an I. T. in the U.S.A. in the past met with fluctuating success. As in England, it began as a war tax when it was imposed by the Federal Gov., which during the Civil War levied a tax of 3 per cent on all incomes over \$800. It was not abrogated till 1872 but when revived in 1899 the courts declared it to be unconstitutional with the result that the constitution had to be amended to vest in Congress the necessary authority to impose the tax.

On Feb. 25, 1913, the XVI Amendment of the U.S.A. constitution was declared in force. It states that Congress should have power to levy and collect taxes on incomes from whatever source derived with out apportionment among the sev. states and without regard to any census or enumeration. This amendment was ratified by all states except Connecticut, Florida, Pennsylvania, Rhode Island, Utah and Virginia. See *The Annual Reports of the Commissioners of Inland Revenue*, S. Dowell *Income Tax Laws, 1871 and History of Taxation in England, 1884*, R. L. H. *Taxation in American States and Colonies, 1888*, Sir R. Butler, *Income Tax for 1946 year, 1945 & 46*.

**Incommensurable**, see COMMENSURABLE.

**Incorporated Law Society**, society of solicitors estab. in 1820 to exercise a general control over the interests of solicitors. Any solicitor practising in Great Britain, or who has ceased to practice, is eligible for membership. The society examines students for all the solicitors' examinations, and makes arrangements for lectures. It is authorised by statute to inquire into all cases of alleged misconduct on the part of solicitors, and to report the result of its inquiry to the High Court; the High Court may in its discretion either strike the name of the offending solicitor off the rolls or suspend him from practice. In cases of suspected criminal offences by solicitors the society may report to the Public Prosecutor. The society has a building in Chancery Lane, London, and a splendid library.

**Incorporeal Chattels and Hereditaments**. Incorporeal chattels are the rights or interests incident to personal property, e.g. copyrights, patent rights, annuities, debts, cash at a bank, gov. stocks, debentures of companies. Such property is said to be incorporeal because it has only a notional existence as opposed to corporeal chattels, or those having a physical existence. Incorporeal hereditaments are rights over or in connection with the enjoyment of land, as opposed to the right on

immediate or future possession of the land itself, e.g. rights of way, advowsons (right of presentation to a vacant living), rents, commonable rights (see COMMON, RIGHTS). Formerly the term incorporeal hereditament included future estates or interests in land or the right to the future possession by way of reversion or remainder (see LEASE, GRANT) such incorporeal hereditaments were said to 'lie in grant' (by deed) while corporeal lay in livery i.e. transfer of possession was necessary, essentially to pass them to another. As both incorporeal chattels and hereditaments now pass by deed, the distinction between them has no practical importance.

**Increment Value Duty** was introduced by Mr Lloyd George as Chancellor of the Exchequer in his famous Budget of 1909. The duty imposed by the Finance Act of that year was one pound for every five pounds of 'increment value' accruing to land on: (1) Sale or lease (for a period exceeding 14 years) (2) Succession (on death of the owner) (3) Valuation to be made every fifteenth year in respect of land held by permanent corporations.

The Act provided that increment value was the amount by which the site value exceeded the original site value.

The commissioners of Inland Revenue were made responsible for valuing all land in the U.K., having regard to (1) site value and (2) total value. 'Site value' was defined as the value of the bare land without buildings, etc. (these latter being included in the total value) and 'original site value' as the value of such land on April 6, 1909. Agric. land was exempt from the duty so long as its value did not exceed the market value for agric. purposes.

The duty was a failure. Valuation was a long, costly, and inquisitive process and the actual return from the tax proved disappointing. The Finance Act of 1920 abolished the duty.

**Incubation and Incubators** (from Lat. *in ubere*, to brood; *incumbere*, to lie on or within). I. is strictly the action of a bird in sitting on her eggs to hatch them but the term is also used of the development of the germs of disease within the body and especially in connection with the artificial machines (incubators) employed in hatching eggs artificially, or for similar purposes in bacteriological laboratories. In nature I. is often the task of the female only, but sometimes the male takes his share as in the case of ostriches and most jassering and running birds. In other cases, again, the eggs are laid among rotting vegetation, the high temp. thus afforded making brooding unnecessary. The period of incubation varies considerably in length from three weeks with ravens and common fowls, to six or seven with swans and ostriches, and two weeks or less with swallows. The habit of brooding over their young is not infrequently found in other creatures as well as in birds, for example, in earwigs, centipedes (*Scolopendra*), and pythons.

Artificial incubation was known from the earliest times, and practised among

the Chinese and Egyptians by means of huge egg-ovens, types of which are in use by primitive people to the present day. Commercial manufacture of incubators began about 1900 and the only machine then made was a hot water type. This incubator consisted of a double walled cabinet with insulation or dead air space between the walls. The interior of the incubator was heated with a hot water tank

whole with hot water pipes running from an anthracite boiler. Each compartment could be operated independently but the chief disadvantage to this type of machine was the amount of space necessary for easy operation. This, together with the amount of labour involved, gradually led to them becoming obsolete.

A few years after the invention of the hot water incubator a new type was

HORACE W. S. P. 1916

#### EGG INCUBATOR

1, Substantial depth of packing preventing loss of heat 2, Pipes which circulate fresh warm air into interior of incubator 3, Heater for and diffuser 4, Air inlet and discharge over the egg chamber 5, Insulated regulator for maintaining even temperature 6, Thick packing, which makes up the back and front of the incubator 7, Draw is into which newly-hatched chicks are placed

placed in the top of the cabinet and this water was passed from an outside boiler which in turn was heated by an oil lamp.

The first incubator of this type held approximately 100 hen eggs. Regulation of the temperature was obtained by a thermostatic capsule filled with ether or methylated spirit or a mixture of same. This capsule expanded when heated and the action of the expansion was used to work either a damper or slide to control entry of the heat into the machine or to allow excess hot air to escape from the egg compartment. In order to meet the demands of large poultry keepers who wished to incubate hundreds of eggs at a time, this type of machine was later developed by placing several of these compartments in long rows and heating the

developed which proved a great improvement in many ways. This was the hot air machine. In this type, air is heated in a heating compartment and passed through the machine in metal pipes. The heating unit can be arranged to work in conjunction with oil lamps, electric heaters or gas burners. This type of machine usually proved to be more sensitive than the hot water model and easier to work. These incubators are used extensively by pedigree breeders and all poultry farmers who prefer to hatch their eggs in small units.

With the expansion of the poultry industry and the setting up of large commercial hatcheries, the need arose for large incubators, holding several thousands of eggs, that would take up little space and

be practically automatic in operation. This need was met by the invention of the Cabinet incubator in the U.S.A. It was later developed and improved in this country and today the Cabinet incubator is a precision built appliance that is practically fool proof.

Usually it consists of a double walled chamber built of selected timber and divided into two compartments. In the setting compartment the trays are so fitted that they can be tilted by some outside medium. In the hatching compartment they are placed at the same level as no turning of eggs is necessary after the nineteenth day. These compartments are heated by electric elements or hot water pipes or a combination of both. The air is circulated by means of a fan which ensures even temp. through the whole of the compartment. This fan can be driven by small electric motors or petrol engines.

The largest Cabinet incubators accommodate up to 50,000 eggs in a space little more than 1,000 cubic feet. The temp. and humidity is automatically controlled and when required, the eggs can be automatically turned at preset intervals. Alarm and safety devices are fitted to ensure freedom from breakdown with consequent loss of eggs. These incubators are now used extensively in all parts of the world.

Artificial I. has the following advantages over the natural process: (1) a much larger number of eggs are able to be successfully hatched; (2) the chickens are free from vermin; (3) they are free from the danger of being trodden to death by the hen. Game-keepers use I. largely for rearing pheasants, and, of course, on large poultry-farms they are indispensable. Various forms of foster-mothers, artificially warmed by lamps or hot water, have also been contrived in which the chickens can be successfully reared after they are hatched. In due course they are moved to cold brooders, and finally to poultryhouses.

Bacteriological I. differ from those for birds in that the heating surface generally surrounds all sides of the I. chamber, and there is usually no special apparatus for keeping the air moist. There are various forms, some heated by warm water, others by warm air. They are mostly square or rectangular in shape, but some bacteriologists prefer cylindrical forms.

Human I. have also been designed for rearing children too weak to survive under ordinary conditions. The first was that of Dr. Tarnier (1880), used in Paris, and an improvement was made in Heer-on's, which is used at various hospitals and institutions throughout Great Britain.

See T. Christy, jun., *Hydro-Incubation*; L. Wright, *The Book of Poultry*, 1911; J. H. Sutcliffe, *Incubators and their Management*; H. H. Stoddard, *The New Egg Farm*. For bacteriological I., see catalogues of Heaton of London; Cambridge Scientific Instrument Co., Cambridge; and P. Lequeux, Paris.

Incumbent (Lat. *incumbo*, I bend or lean), word which is said variously to

signify 'diligent residence,' or 'assiduous application to duties.' In eccles. law it includes such rectors, vicars, and perpetual curates as have been duly instituted in their offices. Every I., or holder of a parochial benefice, has care of souls in his own par. (see IMPROPRIATION), and it is a spiritual offence for any other clergyman to preach, read prayers, or otherwise officiate in the par. of another I. without authorisation of the diocesan bishop. An I. is *ex officio* chairman of the vestry, and upon him devolves the duty of keeping the local register of marriages, baptisms, and burials. Two I.s. may in certain circumstances effect an exchange of livings (see also GLEBE, as to extending poor livings) by deed. An I. may be deprived of his living for illiteracy, minority, simoniacal offences (trafficking in benefices), lack of holy orders, conviction for felony, and other crimes, and such spiritual offences as affirming doctrines contrary to the Thirty-nine Articles, heresy, schism, and demanding payment for administering a sacrament. An I. may resign by application to the ordinary, but a resignation is invalid unless assented to by the bishop.

Incunabula is a word derived from the Lat. meaning a cradle or birth, but has come to be used in a very specialised sense to signify the earliest books printed from type, and more particularly those printed before the year 1500. Since the invention of printing in Europe is generally attributed to Gutenberg whose first books appeared about half-way through the fifteenth century, we are limited by definition to a period of about fifty years. The rival claim that printing was invented earlier in the century by Laurens Coster of Haarlem is without corroboration, and in fact there are no known books in existence bearing his imprint. The first book ascribed by Gutenberg, probably in collaboration with John Faust, was the *Mazarin Bible* which was printed in a Gothic type, with initials and ornamental borders illuminated by hand. It is interesting to note that the early printers aimed not at creating a new style suitable to the medium of type, but emulated the finest examples of existing illuminated manuscripts. Chief among the notable books which came from this press were the *Pentateuch* of 1457, the first book in the list of printing to bear a date, and the *Latin Bible* of 1462.

Printing was first introduced into Italy by two Ger. printers, Sweynheym and Pannartz, who set up a press at the monastery of Subiaco in about 1464, and this country rapidly achieved supremacy in the art. Venice became pre-eminently the centre, attracting many printers, among them Da Spira, Jenson, Ratdolt and, later, Aldus. The 16th cent. was the time to which these printers turned for their models, and were written in the 'humanistic' script, a refinement of the caroline minuscule. This 'round,' cursive and easily legible hand became, fortunately for the eyesight of the modern world, the prototype of what are now known as 'roman' type-faces. Germany, the only country not to adopt this design, still uses

type-faces based on the Gothic letter, or *lettre de forme*. The length of the eds. of the earliest books was governed chiefly by the capacity of the type to stand up to the printing press, and numbers averaged about 200-300 copies, rising to about 500 by the end of the century. The fact that the total number of books printed in Venice alone by the end of the century is estimated to have been about two million, gives some idea of the rapid expansion of printing from its inception. Paper, then a staple product of Italy, was chiefly used for books, though frequently a smaller part of an ed. was printed on vellum. Many eds. were illustrated with woodcuts, some of which were afterwards illuminated by hand. A notable illustrated book was Aldus' *Hypnerotomachia Poliphili* which contained over 500 woodcuts. Caxton set up his press at Westminster in 1476, though his first book, *The Histories of Troy*, also the first to be printed in Eng., was printed at Bruges a year earlier. This was followed by an ed. of the *Canterbury Tales*, and in 1481 he issued his first illustrated book, *The Mirror of the World*. Caxton used a formal Gothic type and also 'secretary,' a cursive version of the same face. His achievement lay not so much in the quality of his work which was not equal to the best It. printing of the time, as in the fact that his prolific output did much to establish a national Eng. language.

The difficulties of establishing classifications of I. spring from the fact that so many early books are not only undated, but also bear no printer's name. Identification is most safely made from the type-face. Haebler's *Typenrepertorium der Wiegendrucke* (1905) takes this approach. Other earlier bibliographies are Panzer's *Annales Typographici* (Nuremberg 1793), and Hain's *Repertorium Bibliographicum* (Stuttgart 1826-38). In more recent times we have Robert Proctor's *Index to the early printed books in the British Museum* (1894) which has been revised and expanded since the author's death.

**Indecency.** Indecent exposure of the person in public is a common law misdemeanour, punishable by fine or imprisonment with hard labour or both, whether there be an intention to violate the canons of decency or not. The public exhibition of obscene writings, pictures, or photographs is punishable by fine and imprisonment, and magistrates have power to issue search warrants for the seizure and destruction of obscene books or pictures in places where such articles are suspected to be sold or dealt with for profit. Advertisements dealing with venereal diseases also come within the Acts prohibiting the exhibition of indecent writings or prints, and are punishable on summary conviction with one month's imprisonment or a fine of 10s. Sending indecent prints, books, etc., through the post is punishable either on indictment with twelve months' imprisonment with hard labour, or summarily by a fine of 210. An indecent assault upon any female is punishable by imprisonment

not exceeding two years, under the Offences against the Person Act, 1861. Sodomy or bestiality is a felony punishable by penal servitude for life, or imprisonment, not exceeding two years, with or without hard labour. The Criminal Law Amendment Act, 1885, provides a punishment of not more than two years' imprisonment with or without hard labour, in the case of any male person publicly or privately committing, or being a party to the commission of, any act of gross I., with any other male person. Scots law is practically similar in all respects.

**'Indefatigable.'** The Brit. battle-cruiser launched in 1911, 12-in. guns, 23 knots. On the outbreak of the First World War she was stationed in the Mediterranean. During the battle of Jutland (q.v.) she was a unit in Adm. Beatty's fleet, but was sunk by the Ger. battle-cruiser *Von der Tann*. A Brit. fleet aircraft carrier of 23,000 tons, laid down in 1939, now bears the name.

**Indefinite.** In mathematics, was originally used for infinite, but at the present time is generally only to be found in the phrase I. integral, to denote the process of integration, without reference to limits.

$\int x^n dx$  and  $\int_a^b x^n dx$  are respectively I. and definite integrals.

**Indemnity, contract, express or implied,** to keep a person immune from liability under a contract into which he has entered, or intends to enter. Contracts of fire, marine, and accident insurance (but not life assurance) are instances of such contracts. An I. differs from a contract of guarantee or suretyship, because the liability of a guarantor or surety depends upon a third person, the prin debtor, making default, whereas the person under a liability to indemnify another is bound to do so, irrespective of the default of other persons. A contract of I. is not, but a guarantee is, within the Statute of Frauds (see CONTRACT, and FRAUDS, STATUTE OF), and, therefore, the form of an I. is immaterial. Other familiar examples of I. are the implied contracts by prin. to indemnify their accredited agents from all liability properly incurred in relation to the agency. This prin. in the law of agency also applies as between partners. A contract to indemnify a person against liability for an unlawful act is void. In a wider sense I. connotes that unwritten prin. of our law which enjoins the obligation of the state to compensate a person whose private property has been compulsorily taken for public purposes; a prin. which, in particular cases, finds statutory expression in various private Acts of parliament supplemented by the Lands Clauses Acts.

**Indenture, practically synonymous with a deed (q.v.),** since the requirement of 'indenting' the edges became unnecessary to the validity of an instrument. An I. was an instrument made between two or more persons with distinct interests, as opposed to a deed poll or instrument made by one person or set of persons having

identical interests. Formerly, copies of an instrument were always made on the same parchment, or paper, and then cut into as many parts as there were copies, with a wavy or scalloped line, so that the genuineness of any part could at any future time be established by merely fitting the edges together. Other formalities having taken the place of 'indenting,' the designation of a deed as an *J.* is now mere surplusage.

**Independence:** (1) The cap. of Buchanan co., Iowa, U.S.A. It is situated on the Illinois Central, and on the Chicago Rock Island and Pacific Railroads, also on the Wap-sipuncion R. The Ln. is noted for farming, and has iron foundries. Pop. 1,300. (2) The cap. of Montgomery co., Kansas, U.S.A. It is situated on the Verdigris R., and on the Atchison, Topeka, and Santa Fe, and the Missouri Pacific Railroads. It is the centre of a natural oil and gas region. The chief industries are agriculture and the manuf. of cotton. Pop. 11,500.

**Independence, American War of, see UNITED STATES OF AMERICA, History.**

**Independence Day,** commemoration observed in the U.S. on July 4. It is a legal holiday, and is kept up by various celebrations, such as patriotic speeches and meetings. It commemorates the Declaration of Independence on July 4, 1776.

**Independence, Declaration of, see DECLARATION OF INDEPENDENCE.**

**Independence Hall,** building in Philadelphia, where, on July 4, 1776, the Declaration of Independence was adopted by Congress and read to the people. The Continental Congress met there. It is now used as an historical museum.

**Independent Labour Party** (the 'I.L.P.'), throughout the greater part of its list, the largest and most influential of Brit. Socialist organisations. The I.L.P. was founded at a conference held at Bradford in 1893 over which J. Keir Hardie, M.P., presided, and, as illustrative of the close connection of the man with the party it may be mentioned that Keir Hardie was elected in 1913 to the chairmanship, so that he might preside over the coming-of-age conference. Other distinguished chairmen have been J. Ramsay MacDonald, M.P., and Philip Snowden, M.P. (later Lord Snowden). The fortunes of the I.L.P. have been intimately bound up with those of the Labour Party which it created and to a certain extent dominated. On Feb. 17, 1930, the Prime Minister, Ramsay MacDonald, severed his connection with the I.L.P., an example that was almost immediately followed by Philip Snowden, the Chancellor of the Exchequer. The reason for these resignations was that during the last few years the organisation had increasingly adopted the policy and approved the actions of the more advanced section of the Labour Party in the House of Commons. James Maxton, the leader of this small but energetic group and one of the severest critics of the Labour Cabinet, then became chairman of the I.L.P., and held the post again from 1934-39. The I.L.P. counts

for nothing to-day. Its fall after the First World War was due to faction. A substantial section of its membership was strongly pro-Soviet, and a part broke away when the Communist Party was formed. The I.L.P. became the advocate of 'Socialism in our time' and at one Labour Party Conference after another its socialist resolutions were voted down by the trade union block vote. The experience of the second MacDonald Gov. brought the dispute to its crisis, and the I.L.P. under James Maxton seceded from the Labour Party and, in the secession, split again, the anti-secessionists joining with Sir Stafford Cripps and Mr. Ernest Bevin's Society for Socialist Inquiry and Propaganda to form the short-lived Socialist League. What remained of the I.L.P. under Maxton had its main influence on C.L. decide. In the Second World War it was 'anti-war,' not on pacifist grounds, but because it persisted in denouncing this war also as an 'imperialist war.' It also rejected the view that socialists can unite with capitalist parties in any circumstances without betraying Socialism. It is not a little ironical that the present Labour Party Gov. has not only passed sev. nationalisation Bills but would seem to be committed to a policy of Socialism well within our time.

**Independent Order of Oddfellows, see GODELLIOWS.**

**Independents, or Congregationalists, see CONGREGATIONALISM.**

**Indeterminate,** in mathematics, used in sev. connections. Simultaneous equations are called *i.* when an insufficient number of such equations is given. Thus the equation  $5x + 3y = 21$ , where  $x$  and  $y$  are independent unknown quantities, is *i.*, and has an infinite number of solutions. In the differential calculus the name *indeterminate* is given to such expressions as the limit of  $\frac{a^x - x^a}{a - x}$  when  $x = a$ ,

which take the form  $\frac{0}{0}$ , or similar forms.

It has  $\infty \cdot 0 \times \infty$ , etc.

**Index,** in mathematics, that number placed after a quantity to denote the power to which the quantity is to be raised. Thus  $a^4 = a \times a \times a \times a$ . It follows that  $a^4 \times a = a^{4+1} = a^5$ , and, more generally,  $a^m \times a^n = a^{m+n}$ , where  $m$  and  $n$  are positive whole numbers. This is one of the fundamental laws of algebra, and is known as the Index Law. So also  $a^m \div a^n = a^{m-n}$ , and  $(a^m)^n = a^{mn}$ . It has been found convenient to make use also of fractional and negative indices, which at first sight seem unintelligible. To ensure that the Index Law  $a^m \times a^n = a^{m+n}$  shall be true for all values of  $m$  and  $n$ , integr. and fractional, positive and negative, we give to such quantities as  $a^{\frac{1}{2}}$  and  $a^{-1}$  those meanings to which

the formula leads us. Thus  $a^{\frac{1}{2}} \times a^{\frac{1}{2}} = a^{\frac{1}{2} + \frac{1}{2}} = a^1 = a$ ,  $\therefore a^{\frac{1}{2}} = \sqrt{a}$ , and more

generally  $a^p = \sqrt[p]{a^p}$ , also  $a \times a^1 = a^{1+1} = a^2$ ,  $a^2 = a^1 \times a^1$ ,  $1$  and  $a^1 \times a^1 = a^{1+1} = a^2 = 1$ ,  $a^1 = \frac{1}{a^1}$ , and more generally  $a^{-1} = \frac{1}{a}$ . See also LOGARITHM.

**Indexing**, operation of compiling an alphabetical list of statements and allusions contained in files or in a book or series of books or periodicals, together with the page number folio number or other reference to where the indexed matter is to be found. An index differs from a 'table of contents' by being a more complete analysis of the contents, and by being arranged in alphabetical order. The term as applied to the list of books and periodicals have been in use since the sixteenth century and derives from the Lat. word *index* which was used by Cicero and other classical writers in the same sense. Calendar, inventory and register were alternative terms which have now been superseded. Specialised lists such as that of the contents of a library is more properly termed cataloguing (20), while an index of the works of a single author or a works on a given subject comes under the heading of bibliography (21). There were a number of indexes to books published in the sixteenth century, among the most notable being that to the 1566 ed. of Polydore Vergil's *Anglica Historia*. Many indexes of the seventeenth and eighteenth centuries were intended more as whimsical enticements to the reader to dip into the contents rather than as serious analysis of the subject matter. The index of the *Spectator*, *Lettler*, and *Guardian* (1757) was, however, a model of its kind. During the nineteenth century and after, a number of scientific and informative works have made an indispensable aid to the reader while the growth of periodical writing brought into being a number of cumulative indexes, an early example of which was W. F. Poole's *Index to Periodical Literature* (New York, 1833). A 'general' index contains entries under proper names, place names, and subject headings. It may however be advisable to provide two indexes to a single work, one being an Index of names and the other an Index of Subjects. In a subject index the selection of catchwords presents the indexer with a problem which he can only solve by an understanding of his author and by an assessment of what the reader to whom the work may be unknown would look for. Correct alphabetical order is never so simple a process as it may seem to the inexperienced. It should be carried through either to the end of the initial word or to the end of the initial group of words, that is, to the first mark of punctuation. If, however, there are two or more entries with identical catchwords, as may happen when indexing references to two persons with the same name, then the order is decided by the words (e.g. Christian name or initials) which follow the comma after the catchword. Indexes prepared for press may be compiled either on the slip

system or the card system. The slip system consists of allotting a slip to each letter of the alphabet or each subdivision of a letter (e.g. Aa-Ak, Al-An, Ar Az). The entries are then made on the appropriate slip. The card system differs from this in that each reference is written on a separate card which bears the appropriate catchword as a heading. The cards may then be sorted into alphabetical order and added when all the entries are complete. The invention of the card index system is attributed to the Abbe Jean Rozier (1734-1805) whose *Tables des Mémoires de l'Académie des Sciences* was published in 1773. It is the only suitable method for compiling an expansive index of e.g. files to which constant additions are being made. In book indexing if there is a number of references under one entry, the references should themselves be classified under appropriate sub-headings which may be arranged either alphabetically or in chronological order or in the order in which they appear in the course of the book—the choice being determined by the nature of the work to be indexed. See H. B. Whitley, *How to make an Index* 1900. (R. Cutter, *Rules for a Dictionary Catalogue* (4th ed.) 1904.) A. I. Clark, *Manual of Practical Indexing* 1933.

**Index Librorum Prohibitorum**, the title of a list of books prohibited by the Roman Church on doctrinal or moral grounds. The origin of ecclesiastical prohibitions dates from a very early period in the history of the Church and the earliest known statement is the *Index Librorum Prohibitorum* promulgated by Pope Gelasius (491). What may be regarded as the first Roman Index was published by Pope Paul V (1609) through the Inquisition at Rome and was confirmed by Clement VIII (1616). When the books in the list of catalogues are allowed to be read after correction or alteration with the approval of the orders of the papal authorities the list is termed *Index Librorum Prohibitorum*. Later Pope Sixtus V organised a special congregation, consisting of a prefect, cardinals, consultants, and censors of books, the proceedings being governed by rules laid down by Pope Clement XIV in a constitution issued in 1773. All books considered pernicious to Roman Catholics and all versions of the Bible by unauthorised persons are placed on the Index by the Congregation of the Holy Office.

Obscene books are forbidden except 'classical authors, ancient or modern', on account of the elegance of their diction which is not to be used for teaching children. The ban still remains on Gibbon's *Decline and Fall*. The works of David Hume, John Stuart Mill and Oliver Goldsmith for his list of England are proscribed along with Sterne for his *Sentimental Journey*. Savonarola, Kant, Voltaire, and Goethe share the Index pages with Stendhal and D'Annunzio.

The Book of Common Prayer is also banned. Dante, Copernicus, and Giordano Bruno have been removed.

Any living author placed on the Index

can earn remission by re-writing his book or cutting out the offending passages. Permissions to read forbidden books are granted to students. See T. Hurley, *Commentary on the Present Indian Legislation*, 1908.

**India**, extensive peninsula or sub-continent of S. Asia; after China the most populous country in the world. The pop. of the country approaches 400,000,000 and is composed of a heterogeneous mass of various nations, having different languages, faiths, and customs. Since the beginning of the seventeenth century the hist. of I. has been closely connected with that of Great Britain. In course of time it became a dependency of the Brit. empire and afforded a huge mkt. for her produce and also a great held for Brit. capitalists. At the same time it developed a great number of highly profitable secondary industries of its own. The name by which the country is known, 'India,' is derived from the Persian name *Hind*, which has been handed down to us through the Gks. and Romans. This name is derived from the Sanskrit name given to the R. Indus (*Sindhu*). At times the name Hindustan has been applied to the whole peninsula, but this is incorrect, since the name applies only to a particular region of that country. The natives of I. are so mixed that they have no one name for the country, but after the Brit. occupation the official native form of the name was fixed as *Hind* and the Anglicised form as *I*. The Indian Independence Act, 1917, brought to an end the whole structure of Brit. Gov. in I. and from Aug. 15 (1947) the Indian Empire is represented by the dominion of I., the dominion of Pakistan, and Terr. of Indian rulers formerly under the suzerainty of the King-Emperor. Except where otherwise stated herein 'India' includes the dominion (now Republic) of I., the dominion of Pakistan, the states of I., and Tribal Areas. Fuller details for Pakistan under most heads will be found in the separate article PAKISTAN.

**Boundaries: Area and Population.**—The political boundary of I. matches with Persia and Afghanistan from the gulf of Oman to Porvilo Schuyekowski on the Taghdumbash Pamir. From this point the frontier, in many parts not clearly defined, touches the Chinese Empire and Nepal, up to the limits of Burma. Continental I., including Baluchistan, extends from 8° to 37° N. lat., and from 61° to 97° E. long. Delhi, the cap. of the dominion of I., lies in 77° E. long., Karachi (Sind), the cap. of the dominion of Pakistan, lies in 66° E. long. The total area of I. proper in 1911 was 1,581,410 sq. m., with a pop. of nearly 389,000,000. The Brit. provs., as distinguished from the Indian states, comprised 55 per cent of the area and about 76 per cent of the pop.

**The country.**—I. is a large peninsula which juts out southward from the mainland of S. Asia. It is a triangle in form, the huge mt. ranges of the Himalayas forming the base of the triangle, whilst the apex runs far out into the Indian Ocean. In its W. coast it is washed by the waters

of the Arabian Sea, whilst on the E. is found the Bay of Bengal. The extreme length of I. is about 1900 m., and its breadth, at its widest part, is about 1600 m., but the peninsula tapers down almost to a fine point, its S. extremity being Cape Comorin. The southernmost point is in the very centre of the tropical region, its lat. being about 8°, whilst the most northerly point is found well within the limits of the temperate zone, i.e. 37° N. Thus the peninsula experiences extremes of weather. The official designation I. includes not only the peninsula already described, but also Burma on the E. together with the is. of the Arabian Sea, and the bay of Bengal, and Aden and Perim, all of which are politically administered as I. On the other hand, Ceylon, an is. adjacent to the S.E. coast of I., is treated and administered separately. In former days—the days of the great companies I. was by no means altogether under the sway of the Brit., for the Dutch, Portuguese, and Fr. had settlements on the coast also. The remains of these settlements may be traced in the various towns which belong to the Fr. and Portuguese even at the present day, e.g. Goa (Portuguese), Pondicherry (Fr.). The chief boundaries of I. are: On the N., the Himalaya Mts., which separate Tibet and China; on the W., the Suliman Mts., which separate it from Afghanistan and Baluchistan; on the S. and S.W., the Arabian Sea and the Indian Ocean; on the E., the spurs of the Himalayas, which separate it from Burma, and the bay of Bengal, an inlet of the Indian Ocean. The geography of I. can be the more easily examined and followed if we divide the whole country up into the three natural divs. into which it falls: (1) The mt. ranges, i.e. the Himalayas; (2) the riv. plains; (3) the peninsula red. or the plateau of I., which goes by the name of the Deccan. (1) *The Himalayas*: This series of mt. ranges is the loftiest mt. system of the world. The range extends for a distance of 1500 m. round the N. boundary of I., and sweeps round in a half bend. The most conspicuous face of the mts. is the S., forming an almost, but not altogether, impassable boundary. In two places the mt. range is severed by streams: the Dihang R. in the E., and the Indus in the W. The mts. soar to a height in places of nearly 30,000 ft. and are continually snow-covered. Nevertheless, since time immemorial distinct and well-known trade routes have been known and communications kept up with the countries N. of the Himalayas in spite of the barrier of the mts. The Himalayas form a double boundary to the N. of I. and send out also spurs and offshoots which fill the country between the Ganges and the parent mts. themselves. On the W. this offshoot is known by the name of the Suliman Mts.; on the N.E. it forms the boundary between Assam and I., being known as the Naga Mts. The boundary between I. and Baluchistan is also formed by the offshoots of the Himalayas, but these latter offshoots by no means attain the elevation

of the others mentioned. The chief passes of the mountainous div. of I. are the Khyber Pass, the Kurram Pass, the Gomal Pass, and the Bolan Pass. These form the chief means of communication between I. and the N.W. *See also HIMALAYA MOUNTAINS.* (2) *The river plains:* This div. of I. is the richest and most populous part. It extends in a broad belt across practically the widest part of I., running from E. to W. From the beginning of hist. we find this part of I. the continual prey of marauding tribes, who sweep down from the hills to plunder. The chief provs. of this part of I. are Bengal (E. Bengal in Pakistan and W.

This comprises the presidencies of Bombay and Madras, together with the Central Provs., Hyderabad, and Mysore. The name of the Deccan was formerly applied to it. Its N. boundary is the Vindhya Mts., a range which stretches for about 800 m. from E. to W., and which has two great peaks at each extremity. In earlier days this formed a fairly effective barrier between the N. and the S. of I., since the range varies in height from 3000-4000 ft. It has long since, however, been pierced by both road and railway, and communication between N. and S. firmly estab. The two sides of this triangular plateau, which has the Vindhya Mts. for a base, are

JAIN TEMPLES AT CALCUTTA

Bengal in I.), the United Provs., the Punjab (divided between the two dominions), and Rajputana. The importance of the int. system, the Himalayas, may be judged when we see the effect of it on the well-watered plains. The riv. system of I. consists of three great rivs: the Indus, the Ganges, and the Bramaputra. The Indus rises on the N. slopes of the Himalayas, sweeps round, and enters at the W. extremity of the range, and waters the Punjab. The Ganges is formed by the amalgamation of the streams which drain the southernmost slopes of the Himalayas, whilst the Bramaputra rises also within easy distance of the Indus in the N. slopes of the Himalayas, flows E. N. of the Himalayas, for some considerable distance and then enters I. at the extreme E. point of that range. It is therefore to be noticed that the riv. system, of such vast importance to the people of I., is the drainage of both the N. and the S. slopes of the Himalaya Mts. (3) *The peninsula proper, the southern plateau of India:*

formed by the E. Ghats and the W. Ghats. The W. Ghats are on an average much loftier than the E. The three chief rivs. of this dist. are the Godavari, the Kistna, and the Cauvery. These rise in the W. Ghats, but discharge into the bay of Bengal on the E. coast. The W. Ghats, in fact, form such a strong barrier on the W. coast that the line of mts. is unbroken by a riv. gorge. The rivs. which rise in the W. Ghats discharging, as already stated, in the bay of Bengal and those which drain the Vindhya Mts. into the gulf of Cambay. Chief amongst the latter may be mentioned the Nerbudda and the Tapti. The three geographical divs. of I. apply, in other respects—in speech, language, race, and characteristics.

**GEOLOGY.** The oldest of these three divs. is the peninsular proper. It has been land for many thousands of years; indeed it was already dry when the Himalaya region was covered by the sea, from the Palaeozoic to the Eocene period. This much is proved by the marine deposits of

the Himalayas. It is in the peninsular that we find the oldest strata; in fact, the age of the Vindhya Mts. cannot be determined. The Himalayan region is one of great compression, in which we find masses of Tertiary rocks of vast thickness, which are overthrust and folded in the most violent fashion. In peninsular I. the oldest rocks consist of gneiss, granite, and crystalline formations. The rocks of this region are intersected by bands of transition strata of very ancient, but undetermined age. The strata are generally found in an undisturbed state, and the Vindhyan formations, as already mentioned, are of great antiquity. In great contrast to these regions is the region which separates the two, and which is known by the name of the Indo-Gangetic plain. This plain is covered with alluvium and sand blown thither by the winds. There is no rise in level between the two great rivers, the Indus and the Ganges. The alluvial deposits of the plain have been subjected to frequent examination and prove to us that there has been a gradual depression of that region even within comparatively recent times. The chief deposits which are found in the Indo-Gangetic plain are gravel, sand, and clay, together with deposits of peat and forest beds. The Delta deposit has also been subjected to close examination, but its depth at this point cannot be exactly calculated. By boring, a depth of some 480 ft. was reached, but this was known not even to approximate to the real depth. In one part of the bay of Bengal, which washes the Delta, the currents have apparently washed away the deposit brought down by the rivers. The depth of the bay here is over 1800 ft., so that, allowing for the fact that the rest of the soundings which are taken in the immediate neighbourhood only give, at most, 10 fathoms, we can come to the conclusion that the deposit from the river has filled up the bay in that part, and that therefore the alluvial deposit equals the depth of the bay, i.e. about 1800 ft. The alluvial deposit of the plain has been proved by boring to be over 1000 ft. in thickness and we are able to gather that the depression of the Indo-Gangetic plain is of recent date, and that it is probably connected with the elevation of the N. mountainous dist., the Himalayas.

**CLIMATE.**—Not unnaturally, in a country which stretches from the tropical regions to well into the temperate zone, many differences will be experienced in the climate. Any extreme of climate, then, either of the tropics or of the temperate zone, will be found in I. Its geographical characteristics have great influence on this, especially the huge mt. barrier of the N., which prevents any influence of the plateau of Central Asia, and its peninsular point surrounded by the sea in the S. The whole country experiences three well-marked and well-defined periods—the cool, the hot, and the rainy seasons. The cool months are experienced during Nov., Dec., Jan., and the early part of Feb. The weather is then at its pleasant-

est, dry and cool. The hot season which follows belongs, at any rate officially, to March. From this time until the middle of June, there is a continual rise of temp. which is experienced with greatest severity in Central and Southern I. The contrast in temp. during the cool months is between N. and S., but during the hot months the contrast is between the interior and the coast. It is in the interior of Northern I. (Punjab) that the greatest temps. are experienced during this period. The monsoons or the rainy season usually begin about the middle of June. These monsoons are caused by the absorption by the sun of moisture from the ocean, and if the monsoons fail, then follows one of those famines which periodically do so much harm to I. The rainy season lasts for about three months, and during that period rain is generally experienced all over I. The rainfall is by no means, however, equal all over I. Parts especially in the Deccan, are left after the rains with a very small supply of water, hence arises the necessity for a good system of irrigation and canals. At one place the average rainfall for the year is 500 in. (Cherrapunji). The season which immediately follows the rains is the most unhealthy of all. The monsoons cease about the middle of Sept., and the months which follow, Oct. and Nov., may be regarded as the Indian autumn. During this period malaria and malarious diseases are usually rife especially in the N.

**LION.**—The lion, although at one time threatened with extinction, is now found fairly plentifully. A variety peculiar to I., i.e. manesless, is found here. The chief beast of prey, however, is the tiger, which is practically ubiquitous. The advance of civilisation and the attacks made on this animal by sportsmen have caused the tiger to become rarer than formerly, but it is by no means exterminated. The man-eating tiger is usually an old animal that has become too enfeebled to be able to catch his ordinary prey, but kills often from sheer desire to destroy, and is a real curse to the country in which he is found. It is no unusual thing to hear of a man-eating tiger which has killed over 100 persons. The favourite method of tiger shooting is from the backs of elephants. The leopard is found in even greater numbers. The destruction to life and property caused by this animal is enormous. The cheetah is another type often confused with the leopard proper. Amongst the other wild animals to be found are the bear, boar, wolf, fox, bison, elephant, and rhinoceros. Wild goats and wild sheep are found at considerable altitudes in the Himalayas. The wild ass is also to be found in parts but is practically unapproachable owing to its timidity and speed. The domesticated animals are chiefly the cow, ox, and buffalo. The two latter are used principally as beasts of burden, the cow being regarded as a sacred animal by the Hindus. Horses are bred, and but recently the breed has been improved by the importation of foreign blood; they are used but little amongst the working native pop. Donkeys and mules

are used very considerably. Sheep and goats are plentiful, as is also the pig, but this latter animal is of little use, since by the majority of the native pop. it is despised and abhorred. Monkeys abound, but they are regarded as sacred, and are therefore in perfect security and become very tame. Deer of all kinds abound throughout the country, and they are of use chiefly in providing sustenance for the beasts of prey.

The rivers are infested with crocodiles and alligators. Poisonous snakes abound, the most deadly being the Cobra dâ (Capello the hooded cobra). Another dangerous reptile is the Russ-chun snake; specimens of this latter are usually carried about by the native showmen, who cause them to assume a position as if dancing whilst they charm them with music. Many of the snakes, however, are innocuous, and the dangerous ones are gradually receding before the march of civilisation, since the gov. offers a reward for every one which is killed.

The birds of I. are of the usual tropical varieties. The birds of prey include the vulture, the eagle (many specimens of which are to be found), and falcons of all kinds. Herons and kingfishers abound, and are much sought after on account of their plumage. Waterfowl are particularly numerous, and almost all the game birds found in Europe abound also in I., e.g., pigeons, partridges, quail, plover, and duck. The jungle fowl of I. are supposed to be the ancestors of our domestic fowl. The supply of fish in sea, lake, and riv. is exceedingly abundant, and, indeed, forms a very great proportion of the food of the poorer classes.

**FLORA.**—I. has no peculiar botanical features of its own. Its geographical position, however, as in many other respects, causes its vegetation to be various and plentiful. Its products are those of the tropics and of the temperate zone. Rice has always been the staple product. The products of the tropical regions are tobacco, sugar cane, and spices. Tea is grown on the slopes of the E. Himalayas, and has become one of the main products of I. In Assam the tea plant is found growing wild. Coffee has been grown in the S. parts of the peninsula, but with somewhat indifferent success. The chief trees which are found are the mango, orange, banyan, and bamboo. The teak and various other trees useful for timber are produced in the more hilly dists., whilst on the slopes of the Himalayas are found the cedar, fir, and pine. But within recent times a Forestry Dept. was set up for I., and the forests, which previously had suffered much owing to wanton destruction, are now more carefully preserved. The total area of forest land under the control of this dept. is above 160,000 sq. m. Of this total, 98,000 sq. m. are reserved and worked scientifically by the State. This forestry dept. has been taken over by the Indian Dominions Gov. The most indigenous flower is the water-lily, and European flowers are found in the greatest profusion at the present time. The whole of the vegetation of I., however,

may be regarded as an extension of that found in the prin. dists. which immediately border on the peninsula, i.e. of China, Persia, and Malaysia.

**CENSUS OF 1911.**—The census of I. for 1931 gave a total pop. of 338,119,000, divided into 256,686,500 for the provs. and 81,361,000 for states and agencies. The census of 1911 returned the total pop. as 388,007,955—an increase of nearly 50,000,000 in ten years—the pop. for the provs. being returned as 295,812,000 and for the states and agencies as 93,189,000. Just over 19,500,000 people form the urb. pop. of I., and slightly less than 339,500,000 her rural pop. Thus the urb. pop. is to the rural approximately as 1:7. In all I. there are 935 women to every 1000 men; in the Punjab the figure is 817. To be set against this serious discrepancy is the estimated total of 9,000,000 widows, largely very young, debarrd from remarriage by the stern decree of Hindu custom. The tns. of a pop. of 5000 and upwards number 2703 and the vils. 655,000. For all I. the density is 246 to the sq. m., in Bengal it is 779, which is far higher than that of Great Britain. Of the provs., Sind with 91 to the sq. m. has the least density of any prov. A city is a tn. with no fewer than 100,000 inhab. Of these there are 58 in India, and 23 of them are new, owing their rise to the development of ports and industry. By far the greatest number of tns. and vils. come into the class with fewer than 500 inhab.—a fact which accounts for the slight density of pop. In the last fifty years, Calcutta (India), has trebled its pop.; Madras (India) and Bombay (India) have nearly doubled; and Lahore's (Pakistan) pop. has increased fourfold. The influence of the rise of industries and overseas trade on the growth of cities is seen in such places as Karachi (Pakistan), Jamshepur (India), Ahmedabad (India), Trivandrum (Trianamcor), and Sholapur (India). Karachi had 98,000 inhab. fifty years ago; in 1911 it had 359,500. In the same period Jamshepur, the seat of the Tata steel and iron works, increased from 3672 to 148,711; Ahmedabad from 141,141 to 591,267; Trivandrum from 27,887 to 128,365; and Sholapur from 61,91 to 212,620.

**Political Divisions.**—The total area of I. may be divided into Provs. and Native States, and former Agencies (which were in political relations with the Indian Gov. and more or less under the control of Brit. officials). Reference to the present political orientation of the Indian states is made below.

The following tables give the provs., unions, and former states of the dominions of India and Pakistan with areas, total pop., and density per sq. m.; and the areas and pop. of the former agencies.

**CITIES AND TOWNS.**—The prin. cities of the Dominion of India, the Dominion of Pakistan, and other cities belonging to States are:

**Dominion of India:** Calcutta, 2,108,000; Bombay, 1,439,000; Madras, 777,500; Ahmedabad, 591,300; Delhi, 522,000;

## THE DOMINION OF INDIA

Provinces and Capitals	Area in square miles	Population	
		Census 1941	Per square mile
Ajmer Merwara (Ajmer)	2,400	583,893	244.0
Andamans and Nicobars (Port Blair)	3,143	33,768	10.7

## THE FORMER AGENCIES

Agency	Area in square miles	Population (1941)
Baluchistan :		
Kalat State and Las Bela State	7,132	63,000
Baroda and the states of Western India and Gujarat :		
Baroda	8,236	2,855,000
Western India, etc.	43,547	6,050,000
Central India :		
States : Indore, Bhopal, and Rewa	52,017	7,506,000
Deccan and Kolhapur States	10,870	2,785,000
Eastern States :		
Cooch Behar, Tripura, Mayurbhanj, Patna, Bastar, and Kalahandi	65,210	8,087,000
Madras States :		
Malayalam States of Travancore	7,662	6,070,000
Cochin	1,403	1,422,000
North-West Frontier :		
Chitral and four other states	9,061	588,000
Punjab States :		
Patiala, Bahawalpur, Khairpur, Nabha, Kapurthala, and Jind	49,521	6,504,000
Rajputana :		
Jodhpur, Udaipur, Jaipur and Bikaner Tonk, Palanpur, Bharatpur, Dholpur and other states	132,559	13,670,000

Cawnpore, 487,300; Amritsar, 391,000; Lucknow, 387,200; Howrah, 379,300; Nagpur, 302,000; Agra, 284,100; Benares, 263,100; Allahabad, 260,600; Poona, 258,200; Madras, 239,100; Sholapur, 212,600; Bareilly, 192,700; Jubbulpore, 173,300; Patna, 171,700; Surat, 171,400; Meerut, 169,300; Trichinopoly, 159,500; Bangalore, 248,300; Mysore, 150,500; Jamshedpur, 148,700; Ajmer, 147,200; Moradabad, 142,100; Jullundur, 141,300; Coimbatore, 130,300; Salem, 129,700; Hyderabad (Sind), 128,200; Calicut, 126,300; Bhatpara, 117,000; Aligarh, 115,600; Ludhiana, 117,600; Shikharpur, 111,100; Saharanpur, 108,200; Gaya, 105,200; Jhansi, 101,200.

Mongolo Dravidian type, Bengal and Orissa. Mongoloid of the Himalayas, Assam and Butma the Dravidian (*q*) type, which extends practically throughout the whole of the peninsula proper.

*Religion* — The chief religions of I, with the adherents to each as given by the 1911 census as follows: Hindu 244,930,006 (i.e. 61 per cent of the total pop.) Mohammedan or Muslim, 92,080,096 (i.e. 24 per cent), leaving 11 per cent for the remaining religions, including Indian Christians, 6,316,549; Sikhs, 5,691,447; Jains, 1,149,286; Parsis, 114,890; Jew, 22,180. Besides these, there are 2,141,489 persons des-

MONGOLOID WOMAN OF NEPAL

INDIAN SIKH OF JAMMU

*Dominion of Pakistan* Lahore, 671,600; Karachi, 59,500; Dacca, 217,200; Rawalpindi, 181,100; Multan, 111,800; Sialkot, 138,300; Peshawar, 111,000.

*States* Hyderabad (Hydrabad State), 731,100; Srinagar (Kashmir), 207,800; Indore (Malwa Union), 205,700; Lashkar (Malwa Union), 182,500; Jaipur (Jaipur), 175,800; Paroda (Baroda), 133,800; Kolar Gold Fields (Mysore), 133,800; Travancore (Travancore), 128,200; Bikaner (Bikaner), 127,200; Jodhpur (Jodhpur), 126,800; Bhavnagar (Saurashtra Union), 102,800.

*Racial Types* — The whole pop. of I may be divided into at least seven distinct racial types. The following is a list of the types, and the districts in which these types most frequently prevail: the Turko-Iranian type, Baluchistan and N.W. Frontier; the Indo-Aryan type, Punjab, Rajputana, and Kashmir; the Scytho-Dravidian type of Western I; the Aryo-Dravidian type, United Provs. and Bihar;

and it is 'tribes' including persons of the Animist religion, and of this total 700,000 believe in magic and strive to procure impersonal forces. Unspecified numbers number 401,577 persons. The Hindus or Mohammedans who are increasing at a greater rate than the Hindus are influenced by the caste system and other Hindu characteristics. The oldest and most primitive of all these religions is that of the Animist. From the Animist to the Hindu is, however, a great step, the chief characteristics of the Hindu faith being the belief in a large number of gods, in the caste system, and in the cow as a sacred animal. Buddhism, Jainism and the religion of the Sikhs can be held to be almost offshoots of the original Hindu faith, and in fact, other beliefs which can be held to differ far more than Buddhism from Hinduism are regarded simply as sects or offshoots of the original Hindu faith. Of recent years the hostility between the Hindu and the

Moslem has sometimes seemed to be considerably on the decrease, but after the partition of India in 1947-48 there were formidable outbreaks of religious conflict especially in Bihar and the Punjab. Whereas, however, there are innumerable sects and schisms amongst the believers in the Hindu faith, there are but two sects amongst the Muslims—the Sunnis and the Shīahs. The Sunnis in I. are greatly in the majority. The original Moslem pop. was found amongst the Mongols and Pathans who invaded I. conquering races, and even to the present time it is possible clearly to distinguish the descendants of these conquering races who were originally Moslem, from the converts of the conquered race who followed the faith of the conquerors less from religious conviction than from the desire to better their lot, and whose descendants since have become as fanatical as the descendants of their previous conquerors. The majority of Buddhists are found in Burma. Most of the Parsis are in Bombay (in 1911 there were 89,500); of the Sikhs over 3,000,000 are in Madras, Travancore, and Cochin. The Indian Christian pop. of Bombay is over 320,000; and there are some 1,000 Jews there. In the Native States the totals (in 1931) were: Hindus, 61,467,000; Muslims, 10,857,000; Buddhists, 94,000; Tribal, 2,501,000; Indian Christians, 2,430,000; Sikhs, 1,115,000; Jains, 799,000; Parsis, 13,000; and Jews, 3000.

**HINDU PHILOSOPHY.** The Indian mind, as is evident in Sanskrit literature, is strongly disposed to metaphysical speculation, and this tendency may be seen in the old religious lyrics. In the later age of the hymns the pantheistic idea becomes dominant and finds its outlet in cosmogonic speculation, becoming fully developed in the Brāhmana period. The fundamental conception of this doctrine is expressed in the two synonymous terms *brahman*, originally 'power of growth,' then 'prayer,' or 'devotional impulse,' and *ātman*, 'breath,' 'self,' 'soul.' The recognition of the essential sameness of the individual souls emanating all alike from the ultimate spiritual essence (*parama-brahman*) involved difficulties for speculative minds, which turned for a solution of their problems to metempsychosis (*samsāra*), speculations which were not approved by the great body of Brāhmanas engaged in ritualistic practices. The body of treatises propounding the pantheistic doctrine, the Upanishads, were, later admitted into the sacred canon as appendages to the ceremonial writings, the Brāhmanas; and they thus form literally 'the end of the Veda,' the *Vedānta*, but their adherents claim this title for their doctrines in a figurative rather than a material sense, as 'the ultimate aim and consummation of the Veda.' It is difficult to determine the time when the so-called *Darśanas* ('demonstrations'), or systems of philosophy, were first formulated; but they certainly developed from the tenets enunciated in the Upanishads. Among the different systems six are generally recognised as

orthodox as being consistent with the Vedic religion: *Purva-mīmāṃsā* and *Uttara-mīmāṃsā* (*Vedānta*); *Sāṅkhya* and *Yoga*; *Nyāya* and *Vaiśeṣika*—each pair being more closely related to each other than to the rest. See further under SANKHARA; SĀṆKHYA; SANSKRIT LANGUAGE AND LITERATURE; VEDĀ and VEDISM; VEDĀNTA, UTTARA MĪMĀṂSĀ, or UPA-NISHAD; VĪSHIṢṬ; and YOGA. For the tenets of the two great anti-Brahmanical sects, the Jānas and Buddhists, see under JAINISM; BUDDHA and BUDDHISM.

**LANGUAGE.**—Today the very speech of the people in I. and Pakistan has become a matter of bitter communal dispute. Most of the peasants continue to talk the speech of their fathers but the literate minority and politically-conscious individuals and students argue about the rights and wrongs of the 'Hindu-Urdu controversy.' The sub-continent possesses hundreds of languages and also over 500 dialects; but when tribal idiom and local variants have been eliminated, we have some 15 major or literary languages, some alike, and some, especially the Dravidian south, very different. But the Hindi-Urdu advocates can rightly claim that so far as the ordinary person, especially in the N., is concerned, the only common language is bazaar Hindustani—a pidgin form of mixed High-Hindi and Urdu, which together constitute the same language written in different scripts, and compose the natural speech of nearly 260,000,000 people. This is also the literary language of 140,000,000 people, and the third largest language in the world. Unfortunately this bazaar Hindustani is a basic tongue, ill-adapted for the expression of ideas more complex than simple direction and marketing. Meanwhile Eng. remains the normal language of communication between the better educated Indians from all parts of the sub-continent in a very similar way to that in which Lat. in the Middle Ages was the *lingua franca* of the nobility and ecclesiastics all over Europe. But just as the Lat. of the Middle Ages was far removed from the classical Lat. of the schools, so the Eng. of I. shows signs of becoming a very different tongue from the Eng. of England to-day. The difference is due to ignorance, historical circumstance, and natural development. There remain, however, a large number of able Indians—business and professional men—who use Eng. with the greatest facility, but use words and forms of speech which sound unfamiliar to the contemporary Brit. ear. The speed, and height of pitch and tempo in Indian speech in Eng. is its most constant quality, and the extreme form is found in Anglo-Indians (Eurasians), who all, to the non-Celtic ear, seem to speak like Welshmen.

Some 225 languages are recorded in linguistic surveys as vernacular in I. and Burma. Briefly, they may be divided as follows (1) W. Hindi, with its main dialect, Hindustani, in Urdu and Hindi forms; (2) E. Hindi; (3) The central group: (a) Punjabi (including Lahnda or W. Punjabi), (b) Sindhi, (c) Rajasthani,

(d) Gujarati, (e) Kashmiri (main dialect *Kashawari*); (4) *Pahari*, divided into E., W., and Central; (5) The E. group: (a) Bengali, (b) Bihari, (c) Oriya, (d) Assamese; (6) S. India group: (a) Marathi, (b) Saurashtri, (c) Hindustani. For further details on the languages of I. see *INDO-EUROPEAN LANGUAGES*.

**GOVERNMENT AND CONSTITUTION.**—The present govs. of I. and Pakistan are functioning under the Gov. of I. Act, 1935, but suitably adapted to meet the current needs. The framework of the new Constitution of I. has now been thoroughly discussed in the Union constituent committee of the Constituent Assembly and it is unlikely that there will be any major alterations in the draft Constitution between now and the time when the Constitution is estab. and operative. On the Constitution of Pakistan see *PAKISTAN*. The following is an analysis of the Constitution of the Union of I.

The Union of I. is, in spite of its name, a federation. The various governmental powers whether executive, legislative, or judicial, are distributed between the centre and the units of the federal union. The federation is, however, of the Canadian type rather than of the Amer. or Australian; the powers not allocated to the units belong as in Canada to the centre, whereas in the U.S.A. and Australia they remain with the units (see *FEDERATION*). The executive head of the union is a President, elected by an electoral college consisting of all the elected members of the central legislature and of the various state legislatures. The votes are weighted so that the voting strength of the central legislature shall be the same as that of the state legislatures put together. The President's term is five years, but he is eligible for re-election. He can be removed by impeachment for violation of the Constitution. As in Britain, the president (like the king) is a constitutional head acting on the advice of ministers responsible to the legislature. The relations between the President and his ministers are much the same as between the king and his ministers in Britain. There is a Parliament for the Union consisting of the President and of two Houses, the Council of States and the House of the People. The Council of States, or Upper House, consists of not more than 250 members. Each state sends one representative for every million of the pop. for the first 5,000,000, and one additional representative for every additional 2,000,000. The election is indirect through the state legislatures. The Council of States is a permanent body not liable to dissolution but one-third of the members retire every second year. The House of the People, whose normal life will be five years, consists of not more than 500 members. Election is direct, and on the basis of adult suffrage. There is to be not less than one representative for every 750,000 of the pop. and not more than one for every 500,000. In previous constitutions there were separate electorates for such minorities as the Moslems, Sikhs, and Christians. This is now abolished, but seats are re-

served on the pop. basis for Moslems, the scheduled castes, certain aboriginal tribes, and, in Madras and Bombay, for the Christians as well. The question of reserving seats for the Sikhs remains to be decided, and there is a feeling among certain sections that even the system of reserving seats for religious minorities is inconsistent with the idea of a secular state. But, whether these proposals are ultimately retained or not, the electorate will in all cases be joint. There is no special reservation of seats for Anglo-Indians, but the President may nominate not more than two members of the community to the House of the People. Any bill, except a money bill, may originate in either House; it is to be passed by both Houses and assented to by the President before it can become law. If there is a conflict between the two Houses, the President must summon a joint session, and the bill, with such amendments, if any, as are agreed to by a majority of the members of both Houses, is deemed to have been passed by both Houses. There is a special procedure for money bills. The various subjects of legislation have been enumerated as exhaustively as possible in three lists: List I. or the Union List, List II. or the State List, and List III. or the Concurrent List. Any Union law on a subject in the concurrent list overrides any State law on the same subject in the event of any conflict between the two. The Union List contains over 90 entries, including such subjects as defence, external affairs, citizenship, posts and telegraphs, railways, shipping, airways, broadcasting, and atomic energy. The State List contains about seventy entries and includes justice (excepting the Supreme Court), police, local gov., agriculture, public health, and education. The Concurrent List contains about forty entries, and includes such subjects as criminal law, criminal and civil procedure, marriage and divorce, contracts, trade unions, and welfare of labour. Residual powers are allocated to the Centre. In circumstances requiring immediate action when Parliament is not in session, the President has a limited power to make Ordinances, which have the same effect as an Act of Parliament, but must be laid before both Houses as soon as Parliament meets. There are also provisions on emergencies. If the President is satisfied that a grave emergency exists, which threatens the security of I. by war or domestic violence, he may make a proclamation to that effect, and thereupon the Union Parliament is empowered to make laws even in respect of the matters enumerated in the State List. Although the Constitution is of the federal type, there is not a double chain of courts, one to administer federal law and the other to administer state laws. All the courts form a single hierarchy, at the head of which is the Supreme Court of the Union. Immediately below the Supreme Court are the State High Courts, and below them are the subordinate courts of each state. Every court in this chain will, subject to the usual pecuniary and local limits, administer the whole law of

the country, whether made by the Parliament of the Union or by the State Legislatures. The Supreme Court has exclusive original jurisdiction in disputes between the Gov. of I and one or more States or between two or more States *inter se*. It has also an appellate jurisdiction over the State High Courts in all cases involving questions of law as to the interpretation of the constitution and in certain other types of cases. Broadly speaking, its appellate jurisdiction corresponds to that exercised by the Privy Council of Britain before the Indian Independence Act came into force. It is further clothed with a special jurisdiction for the enforcement of the constitutional rights guaranteed by the constitution.

**Indian Civil Service**—The service that carried on the work of governing India in the time of the British occupation. It also included the public works, forest, and telegraph departments, though strictly these did not belong to the Indian Civil Service. The service was limited to about 1200 members appointed by the Secretary of State for India. Vacancies were filled by open competition every summer in England; the examination being the same as for Class I of the Civil Service of England (later known as Administrative Grade). The successful candidates had to pass one or two years' study in England, and pass an examination in riding and an examination in the Indian Penal Code and Code of Criminal Procedure, the principal vernacular language of the provinces to which they were assigned, and the Indian Land Act. In addition the optional subjects were Hindi and Mohammedan Law, Sanskrit, Arabic, Persian and Burmese. The pay began at about £720 a year, and candidates could secure high positions as judges and administrators. After twenty-five years of service a pension of not less than £1000 a year was given. Under the terms of Command Paper 7192 of Aug. 1947 members of the Indian Civil Service were given the option of continuing to serve the Govs. of I and Pakistan or retiring with compensation. Pensions and compensation alike are paid under arrangements made with the Govs. of I and Pakistan. Of the 1200 officials of the service there were more Indian than British (629 Indian and 500 British in 1943). Many British civil servants are still serving in India or Pakistan. See Sir E. A. H. Blunt *The Indian Civil Service, 1937*, also L. S. O. Malley, *The Indian Civil Service, 1901-1930*, 1931.

**INDIAN LAW**—The laws of British India are in part universally applied and in part applied only to certain classes. There is a right of appeal to the Privy Council in England, while high courts are held in the Provinces of Madras, Bombay, Bengal, Agra, Bihar, Punjab, Central Provinces, and Berar. These courts had (1943) 11, 11, 18, 11, 10, 11, and 6 judges, respectively, while the N.W. Frontier Province, Sind, Coorg, Ajmer-Merwara, and Baluchistan had judicial commissioners. The high court of Calcutta was up to 1948 the highest judicial authority for Assam, but in April of that year a separate high court was set up for Assam. In descending

order of authority are the courts of session for criminal cases and the courts of magistrates (first, second, and third grade). For Delhi the high court of Lahore was formerly the highest judicial authority, but there is now a high court at Lahore (see PAKISTAN) and also at Karachi, and at Dacca, besides a judicial commissioner's court at Peshawar. In the lower civil courts each province has acts and regulations peculiar to itself and usually a sessions judge presides or a district judge with subordinate judges and *munsifs* below him. There are revenue courts presided over by revenue officers, and a number of small courts for trying minor cases. All cases pertaining to family relations covering inheritance, marriage, adoption, etc., are judged according to whether the parties are Hindu, Moslem, or Christian. The criminal law, however, until 1947 was part of the King's jurisdiction and some branches of the Hindu law had been prohibited by English law. The laws of the Hindus and the Moslems are both of religious origin. The former is derived from the Vedas and its interpretation the Veda itself being believed to be divinely inspired, but the date of the revelation and the person to whom it was revealed are unknown (see *Indian Literature* below). The main features of Hindu law are the rigid caste system and the inviolability of the family. See CASES. Buddhist law is more secular and omits many of the earlier regulations of the Hindus with regard to women and the family. Mohammedan law is also religious in intent, as Mahomet is believed to have been divinely inspired. The Mohammedan laws of inheritance prevail in Pakistan and in Muslim districts of the Dominion of India, whereby all but a third of a person's property is distributed among his descendants in a manner prescribed by the Koran. The proportions of the distribution, however, vary according to whether the interpretation followed is that of Hanafi or of Shafi. The Hanafi code is the more prevalent in India. The civil judges and magistrates in Indian courts are mostly of Indian nationality, while in the higher courts also there is a large proportion of Indians.

**EDUCATION**—The system of education which exists in India at the present time owes its existence entirely to the British Government, but it has always been found to be most successful when, as far as the natives are concerned, it has been based upon some system previously set up by tradition or by the efforts of the natives themselves. From the earliest days I cannot be said to have been a primitive country, it had its system of education in its own peculiar literature, at a time when its future European conquerors were wrapped in the mists of ignorance themselves. We find traces of Indian literature and education as far back in the history of that country as we can go, and many of the institutions of which we find evidence are similar to the early educational institutions of Europe and Western Asia. The real impetus to education, i.e. modern education in India, came from the missionaries, who had

studied the vernacular in order the more easily to continue their work, and who aimed also at the teaching of Eng. to the natives, in order that they might attain to the culture of the W. After a number of colleges had been estab. in I., the gov., after a long report had been made to them, estab. three univs. one at Calcutta, another at Madras, and a third at Bombay. This was also accompanied by a scheme of local education which was, in principle, very thorough, and which extended throughout every prov. Schools receiving gov. aid were set up everywhere, and a properly graduated system of education which extended from the elementary school to the univ., was estab. A system of State Scholarships existed by which it was possible for a boy to pass from the vil. school to the univ. There were also state scholarships awarded by local govs. and by the Gov. of I., to enable the holders to study in the United Kingdom for two or more years. In recent years the desire for secondary education and a univ. course was, amongst a certain class, very great; but (1931) in the primary schools less than 5,000,000 attended out of a total pop. of nearly 340,000,000 (1931 census). Some remedial steps were taken and a permanent grant of nearly £4,000,000 was made annually for primary schools. Technical schools and industrial schools were set up all over the country. Engineering, veterinary, and agric. colleges have done much good work, and have been very largely attended.

The returns made in the census of 1931 are as follows:

	Literate	Illiterate
Males	23,969,751	129,808,571
Females	4,169,105	138,354,143

(these figures exclude persons aged 5 years or under and some 3,000,000 persons not enumerated by literacy). The census of 1911 shows a good increase of literates during the inter-census period 1931-11, the percentage of literates being 12.2 (1941) compared with fewer than 7 per cent. in 1931.

The total expenditure on education in 1911-42 was £23,145,000 (or Rs. 3,086 lakhs).

In the dominion of I. education is undergoing great expansion in accordance with plans for post-war development prepared by the Central Advisory Board of Education in 1944. It is estimated that these plans, which will modernise all branches of education, will take 10 years to complete. An All I. Council for technical education has surveyed the needs of the country as a whole, and the Central Gov., in co-operation with the prov. govs., has sent abroad some 1400 scholars for higher technical training and research. Reorganisation of 54 existing technical institutions and the estab. of 160 others are contemplated in the prov. five-year plans. Special provision is being made for the training of high-grade engineers and technologists; and the gov. proposes to estab. central higher technological institutes, at or near Calcutta, and Bombay, each with facilities for 2000 undergradu-

ates and 1000 post-graduates. (See also PAKISTAN.)

There are nine univs.: Calcutta (founded 1857), Madras (1857), Bombay (1857), Punjab (1882), Patna (1917), Nagpur (1923), Andhra (1927), Agra (1927), and Utkal (1943). There are also five unitary teaching and residential univs.: Allahabad (founded 1887), Lucknow (1920), Dacca (1921), Delhi (1922), and Annamalai (1929); two denominational univs.—the Hindu Univ. at Benares (1916), and the Muslim Univ. at Aligarh (1920); and three univs. in Indian States—Mysore (1916), Hyderabad (Osmania) (1918), and Travancore (1937). At all the univs., except that in Hyderabad, teaching is mostly in Eng.; at the Osmania Univ. it is in Urdu. In some provs., secondary and intermediate education is controlled by Boards; in 1942-43 there were seven of these Boards. Educational institutions are divided and described as 'recognised' and 'unrecognised,' according as they conform or otherwise to the standards prescribed by the Dept. of Public Instruction. There are approximately, in what was formerly Brit. I., 219,200 'recognised' institutions with 13,258,000 scholars and 37,000 'unrecognised' with 701,000 scholars.

**Broadcasting**—All I. Radio is a Dept. of the Central Gov. which controls broadcasting in I. There are 9 stations and 15 transmitters in operation. There are also 7 receiving stations in operation at Bombay, Calcutta, Delhi, Madras, Peshawar, Dacca, and Trichy.

**SOCIAL CHANGES IN THE VILLAGE.**—Various factors have made for changes in the Indian vil. in the last decade or two—education, a period of prosperity or adversity, the services supplied by the gov., the univ. the motorbus, and the propinquity of a large tn. In the eyes of those who have known I. in the days of the Brit. Raj, the psychological changes at least seem at first sight mostly for the worse. Many good judges think that litigation has increased; many comment on the increase of corruption, and some, as did Gandhi, deplore the growth of the acquisitive spirit; the spread of the communal virus is only too evident and hardly counterbalanced by the blind desire for freedom. This change has affected all the traditional forms of authority, and is tending to narrow the gulf, often still very wide, between those above and those below. The Hindu villager's almost crazy fear of pollution at the hands of the untouchable is or has been matched by an almost superstitious reverence for the Brahmin. But as the untouchable becomes more human so does the Brahmin become less divine. In the Hindu vil. caste gives degree an added force. But the narrowing of the gulf between Brahmin and untouchable suggests that the force is weakening and that caste is relaxing its age old hold on Hindu society generally. The two tests are food and marriage. So much weaker now are the barriers due to food that amongst those who accept European ways of life inter-dining is universal, irrespective of caste or creed—though difficulties still remain

where the difference is of both caste and creed. Marriage is a more serious affair, and till recently it presented an almost insuperable barrier to lovers divided by caste or creed. Marriage is still not common between Brahmin and non-Brahmin, or between followers of different creeds, but amongst the intelligentsia the barrier is less formidable. But in the vil. the food and marriage barriers are as strong as ever and communalism has done nothing to weaken them. The sanction behind caste is a religion so ancient, and all embracing that any social change is difficult without its assent. On the purely material side there are many changes for the better. The 300 per cent rise in prices which set in sharply in 1912 put more cash into the peasant's pocket than ever before and he wisely used it to pay his debts and redeem his land. For the first time for at least two generations debt was no longer a millstone round the peasant's neck. Wherever the peasant is prosperous or the tie with the Army was strong change is evident in the sphere of habit and fashion. Thus in dress lighter materials have replaced the heavier mill-made cloth of homespun, silk has replaced cotton, heeled shoes have replaced slippers. One gold earring is worn in place of many and the nose-ring and anklet have been renounced. In the house the brick floor is found to be cleaner than the old-fashioned floor of mud plaster. Furniture is more elaborate and cooking vessels more numerous. Some of the girls are even giving up the purdah for the modes of the W. Whence, in fact, most of the new ways have their origin; as too, perhaps the slackening in religious observance.

**OCCUPATIONS OF THE PEOPLE.**—The great mass of the pop. of I. is occupied in agric. work. This is not to be wondered at in a country where the accidents of birth and bp. combine to make it difficult for the people to do anything other than follow the chosen occupation in a given place. Each Indian vil. is practically self-contained, and as far as possible the gov. provides that the land shall be held by peasant proprietors. The bulk of the pop. lives in the vils., and the caste system tends to crush any natural ambition which a native may have. Further, the differences of race and religion tend to make it difficult for any native to emigrate from place to place as his ambition dictates. The vast majority of the natives are contained in the vils., and are self-supporting. They engage in cattle and sheep breeding and the occupations of the country. The material and the implements used are usually manufactured by the natives in the vils. themselves. The present age has seen, however, a great change come over some parts of I. In the W., for example, large cotton factories have been set up, whilst the manuf. of jute is one of the staple industries of Calcutta. This has necessitated the founding of factories, and both industries have taken a strong hold of the natives. Other indigenous industries are silk-rearing and weaving, shawl and carpet weaving, wood-carving, and metal-working. In Assam and the lands

of the lower Himalayas many of the natives are engaged in tea-growing. Agriculture, however, still remains, and probably will remain, the greatest of all the industries of I., its most important branch being the tea-industry, which employs about 1,000,000 workers. The development of the seaports and the increased demand have caused a great change to come over the I. that in pre-Brit. days exported only the spices, cottons, fabrics, and other luxuries which the W. demanded. Wheat and rice are exported nowadays in huge quantities; raw cotton, oil, seeds, raw jute, tea, opium, hides, and indigo are amongst the next most important of all the exports of I., to which can be added manufactured cotton goods, hardware, machinery, clothing, and coal. Through the initiative of Lord Linlithgow, an E. Group Supply Council was formed during the Second World War for the supply by various Empire countries of munitions to the imperial forces in N. Africa, the Middle E., Malaya, and elsewhere. This great scheme of making munitions E. of Suez was based on I. which country thus had an opportunity of securing a large share of in a lucrative trade.

**Agriculture.**—The total number of the pop. supported by agriculture, including forestry and the raising of livestock, was according to the census of 1931 about 110 m. In every prov. there is a dept. of agriculture. There are staffs of experts and a central staff, with a fully-equipped central station, research institute, and college for post-graduate training of private students and of those who have completed the agric. course in prov. colleges; a civil dept., veterinary dept. for the prevention and cure of cattle diseases, and a dairy research institute. Following the recommendations of the Royal Commission on Agriculture, an imperial council of agric. research was set up by the Gov. of I. with the object of promoting agric. and veterinary research throughout I. The production and introduction of improved strains of crops is still the chief feature of the work of agric. depts. although progress in other directions is now evident.

The chief crops and the production in the year 1913-41 were as follows:

Crop	Acres sown	Field (tons)
Rice . . .	91,117,000	30,664,000
Wheat . . .	33,961,000	9,741,000
Sugar-cane . .	4,231,000	5,848,000
Tea . . .	837,000	1573,773,600
Cotton . . .	17,127,000	13,626,000
Jute . . .	701,000	1,541,000
Linseed . . .	3,353,000	381,000
Mustard . . .	5,361,000	921,000
Sesamum . . .	4,119,000	447,000
Castor seed . .	1,543,000	140,000
Ground-nut . .	9,808,000	3,323,000
Coffee . . .	198,000	17,000
Rubber . . .	143,500	186,684,000

<sup>1</sup> Yields of tea and rubber are given in lb

<sup>2</sup> Cotton and jute in bales of 400 lb.

The following table shows crop estimates (1947-48) for the dominion of I. :

Crop	Area (acres)	Yield (tons)
Wheat . . .	20,207,000	5,316,000
Rice . . .	59,850,000	18,760,000
Sesamum . .	3,704,000	333,000
Cotton . . .	10,932,000	12,116,000
Rape and Mustard . .	4,389,000	782,000
Linseed . . .	3,338,000	364,000
Ground-nuts .	9,974,000	3,454,000
Maize . . .	7,755,000	2,111,000

<sup>1</sup> Bales

Great benefits have accrued from irrigation, the development of which began a

great effort, it is hoped, will yield another 2,000,000 tons of food a year.

The livestock census in Brit. I. (excluding the United Provs. and Orissa) for 1940 is the most recent available: Cattle, 87,674,800; buffaloes, 22,115,500; sheep, 25,183,000; goats, 30,212,000; horses and ponies, 1,000,900; mules, 40,270; donkeys, 1,157,100; camels, 428,600; pigs, 1,955,400; poultry, 61,128,300.

The lands under the control of the prov. forest dept. are classified as 'reserved forests' (forests intended to be permanently maintained for the supply of timber and pulp, or for the protection of water supply or the prevention of soil erosion), 'protected forests' and 'unclassified'.

*Indian State Railways*

#### WOMEN SPINNING COTTON YARN IN AN INDIAN VILLAGE

century or more ago under Brit. engineers. In the past two decades the Lloyd Barrage (Sukkur) and canals (Sind), the Sutlej Valley and Havell schemes (Punjab), the Sarda Canal (United Provs.), and the Mettur Dam (Madras) projects have been successfully completed, and a sixth canal, the Thal, is being constructed. The total area under irrigation is nearly 60,000,000 ac.

For centuries I.'s primitive, wasteful farming methods have left her vast pop. at the mercy of recurrent famine. The Indian Gov. plans to reclaim six million idle acres by tractor in an effort to grow its own food. This acreage represents ten per cent of the cultivable land now lying idle and is planned to reclaim the six million acres within seven years, while 4000 tube wells are to be sunk at an outlay of £205,000,000, which will in time be more than recovered from the soil. This

forest land. Reserved forests cover about 72,000 sq. m. (Central Provs., 19,422 sq. m.); Madras, 15,620 sq. m., Bombay, 10,523 sq. m., Bengal, 6,935 sq. m., Assam, 6,680 sq. m., United Provs., 5,213 sq. m. Protected forests cover 6,569 sq. m., and 'unclassified' 16,630 sq. m. Total area of forests, 95,157 sq. m.

*Minerals.*—The chief minerals are coal and petroleum. The Damodar Valley in Bihar and Bengal contains the greater part of the coal resources of I., and in quality it is suitable for industrial development. In 1938 the output of coal was 28,342,906 tons. The output of crude petroleum was 87,000,000 gallons. Other minerals are: salt (14 million tons), manganese ore (967,929 tons), iron ore (2,743,675 tons), saltpetre, (148,824 cwt.), gold (331,000 oz.) nearly all from Mysore. Monazite, chromite, tungsten ore and ilmenite are increasing in importance.

**Manufactures.**—The chief indigenous industry, after agriculture, is the weaving of cotton cloths. Other important indigenous industries are silk-rearing and weaving, shawl and carpet weaving, wood-carving, and metal working. These are mostly surviving anc. vil. handicrafts. In 1939 there were 10,100 factories subject to the Indian Factories Act, employing 1,751,137 persons (including 239,414 women and 9403 children) (no child may be employed for more than 30 hrs. a week). There were in the same year 420 cotton mills in I., including the Indian states, mostly in Bombay and Ahmedabad. In 1939-40 production was 1235 million lbs of yarn and 878 million lbs. of woven goods. Excluding Indian states and gov. factories there were in 1939-40: 106 jute mills (mostly in or near Calcutta), 110 rice mills, 58 tanneries, 150 tile and brick factories, 16 shipbuilding yards or workshops, 1000 tea factories, 110 foundries, 19 iron and steel smelting and steel rolling mills, 266 sugar factories, 293 oil mills, 112 motor and coach-building works, 168 tobacco factories, 16 paper mills, 6 breweries, 20 lac factories and 108 silk mills.

The latest available statistics (1949) of mills, factories etc., are given as follows for I. as a whole, but excluding Indian States and gov. factories:—

Industry	Establishment	Workers
Cotton spinning and weaving mills . . .	819	439,000
Jute mills . . .	109	304,000
Cotton-spinning and pressing factories . . .	1861	124,000
Railway and tramway workshops . . .	97	51,500
Rice mills . . .	1314	48,600
General engineering . . .	464	16,500
Electrical works . . .	125	11,700
Printing, bookbinding etc. . .	687	31,300
Tanneries and leather works . . .	61	11,100
Jute presses . . .	65	11,700
Tile and brick factories . . .	168	18,200
Shipbuilding and engineering . . .	16	20,500
Tea factories . . .	1061	67,100
Foundries . . .	105	6,300
Iron and steel smelting and steel rolling mills . . .	21	47,600
Saw mills . . .	64	5,600
Petroleum refineries . . .	4	2,600
Woollen mills . . .	15	9,200
Sugar factories . . .	330	86,000
Stone dressing . . .	11	100
Oil mills . . .	291	16,600
Kerosene tinning and packing works . . .	36	5,700
Motor works and coach building . . .	117	8,000
Tobacco factories . . .	171	22,500
Paper mills . . .	17	10,000
Lac factories . . .	22	2,300
Silk mills . . .	112	5,500

With regard to cotton spinning and weaving, the number of spindles in all I.

in 1941-42 was over 10,000,000. The production of yarn in that year was 1,577 million lb. and of woven goods, 1093 million lb.

**FINANCE.**—By the system of decentralised finance initiated by Lord Mayo in 1870 the Central Gov. assigns to the prov. govts. a fixed share of the revenue collected by them under specified heads. As a result of the Montagu-Chelmsford reforms the finances of the Central Gov. and those of the provs. were almost completely separated, the provs. retaining all income from land revenue, irrigation, excise, stamps etc., while the Central Gov. had the income from communications and income tax. On the introduction in 1937 of prov. autonomy, there was a further change, and from April 1 of that year the provs. have had a definite share of the proceeds of income tax; and a prescribed share of the proceeds of the excise duty on jute is assigned to the jute-producing provs. Some of the prov. govts. receive ann. grants-in-aid from the Central Gov. and a share of the additional duty on imported salt. The Central Gov. bears all expenditure on defence while the provs. are responsible for the charges of their own services and also for expenditure on finances. The provs. govts. frame their own budgets, can raise loans and impose additional taxation.

Land revenue is the oldest and the most important source of revenue. It is levied according to an assessment on estates or holdings. In the greater part of Bengal, Bihar, and Orissa, and in some dists. of Madras, and in Agra and Oudh, the assessment was fixed permanently at the end of the eighteenth century, while it is fixed periodically at intervals of from 12 years to 40 years over the rest of I. The gross land revenue in 1913-14 was nearly £23,000,000. Opium is a declining, though still large, source of revenue. In former Brit. ter. the cultivation of the poppy for opium is confined to the United Provs., though owing to war requirements, the area under poppy was increased there. Opium is also produced under special supervision in the Central Indian, Rajasthan, and Gwalior States; and it is bought in its crude state by the gov. at fixed rates. In 1926 the Gov. of I. announced its intention to restrict export except for medicinal purposes and exports to foreign countries ceased at the end of 1935. The gross revenue in 1913-14 was about £600,000.

The first budget (Dominion of I.) presented to the Dominion Constituent Assembly (Feb. 1918) showed a total deficit of Rs. 268.5 million (£20.1 million). After a contribution of Rs. 45 million from the railway surplus and new taxes the remaining deficit of Rs. 100 million (£7.5 million) was covered by taking direct to revenue the advance payments of corporation tax, leaving a final deficit of Rs. 10.9 million (or £817,500). The first full year's railway budget of I. announced a surplus of Rs. 100 million (£7.1 million). Estimated revenue for 1918-49 was Rs. lakhs 2,35.02. Chief heads: customs, 81.75; central excise,

34.00; taxes on income, 92.13. Estimated expenditure, Rs. lakhs 2,57.38. Chief heads: defence services (net), 1,21.04; debt services, 41.16; civil administration, 31.56; total revenue, £176,203,000; expenditure, £193,033,000.

Budget estimates of prov. govts.: (1948-49): Madras: revenue, 14.55.91, expenditure 55.94; Bombay, 11.38 and 41.02; W. Bengal, 31.19 and 31.97; United Provs., 45.47 and 50.57; E. Punjab, 11.13 and 17.82; Bihar, 21.57 and 20.09; Central Provs., 15.75 and 15.74; Assam, 13.12 and 11.61; and Orissa, 6.82 and 7.51. Total, revenue, Rs. lakhs 242.77 (£142,077); expenditure Rs. lakhs 258.27 (£193,702).

EXPORTS AND IMPORTS.—The following tables give the foreign trade of I. in 1944-45 (values converted at Rs. 13½ to £1).

Exports	Value, in thousands of £
Jute, raw . . . . .	5,625
Jute, manufactured . . . . .	15,318
Cotton, raw . . . . .	5,776
Cotton yarn . . . . .	9,472
Tea . . . . .	29,548
Seeds . . . . .	7,900
Hides . . . . .	6,298
Metals and ores . . . . .	1,055
Wool and woollens . . . . .	1,223
Lac . . . . .	3,560
Milk . . . . .	2,103
Fruits . . . . .	3,444
Coir goods . . . . .	729
Spices . . . . .	876
Rubber (crude) . . . . .	952
Dyes . . . . .	376
Hemp . . . . .	523
Coffee . . . . .	184
Tobacco . . . . .	723
Imports	
Cotton yarn (and manufactured)	2,759
Cotton, raw . . . . .	18,000
Grain and pulse . . . . .	6,009
Mineral oils . . . . .	60,527
Machinery . . . . .	12,225
Iron and/or steel . . . . .	2,672
Other metals . . . . .	2,146
Motor cars and other vehicles . . . . .	1,334
Chemicals . . . . .	7,006
Paper . . . . .	2,181
Instrumenta, electrical . . . . .	1,916
Dyes . . . . .	5,912
Provisions . . . . .	9,049
Spices . . . . .	1,154
Wood and timber . . . . .	17
Hardware . . . . .	2,767
Wool and woollens . . . . .	7,868
Alloys . . . . .	812
Rubber (manufactured) . . . . .	1,081
Tobacco . . . . .	2,177
Glass . . . . .	418
Seeds . . . . .	1,084
Tea chests . . . . .	1,128
Quarry products . . . . .	4,053

On the basis of the trade returns for 1944-45, 6.34 per cent of Indian exports went to the United Kingdom and other parts of the Brit. Empire, and 34.66 to foreign countries. The United Kingdom took 29.24 per cent of these exports,

Ceylon, 9.08 per cent, Australia and New Zealand, 8.60 per cent; and the United States of America, 21.22 per cent. Brit. imports accounted for only 38.81 per cent of the total imports as against 61.19 per cent for foreign countries. The United Kingdom sent 19.94 per cent of the total imports and Australia and New Zealand 5.11 per cent; while the United States sent 25.17 per cent, Persia 21.53 per cent, and Egypt 8.65 per cent. The total imports into the United Kingdom from I. in 1945 were valued at £86,410,000 and exports to India from the United Kingdom were £33,151,000.

In 1934-39 the number of ships engaged in the foreign trade which entered and cleared with cargoes at ports in Brit. I. was 7440, with a tonnage of 10,091,691, nearly 70 per cent of which was under the Brit. flag. The tonnage of vessels which entered with cargoes in the interportal trade of I. was 13,764,794 tons in 1939-40 and cleared 13,517.32 tons. The number and tonnage of vessels built or first registered at Indian ports for 5 years, 1936-40 was as follows: built, 213; registered, 284; tonnage 8996 and 35,970 respectively.

CURRENCY.—The monetary unit of I. is the Indian Rupee, the sterling equivalent of which is 1s. 6d. The coins in circulation are: silver, 1 rupee, equivalent to 16 annas; ½ rupee or 8 anna piece; ¼ rupee or 4 anna piece; nickel, ½, 1, 2 and 4 anna pieces; bronze, 1 pie, equivalent to ¼ anna, ½ pie equivalent to ¼ anna; 1 pie or ½ pie. The paper currency consists of Reserve Bank notes in denominations of Rupees 2, 5, 10, 50, 100, 500, 1000, and 10,000. A 100,000 rupees is called a lakh and is written thus: Rs. 1,00,000; and one hundred lakhs is called a crore and written: Rs. 1,00,00,000. A lakh of rupees when the rupee is 1s. 6d. is equivalent to £7500.

COMMUNICATIONS.—The development of the communications of I. have had a very marked effect upon the increase of trade. The improved system of roads, the increased use of the natural and artificial waterways, and the building of good and reliable railways have been of the greatest importance to industrial I. The great trns are linked together by good roads which are utilised for short distance traffic and even for places some hundreds of miles distant. The rivers, especially the Ganges, the Brahmaputra, and the Irrawaddy are used by the natives to take the produce of the interior to the seaports, whilst the canals also are well utilised.

Railways.—The most important development of all, however, is that of the railways. I. and Ceylon are connected by combined rail and steamer ferry. All the large trns. are linked up together, this having been done by means of good trunk systems for military purposes, and they are now used for purposes of trade. Every dist. of I. is served by a railway, and the thinly populated dists. have specially narrow-gauge light railways. Nearly 700,000 men are employed, and the whole system was thoroughly overhauled before the First World War and linked up

properly. Before partition, almost the whole of the Indian railway system was owned and worked by the Central Gov. There were some lines of minor importance owned by companies, some of which were operated by their owners and some by the Gov. There were also lines in which Indian states and dist. boards were interested. The mileage open for traffic (on March 31, 1945) was 40,509—about 50 per cent on the standard gauge (54 ft.) and 49 per cent on the metre gauge. The net earnings of the railways in 1944-45 were about Rs. 2,865,000 and the contribution paid from railways to general revenues was Rs. 221,000,000. On Aug. 15, 1947, 10,524 m. of railway were divided into two portions: 6650 m. of line in Sind, N.W. Frontier Prov., W. Punjab, and E. Bengal were allotted to Pakistan, and the rest, comprising 33,865 route m., to I. Locomotives were so divided as to ensure that each section had the type suited to its operational requirements. About 73,000 employees operated for Indian Railways after partition. At the end of 1940-41 there were over 102,000 m. of telegraph line carrying 528,000 m. of wire and 1500 m. of cable. There are over 9200 telegraph offices open for paid traffic in I. and over 21,000 post offices in the country. After 1947 there were twenty-three civil aviation companies with an authorised cap. of Rs. 42.2 crores. Air services were operated in 1947-48 on twenty-two routes covering 13,295 route m. by eight transport undertakings using 166 aircraft, 229 pilots, and more than 130 aircrew personnel. M. flown were 4,618,000, and traffic carried, eight million tons. The number of passengers flown was 136,800. There were sixteen daily services and forty-two weekly.

The wireless stations, maintained by the Indian Posts and Telegraphs Dept., numbered twenty in 1940, of which five were coast stations available for general public correspondence and the remainder inland. The same dept. operates the telephone system, though exchanges have also been estab. in Calcutta, Bombay, Madras, Karachi, and Ahmedabad by companies under gov. licence.

**Ports.**—The chief seaports are Bombay, Calcutta, Karachi, and Madras; lesser ports are Port Blair (Andamans), Calicut, and Trivandrum (Madras), and Surat (Bombay).

**DEFENCE.**—The partition of I. involved a div. of the armed forces between the two dominions on a territorial basis, and the result was a div. in the proportion of one-third to Pakistan and two-thirds to I. The armed forces of I. formerly contained a substantial Brit. element, but I. decided to nationalise her armed forces and only a small number of Brit. officers, mostly of the technical and specialist arms, were retained. After partition, regiments and formations of the Indian army, which for many years had consisted of sub-units comprising men of various castes and creeds had to be reorganised into regiments containing only representatives of their own dominion. From the end of the Second World War to Aug. 1947, the net

reduction in the strength of the Indian and Pakistan armies amounted to 1,048,772 men and women. Of these 32,677 were Brit. and Indian Pakistan officers, 12,177 were officers and auxiliaries of the WAC (I.), 49,024 were Brit. other ranks serving with Indian and Pakistan armies, and 1,333,570 were Indian and Pakistan ranks, including 64,321 civilians attached to the two armies. A total of 8668 army units were disbanded, sixty-one Indian State Forces units returned to the States, and eleven Nepalese contingent units returned to Nepal. The old Indian Army prior to Aug. 1947, was divided into three Commands—Northern, Southern, and Eastern. A fourth, Central Command, was raised during the war and disbanded when it was over. Of the Indian divs. which took part in the war eleven were disbanded, leaving three infantry divs., one armoured div., and one airborne div. On Aug. 15, 1947, the army was divided into the Indian Army and the Pakistan Army. The N. Command was allotted to Pakistan and the S. and E. Commands to I. A new Command, Delhi and E. Punjab Command, was formed soon afterwards. There has also been a considerable expansion of transport services. Other additions to the services were tank transporters, amphibians and sev. water transport companies. The army of Pakistan comprises six armoured corps units, eight and a half artillery regiments and thirty-four engineer units. Most infantry regiments of the old Indian Army with a Muslim majority were allotted to Pakistan after partition.

The Royal Indian Navy traces its hist. uninterruptedly from the early seventeenth century when the E. India Company's Marine was formed. Formerly styled the Royal Indian Marine, the service was reorganised between the two world wars on a combatant basis. In 1928 it hoisted the White Ensign for the first time and in 1934, following the passing of the Indian Naval Discipline Act, was redesignated the Royal Indian Navy. As a result of partition the navy was divided between the two dominions. To I. went 4 modern sloops, 2 frigates, 1 corvette, 12 minesweepers, 4 trawlers, a survey ship, and some auxiliary vessels, with a personnel of 200 of whom about forty-five are Brit. officers and 5500 ratings. Indianisation of the navy will be completed in 15 years. A large naval estab. is being constructed in Cochin (H.M.S. *Venduruthy*) which will include specialist training facilities in gunnery, communications, navigation, torpedo, anti-submarine, electrical, and radar branches. The Pakistan navy consists of two sloops, two frigates, four minesweepers, two trawlers, two motor minesweepers, and some harbour defence launches.

The Royal Indian Air Force had its inception in the recommendations of the Skeene Committee in 1926, and in 1932 the Indian Legislature passed the Indian Air Force Act, the first flight being formed the following year. In 1946 it consisted of nine fighter and two transport

squadrons with modern aircraft. On partition seven fighter squadrons and one transport squadron were allotted to I., and two fighter squadrons to Pakistan.

*Indian Army (1857-1947).* After the Mutiny of 1857, and when the Indian empire was taken over by the crown, it was decided that the European army in I. should be amalgamated with that of the crown. Formerly, in the days of the E. India Company's control, the army was organised on a presidential basis, a staff corps being formed in 1861 for each of the Presidencies. This system for a time worked well, but finally the old presidential system of organisation was done away with, and the whole Indian Army was reorganised under the command of a single commander-in-chief. The staff corps became the staff of the Indian Army, and the basis of organisation was one N. and one S. command, together with a separate command for Burma, all under the control of a commander-in-chief of the Indian Army. Previous to this, and during the gov. of Lord Dufferin, the incident usually known as the Peshawar scare (over the Russian occupation of that and another place in Afghanistan) took place, and led incidentally to the formation of the Imperial Service Corps. The princes of I. volunteered to give pecuniary aid to the gov.; this was at the time rejected, but they were later informed that a proposal to place a certain number of native troops in each state at the disposal of the gov., to be trained, drilled, and officered by Brit. officers, would be welcomed. This was done, and gave rise to the Imperial Service troops, whose value and efficiency were tested and proved. In 1939 the defence forces of I. comprised units of the Brit. Regular Army (60,000), the Indian Native Army (140,000), the Indian Army Reserve (35,000), the Indian State forces (about 35,000), the Auxiliary Force (about 24,000), and the Territorial Force (18,000). For police duties and frontier service the regular military was supplemented by frontier militia and local levies. The military forces were organised as the N., S., E., and W. Commands, and the Burma Independent Dist., there being a number of dists. and independent brigades in each command. The Field Army was organised in four divs. and five cavalry brigades. The Brit. Regular Army in I. was paid by the Indian Exchequer and was organised in divs. and brigades with the Indian (Native) Army in the proportion of one Brit. to three Indian battalions. The Artillery Corps at this time was 13,000 strong, organised into one field and six mt. regiments besides various small units—altogether a score of park batteries and a number of field and garrison artillery batteries, the latter with a proportion of Indian drivers. The tank corps units consisted exclusively of Brit. personnel. The Auxiliary Force was organised in 1920 as a second line to the permanent garrison, and was formed by voluntary enlistment of men of Brit. extraction. The Territorial Force, also organised in 1920, was a militia force, and, like the

Territorial Army of Britain, was intended to be a second line replica of the regular army in time of war. The Indian State forces were raised and maintained by the Indian States and trained under the supervision of Brit. officers. In the native army the composition of the regiments was very varied indeed. The troops consisted of men of all races and religions, and these varied naturally with the position of the command. In the ranks of the native army in I. were found Pathans, Sikhs, Punjabis, Mahrattas, Hindus, Gurkhas, together with representatives from almost every race to be found in I. The terms of enlistment were general, and although the native troops had not, up to 1939, ordinarily served overseas, nevertheless they enlisted for service within or without the Brit. empire, and could be taken overseas if necessary. During the First World War, 1,215,000 officers and men of the Indian Army were sent on service overseas from I., the number of Indian troops being 570,000. The total Indian casualties were over 158,000 (deaths, 73,132; wounded, 84,715). Between the world wars some native units served in Iraq and at colonial stations, their maintenance being defrayed by the Brit. exchequer. The infantry and cavalry of the old Indian Army were organised into double companies, each commanded by a Brit. officer, together with a Brit. junior officer. The native officers, risaldars in the cavalry and subahdars in the infantry, issued all orders to the native troops. The senior officer was called the risaldar-major, whilst to each half company was usually attached a junior native officer, who was called a jamadar. A reorganisation of the Indian Army was begun in 1921 to meet defects brought to light in the 1914-18 world war. This consisted of grouping regiments for training purposes, and in 1922 the system was carried a stage further by converting the groups into regiments in the case of the Indian Infantry and Pioneers. The chief reform, however, was that of 'Indianisation,' i.e. having units officered entirely by Indians and without any Brit. cadres. The Indian Territorial Army was also Indianised (see *The Army in India and its Evolution*, 1924, issued under the authority of the Gov. of I.). In the Second World War the Indian Army fought in Burma, N. Africa, Italy and the Middle E., winning over 5000 awards including thirty-one V.C.'s—an Empire record surpassed only by the Army of the United Kingdom. Exclusively recruited on a voluntary basis, the strength of the Indian Army at its peak was 2,250,000, a feature of this expansion being that of the Royal Indian Artillery, which was increased to 81,000 all ranks, and consisted of twelve mt., eleven field, seven anti-tank, two medium and twenty-nine anti-aircraft regiments. The airborne forces of the Indian Army took part in operations leading to the capture of Rangoon (May 3, 1945). The Indian Army's total casualties in the Second World War were 179,935 (killed, 24,338; missing, 11,754; wounded, 64,351; and

79 189 prisoners of war, chiefly on the Burmese front) By Sept 30, 1946, in the process of demobilisation over a million men had left the service the ultimate peace time strength of which had not been finally determined when the partition of I consequent on independence involved the complete reorganisation of the armed forces of I and also the disappearance of the old Indian Army.

**Royal Indian Navy**—In 1926 it was decided to establish a Royal Indian Navy (on a combatant basis) the nucleus of which was to be provided by the former Royal India Marine. This navy at the close of the Second World War, included six modern sloops, three frigates, two corvettes sixteen minesweepers a survey vessel and six modern trawlers. There were also a number of auxiliary vessels. In 1946 naval strength was reduced by demobilisation to 1000 officers and 10 000 ratings. It was decided in the same year to purchase three cruisers from the Royal Navy for the Royal Indian Navy.

**Royal Air Force of India**—Had its beginnings in the Indian Air Force Act (1932) the first flight being formed at Karachi in 1933. On March 12 1944 the King approved the designation of Royal in recognition of the war services of the force. In 1946 it consisted of eight fighter and two transport squadrons with modern aircraft. For the division of all the armed forces on the partition of the country see *Defence*.

**The Indian Princes (before the Partition of India)**—The Indian States numbered 562 of which 327 were relatively of very little consequence and only existed independently as the result of a historical accident. The chiefs on the Afghan frontier are in a different category compared with the Princes of I all being Moslems with a political gravitation towards Kabul and not to Delhi and as regards their internal administration they were to all intents and purposes independent. There are only seven of these border States having no important firm that of the Khan of Kalat with a wild and arid mt country of 75,000 sq m in Baluchistan and a pop. of 305 000 in the small state of Phulera on the Hazara border with an area of 34 sq m. Two of the chiefs the Mahar of Chitral and the Khun of Kalat, have the title of His Highness and a salute of guns. One of the most important is the new state of Swat founded in comparatively recent years by a descendant of Akhbar of Swat on the Peshawar border. Nepal is an independent state but it is not and never has been an Indian state. From the mt mass of the Pannus and Karakorum in the N where political I impinge on central Asia to Cape Comorin in the S a distance of 2000 m. It was possible to travel almost entirely through ter of the Indian princes without touching Brit I from Chitral (which was a Brit Protectorate) one would pass through Gilgit a dependency of Kashmir, thence the route would lie through small Rajput States in the Himalayas, past Simla to the Sikh State of Patiala in the Punjab plains, a country of prosperous

vills and stalwart fighting men, thence to the desert of Rajputana home of the blue blooded Rajputs and memories of ancient chivalry, then on to the sphere of the Marathas in Baroda and Indore secular rivals of the Rajputs. Thence into the great Muslim state of Hyderabad equal in area to Great Britain and then to Travancore with its unrivalled beauty of forest lands and lagoons, and so to Cape Comorin, fabled abode of the goddess Kunnari. In all the Indian states covered some two fifths of the whole of I and contained more than one fifth of the pop. Their subjects were Brit protected persons, not Brit subjects, and they were governed by hereditary rulers under the suzerainty of the Brit Crown. In the administration of internal affairs the authority of the Princes was limited by treaty relationships with the Paramount Power (Britain) and by usage and custom. Brit Indian law did not prevail nor could the Central Indian Legislature legislate for them. The Princes had no relations, however with foreign powers. The great majority of the States are now either merged in Provs of I or in Pakistan or have been integrated in groups or 'unions' so that very few preserve their old identity.

The manner of evolution of this type of autonomous or semi autonomous kingdom is a problem the solution of which is lurid in antiquity. Originating in Hindu political theory it has certainly been influenced by the Brahminical caste system which is at least 3000 years old. This scheme of life harmonised best with a gov in which the ruler administered a small ter with the assistance of a *darbar* or council of ministers, priests, military auditors and representatives of the *castes* or guilds. This *darbar* rule is best illustrated in the more ancient Rajput States of Central I and the oasis of the great Indian Desert some of these being tribal in origin. States like the Rajput *tribal* states and some of the *tribal* states of the S—Mysore, Travancore and Cochin—owed their centuries of existence to the support of the nobles and peasantry.

I obtain a clear view of the position of the states in the political fabric of I of today they must be seen in historical perspective. The long drawn tragedy of invasion the crash of empires and kingdoms the bitterness of religious feuds, are reflected in the evolution of I's minor kingdoms' (Sir Wm Barton). Hindu I in the tenth to eleventh centuries was fortunate up to a point in having found its defenders in the age of terror that was then impending. But for the Rajputs Hinduism would probably have been lost in the surge of Muslim invasion. Unaided the Brahmins could never have held the people to their faith. But although the Rajput cavalry, in 1191 hurled the Moslems back across the battle the victory gained only a brief respite. Bengal, Bihar, and Orissa fell before a handful of Afghan horsemen. A new kingdom was estab (1202), and Moham madanism prevailed until Clive's victory at Plassey in 1757. For the first four

centuries of Muslim rule the chief opponents, the Rajputs, short of man power, could not for long keep the field. Refusing, however, to admit defeat, they fled to the oasis of Rajputana, into the fastnesses of the central plateau N. of the Vindhya and to the peninsula of Kithiwar, and there they set up small kingdoms most of which later became part of the great Mogul Empire. On the central plateau many of the smaller Rajput barons, however, became feudatories of the Muslim kingdom of Malwa. The resistance of the Rajput rulers preserved the culture, traditions, and religion of the Aryan age. Most of them have survived the storms of centuries and form the bulk of the Indian states of to-day, proving the vitality of the political system they embody (see Sir Wm. Burton, *The Princes of India*, 1934).

The rulers of Indian States have not necessarily any religious or tribal connection with the majority of their subjects, thus, the Nizam of Hyderabad is a Moslem, yet most of his subjects are Hindus. The salutes accorded the Princes indicated their relative importance. Princes with a salute of eleven guns and more were addressed as His Highness. Yet some well known Indians of title, such as H. H. the Aga Khan (q.v.) and the late Maharajah of Burdwan, are not ruling chiefs. The Chamber of Princes was established in Feb. 1921 as a permanent consultative body on matters affecting the States, generally, or both them and Brit. I., or the Empire as a whole. In 1947 it consisted of over 100 rulers of States who were members *de jure*, and twelve rulers elected by 127 other States. Arising out of the Montagu-Chelmsford reforms most of the States were in direct relations with the Gov. of I. In recent years the policy was pursued of promoting co-operation in such matters as justice, police, and public health. In 1943 an extensive scheme was launched for improving the administrations of hundreds of petty States in W. I. by attaching them to large neighbouring States such as Nawanganagar and Baroda.

**HISTORY**—In a country of the great pop. and the diversity of language and race such as I., not unnaturally history becomes a matter of some complexity and difficulty, and it is only with the widest movements that this sketch of the history of I. is concerned. Indian hist., for all practical purposes, begins with the first invasion of I. by the Aryans, who came from the N.W. and who lived for some time on the S. slopes of the Himalayas before they finally entered the great Indo-Gangetic plain and drove back the Dravidian pop. into the real peninsula to the S. These invaders had a settled system of civilisation and a fixed religious system. They were well acquainted with the various arts, and above all they brought with them the *Rig Veda*, the Hindu hymnal that establishes the antiquity of their origin (see also RELIGION above and INDIAN LITERATURE and ART, below). They formed states in the great plain, and they built great cities, the sites of many

of these remain down to the present day (e.g., Benares, Aryan Baranes). Their social system divided them definitely into four divisions, the Brahmins, or the priests, the Kshatriyas, or nobles, the Vaisiyas, almost the modern middle class, and the Sudras, or serf class, composed principally of non-Aryan peoples who were the slaves of their conquerors. Gradually the civilisation and the religion of this people became corrupted and about the year 600 B.C. there lived the great reformer Buddha (q.v.). At the same time occurred the rise of Jainism, a religion which was founded by Vardhamana Mahavira, and has often been regarded as an offshoot of Buddhism. But Buddhism never superseded entirely the older faith of the Hindu, the Brahminism which had been introduced with the coming of the Aryans and although for a time Buddhism appeared to have gained the upper hand, ultimately the original religion became the more prominent. It is with the invasion of Alexander the Great (q.v.) that the real history of I. with relation to the outside world may be said to begin. Alexander's campaign was confined, however, to the Punjab and to Sind, and although he made no definite settlement we know that he planted cities and left garrisons behind him. On his death I. passed to Seleucus, Chandragupta, Emperor of I. of the Indus was contemporary with Seleucus. The two Emperors made an alliance, and for a time the relations between the Gk. and the native kingdoms were well established.

As records grow more certain and continuous, the very full periods in which great Indian dynasties acquired power over a large part of I. Thus, there are the Maurya Empire (c. 321-184 B.C.) with Chandragupta and Asoka as its outstanding rulers and there is the Gupta Empire (c. A.D. 320-500) the golden age of Hindu culture. But none of these Empires extended over the whole of I., and beyond their borders princes and chieftains powerful and weak were in constant rivalry and strife. Our knowledge of the system of gov. of Chandragupta is due to the fact that the ambassador to his court by Seleucus, Megasthenes, wrote an account of the court, gov. and institutions of I. The grandson of this great king was Asoka, the champion of Buddhism. From the inscriptions and rock edicts which Asoka caused to be placed throughout his empire we learn that he ruled practically the whole of I. with the exception of the extreme S. of the peninsula. During his reign Buddhism became the predominant religion but after his death, the empire began to decay, and near the beginning of the second century B.C. the Mauryan dynasty came to an end. Two other dynasties may be here noticed, the Sungas and the Andhras, but of neither is very much definitely known. The Gk. provinces of I. had in the meantime become independent kingdoms under Gk. rulers, and in the middle of the second century B.C. the W. Punjab became for a time part of the Parthian empire.

In the middle of the second century

B.C., tribes from Central Asia began to invade I. The first of these was known as the Sakas, who estab. themselves W. of Kandahar, and gave to the country the name of Sakastan. Another was the Kushan, and in the first century A.D. the chief of this tribe estab. a great kingdom in the N.W. of I. The empire of the Kushans does not seem to have come to an end until the beginning of the fourth century of the Christian era, when the Gupta dynasty was estab., and almost immediately began to prosper. It was founded by a second Chandragupta, who extended his kingdom along the valley of the Ganges, and was increased by his son, Samudragupta, who conquered all the provs. of the Ganges, and estab. himself in Southern I. as well. Under Chandragupta II. fresh additions were made to the empire, but finally, about the year 480, the Huns from Central Asia broke up the empire and estab. themselves in Northern I. But at the beginning of the sixth century, the Huns were beaten by a Gupta king. The last native prince of Northern I. was Harsha, who ruled with a strong hand the whole of Northern I.

After the death of Harsha, the hist. of I. is a confusion of provinces and kings, whom it is impossible to mention in detail. But gradually in Northern I. the provinces began to find some shape and form under the gov. of the Rajputs, or members of the ruling families. At the end of the ninth century the most important kingdom was that of Panchala, whilst the Pala kings ruled in Bengal, and another important dynasty was that of the Chandel. Until the end of the third century the Andhra dynasty ruled the Deccan, and this was succeeded by that of the Chalukya Rajputs, which lasted until the beginning of the seventh century, and was then merged in the Chola dynasty. Early in the eighth century Arab armies conquered Sind.

The close of the tenth century witnessed the beginning of the incursions of the Muslims. The great Moslem empire originated in the setting up of two small independent Moslem states in the N. of I. The founders of both these states were originally slaves, and they were bitterly opposed by the Rajputs. In 987 the Sultan Mahmud of Ghazni ascended the throne of the Amir of Sabuktigin, and commenced a holy war against the infid. of I. In a great number of campaigns he gradually increased his power until it extended practically to the Deccan. Dynasty after dynasty settled themselves at Delhi, and gradually spread into the Deccan itself; amongst the Moslem states formed in the Deccan, the more important ones were Golconda and Nagapur. The beginning of the thirteenth century witnessed the incursion of the Mongol chieftain, Genghis Khan. The Mongol hordes, however, although they attained considerable power in the N.W., were, nevertheless, unsuccessful in their attempts to penetrate into I. itself, and these attempts were beaten back principally by the Moslems of Northern I. In 1398 came the great invasion from

Central Asia of Timur the Lame (usually spoken of as Tamerlane), who swept all opposition before him, and after perpetrating a fearful massacre before Delhi caused himself to be proclaimed emperor of I. Between 1000 and 1500 a succession of Afghan invaders drove right across Northern I. Moslem dynasties ruled at Delhi from the Punjab to Bengal; and the new conquerors pushed farther S. than any of their predecessors. Five separate Moslem Kingdoms were set up in the Deccan. Only S. of the riv. Cauvery was Hindu I. saved from the invader. Finally, from 1505 onwards, over the same N.W. passes, came the Moguls. At the beginning of the sixteenth century, however, appeared the greatest of all the conquerors of I. in the person of Baber. He was a Mongol descended from Timur and Genghis Khan. In the year 1526 he defeated the army of the Sultan Ibrahim in a battle fought to the N. of Delhi, and was proclaimed emperor of I. From this time dates the succession of Great Moguls who ruled, at least nominally, from the time of Baber until 1707. For a time Delhi alone remained in the hands of the conqueror, but gradually the whole of Northern I. was conquered. The greatest of all the Mogul emperors was Akbar the Great (1556-1605), to whom the whole of I. with the exception of the very S. owed allegiance. His legal code, the brilliance of his court, and the magnificence of the architecture of his reign are all worthy of note. Akbar was far more liberal in the matter of religion than the contemporary sovereigns of Europe; but for one reason or another multitudes of Indians, especially in the N., accepted their Moslem conquerors' creed; and so 'beneath the surface of unity the soul of I. was divided between two faiths or two philosophies of life, a gulf which seems to-day almost as deep as when it was first cut so long ago' (see H. Comland). The last of the great Mogul emperors was Aurangzêbe, who died in 1707 marking the final break-up of the Mogul empire, on whose ruins the Mahrattas formed an empire which was the greatest and most important in I. in the middle of the eighteenth century. On the break-up of the Mogul empire, the following practically independent states sprang into existence, that of the nabob of Oudh, the nizâm of Hyderabad, the nabob of the Carnatic, and Hyder Ali at Seringapatam. Little by little the provs. of the Mogul empire fell away from their allegiance. The Deccan became independent, Oudh followed suit, Bengal, Behar, and Orissa, though nominally still dependent, became to all intents and purposes independent. A general revolt of the provs. took place, and to make the confusion worse confounded, a foreign invader in the person of Nadir Shah, Shah of Persia, appeared in the land. The power of the Mahrattas had increased, and they were now the greatest power in I. The throne at Delhi was still occupied by descendants of the Mogul dynasty; but they were weaklings and were only nominal kings. The shah, having plundered Delhi, returned home to Persia, and

I. was again free of foreign invaders. Nevertheless, she was now but a conglomeration of independent states. The Punjab was annexed in 1761 by the Maharajas who were finally defeated by a coalition of the Muslim princes in I. who feared the growing power of the Hindus.

*The first European settlements and the power of the British in India.*—Europeans had for a long time known of the existence of the trade route to I. via the Red Sea, but the estab. of a Muslim power in Egypt had effectually closed that route to trade, and the result was that it had been necessary to seek some new way of approaching I. Towards the end of the fifteenth century many attempts were made to 'double the Cape,' and finally the task was accomplished by Vasco da Gama, who arrived by that route at Calicut in 1498. After this, the Portuguese made many settlements on the W. coast, the most important of all being Goa. But towards the end of the sixteenth century power in the E. began to pass into the hands of the Dutch. The Portuguese were driven from Ceylon, and the Dutch also estab. themselves firmly in the Malay Peninsula. The next great struggle which ensued was that between the Brit. E. India Company and the Dutch. The latter were finally driven out of I. altogether. England first appeared to claim a share in the spoils of the E. in 1600, when she obtained a charter for her E. India Company (q.v.), and her first factory was estab. at Surat in 1608. Trade, and trade alone was the E. India Company's objective; and trade, moreover, obtained by peaceful enterprise and agreement, not by force. The Company's first act was to send an envoy to the Mogul Emperor at Delhi to secure his permission to establish a trading-post on the coast. The envoy was followed by a full-scale ambas., Sir Thomas Roe (q.v.), whose title to fame is founded on his formulation of the Company's policy, which was, not to waste money on military adventures or in acquiring ter., but to 'seek profit at sea and in quiet trade.' (P. E. Roberts). In 1639 the site of Madras was bought, and in 1661 Bombay passed as the dowry of the queen of Charles II. into the hands of the Company. In 1690, after many failures, a settlement was made on the Hugli, which developed into the city of Calcutta.

The Fr. appeared in I. later than the Eng. A company with somewhat similar objects to that of the E. India Company was founded in 1664. Their most important settlement was at Pondicherry, which they retain even to the present day. Although, as will be shown, they made a great struggle for political power in I., they failed very largely because of the lack of interest of the home gov. By the time of the collapse of the Mogul Empire the E. India Company had acquired three prin. trading posts—at Madras, Bombay, and Calcutta; and, in order to protect these posts from pirates and from European rivals, forts were built and bodies of Indians known as 'sepoys,' enlisted and drilled under Brit. officers. The life

struggle for supremacy in I. between the Fr. and the Brit. commenced during the War of the Austrian Succession (1740-48). During this war the Fr. had been the more successful, and had, in fact, captured Madras. The treaty which ended the war, however, ordered the restoration of all conquests, and so Madras again passed into Brit. hands. With the outbreak of the Seven Years' war (1756-63) rivalry between France and England was renewed. A series of succession questions in the Deccan had given both a pretext for joining in the native quarrels, and now the attention of the Eng. commander, Clive, was called from the Deccan to the N. The succession of Surajah Dowla to the throne of Bengal had brought about the Black Hole of Calcutta, and Clive came N. with Watson to revenge the massacred Eng. The battle of Plassey (1757) ensued, and with the victory of the Brit. Company troops at that battle began the final supremacy of the Brit. in I. Three years later, at Wandowash, Sir Eyre Coote finally broke the power of the Fr. in the Deccan.

The throne of Bengal had passed into the hands of the nominees of the Brit. Company, and out of gratitude favour after favour was heaped upon them. But for a time the Brit. Company still regarded the victory which they had won as merely a means of definitely establishing a monopoly and not an empire. Clive, when he returned to I. in 1765, realised that it was possible to build up a great Brit. empire on the ruins of the fallen Mogul empire, but he advised against taking the risk which was necessary. The Company collected the revenues of Bengal, Behar, and Orissa, but as the vassals of the nominal emperor at Delhi. Clive during his administration pressed on many reforms which were necessary, but was sadly hampered by the fact that any reform which entailed a diminution of dividend was not popular with the board of directors who still ruled I. Finally, in 1767, he returned to England, and was later bitterly attacked. The House of Commons, however, recorded its appreciation of the services which he had rendered; but worn out by the attacks and by ill-health, he committed suicide in 1774. Clive may well be regarded as the founder of Brit. greatness in I., and had witnessed the Company become the sovereign of Bengal, Behar, and Orissa. In the meantime the Eng. had been left with a clear field in the rest of I. after the treaty of Paris (1763). The Portuguese, the Dutch, and now the Fr., had all disappeared as rivals to the power of England. Henceforth the Eng. could consolidate their power with little fear of interference from any of the European Powers. The Brit. power was threatened by Hyder Ali of Mysore, but the victory of Coote at Porto Novo again asserted the power of the Brit., which had seemed to fail at the end of the first Mysore war.

Between the years 1767 and 1773 the Brit. gov. of I. may be regarded as being in a state of flux. The first results of Brit. conquest in the eighteenth century

were deplorable because in England both politicians and commercial men had failed to grasp the significance of the conquest. Clive had realised all that was implied in the 'sovereignty' of Bengal, and in a letter to the elder Pitt had suggested that the Brit. Gov. should oust the company and shoulder the task. It took the Company some time to realise that it was a sovereign power, but finally, in 1772, it appointed Warren Hastings as governor of Bengal. There are points which are debatable in the career of Warren Hastings, but here it is necessary only to mention the events without discussing ethics. Hastings certainly reformed the revenue collecting system, estab. civil and criminal courts, and made large economies. He sold certain ter. to the nabobs of Oudh, but by so doing set up Oudh as a buffer state between the Brit. and the Mahrattas, and later, when he gave the nabobs of Oudh help in the Rohilla war, he did so because he realised that the Rohillas were a real menace to the Brit. In 1775 Lord North's Gov. passed the Regulating Act, which gave the home gov. certain powers over the officials of the E. India Company, and instituted a supreme court of justice and a council of w. Warren Hastings became the first governor-general, but for a time the hostility of his councillors prevented the operation of his schemes. During his period of power hardly any annexations had been made. Some ter. had been gained round Bombay, but on the whole he had been opposed to annexation, otherwise he would probably have annexed the ter. which he sold to the nabobs of Oudh.

In 1784 Pitt's India Bill was passed, which created a council for I. on which certain of the directors and the board of control, nominated by the crown. The real power was now in the hands of the crown, although nominally it still remained with the Company, a state of affairs which existed until 1858. Lord Cornwallis both governor-general and commander-in-chief, had power of veto to an extent never employed by Warren Hastings. He busied himself at first with internal reform, and estab. a proper system of civil service for the servants of the Company. He was responsible in 1793 for the permanent settlement of Bengal, Behar, and Orissa; by this the assessment of the revenue was declared perpetual. Legal reform also occupied his attention. The attack by Tipoo Sahib on Travancore, however, necessitated the interference of Cornwallis, and the war ended by the cession of half of Mysore to the Company. The ter. acquired by the Company went to form the beginning of the Presidency of Madras. Cornwallis left I. in 1793, and was succeeded for a time by Sir John Shore, who, five years later, was succeeded by Lord Wellesley, probably the greatest of all the governors-general after Warren Hastings. In 1799 the fourth Mysore war broke out, undertaken by Wellesley with definite aims. It was short and in the course of it Tipoo Sahib was killed. Wellesley was an open advocate of a policy of annexation, and

by his system of setting up subsidised princes did much to extend the power of Britain throughout the whole peninsula. In 1803 the second Mahratta war broke out, and Gen. A. Wellesley (brother of the governor-general) won the battle of Assaye against overwhelming odds and practically broke the power of the Mahrattas. Almost at the same time Lake defeated another army and entered Delhi. The troops of Sindia were utterly defeated, and the prince accepted a subsidy from the hands of the Brit. The aggressive policy of Wellesley, however, led to his recall, and Cornwallis was sent out for a second term. But Wellesley had been instrumental in causing many reforms in I., in establishing a school for civil servants, and in bringing the finances of the country into a sound condition in spite of the expenses of his numerous campaigns. During the eighteenth century the power of the Sikhs had been increasing continually in the Punjab, and they now, under their leader, Ranjit Singh, put forward claims, that could not for one moment be admitted by the Brit., to ter. in the Punjab itself. A Brit. Army was sent against Ranjit Singh, but no fighting took place, the menace being sufficient. Under Lord Minto's governorship missions were despatched to Persia and Afghanistan to combat Fr. influence, whilst at the same time attacks were made on the Fr. colonies of Mauritius and Ile de Bourbon, the Dutch colonies in Java also being attacked and captured. The monopoly of the E. India Company was abolished in 1813, save so far as trade in the China seas was concerned. The period between the departure of Wellesley and the arrival of the Marquess of Hastings was one of stagnation. Hastings, however, reverted to the policy of his predecessor. During his governorship the Gurkhas were defeated and part of their ter. of Nepal was annexed; and the war against the Pindaris widened into a war with the Mahrattas, much of whose ter. in the neighbourhood of Poona was annexed.

Hastings left I. in 1823. Brit. supremacy over the native states was finally estab. and the whole peninsula of I. was ruled by the Brit. But an independent kingdom had been set up in Burma, Afghanistan had developed into a really strong state, and under Ranjit Singh the state of the Punjab had been unified and strengthened. Almost immediately there were clashes between Britain and these states. The Burmese war resulted in the loss of some ter. to the Brit. Afghanistan, regarded as an important buffer state between Russia and Brit. I., became for a time the centre of the storm. The Persians, influenced by the Russians, interfered there; the Brit., to protect their interests, were forced to intervene. They were at first successful, but a later Afghan rising drove them out of Afghanistan, and of the 4000 Brit. who left Kabul only one arrived safely at Jellalabad. An expedition was sent to Afghanistan to avenge this disaster; Kabul was stormed, the prisoners released, and the Brit. evacuated the country. In 1843, Sind (Sinde) was

annexed by Sir C. Napier, and the next war broke out on the death of Ranjit Singh, the lion of the Punjab. Two wars were fought with the Sikhs, the first in 1847, the second in 1848-49. The Sikhs of the Punjab were the most formidable enemies the Brit had yet met in I, but the victory at Gujrat (1849) delivered the Punjab to the Brit. In 1852 Lower Burma was annexed during the governor-generalship of Lord Dalhousie and in 1856 Oudh was also annexed. Nagpur and Gwalior also passed into the possession of the Brit about the same time. Between 1825 and the outbreak of the Mutiny many social reforms had

ridges were smeared with the fat of the cow and the pig, thus offending both Hindu and Moslem enraged the Indians. The Mutiny broke out on May 10 at Meerut and spread to Delhi. Within three weeks the whole Ganges basin was aflame, and at Delhi the representative of the royal line had again been proclaimed emperor of I. There were less than 10,000 Brit soldiers to hold in check a pop of well nigh 100,000,000. Cawnpore and Lucknow were besieged. The most horrible episode of the whole mutiny was the massacre at Cawnpore (July 1857). But Lawrence held the Punjab in check, a small Brit force advanced against Delhi. Havelock

taken place under Brit. rule. The country had been developed, the education of the natives had been encouraged, canals had been developed, the telegraph and railways introduced, a system of cheap postage had also been instituted, and suttee had been abolished. This was a practice of Brahman women in which a widow committed suicide on her husband's funeral pyre. These reforms had been especially noticeable during the administration of Lord Dalhousie, and must be regarded as one of the causes of the outbreak of the Mutiny in 1857.

**Indian Mutiny.**—The Indian Mutiny may be traced to many causes. Inventions such as the telegraph were not understood by the native mind, and railway travelling upset the ideas of caste. Other causes were the distrust of the Brit. policy of annexation, and especially great were the military causes. The Sepoys believed themselves the essential part of the Brit. military power in I. The campaign in Afghanistan and the late Crimean war had shaken their faith in Brit. power, and above all a report that the new cart-

maged to the relief of Cawnpore with a small force, and Lucknow held out. In Sept. the tide turned at last. Delhi was stormed. Lucknow was reinforced by Havelock and Outram and was relieved by Campbell in Nov. although the city was not finally taken until the following year. In 1858 the Mutiny may be said to have ended, although the Central Provs. were not pacified until the following year. It was the saviour of the Bengal Army, recruited chiefly from high caste Hindus and from Moslems, who began the revolt and sustained it, and their main grievance was their belief that the ultimate intention of their Brit. rulers was to subvert their faith. It is true that the Mutiny was backed by mahonts in Oudh who had never forgotten or forgiven the annexation, but it is important to observe that the Mutiny was not a national rebellion against alien rule, and indeed some Sepoy regiments fought bravely beside the Brit., while the Sikhs made no attempt to recover their independence. On the great mass of the Indian pop., the country folk, the mutiny

had little effect outside the areas of disturbance (Sir R. Coupland). The chief results of the Mutiny were that the rule of the E. India Company came to an end, in 1877 Queen Victoria was proclaimed empress of I., and the governor-general was known henceforward as the viceroy.

*The Indian Empire established.*—After the Mutiny I. settled down to a period of peace broken only by the constant suspicion of Russian intrigue in Afghanistan. This led in 1878 to the second Afghan war. The Amir was deposed, and his successor promised to receive a Brit. resident, who was shortly afterwards murdered with his escort. This resulted in the famous march of Roberts from Kabul to Kandahar, and eventually an Amir who was favourable to the Brit. was installed. Quetta and the S.E. dists. of Afghanistan were annexed after this.

In 1885 Upper Burma was annexed as a result of the third Burmese war, and the Indian empire was practically completed. The 'Morley-Minto' constitutional reforms may be briefly noticed. These enlarged the legislative councils, accepted the elective prin. and gave Indians a direct share in administration by admitting an Indian member to the Executive Council in each of the provs. and at the centre. But if Lord Morley, then secretary of state for I., was the leading exponent of the Liberal tradition, he did not intend that these reforms should lead directly or indirectly to the estab. of a parl. system in I. Opinion in England was not favourable to democratic institutions for I. State-men and official-like recognised that majority rule was impossible for a country which was anything but homogeneous. But on the whole, after the Mutiny, Brit. statesmen were occupied in attempting to better the lot of the Indian pop. The plague, which used so frequently to occur has been combated, railways have been fully developed, and, above all, education has been much improved. Legislative councils were adopted for each prov., and the electoral system developed in the constitution of the Legislative Council of the Viceroy. After his coronation in 1911, George V. visited I. and held a Coronation Durbar at the beginning of 1912, this being the first visit of an King, sovereign to the Indian empire. At the Durbar the King-Emperor announced that Delhi would be the new cap. of I. Later Indian hist. is entirely political and concerned with the movement for Home Rule. For a time, the First World War put a stop to the movement; but the revolutionary spirit, which had sprung up in the last few years was only slumbering, and in Sept. 1911 there was rioting in Calcutta by Sikhs returning from abroad, and the Punjab was in a disturbed state till the end of 1911. There was also revolutionary activity in Bengal. After a two years' lull in politics the Home Rule movement was started again by Mrs. Besant and Tilak with fresh strength, and in Dec. the Congress and the Muslim League declared for it. In 1917 E. S. Montagu, secretary of state for I., arrived to discuss what steps should be

taken towards establishing a gov. responsible to the Indian peoples. In 1918 a report by the viceroy and the secretary of state was pub. proposing reforms in local self-gov., the administration of the Provs., the Central Gov., and the relations of the Native States. Appointments were to be made to all branches of the public service without distinction of race. These were indignantly rejected by the Home Rule leaders. After the Rowlatt Committee, appointed to consider methods of dealing with lawlessness, had reported in 1918, measures in accordance with their recommendations were passed in the Imperial Legislative Council in Feb. 1919 against the votes of the non-official Indian members. Outside the Council the opposition to them was widespread and highly organised; Gandhi (q.v.) inaugurated 'civil disobedience,' and a general *hartal* (stoppage of business) was planned for April 6. Throughout April there was rioting and loss of life. On the 13th at Amritsar about 379 persons were killed by the military. The events of April had a serious effect, and the delay by the Central Gov. (for good reasons) in holding an inquiry made the position still more difficult. In the summer a committee of the Lords and Commons in London had been considering the Gov. of India Bill, drawn up by Montagu, and made various recommendations. The Bill modified accordingly, was passed in Dec. 1919: dyarchy was abolished, the Council of State became a second chamber, the budget was to be voted by the Legislative Assembly, certain franchises (racial, etc.) were created, and a High Commissioner in London was appointed. Stress was laid on the intention that the Bill was not definitive, but only provided for a period of transition to a form of self-gov. The new constitution began working on Jan. 1, 1921, and on Jan. 10 the duke of Connaught landed in I. to inaugurate the new order. I. was being deeply stirred by an agitation which outwardly conformed to Gandhi's policy of non-violence: throughout 1921 there were outbreaks all over I. and crime generally increased. In March Gandhi started his home spinning campaign to oust all imported cloth. In the N. the Punjab was seething with unrest among the Sikhs owing to religious disputes; encouraged by congress propaganda, the new section among them known as the Akalis proclaimed the restoration of Sikh rule. In April 1921 Lord Reading became viceroy in succession to Lord Chelmsford, and the Rowlatt Acts were repealed. Attempts were made at an early stage in the new Imperial Legislative Assembly to amend the new constitution but the home Gov. refused to move. In March 1922 Gandhi was arrested, and sentenced to six years' imprisonment. In 1924 he was released on grounds of ill health, and more or less withdrew from politics till early in 1930, when he started once more a campaign against Brit. rule, picking out the salt monopoly as a special object of attack.

*Steps toward Self-government.*—In Feb. 1948 the Simon Commission arrived in I.

to study the whole constitutional question, and in the following year the Viceroy, Lord Irwin declared that dominion status was the aim of Brit. policy. The Commission had been called upon to report 'whether and to what extent it was desirable to establish in Brit. I. the principle of responsible gov., or to extend, modify, or restrict the degree of responsible government then existing.' It had been provided, when the original Brit. I. constitution was set up after the war, that it should be periodically revised; the Simon Commission whose report was pub. in 1930 represented the first of these revisions, and, in view of the disadvantages of such periodical overhauls, found itself at the very beginning forced to suggest that the original recommendation should be cancelled, in order that any scheme adopted should not seem to be only a temporary measure, and changes made only so far as time might show them to be needful. Dyarchy, with its fixing of certain functions in the prov. govs. which might not be exercised by Indian ministers, was recommended for abolition. As a whole, the future constitution of I. was to be federal in its essence, that is, there was to be a central federal assembly made up of members elected not by constituencies directly, but more indirectly by the prov. legislatures. Provision was to be made for consultation of All-India questions between Brit. I. and the Indian Native States; the police was to be under the administration in each prov. of a minister who would be part of the gov. as a whole, and share in its responsibility to the legislature. As to the protection of the minorities, the Commission proposed the continuation of separate representation for Moslems, for Sikhs, and for Europeans, and also for the depressed classes; and powers were to be reserved to the governor on behalf of the protection of minorities. Such were the main recommendations of the Simon Commission, which were put forward for public discussion.

The report of the Simon Commission marked the first stage of consultation and preparation, the second being the convening of three Round Table Conferences in London between 1930 and 1932. Prior to the first of those conferences the Brit. Gov. had issued a preliminary statement of its Indian policy which was approved by Parliament. After consideration of the Simon Report and the discussions of the Round Table Conferences, the gov. pub. its own proposals for Indian constitutional reform in a White Paper issued March, 1933. But there was still to follow a third stage of consultation, the White Paper proposals being submitted to a large joint committee of both Houses of Parliament. The Committee having consulted representatives of Brit. I. and of the Indian States, reported in Nov. 1931, with the result that the gov.'s proposals were altered. Then in Aug. 1935 came the second Act for the Gov. of I. This Act, unlike those which gave self-gov. to Canada, Australia, and S. Africa, was essentially an enactment of the Imperial Legislature and not of a dominion

parliament followed by formal enactment of the imperial parliament. Yet, considering the divergence of opinion in I., consultation followed by an imperial act was the only practicable method, particularly in view of Brit. responsibility for the minorities. But this stage had not been reached without incidents. For in Aug. 1934, Gandhi had set out from Poona to visit in the Kaira dist. to foment civil disobedience; but he was again arrested and imprisoned. He then concentrated his energies on the *Harizan*—'Men of God Movement,' aiming at communism on the Russian model; but he had by now lost much of his Hindu support. Terrorism, however, now arose in Bengal again, and there was trouble on

L.N.A.

NEW DELHI: GOVERNMENT BUILDINGS

the N.W. frontier with the 'Red Shirt' agitators and the gov. had to send up troops and guns to repel marauding Mohmands. In 1934 the Bengal Legislature passed anti-terrorist legislation by a large majority. Meanwhile the Home Rule (Swaraj) party had tried to make political cap. out of these disturbances, and adopted a resolution rejecting the constitutional proposals of the White Paper. It may be noted that the report of the joint parl. committee advocated the creation of an All India Federation composed of self-governing units in place of the existing centralised gov. It also proposed that the provs. should be given a greater share in the management of their own affairs. But it recommended that a number of important matters, such as customs and tariffs, should be subjects for the governor-general and his council. The Act of 1935 implemented practically all the recommendations of the joint committee. Put briefly, it provided for an All India Federation, Provincial Autonomy, and Responsible Gov. with safeguards at the centre.

#### *The Government of India Act, 1935.*

Like the constitution of 1919, that of 1935 falls into two parts: under the first, a full cabinet system was instituted in the provs.—now increased to eleven; while the second part of the Act was directed to the reconstitution of the central gov. But, in the interests of the general well-being, the prov. governors were given the right of exercising special responsibilities at all times to ensure peace and to protect minorities, and also to legislate by ordinance and pass acts in times of emergency.

The Act also extended the prov. franchise, but the property, service, and educational qualifications still remained, and communal electorates were still continued, notwithstanding the existence of a general electorate. This part of the Act came into operation in April, 1937 and worked well, particularly in Madras; but, in 1938, for reasons relative to the second part, the Congress Party instructed its members to resign their cabinet posts, a move which thwarted the general development of prov. responsible gov. The second part of the Act—which never came into operation—created a new federal state comprising both Brit. I. and the Indian states, with a bicameral legislature, the representatives in each House to be elected, mainly, by communal constituencies, but with the representatives of the smaller communities elected by an indirect method and those of the Indian states nominated by their rulers. The federal gov. was based on the system of dyarchy which had prevailed since the Act of 1919. Defence and external affairs were reserved subjects, to be dealt with by the governor-general and his council with ultimate responsibility to the Imperial Parliament. Other subjects were transferred to a Council of Ministers responsible to the federal legislature; but, just as in the case of the provs., the full cabinet system in the federation was modified by vesting limiting rights in the governor-general. Ordinarily the governor-general had special responsibilities for the maintenance of order, the protection of minorities, the security of federal finance, and the safety of the rights of Indian states; in special circumstances he might issue federal ordinances or even legislate by Federal Act. Legally, the inauguration of this federation depended on the execution of instruments of accession to the Federation by the Indian rulers in respect of their states. Morally, too, it would have been unworkable without the general agreement of Indian communities and parties. Heretofore the Indian princes seem to have been hesitant; the Moslems feared that their community would disappear in a federation; while the Congress Party challenged not only the machinery whereby the Act was made, but the entire constitutional system set up by it. The 'great problem in regard to the general government of India is the old but recurrent problem of achieving unity out of diversity—a unity consistent with the diversity engrained in India, and yet transcending and binding its elements together' (Prof. Ernest Barker). The problem could never be solved by merely asserting the majority principle, which would give the Hindus exclusive power—an exclusiveness inconsistent with the spirit of compromise inherent in true democracy. It has been suggested that one method of solution would have been to recognise religious communities as autonomous corporations in their own spheres, that is in matters concerning education or the religious life generally. Others suggested that instead of cabinet gov. the federal executive might be com-

posite in character and, like the Swiss form, recruited from the different parties and provs. But whatever method of solution were to be found and adopted, it had to be a solution by Indian agreement. That accomplished, the road might then lie clear to the vindication of the Brit. Gov.'s dictum that 'the natural issue of India's progress is the attainment of dominion status.' This consummation would materially strengthen the bonds of the Brit. Commonwealth of Nations, for through it, I. could influence and determine, for the better, the relations between E. and W., the two major divs. of mankind. It should, however, be pointed out that as long ago as 1917 I., while in form it may not have had dominion status, yet had even then much of its actual substance. For in that year an Imperial Conference had declared in favour of the recognition, not only of the dominions as autonomous nations of an imperial commonwealth, but also 'of India as an important portion of the same.' Already in 1917, I. had signed the treaty of Versailles and become an original member of the League of Nations, and by 1921 even had fiscal autonomy; and again, in 1932, I. was represented at the Imperial Economic Conference at Ottawa. Thus, I. had for years been steadily moving towards the goal of complete self-gov.

Prov. autonomy was in operation throughout Brit. I. by 1938, though its introduction was attended by serious difficulties, which were surmounted by the constructive efforts of the viceroy, Lord Linlithgow, and by the conciliatory part played by Gandhi in the settlement of differences which really concerned matters of procedure rather than fundamental questions of prin. Thus, a deadlock was avoided and the Congress Party accepted Ministerial office, some seven of the eleven provs. being administered by Congress Ministries by the end of 1938, while in all eleven provs. representative gov. was working far more smoothly and efficiently than had been anticipated. But responsible gov. with safeguards at the centre was still unattainable. The Central Gov. of I. remained the offspring of the Montagu-Chelmsford reforms as embodied in the earlier Gov. of I. Act of 1919. Both the Congress Party and the Indian Moslems were hostile towards Federation, although for different reasons. The Congress Party opposed the federation of democratic Brit. I. with states which were under more or less autocratic rule. Many of the leaders said that the democratisation of the states was an essential condition of their acceptance of Federation. The Moslems, on the other hand, were opposed to it because the accession of the Indian states, which are mostly Hindu, would give the Hindus an excessive influence at the centre, where they thought the Congress Party was already too strong. The leaders of the Congress Party resented the possibility that future members of the Federal Parliament might be no more than the mouthpieces of autocrats; and it must be admitted that the more recent hist. of some of the

Indian states gave some colour to their apprehensions. The Moslems resented the use of the Congress flag as a national flag; they opposed the singing in schools of a Hindu hymn which Congress regarded as a national hymn; they alleged ill treatment of Moslems in Congress governed provinces and they asserted that democracy in I had failed, since it implied, in the greater part of the country, that the majority party was primarily composed of Hindus and that the Moslems could never form an alternative gov in view of their numerical inferiority. It was for such reasons that they asked for representation in the Congress Cabinets, and it was for such reasons that the viceroy invited party leaders to collaborate in finding some agreement in the province as a preliminary step to constitutional advance at the centre. Faced in 1941 during the anxious days of the war by the continual refusal of the chief Indian political parties to co-operate with the gov save on their own mutually exclusive terms, Mr Amery, secretary of state for I, after consultation with Lord Linlithgow, decided to enlarge the Executive Council to meet increased pressure of work due to the war and to establish a National Defence Council to associate Indian non-official opinion as fully as possible with the prosecution of the war, and, shortly afterwards, representatives of the provinces and of the Indian states were appointed. The Brit Gov would naturally have preferred to leave the initiative to the elected representatives of the major Indian parties, but the attitude of the Congress party towards the Indian war effort—which indeed Gandhi did his utmost to obstruct—and the absorption of rival leaders in the pursuit of purely tactical advantages, made this impossible. While no constitutional change was involved in these appointments—constitutional changes were obviously impracticable in the midst of a life and death struggle—and the enlarged Executive Council was not to be responsible to the Legislature, the gov's decision represented a bold departure from tradition and its effect was to give the viceroy a War Cabinet containing a marked majority of Indian public men who were as representative of, and as responsive to, public opinion as was possible under existing conditions. Hindus and Moslems, Conservatives and Liberals being well balanced. The formation of the National Defence Council brought representatives of the most influential sections of the community into close collaboration with the Central and prov govs. It associated Brit I and the Indian States in the common task, and it provided that large body of moderate opinion which wanted to make the gov's war effort as national as possible with opportunities for co-operation on a nation wide scale.

The next notable step in the evolution of Indian constitutional history was the Cripps' Mission for the creation of a new Indian Union. Sir Stafford Cripps, a member of the War Cabinet, went to I, with the draft declaration of the Brit

Gov's proposals for a settlement of the Indian problem. The offer seemed so complete, flexible, and practical that its rejection by Congress came as a surprise even to those who had experienced the Congress mind. This offer contemplated I after the war as a self governing country under a constitution framed by an elected body of representative Indians by agreement among themselves, as a full fledged dominion within the Commonwealth, and as free as any dominion to secede from the Commonwealth and declare its independence. While the door was held open for all Brit provs and Indian governed states to join in the framing of the constitution, it was left open for those who could not accept the constitution framed by the majority to go their own way. Finally, during the critical interim of the war when responsibility for I's defence had perforce to be borne by Great Britain, leaders of the main parties were to be invited to be members of the viceroy's Executive Council, with whom would rest the task of organising the military, moral, and material resources of I for the victory on which her future freedom depended. The Cripps' offer suggested that immediately after the termination of hostilities, an elected body, representative of Brit I, and the Indian States, should be formed to frame a constitution and the Brit Gov undertook to accept any constitution so framed, subject to the right of dissentient provs to form separate Unions (and 650 April 1942). The Chamber of Princes were willing that their States should operate in every way compatible with their sovereignty and integrity in formulating a new constitution, but after brief negotiations the Brit proposals were rejected by all the Indian party leaders. After a further expansion of the governor general's Executive Council in July 1942, that body then consisted of fourteen members besides the viceroy and the commander in chief, and of these fourteen, eleven were Indians, while for the first time a Sikh and a representative of the depressed classes were included.

At this time presented a political paradox. For the outbreak of the Second World War strengthened the desire that I should be free. It both sharpened the eagerness of educated Indians to see their country, rid at last of all foreign control and whetted the impatience of the Brit people for I's liberation which should prove that their promises had been fulfilled and bear witness to a sceptical world that the imperialism of a bygone age was dead. I's share in the war was great and it was still growing at this time, but to the accompaniment of regret in Britain that the largest and most powerful political organisation in I had not only taken no part in I's valuable contribution to the Commonwealth's war effort (a statement on Indian casualties in the war up to March 1945 put the total on all fronts at 179,759), but on the contrary had been led stage by stage under Gandhi's obsession of pacifism to seek to impede it by 'open rebellion' in pursuance of the

demand for Brit. abdication. The Congress Party in fact revolved (at a meeting of the All-I. Working Committee on July 11) to sanction the starting of a mass struggle on non-violent lines on the widest possible scale, unless its demand for immediate transfer of power were not conceded. (Gandhi, Pandit Nehru (*q.v.*), Maulana Azad, and members of the Working Committee were arrested, and the All-I Congress Committee and the prov. committees declared illegal. In the disorders which ensued on the arrests some 600 persons were killed. Gandhi, in Feb. 1943, then sought by fasting to secure his unconditional release and three members of the Executive Council resigned on the ground that they could not share responsibility for the gov.'s refusal to yield to Gandhi's demand. The pub. correspondence between the viceroy and Gandhi shows that the gov. held Congress and its leaders responsible for the deplorable acts of sabotage and terrorism which had supervened on the Congress revolution of Aug. 1912 (on these disturbances see Cmd. 6130 of 1913).

Grave famine conditions prevailed in 1913 in parts of Bengal; but energetic measures adopted by the new viceroy, Field-Marshal Lord Wavell (who succeeded Lord Linlithgow in Oct. 1913), mitigated its effects, though the number of dead from starvation and disease was nearly 700,000 (see under **BENGAL**). In April 1914 some 500 persons were killed in explosions in Bombay docks and 2000 were injured; but whether the explosions were caused by sabotage or not was not stated.

The Brit. Gov. made a statement of policy on I. in both Houses of Parliament on June 11, 1915. The main proposal, which was without prejudice to the final constitutional settlement, was that the members of the viceroy's Executive Council should in future be chosen from among leaders of Indian political life at the centre and in the provs. Meanwhile the Cripps offer remained open to I., the gov. hoping, though on no strong grounds, that Indian political leaders might reach agreement on the procedure by which I.'s permanent form of gov. could be formulated. In the vain hope of ending the deadlock the gov. stated that, provided the party leaders were prepared to co-operate in the successful conclusion of war against Japan, they were prepared to agree to important changes in the composition of the viceroy's Executive Council. It was proposed that the Executive Council should be reconstituted and that the viceroy should make his selection from among leaders of Indian political life in proportions which would give a balanced representation of the main communities, including equal proportions of Moslems and Caste Hindus. The members of the Council would therefore be Indians, with the sole exception of the viceroy and commander-in-chief—an essential proviso so long as the defence of I. remained a Brit. liability. If co-operation in this policy could be achieved at the centre it would no doubt be re-

asserted in the provs. where, owing to the withdrawal of the majority party from participation, it became necessary to put into force the powers of the governors under the Act of 1935 (section 93). Nothing, however, contained in any of these new proposals affected the relations of the Crown with the Indian states through the viceroy's (Crown representative (Cmd. 6652 of 1915). The above proposals owed everything to the initiative of Lord Wavell, who convened a political conference at Simla to take counsel with him on the proposals for a new Executive Council. The conference agreed that the Council should be reconstituted, but could not agree on the question how it should be constituted in terms of parties and communities. After consultations in London Lord Wavell on return to I., announced the gov.'s intention to convene a constitution-making body, and as a preliminary step he would, immediately after the elections, undertake discussions with representatives of prov. Legislative Assemblies to ascertain whether the Cripps proposals were acceptable. But pending the elections the schism between the Hindus and Moslems became more emphasised than ever. The Congress Party, through Nehru, made it clear that it would stand out for immediate transfer of power. Jinnah (*q.v.*), leader of the Muslim League, merely reiterated his demand for separation and re-defined Pakistan (*q.v.*) as including the existing provs. of the Punjab, N.W. Frontier Provs., Sind, Bengal, Assam, and Baluchistan. As a result of the general elections the composition of the Central Legislative Assembly was: Congress, 57, Muslim League, 30, Independents, 3, Sikhs, 2, Europeans, 2.

The change of gov. in Britain, however, was soon to introduce a change of method in not of policy towards the Indian problem. The Attlee Labour Gov. concurred in the Churchill Coalition Gov.'s policy that Indians should themselves form a new constitution for a fully autonomous I., but they pursued a different course in the hope of accelerating that process. Early in 1948 the gov. sent to I. a Cabinet Mission consisting of Lord Pethick Lawrence (Secretary of State for I.), Sir Stafford Cripps (President of the Board of Trade) and A. V. Alexander (Minister of Defence) to co-operate with the viceroy in preparations for setting up a constitution-making body and for creating an Executive Council at the Centre having the support of the chief Indian bodies. When after some three months' negotiation it became evident that, without some initiative from the mission, agreement would not be reached, the Cabinet Mission themselves put forward proposals to the effect that the constitution should be settled by a Constituent Assembly composed of representatives of all communities and interests in Brit. I. and of the Indian states. Their plan contemplated the immediate setting up of an interim gov. in which all the portfolios including that of war would be held by Indians, and that after the gov. had assumed office

the constitution-making body would be assembled. The White Paper (Cmd. 5821 of 1946) on these proposals opened by repeating the hope that the Indian people would elect to remain in the Brit. Commonwealth but that if I. elected for independence, in the view of the Brit. Gov. she had the right to do so. The Cabinet Mission admitted that if there were to be peace in I. it must be secured by measures assuring to the Moslems a control in all matters vital to their culture, religion, and economic interests; but on the basis of census statistics they concluded that neither a larger nor a smaller sovereign State of Pakistan would provide an acceptable solution for the communal problem. Apart from the force of arguments against the inclusion of necessarily considerable non-Muslim minorities there were also weighty administrative, economic, and military considerations, which presupposed a united I. A partitioned I. would result in dislocation of arrangements for defence and communications besides complicating the position of the Indian states. The Mission was therefore unable to advise the gov. that their powers should be handed over to two entirely separate sovereign states. They suggested, however, that the permitted grouping of provs. with executive and legislative bodies would enable the Moslem areas to legislate in common. The Mission recommended that the Indian Constitution should take the following basic form: (i.) There should be a Union of I., embracing both Brit. I. and the states, which should deal with foreign affairs, defence, and communications, and should be empowered to raise the finances required for these subjects; (ii.) the Union should have an executive and a legislature constituted from Brit. Indian and states representatives. Any question raising a major communal issue in the Legislature should require for its decision a majority of representatives present and voting of each of the two major communities as well as a majority of all the members present and voting; (iii.) all subjects other than Union subjects and all residuary powers should vest in the provs.; (iv.) the states should retain all subjects and powers other than those ceded to the Union; (v.) provs. should be free to form groups with executives and legislatures; (vi.) a majority vote of the Legislative Assembly of any prov. could call for a reconsideration of the terms of the constitution after an initial period of ten years. In the relationship of the Indian states to Brit. I. the White Paper stated that with the attainment of independence by Brit. I., paramountcy could neither be retained by the Brit. Crown nor transferred to the new gov. of I. Following the pub. of the mission's plan communal controversy centred on such issues as parity, grouping, and the sovereign rights of the Constituent Assembly, and eventually the Mission and the viceroy proposed that a body consisting of five members of the Muslim League, six members of the Congress Party, and one each of the Sikh, Parsi, and Indian Christian minority

communities should form an interim gov. Later it was stated that until a new interim coalition gov. was formed a 'caretaker government' of officials would be set up and that elections to the Constituent Assembly would take place as soon as possible. The elections to 385 seats, held in July, resulted as follows: Congress, 205; Muslim League, 73; Independent General, 9; Unionists, 3; Independent Muslims, 3. But as the Muslim League, on July 27, revoked its previous acceptance of the Cabinet Mission's scheme, the duty devolved on the viceroy to try to form an interim gov. The Congress Party's nominees assumed office on Sept. 2. Subsequently agreement between the viceroy and Jinnah led to the inclusion on Oct. 26 of five nominees of the Muslim League. Disorders were frequent during these events. Muslim 'direct action day' observed on Aug. 16 was marked by riots in which 5000 persons were killed and many more injured. Later in the year pseudo-nationalist outrages by thugs led to heavy loss of lives and widespread destruction of property in Bihar, Bombay, and E. Bengal.

The Constituent Assembly, owing to differences among Indian Parties, did not function in the manner intended by the Mission's plan. In yet another statement of policy (Cmd. 7017 of 1947) the Brit. Labour Gov. repeated that they desired to hand over their responsibilities to authorities estab. by a constitution approved by all parties in I., but that there was no prospect that such a constitution and such authorities would emerge; and then followed the startling intimation that the gov. definitely intended to take the necessary steps to effect the transference of power into responsible Indian hands by a date not later than June 1948. Assuming by then that a constitution had not been worked out by a fully representative Assembly the gov. would have to consider to whom the powers of the Central Government in British India should be handed over on the due date, whether as a whole to some form of central Government for British India, or in some areas to the existing provincial Governments, or in such other way as may seem most reasonable and in the best interests of the Indian people. The gov. however, intended to put in hand, without delay, preparatory measures for the transference and, while admitting that the efficiency of the civil administration must be maintained and the defence of I. be fully provided for, realised that as the process of transfer proceeded it would become more difficult to carry out all the provisions of the Gov. Act, 1935.

In the Commons (March 1947) in the debate on I., Winston Churchill, leader of the Opposition, said he stood by the principles of the Cripps' mission declaration of 1942, which bound both sides of the House, and he charged the Labour Gov. with departing from the terms of the declaration. He said that by their time-limit they had put an end to all prospect of Indian unity. Sir John Anderson (q.v.) pointed out that unless there was

agreement among the Indian parties the Gov. would hand over to an indeterminate number of authorities, and he thought that the gov. had dismissed very lightly the pledges which Britain gave in respect of minorities and especially of the depressed classes. The Conservative Opposition in fact considered that the gov.'s policy instead of standing out as a great act of magnanimity and self abnegation would go down to hist as a surrender and a betrayal.

*The Indian Independence Act, 1947* — In the discussions of 1946-47 it proved impossible to obtain agreement either on the cabinet mission plan or on any other plan that would preserve the century old unity of I. Coercion being outside practical politics, the only alternative was partition. A political settlement along the lines of Pakistan afforded, at this time, the only practicable alternative to civil war, but the Brit. proposals expressly left the way open to negotiation between the communities for an Indian Union of the kind foreshadowed in the cabinet mission's plan. No agreement other than by partition having proved acceptable, a plan as evolved by Viscount Mountbatten and agreed to by Indian political leaders. This plan involved a decision of the two Indian parties as to whether there should be a partition and if partition was decided, then two Constitutional Assemblies would determine the future constitution of each of these divs. In these circumstances the Prime Minister on June 3, 1947 announced in the House of Commons that the gov. proposed to introduce legislation at once for the transfer of power that year on a basis of dominion status (*q.v.*) to one or two successor authorities—thereby leaving it to Indians themselves to decide whether or not there should be partition. The majority of the representatives of the provs. of Madras, Bombay, the United Provs., Bihar, Central Provs., Benar, Assam, Orissa, and the N.-W. Frontier Prov. and the representatives of Delhi, Ajmer-Merwara and Coorg had, by this time, made progress in evolving a new constitution as invited to do in the cabinet mission's plan. On the other hand, the Muslim League Party, including in it a majority of the representatives of Bengal, the Punjab, and Sind, as also the representative of Brit. Baluchistan, had decided not to participate in the Constituent Assembly. The procedure provided for in the Brit. plan was therefore designed to enable the peoples of I to decide, and to decide quickly, whether the Brit. were to hand over power to one or to two govts., and further, to determine, subject to the future rectification of frontiers by a boundary commission, the areas of Brit. I within which the two govts., if the Indian peoples wanted partition, should rule. The plan of procedure also provided for a transitional period of dominion status for the Indian Gov. or govts. without prejudice to their ultimate right to regulate their own relations with the Brit. Commonwealth and the world at large. This procedure, therefore, antici-

pated the transfer of power which was projected for 1948; for it enabled a beginning to be made at once with the transfer of effective power to Indian hands by calling into existence a succession gov. or govts. well before even the end of 1947. The sequel to the announcement of this new procedure was the introduction in the House of Commons on July 4, 1947, of the Indian Independence Bill, providing for the estab. of the two independent dominions of I. (not Hindostan) and Pakistan on the succeeding Aug. 15. The Bill gave extensive transitional powers to the viceroy and governor-general to make orders for dividing between the new dominions the powers of the governor-general in Council and for the div. of the Indian armed forces. Thus was surmounted the difficulty of finding a method of effecting the transfer of power without waiting for the completion of the process, almost certainly lengthy, by which the peoples of I must finally shape their own constitutional arrangements. The Bill also provided for the appointment of boundary commissions for Bengal and the Punjab. Each dominion was to have its own governor-general; but, pending their decision, there was one governor-general for both. Full legislative authority in each dominion was vested in its Constituent Assembly, which was, consequently, empowered to create its own cabinet. The Bill did not and could not legislate directly for the Indian states, but it laid down in terms the right of the states to accede to either of the new dominions—an important declaration in view of the political pressure to which the states were being subjected by the Congress Party. But the Bill also provided that from Aug. 15 the suzerainty of the Crown over the states would lapse and all power and authority exercisable by the Crown in relation to them come to an end. By its nature the peculiar relation of paramountcy which for so great a period had linked the states to the Crown could not be transferred to any succession gov. It was essential, indeed, that the states should be given time to adapt themselves to the new régime, and that was the intention of the Bill in so far as the states came within its scope. The Indian Independence Act received the Royal Assent on July 18, 1947. Lord Mountbatten who succeeded Lord Wavell as last of the viceroys, was accepted by the Congress Party as governor-general of the dominion of I and Mr. Jinnah (*q.v.*) as governor-general of Pakistan.

On Aug. 8, 1947, Delhi and Karachi became the caps of I and Pakistan respectively. Mohammed Ali Jinnah (*q.v.*) was elected president of the Pakistan Constituent Assembly (Aug. 11). Constitutionally the two new dominions came into existence at midnight of Aug. 14, 1947. Jinnah was sworn in as governor-general of Pakistan and Earl Mountbatten as governor-general of I (Aug. 15). Two days later the Boundary Commission's findings on the partition of Bengal and the Punjab were announced, Calcutta being given to I and Lahore to Pakistan.

The partition scheme allotted 83,775 sq m with an estimated pop of 6,470,000 to W Punjab and 35,314 sq m with a pop of 11,547,900 to E Punjab. Rioting on a wide spread scale then broke out in the Punjab and a mass movement from the riot affected areas of the Punjab began. Serious disorders in the Punjab and Quidia led to the evacuation of threatened minorities. After the premiers of the two dominions had conferred at Lahore (Sept 4) on measures to be taken in this grave emergency, violence in the Punjab declined and on Sept 20 they issued a statement declaring their agreement on the necessity to co-operate in establishing peaceful conditions and their intention to remove causes of conflict. When the disorders in the Punjab reached an uneasy lull in early Oct many thousands of persons had been killed. The lull was broken by frequent minor riots in outlying towns and villages and by sporadic raids by armed gangs on trains and road convoys on both sides of the Punjab border. Nor did Delhi escape the bitterness of communal hate and there whole streets in the Muslim quarters lay deserted and looted, while their former inhabitants either on the move by road or rail to W Punjab or were herded in abject misery and fear into refugee camps. Ultimately some six million Muslim refugees were transferred from E to Pakistan as a result of the Punjab disorders and five million Hindus and Sikhs from Pakistan to India (for details of the Punjab disorders see PUNJAB History). There was also tension in Kashmir State which developed into armed rebellion (Oct 22) by Muslim peasantry against their Hindu maharajah in favour of Pakistan. Kashmir however acceded to the Indian Union (Oct 27) and a new interim gov was formed soon afterwards. Rebel forces advanced on the cap but were driven back. On Nov 9 Indian troops occupied the State of Junagadh (one of the States of the former Western I States Agency) which had previously acceded to Pakistan; the gov of which lodged a strong protest against this action. It was on this date (Nov 9) that the Constituent Assembly of I met for the first time as the Parliament of the dominion. A month later it was announced in this parliament that agreement had been reached in negotiations between I and Pakistan on all outstanding issues relating to partition. This agreement however, did not relate to the Indian states particularly Kashmir and Hyderabad. Under pressure by the Indian Gov the Muslim Nizam of Hyderabad agreed to reform his executive council though as the sequel was to show this was far from ending his difficulties. On Dec 19, Earl Mountbatten took the salute at New Delhi at the farewell parade of the last Brit troops to leave the cap. Five days later fierce fighting occurred between Indian troops and insurgents in Kashmir on the Jammu front, and a week later Pandit Nehru referred the Kashmir dispute to the United Nations Security Council (for details see under KASHMIR). On Jan 13,

1949 Gandhi began a new fast in the cause of Hindu-Muslim unity but after assurances that leaders of all communities would carry out his conditions for restoring communal harmony he broke his day fast. While he was addressing a prayer meeting at Delhi (Jan 20) a bomb exploded in the vicinity but without damage. Ten days later he was shot by a Hindu fanatic while on his way to an evening prayer meeting at Delhi and died half an hour later (see GANDHI). On

JANUARY 1948

This photograph was taken shortly before his assassination.

Feb 21 Junagadh where there had been considerable unrest, voted for accession to the Indian Union by a huge majority. A week later the last Brit troops in E left Bombay (Feb 29). On Earl Mountbatten relinquishing office Sir Chakravarty Rajagopalachari was appointed governor general of I. This was not the only change in the two governor generalships for later in the year Jinnah died of heart failure and was succeeded by Khwaja Nazimuddin. Chief interest in the hist of the subcontinent now centred on the Indian State, especially Hyderabad and Kashmir. In Sept Indian troops invaded Hyderabad, and four days later the Nizam's army formally surrendered (see further under HYDERABAD). Greater difficulties were experienced on both sides in Kashmir and eventually, following an armistice early in 1949, it was agreed to refer a United Nations Commission to arrange a plebiscite. This Commission reported in June 1949, Adm Nimitz being accepted by both sides as chairman of the Commission.

THE END OF INDIAN INDEPENDENCE ON THE INDIAN STATES.—The most striking aspect of the changing face of I during the years immediately following independence was the integration in the new national polity of many once powerful princely states. During that period of swift changes the 550 principalities, large and small, which fell within the sphere of

the dominion of I., found themselves reduced to seven groups of 'unions' and a score of units. The latter were confined to the largest states, at first usually held to justify their separate existence where their pop. was at least 1,000,000. But this criterion of viability was soon abandoned and most of the remaining units were either grouped with neighbouring states or merged in adjacent provs. The princes themselves have mostly become political pensioners still enjoying some personal privileges but with much reduced privy purses. Two main factors contributed to this process of integration: the influence of Indian nationalism within the states and the determination of the States Ministry at Delhi to remove any possible challenge by disaffected princes (see HYDERABAD). Travancore (pop. 6,000,000) and Cochin (1,250,000) still retained their identity in 1949, but may later be united to a new Kerala prov. of Malayalam-speaking people including adjacent dists. of Madras, Mysore (7,000,000) too, having reached a compromise over popular rule, also remains a separate political unit; but if Madras Prov. should be partitioned into its linguistic components, Mysore might eventually be merged in Tamil-Nad (as distinct from the Telugu-speaking part of Madras). Some fifteen of the former Deccan states, and the states of Kolhapur and Baroda were merged with Bombay. Hyderabad, too, retains a precarious identity, but if Nationalist agitation for partition should prevail, its E. half would probably be assigned to the Andhra-Desh or Telugu-speaking part of Madras and its N.W. areas would join the Marathi-speaking areas of Bombay and the Central Provs. to form a new prov. of Maharashtra. The half-dozen Gujarati states, merged with Bombay Prov. early in 1948, have mostly lost their separate identities. A group of minor states, formerly under the Chhatishgarh and Orissa Agencies, were merged early in 1948 into the adjacent Central Provs. and Orissa and have vanished from the map of I. Kutch in Western I. and Chambha and Bilaspur in the Himachalan foothills are directly administered by the Union Gov. of I. Rampur and Benares (in the United Provs.) and Cooh Bihar, Tripura, and Manipur (in Assam) still retain their identity, but will probably be absorbed. The status of Kashmir, which is in dispute between I. and Pak-istan, will eventually be decided by a plebiscite under the auspices of the United Nations (see KASHMIR). The seven groups or unions are: (1) Saurashtra, a combination of 280 states and estates in Kathiawar; (2) Madhya-Bharat, the official style of a union of twenty-eight of the twenty-nine Malwa states, the largest of which is Gwalior (3,000,000). This union, like that of Saurashtra, has achieved a degree of stability, but there is conflict over Bhopal, the twenty-ninth Malwa state, between the Central Provs. and Madhya-Bharat, both agitating for its absorption into their territory; (3) Vindhya-Pradesh, a union of thirty-four Bundelkhand and

Baghelkhand states, and the most backward and undeveloped part of I. In default of some capacity for self-gov. the union may be merged into the adjacent United Provs.; (4) Rajasthan, the biggest of all the unions. Its membership of ten Rajputana states, headed by Udaipur, was expanded in 1919 to include four important Rajput states hitherto regarded as 'viable units'—Bikanr, Jaipur, Jaisalmer, and Jodhpur—and thereby became the greatest administrative unit in I. with an area of 121,000 sq. m. and a pop. of 12,000,000—a notable achievement of the States Ministry; (5) Matsya (E. of Rajasthan) whose future status is under consideration. Probably Alwar, one of the states of the union, will join Rajasthan, while Bharatpur and Dholpur states will merge with the United Provs.; (6) five Sikh states of the E. Punjab, headed by Patiala (pop. 2,000,000); and (7) Himachal Pradesh, also in the E. Punjab and formed out of ten small hill states, differing from other unions in that it is directly administered from Delhi. All these changes have contributed to the unification of I. However arbitrary the methods used, realism demands the admission that the continuance of the states as strongholds of a picturesque mediaeval feudalism and despotism had become an anachronism which could not long have resisted the democratic forces germinating throughout I. It is evident that the states must conform to the pattern of political progress in the rest of I. and already they have been short of much of their former splendour. Courts, banquets, processions, and lavish hospitality must be adjusted to restricted privy purses. The princes are now either servants of the people or absentee aristocrats. Some, however, have been recruited into the foreign service. The states unions at first acceded on three subjects only—defence, foreign relations, and communications, but are rapidly aligning themselves with the provs. in their polity, and in 1949 the Rajpramukhs (comparable to prov. governors) of all unions signed fresh instruments of accession conceding to Delhi legislative powers in respect of all subjects which the provs. themselves conceded to the Central Gov.

INDIAN LITERATURE.—The greater part of the literature dating from 1000 B.C. is of religious inspiration, and each religious sect possesses its own sacred books. The most important of these are the *Veda* (v.c.) of the Brahmins and the *Tipitaka* of the Buddhists. Then there are also the heroic songs, the fairy tales, and the myths, together with a vast amount of gnomic poetry which is very perfectly executed. Scientific work in I. has never been divorced from literature proper, and verse has been the medium not only for biography and hist., but also for treatises on medicine, architecture, astronomy, philosophy, and law. Its languages belong to at least three main linguistic families; and besides the Indo-European languages, of which the Indo-Aryan is the most complicated branch, there are Dravidian and

Indian State kaivasya  
'TOILET SCENE' A P. F. N. C. O.  
AT AJANTA

Kolarian languages (see further under INDO-EUROPEAN LANGUAGES). The Veda is one of the oldest and most important of the literary works belonging to the Indo-European languages. It is not a series of books, like the Heb. Bible, but a great literature which grew during the centuries, and for many generations was handed down verbally. The Vedic literature is now separated into four classes—*Samhitas* or collections of hymns, *Brahmanas*, prose texts, *Upanishads*, forest-texts, and *Panishads*, secret doctrines. The *Samhitas* may again be divided into four divisions, and it is because of these divisions that the Vedic literature is sometimes spoken of as *Vedas* instead of *Veda*. The *Kalpavallu*, manuals of ritual, also form a literature closely allied to the Veda, but as it is not considered to be of divine revelation it is not included in the Vedic literature proper. The first traces of epic poetry are to be found in the *Veda*, but later a whole heroic literature grew up sung by the sutas or bards at various festivals. These epics and ballads have been collected into two great epic works which are rather complete literatures in themselves than single poems. The first of these, the *Mahabharata* (q.v.), is the narrative of the battle of Bharatas, and the author is traditionally supposed to be an ancient mythical seer, Vyasa, who is also supposed to have compiled the Veda and the heroic poems, *Puranas* (q.v.). The second of the two epics, the *Ramayana* (q.v.) is probably the work of a poet, named Valmiki, who, as far as it is known, lived in the third

century B.C.; but much of the *Ramayana* seems to have been added at a later date. There is more unity, however, in the *Ramayana* than in the *Mahabharata*, but which of the two is the older it is difficult to determine because neither may be in its original form. The *Ramayana* may be considered the epic of Eastern India and the *Mahabharata* of Western India. The *Puranas* are 'old narratives', and their date is uncertain, but they belong to a later Indian religion, Hinduism. There are eighteen 'Great *Puranas*' and several lesser ones. The date of the *Lipitaka*, the religious literature of the Buddhists, seems to be between the fourth and third centuries B.C. See also HINDUISTAN LANGUAGE AND LITERATURE.

INDIAN ART.—The earliest known art of India is that of the Indus valley culture (q.v.), dating from about 2500 B.C. and having affinities with the Sumerian art of Mesopotamia. The Indus culture was succeeded after an unknown interval of time by the Aryan culture which again centred in the Indus valley and dates perhaps from 1000 B.C. or earlier. This age is known from the Vedas, but none of the buildings or sculpture of the time has survived. The first period from which dates a continuous knowledge of Indian art comes much later. It possesses a distinctive Indian character. During the reigns of Chandragupta Maurya (322–298 B.C.) and of his grandson Asoka (273–232 B.C.), in particular, it is known that sculpture and architecture, the arts in which India has made its greatest contribution to the world, flourished. Persian influence had been in existence since about 800 B.C., and was particularly evident during the Mauryan period. The commemorative pillars erected by Asoka may have been Persian in origin. Asoka being a devout Buddhist also built a number of burial mounds enshrining Buddhist relics. The greatest of these was the great *Stupa* or burial mound at Sanchi in Bhupal. Among smaller works a number of interesting portrait heads in sandstone and groups of figures in terracotta have survived. Early Indian art is realistic, serious, pantheistic, seldom idealistic. The tradition continued during the post-Maury periods—the Sunga and Kanva dynasties from about 200 B.C. up to A.D. 20. Literary evidences show that painting was also practised, mainly as mural decoration. Some of the paintings in the famous Ajanta Caves in the dist. of Khandesh in the Deccan (Hyderabad) belong to this early period. The Ajanta frescoes were painted over a period from 200 B.C. to the seventh century A.D. They depict realistic scenes from Buddhist life, and parables from the Buddhist religion, and as compositions are among the great works of art of the world. Long subtle curves, bold and vigorous lines, and uniform thickness of line are the chief features. Water-colour, and ingredients made of coloured stone, clay, and silicates, were used. Greek and early Christian influences made themselves felt as a result of the trade carried on in the empire established by the Kushan kings, particularly Kanishka (120–162).

From this time date the early sculptured figures of Buddha which have become so well recognised a feature of Indian art. The Kushan empire was succeeded in Northern I by the Gupta dynasty when Chandragupta I came to the throne in A.D. 320. The dynasty survived for nearly 300 years when it was finally over come by the invasion of the Huns as a result of which few examples of the art of the period have survived. Enough is known however to show the excellence to which the art of sculpture attained especially in the scenes depicted on the walls of temples. The Gupta period is in fact reckoned as the great age of Indian sculpture. The style is less heavy than that of earlier years and is richly decorative. It was the Gupta artists who evolved the most perfect forms of the Buddhist and Brahman divinities. The temples were built structurally, and not as enclosures, with short pillars crowned by heavy square capitals. Greek influences were by now completely absorbed. Metal casting was carried out with enhanced excellence, a remarkable example being the colossal statue of Buddha from Sultanpury of the fifth century now in the Birmingham museum. In Southern I, in the Deccan a style of flat roofed architecture with horse shoe arches and decorative columns was developed. The stability given to the country by the Andhra dynasty which lasted from 225 B.C. to the third century A.D. allowed continuous development. This dynasty and its successors, the Chalukyas, are remembered for its elaborate temples hewn from the rock. Southern Indian architecture achieved its greatest success under the Pallava dynasty (fourth to eighth century) and the Cholas (tenth to thirteenth century) to whom belong some of the finest examples of bronze casting. A distinctive feature of Dravidian architecture under the Cholas was the pyramid shaped tower surmounted by a stone monument. In the great temple at Tanjore the tower of this description rises to a height of 190 ft. Some of the glories of Gupta art were revived in Northern I during the reign of Harsha. With the death of Harsha in A.D. 647 the history of art in the N shifts to the kingdom which was founded in Bengal by the Pala dynasty in A.D. 750 and lasted until the Muslim invasions of the twelfth century. Much intricate and carefully wrought metal work belongs to this period. The sculpture, notably Buddhist figures in black slate, approximates to metal work and lacks the sensuous modelling of earlier periods. Artists whose names are known through the writings of a Chinese missionary as having belonged to the Pala school of art are Dhruvapa and his son Vitapala.

During the medieval period that is the six hundred years from the death of Harsha to the Mohammedan invasions, architecture was the principal form of art. Much was destroyed by the Moslems. The Rajputs of the tenth and eleventh centuries undertook many great building and engineering feats. A medieval Indo-Aryan type of architecture was evolved in

THE CROTON TEMPLE OF VISHNU KARMAM

One of the many underground temples in India and probably the most ancient type of temple

Northern I, characterised by a curvilinear superincumbent at the top and bulging in the middle. This was unknown in Southern I where the Dravidian pyramidal tower prevailed. Delhi was captured by the Moslems in 1193, an event which was commemorated by the founding of a mosque, the earliest Islamic building in India. Islamic architecture now came into being. The dome and minaret were introduced and combined with the indigenous features of Hindu art. An outstanding monument of this period is the enormous Qutb Minar, a mosque over 200 ft. high built at Delhi by the sultan Iltutmish and completed in 1332. Among other of the Delhi sultans who were great builders was Iltutmish (1316-1351) who with the aid of his architect Malik Ghori Sahana entered Delhi and built many new towns. He was also careful to restore earlier monuments. Before I came under the rule of the Mogul emperors, mention must be made of the artistic achievements of the emperors who ruled in Vijayanagar in Mysore from 1336, the traditional date of the founding of the empire, until 1565 when the city was sacked by Muslim armies from the N. The temples built under the Vijayanagar dynasty show a magnificent and vigorous style contrasting with the more staid Indo-Islamic style. The arts of painting and sculpture also flourished.

Under the Mogul emperors a blending of Hindu, Islamic and Persian styles resulted in a flowering of the arts, particularly architecture and sculpture. The beautiful city of Fatehpur Sikri is perhaps the greatest monument to Akbar who however planned his own mausoleum at Sikandra. This with its four terraces and white marble superstructure was completed in 1612 during the reign of Jahangir. In his successor Shah Jahan (1627-58) are owed the most celebrated examples of Mogul architecture—the mausoleum of Shahjahan near Lahore and at Agra the Pearl mosque and the Taj Mahal. The Persian influence predominated over the

Hindu and decoration became more elaborate than was to the taste of the earlier Mogul emperors.

Painting received a great impetus through the patronage and connoisseurship of the three Mogul emperors, Humayun, Akbar, and Jahangir. Humayun, father of Akbar, spent some years of exile in Persia, and on returning to his throne he brought with him Persian painters who influenced the Hindu school. Painting has had a long tradition in I. Mention has already been made of the Ajanta frescoes. Mural paintings of great merit also survive from the sixth century in the caves of Bagh, nearly 300 m. N. of Ajanta. These apart, however, and except for some MS. illustrations of the medieval schools of painting in Bengal, Nepal, and Gujarat, little survives from the centuries before the Mogul era. Mogul painting is mainly miniature work but derives from Persian and not from the traditional style of MS. painting. Akbar had a number of painters working for him, many of them Hindu and many whose names are known. Subjects chosen were portraits of men of the time and scenes chronicle events. W. influences were also felt. Gradations of tone, effects of light and shade are features of Mogul painting. In this it is distinguished from the work of the painters of Rajputana, Bundelkhand, and the Himalayan Punjab. Rajput painting derived from the traditional mural art and was devoted to illustrating the stories of legend and religious epic. The colouring is mostly flat. The two styles often intermingled but in the best work are distinguishable. Mogul painting declined during the reign of Aurangzeb who discouraged the arts for religious reasons. Rajput painting continued into the eighteenth and nineteenth centuries and centred particularly in Jaipur. Later Rajput painting is seen at its best in the Pahari art, named from the hill country of the Punjab where it flourished. It was divided between the schools centred at Jammu and Kangra. Kangra painting is graceful in line and soft in colouring. In the nineteenth century it declined although portrait painting was encouraged by the Sikh rulers of the Punjab. As the century advanced W. influences weakened many of the distinctive features of Indian art, but in the early twentieth century a movement in recognition of the artistic heritage of I. in which the Tagore family was prominent, brought about a renaissance of the arts; Dr. Abanindranath Tagore has given a unique display of Ajanta art motif in brilliant paintings. In Bombay a contemporary school of art sought to assimilate European influences, especially Fr. Among modern Indian painters and sculptors may be mentioned Bhabani Charan (Ml. K. Krishna Hebbar, and Chintumon Kar.

Indiagher, Lake, see ENARE.

India House, the name by which East India House, demolished in 1861, the headquarters of the old East India Company, in Leadenhall Street, was known. Prior to such occupation the Company transacted its affairs from 1621 to 1638, in Crosby Hall, Bishopsgate. The modern I. H. which is situated in Aldwych, London, was opened by the King-Emperor and Queen-Empress in July 1930. The new building was the outcome of proposals submitted by Sir Atul Chatterjee himself, Lord Irwin's Gov. ultimately accepting the project, and the Legislative Assembly voting the sum of £324,000 for erection and equipment. The building is essentially Indian in provenance; its purposes are not exclusively official, but are also directed towards providing a London home for India. It is the work of Sir Herbert Baker, who had much to do with the building of New Delhi.

Indiana, N. central state of the U.S.A., generally known as the 'Hoosier State', the second to be erected from the old N.W. ter. It covers an area of 36,291 sq. m., 305 of which are water-surface; and its greatest length and breadth are respectively 277 m. and 145 m. It is bounded on the N. by Michigan, on the S. by Kentucky, on the E. by Ohio, and on the W. by Illinois. The state lies in the Mississippi valley and in the basin of the Great Lakes, and is well watered by sev. streams, of which the most important is the Wabash. The greater part of the surface is undulating prairie land. The fertility of the soil is largely increased by a system of under-draining. Agriculture is the prin. industry, 91 per cent of its total area being farms; the chief crops are corn, wheat, oats, hay, and rye. Barley and maize are grown, as also is tobacco. Large quantities of tomatoes and other vegetables and fruits are grown for the markets, and exported, and the rearing of livestock has increased in recent years. The chief mineral productions are coal, petroleum, limestone, sandstone, building-stones, etc., and natural gas, the chief field of which is in Delaware county. The production of pig-iron is considerable, and the clay-working industries are important—these yield bricks, tiles, pipes, pottery, etc. Other manufs. include iron, glass, carriages, railroad cars, woollens, etc. Transport is well provided by the natural facilities of the Ohio and Wabash rivers, and by Lake Michigan; while by land there is a total of 7,187 m. of steam railway and 2,135.07 m. of electric. Added to this all the lines from the E. to Chicago pass through Indiana, and other connections with E., W., N., and S., which are of great importance to trade. The prin. univs. are Purdue Univ.; Indiana Univ.; De Pauw Univ.; and the Univ. of Notre Dame. I. is governed by a General Assembly consisting of a Senate of 50

members elected for 4 years and a House of Representatives of 100 members elected for 2 years. The climate is remarkably equable. Pop. 3,427,700. The State is sixth in coal production in the U.S. The leading cities are Indianapolis, Fort Wayne, South Bend, Evansville, and Gary. See W. H. Smith, *History of Indiana*, 1897; S. S. Visser, *Economic Geography of Indiana*, 1923; E. Logan, *A History of Indiana*, 1924; Federal Writers Project, *Indiana: a Guide to the Hoosier State*, 1941.

Indianapolis, cap. and the largest city of Indiana, U.S.A., 195 m. S.S.E. of Chicago by rail, and 824 m. W. of New York. It is one of the best built and most attractive inland cities of America. Many of its streets are 100 ft. wide and diagonally intersect the four main avenues of Massachusetts, Indiana, Virginia, and Kentucky, which radiate from the Central Park, Monument Place. The city is encircled by a railway, connecting all the great trunk lines, thus facilitating traffic. The chief buildings and institutions are the state Capitol, Co. court-house, Board of Trade building, public library, masonic temple, central hospital, Blind and Deaf and Dumb Asylum. As a centre of education, I. is of considerable importance, the most noted institutions being the univ., the Central College of Physicians and Surgeons, technical institute, etc. The manufs. comprise iron goods, furniture, carriages, waggons, glass, woollen and cotton goods, and agric. implements. It is a live-stock centre, with stockyards and packing houses. There is a large trade in grain. Fort Benjamin Harrison is situated near. Pop. 386,900. See B. R. Sulgrove, *History of Indianapolis and Marion County*, 1881.

Indian Archipelago, see EAST INDIES.

Indian Architecture and Art, see ARCHITECTURE—India, and INDIA (ART).

Indian Corn, see MAIZE.

Indian Cross, see NANTURTIUM.

Indian Fig, see BANYAN TREE.

Indian Fire, a white signal light, composed of seven parts of sulphur to two of realgar and twenty-four of nitre.

Indian Hemp, see Bhang and Hemp.

Indian Ink (or Chinese Ink), an ink first made in China; compound of lamp-black and gum, moulded into sticks and sometimes perfumed. Used in China for ordinary writing but in Europe for illustrative work.

Indian Millet, a cereal grass, species of *panicleum* (P. *maximum*), widely grown in Mediterranean countries and the E. Believed to have been the first wild grain to be cultivated. Replaces rice in drier climates, a good bread being made from it. Also serves as cattle fodder; also called Kafir corn.

Indian National Congress. The origin of this C. may be set down to a suggestion of Lord Dufferin's, and the first meeting was held in 1885 during his viceroyalty. W. C. Bonnerji being the first president. This first meeting was attended by seventy-two delegates, mostly lawyers, schoolmasters, and journalists. A. O. Hume largely inspired the movement,

which was meant to grow into a native parliament. At the first C. loyalty to England was stressed. The next C., a year later, had 440 delegates. The movement was in the beginning essentially Hindu and from the W.-educated classes; the Muslims had little to do with it, the Moslem League Association being their representative body. In 1916 both bodies combined in a declaration for Indian Home Rule, and it was evident that C. had now been captured by the extremists. From about this time it became somewhat overshadowed by the organised Nationalist movement under Gandhi's leadership. Thus the I. N. C. owed its birth to Indians who had been attracted by ideals learnt from Eng. culture and teaching; with them were joined from opposite motives other Hindus whose yearnings were for the past days of Indian glory and who hated European rule. It was from the union of these opposites that the Nationalist movement sprang, which found its fruits in the Brit. declaration of 1917 leading to responsible gov. in India. The goal of the Congress is expressed in their phrase 'purna swaraj,' first interpreted as 'complete independence' but later modified as meaning 'not a ship at will.' See further under INDIA—History. See C. F. Andrews and G. Mukerji, *The rise and growth of Congress in India, 1937*; Sir R. Coupland, *Indian Politics, 1936-1942, 1943*; J. T. Gwynn, *Indian politics, 1924*; Sir H. Lovett, *History of the Indian Nationalist Movement, 1921*; B. Pattabhi Sitaramayya, *The History of the Indian National Congress, 1935*.

**Indian Mutiny**, see INDIA—History.

**Indian Ocean**, is bounded on the N. by Asia (Arabia, Persia, India); on the E. by Indo-China, Sunda Islands, Australia, and the meridian of the southernmost point of Tasmania; on the W. by Africa and the meridian of Cape Agulhas; on the S. by the 60th parallel of lat., but the S. boundary is variously given by different authorities. From Cape Agulhas to Tasmania is some 6000 m., and this is the greatest breadth of the I. O. The two great bays on either side of the peninsula of India, the bay of Bengal on the E. and the Arabian Sea on the W., with its arms the gulfs of Aden and of Oman, belong to the I. O. But the Red Sea and Persian Gulf, which communicate with the said arms by the narrow straits of Bab-el-mandeb and of Ormuz respectively, are separate seas. The Pacific Ocean can be approached from the I. O. by means of the channels between the Sunda Is. and the Timor Sea, whilst the Mediterranean Sea in the N.W. communicates with the I. O. by means of the Suez Canal and the Red Sea. There are two important straits, Mozambique Channel in the W., separating Africa from Madagascar, and Palk Strait in the E., separating India from Ceylon. The I. O. is dotted about with thousands of Is., some of which are of coral formation, as the Maldives, Chagos, and Cocos groups; others, such as the Crozet Is. and St. Paul's Is., are volcanic. The chief Is. in the W. are Madagascar, Mauritius, Bourbon, the Seychelles, and

Socotra, belonging to Africa, whilst the prin. Is. in the E. are the Laccadives, Maldives, Ceylon, the Andaman Isles, and Nicobar, belonging to Asia. In spite of these innumerable Is., the I. O. is mostly navigable. The prin. large rvs. discharging themselves into this ocean are the Zambezi, Indus, Ganges, Brahmaputra, Irrawadi, Godavari, and Kistna. The bed of the I. O. attains to a depth of about 2000 fathoms in some parts. The mean temp. of the surface water is over 80° F. in all parts N. of 13° S. There are two warm currents moving southwards, the Mozambique and Agulhas currents, whilst a colder current in the E., called the W. Australian current, crosses the I. O. moving northwards.

**Indian Orders of Knighthood** are two in number, the Most Exalted Order of the Star of India, and the Most Eminent Order of the Indian Empire. The first was estab. in 1861, and besides the king and a grand master as the viceroy of India for the time being, was divided into three classes: Knights Grand Commanders (G.C.S.I.), Knights Commanders (K.C.S.I.), and Companions (C.S.I.). The badge is worn pendant from a light blue ribbon, with white stripes edgewise; the collar is composed of alternate links of lotus flowers, red and white roses, and palm branches enamelled in gold, with an imperial crown in the centre. The mantle worn is of light blue satin, lined with white. The motto is: 'Heaven's light our Guide.' The Order of the Indian Empire was instituted in 1877. In addition to the sovereign (grand master) and the viceroy for the time being, there are three classes in the order: Knights Grand Commanders (G.C.I.E.), Knights Commanders (K.C.I.E.), and Companions (C.I.E.). The badge is hung from a purple riband, and the collar is composed of elephants, peacocks, and Indian roses. The motto is *Imperatrix Auspiciis*.

**Indian Pink**, see PINK-ROOT.

**Indians of America**. See AMERICAN INDIANS.

**Indian Shot**, or *Canna indica*, best-known species of the order Cannaceae, and is to be found in all tropical countries. The plant receives its name from the resemblance of its seeds to shot. The seed yields a beautiful red colour. The rootstocks are very large, spongy, and jointed, and are used in Brazil for poisons in tumours and abscesses. The rootstocks of some of the other species of *Canna* are more valuable, yielding the starch called *tapioca* or *cassia*.

**Indian Summer**, season of mild weather on the Atlantic Coast and in the Central States of the U.S.A. usually occurring in Oct. or Nov., but sometimes in Dec. The sky is cloudless, the atmosphere hazy, and the temp. extremely mild. The tendency to extreme dryness causes a number of forest and prairie fires. This summer corresponds to what is known in England as St. Luke's Summer, which occurs at the end of Oct. or the beginning of Nov.

**Indian Territory**, formerly a ter. of the U.S.A., about the size of Ireland. It lay

W. of Arkansas, and was separated from Texas by the Red R. This country was especially reserved for the Indian tribes by the gov. of the U.S.A., and was assigned to them by Act of Congress in 1830. The ter. contains fertile prairies and rich valleys, and is crossed by a broad belt of forest about 40 m. wide called 'Cross Timbers.' The climate is very pleasant and salubrious, and agriculture and cattle rearing formed the chief occupations. Indian Ter. was occupied by five tribes: the Cherokees, the Creeks,

Indis and Pakistan assumed dominion status the I. O. as such ceased to exist, its functions being taken over by the Commonwealth Relations Office, Div. B. See Sir M. G. O. Seton, *The India Office* (Whitehall Series), 1926.

India-rubber, see *IRUBBER*.

Indicator, term in chemistry to denote a substance used for the detection of minute amounts of materials. Commonly, the word is applied to those bodies that indicate an acid or alkaline reaction. One of the most frequently used Is. is

U. S. Information Service American Embassy

A CONSTRUCTION CREW OF CHOCKTAW INDIANS WORKING ON A STATE ROAD NEAR MUSKOGEE, OKLAHOMA

the Chocktaws, the Chickasaws, and the Seminoles. Admitted with the white-settled central ter. to the Union as the state of Oklahoma in 1907.

India Office, Brit. Gov. dept. set up in 1858 to administer the affairs of India. Its political head, the secretary of state for India, was assisted by an under-secretary of state. The I. O. estimates were met from Indian Gov. funds. Prior to 1858 Indian affairs were conducted by the E. India Company, under the supervision of a gov. Board of Control, whose president was responsible for Indian affairs in Parliament. On the transfer of India to the Crown in 1858 the secretary of State was assisted by a consultative council; this Council ceased to exist only in 1937 when some of its functions passed to a body of advisers. In 1947, when

litmus, a substance prepared from certain lichens. This with alkalis gives a blue, and with acids a red coloration, and in most cases the colour change is sharply defined. In titrating acids and alkalis, care has to be exercised in the choice of I. For example, in the case of carbonates, litmus may not be used (unless the titration be performed so that all the carbon dioxide is expelled, since the latter has a distinct effect upon the I.). Similarly, the Is. prepared synthetically require discretion in their use, e.g. phenol phthalein is an excellent I. for strong acids and bases, but may not be used for the titration of a weak acid by a base, since the end-point is not sharp. Another frequently used I. is methyl orange, which is the sodium salt of an acid, helianthine. This is a sodium salt of an organic acid,

which in presence of alkalis is yellow, and in acid solution red. It is, however, necessary that the acid should be 'strong'; otherwise no sharp end point can be obtained. Of other natural ls may be mentioned cochineal and extracts of red cabbage and other vegetables, but the greater number of the more recent products belong to the benzene series.

Much has been written concerning the theory of indicators, with a view to explaining the change of colour that occurs according to the reaction of the solution. The first adequate explanation was offered by Ostwald, who used his views upon the ionic theory of solution (*q.v.*). According to this view an acid is a substance which in aqueous solution yields free hydrogen ions, and conversely an alkali is one which yields free hydroxide ions. Consequently a solution which contains ions of hydrogen and of hydroxyl in equivalent amounts may be regarded as neutral. This condition is realised in the case of pure water, which is only slightly dissociated into its component ions.

Further a strong acid or a strong base is one which in aqueous solution is strongly dissociated. On the other hand a 'weak acid' is one which in solution is not dissociated to any great extent, but remains *non ionised*. The assumption made by Ostwald in his theory to account for the behaviour of ls is that the latter are either weak acids or weak bases, and that the change of colour is due either to the presence of the non ionised substance or of a coloured ion. In the case of phenol phthalein it is supposed that we are dealing with a weak and colourless acid. In the terms of the dissociation hypothesis, this is only dissociated to a slight extent, and any increase in the concentration of hydrogen ions, such, for example, as takes place if a strong acid be present, tends to diminish the dissociation. In consequence, there is no colour change. If, however, an alkali such as sodium hydroxide be added, the hydroxyl ions associate or combine with the hydrogen ions of the l, leaving cations of sodium and the anions of the l. The latter in this case are supposed to be coloured, and therefore the colour change is manifest. Methyl orange acts as a very weak base, yielding in solution red cations, and small numbers of hydroxyl ions ( $\text{OH}^-$ ), the undissociated substance is yellow. On addition of an acid the hydrogen ions of the latter combine with hydroxyl ions of the l, and more of the undissociated part of the l then ionises so that the red colour of the cations is seen. Addition of alkali, on the other hand, suppresses the ionisation of the l, which therefore shows the yellow colour of the undissociated molecules. In addition to the above theory there has been proposed a so called chemical explanation depending upon the structural differences existing between the 'lactoid' or colourless form and the 'quinonoid' or coloured form. It has been assumed that all coloured substances possess the quinonoid structure (see QUINONE), and one view of the change of colour of ls is based upon

the change into the quinone type. Phenol phthalein in the free state, is represented by the formula

its acidic properties being due to the presence of a phenolic (i.e.  $\text{OH}$ ) group. On treatment with alkalis, a change in structure occurs, and the salt is regarded as having the following constitution —

where M is a univalent metal. (The double bonds (a) and (b) present in the molecule are characteristic of the quinonoid structure.) This latter view is in agreement with Hantzsch's theory of pseudo acids and pseudo bases, and is not entirely antagonistic to Ostwald's dissociation hypothesis.

A large range of ls is now available, so that it is usually possible to select a suitable one for indicating any desired concentration of hydrogen ions (see HYDROGEN ION CONCENTRATION). A 'universal indicator' is a mixture of various ls made up in such a way that it shows a series of colour changes over a large range of hydrogen ion concentration. Universal ls are extremely useful in applied and technical chemistry for the rapid estimation of hydrogen ion concentration.

External ls are substances that are used to determine the end point of a reaction but must not be actually introduced into the reacting mixture, since they would either cause undesirable changes or would be obscured by the colour of the solutions concerned. They are usually placed in drops on a white tile and 'tops' of the reacting mixture are removed from time to time with a glass rod and added to the l on the tile, when the colour changes may be noted.

Fluorescence ls are substances which indicate variations in hydrogen ion concentration by changes in the colour or intensity of the fluorescence they emit in daylight or ultra violet light. They are very useful in determining the acidity of coloured or cloudy liquids, e.g. fruit juices.

Indiction, term used in chronology to denote a period of fifteen years. The meaning of the word originally signified the imposition of a tax, but it gradually crept into the calendar of historians, principally ecclesiastical, to mark time, thus, in the Middle Ages, the dates of charters were expressed in ls as well as in years of the Christian era. The paper l, which has alone survived, was reckoned as starting Jan. 1, 313.

**Indictment**, in criminal law, is a written accusation against one or more persons of a crime preferred to, and presented upon oath by, a grand jury. All treasons and felonies, misprisions of either, and misdemeanour of a public nature at common law (e.g. seditious riots) are punishable on I. The following is an example of an I. for larceny: 'Kent to wit: The Jurors for our Lord the King upon their oath present that Richard Jones on the 1st day of May, in the year of our Lord 1901, four sacks of coal, of the goods and chattels of William Hirst, feloniously did steal take and carry away: against the peace of our Lord the King, his crown and dignity.' The formal parts are:

(1) the commencement, the prin. feature of which is the venue or place from which the grand jury is drawn, and, generally, where the crime was committed; (2) the name of the accused; a misnomer will be cured by the defendant pleading to the I.; (3) the time when the offence was committed, but time is not material except where of the essence of the offence, as e.g. burglary, which must be between 9 p.m. and 6 a.m.; (4) description of the facts and circumstances essential to constitute the crime: an omission of an essential ingredient of crime is not cured by plea or verdict; (5) the places may, in some cases, be required to be stated; in others the venue in the margin (see the form), or co., or other div., is deemed to be the place for all facts set forth in the I.; (6) conclusion—errors in the formal conclusion will not vitiate an I. An I. may contain any number of counts, but not more than one offence can be charged as a rule in the same count. The object of including more than one count is to charge the accused either with different offences, or a previous conviction, or with being an habitual criminal (see CRIMINAL LAW), or to describe the facts of one transaction by different terms, so that if on the evidence they do not sustain one charge they may another. For example, a count for larceny is very often accompanied by a count for receiving. As a rule, it is against the policy of our criminal law to charge different felonies in different counts, i.e. as opposed to charging different species or aspects of the same offence or transaction; and, as a rule, a count for a felony is never joined with a count for a misdemeanour. Different misdemeanours may be charged in different counts, provided all the acts were substantially one transaction, or constituted transactions essentially similar.

**Indies, East and West, see EAST INDIES and WEST INDIES.**

**Indifferentism**, philosophical term, denoting the conception that all things in life are of 'indifferent' value, being outside the moral law. I. in this sense originated with the Stoics, who, in common with the Cynics and the Sceptics, held that only virtue and vice possessed absolute value, all qualities other than these two being 'indifferent.' With the Middle Ages, the term came to have a second meaning, especially as it appeared in the teachings of Adelard of Bath. With him

I. came to mean the philosophy that life is either particular or universal, moral or immoral, according to the point of view from which it is regarded. Values can, therefore, only be indifferently related to any idea of absolute value. Kant used the term 'indifferent' as meaning extra-moral, but I. has come now to be used simply to denote a negation of all values which in life, it is supposed, cancel each other out, leaving no balance of absolute right or wrong.

**Indigestion, see DYSPEPSIA.**

**Indigirka**, riv. rising in the Stanovo' highlands of Yakutsk in E. Siberia, and flowing into the Arctic Ocean. Length nearly 1000 m.

**Indigo**, naturally-occurring dye-stuff obtained from various plants. Chief among these are species of *Indigofera* (e.g. *I. sumatrana*, from which the Bengali I. is prepared). I. is also present in the juices of *Isatis tinctoria*, or the woad plant, which was cultivated in England until quite recently for the preparation of a fermentation vat used in I. dyeing. I. occurs in the form of a glucoside, known as *indican*, and this latter, on exposure to the influence of atmospheric oxygen and a ferment present in the leaves of the indigo-bearing plant, is converted into the insoluble blue, *indigotin*, which is the essential principle of I. The preparation of natural I. is carried out as follows: the plant is cut down, steeped in vats for about twelve hrs. and the extract, which is of a greenish colour, separated and run into fresh vats, where it is stirred vigorously, so as to bring the indican into contact with the atmospheric oxygen. Insoluble I. is precipitated as a mud, which is collected, pressed, dried, and cut into cubes. Various components other than indigotin are present, the most important being indirubine, or indigo red, indigo green, and indigo brown. The importance of natural I. as a dyestuff has greatly diminished during the last few years owing to the perfection of various synthetic processes for its manu. The success of these has been in large part due to the work of Adolf von Baeyer, who, by a series of masterly researches, elucidated the constitution of the dyestuff, and showed that it could be correctly represented by the formula

I. is now manufactured by a process shown in the outline in the diagram (page 475). The synthetic product is considerably cheaper than the natural, and has practically entirely replaced it. Sev. thousand tons of indigo are manufactured annually, particularly in Great Britain and the U.S.A. Many other dyes related to I. in composition have recently been discovered, though they do not yet rival I. itself in importance. **See also DYES and DYING.**

**Indigo Bird** (*Cyanopica cyanea*), small bird of the Finch family, native of the

U.S.A. It is about 5½ in. long, the adult male is of a beautiful blue colour, whilst the female and young are of a bluish-grey. It has a sweet song, something like that of a canary, and frequents open spaces.

Indirect Rule, form of native administration which is characteristic of the Brit. tradition of colonial rule in the African colonies and also in Brit. Malaya (up to the time of the modern federation of Malaya). The principle of I. R. is that native institutions are the most appropriate agencies of gov. rather than any system which seeks to transplant into the

father confessor. The relationship is a delicate one and depends much on individual personalities. On the whole, it works well in this colony. Though the principles of I. R. are in accord with Brit. political sentiment, the actual evolution of the system has been more or less fortuitous; and it was the existence in Uganda of a well-developed political organisation in Buganda, and in N. Nigeria, of the Muslim emirates which facilitated the use of native authorities in a way which could not have been contemplated if experience had been con-

DIAGRAM OF THE PROCESS OF MANUFACTURE OF INDIGO

colony a replica of European political institutions. Conformably to the Brit. sense of trusteeship (see COLONIAL TRUSTEESHIP) and imperial experience the policy of I. R. affords to native peoples not only an opportunity for self-development, but the possibility of adjusting themselves with the least avoidable disturbance of their own way of life to the novel conditions which by contact with the white men they now must meet. N. Nigeria is the original, and classical, example of I. R. which was devised by its conqueror and first governor, Lord Lugard (q.v.), nearly half a century ago. That system with but slight modifications persists there to-day. The typical political unit is the prov. in which the chief executive authority is a Muslim emir. To him a Brit. resident, who is the instrument of higher policy, acts as adviser, and in some cases as

finer, e.g. to the backward societies of S. Nigeria or the weak political units of some parts of Brit. E. Africa. In the latter, however, in Tanganyika, Sir Donald Cameron rendered valuable services in extending the system of I. R. as he himself had helped to develop it in N. Nigeria. Nor, again, does the system owe its origin to any preconceived theory of rule any more than does its opposite, direct rule: for all European govts. have been confronted by the problem of administering large colonial areas with a small European staff mostly ignorant of native custom and language, and in all cases they have been compelled, at least in the earlier days, to make use of chiefs or other available native authorities.

There has been much controversy over the relative merits of I. R. and direct. The most effective means of inducing

native opinion to accept salutary innovations is the end sought in the system of I. R., which relies on the appeal to the respect of a people for its own leaders, and its pride in institutions which it can call its own. The system of direct rule, on the other hand, considers rather how best to make quickly effective the decisions of superior authority, and sees its most effective agency in the council system, or in the training of chiefs as subordinate agents of the executive gov. In the Union of S. Africa the form which native administration has taken has been dictated by the conviction that Bantu development must be regarded chiefly in relation to the place which the native must occupy in a society dominated by European institutions—hence the policy of 'segregation.' It is, therefore, understandable that S. Africa should prefer a system of direct administration in native affairs, and should rely on the council system as the best for native areas with organs of local gov. It is also evident that the traditional authority of I. R. would not be suitable for adoption as an agency for managing the large native pops. resident in the urb. centres of the Union of S. Africa. In S. Rhodesia the system of direct rule, though it rests in principle on the same basis as in S. Africa, is less developed, notably in the matter of suitable tribunals. Although the liberal provision made for native lands is a prominent feature of S. Rhodesian policy, the Dominion has not yet evolved a comprehensive scheme for the regulation of native affairs. Kenya colony, on the other hand, has in operation a fully-developed system of native administration founded on the creation of dist. councils presided over by an administrative officer, with native courts consisting of *ad hoc* nominated members. The adoption of this system of direct rule is not due to any assumption (as in S. Africa and in the Fr. African colonies) that the welfare of the native lies in his rapid assimilation of the use of 'civilised' institutions; but rather to the fact that the Kenya Gov. had no sufficient confidence in the traditional authorities to justify their exploitation whether as judicial tribunals or as agencies of local gov. But it is claimed for the Kenya system, not unjustly in the circumstances, that it is the best adapted to a colony where Africans were continually in close contact with Europeans and also that it provides opportunities for educated natives to take a part in local gov.

In the Fr. African terrs. the adoption of a system of direct rule was deliberate. Whereas Brit. sentiment favours the setting up of institutions which afford a training in the arts of self-gov. besides holding out the prospect of autonomy in the future, this forms no essential part of the Fr. theory of colonial administration. The Fr. goal is not native independence but a progressive association with Fr. methods of administration and with Fr. economic and social institutions. It is natural that, in this scheme of native development, the traditional indigenous institutions should not appear to have the

intrinsic value which the scheme of I. R. assigns to them. It is claimed, not without some justification, that this system gives the metropolitan administration a more efficient and more easily controlled agency for development than any other system to be found in operation in Africa, especially as the chiefs are now an educated class trained at one of the chiefs' schools. Critics, however, of the Fr. system think that it is not to the Africans' own interests to pass as rapidly as possible from the use of his indigenous institutions and of his own language to a régime of Fr. civilisation and language. They hold, too, that the operation of the system must inevitably prejudice the development of a spirit of responsibility and initiative. In the Belgian Congo the system of native administration is in a state of transition. The gov. is as convinced as the Brit. that a traditional chief can render better service to the administration than one who is appointed (as they are in some of the Brit. E. African colonies); but the Congo Gov. is not yet prepared to give the chief either the same judicial authority or the same position in local gov. as would be assigned to him in Brit. terrs.—like the Fr., the Belgian Gov. has less hesitation than the Brit. in removing their chiefs. Moreover, with the exception of the Ruanda-Urundi, the Belgians have encountered few traditional authorities who have commanded a wide measure of support among their people.

In both Brit. W. and E. Africa the prevailing policy is still that of I. R., but is encountering ever more criticism. In W. Africa there has been no European colonising enterprise and consequently less direct impetus towards the development of responsible self-gov. than in E. Africa (especially Kenya with its relatively large European and Indian pops.); but the principles of I. R., if not necessarily incompatible with the avowed ideal of self-gov. by representative institutions '—the tendency to-day is towards greater African (elected and nominated) representation in the legislative councils—' are so far alien to it as to presuppose considerable modifications of native institutions before they can fit into any scheme involving an elected parliament' (Lord Hailey). Fr. policy on the other hand does not envisage a future self-gov. for their colonies; development in their case is regarded as adapting the colony to pre-empt in reality the position now assigned to it in principle as an integral part of France. This is emphasised in the definition of the constitutional and legal status of the overseas dept. and terrs. within the Fr. Union (see FRANCE—*Constitution*).

The innate loyalties of the African have always been to his tribe or vil.; loyalty to the larger organisation which the white man has created can be built up only gradually. The use of the innate loyalties to introduce the idea of self-gov. was, as shown, above, the essence of the fruitful principle of I. R., but the last ten years have seen a silent revolution of imperial policy, as a result of which the days of I. R. seem to be numbered. There are two

necessities of the coming generation for which I. R. cannot provide. By the first principle of Brit. Imperial rule the purpose of the suzerain power is to make available to the colonial peoples the characteristic benefits bestowed by gov. upon its subjects at home--that is, to-day, the manifold services of the 'welfare' state. But as a method of administering social services the traditional tribal system of Africa is hopelessly inadequate. Secondly, the future political system must offer scope for the natural aspirations of Africans who, after contact with European political thought, expect as a general right those opportunities of public service and advancement which in the tribal system could only fall to them by the accident of birth. These two necessities, that of the *carrière ouverte aux talents* and that of the large-scale administration dictated by the economics of the social services, in themselves mean the eventual doom of I. R. Yet the system cannot be hurried to extinction: for the tribal system imposed its own restraints upon power, variable yet always substantial--the restraints of custom, in which the system itself was rooted. All over Colonial Africa these are now passing. The required restraining element cannot come solely from dependence upon a popular franchise. A loyalty comparable to that evoked by the old tribal system must be engendered. Hence the efforts being made by the Brit. Colonial Office to educate Africans in self-gov. through participation in both legislative and executive responsibility at the local level. The test of their success will be the development of a true loyalty to social units of a national scale; this is the great problem that challenges the emancipating imperialism of the twentieth century. See Lord Lugard, *The Dual Mandate in Tropical Africa* (11th ed.), 1929; H. B. Thomas and R. Scott, *Uganda*, 1935; Sir R. Winstedt, *A History of Malaya*, 1935; L. S. B. Emerson, *Malaysia: a Study in Direct and Indirect Rule*, 1937; M. R. Diller, *British Policy in Kenya Colony* (anti-imperialist polemic by an Amer. author), 1937; Lord Hailey, *An African Survey*, 1938; Sir D. Cameron, *My Tanganyika Service and Some Nigeria*, 1938; M. Wight, *The Gold Coast Legislative Council*, 1947.

Indium, rare metallic element which occurs in certain specimens of zinc-blende, and resembles aluminium and thallium in its properties. Its symbol is In, its atomic number 49, and its atomic weight 114.8. It is a soft white metal, unacted on by air or water at ordinary temps., but on heating it burns to its sesquioxide with a blue-violet flame, which gives two characteristic lines in the indigo part of the spectrum; hence its name.

Individual (Late Lat. *individualis*, that which is not divided), originally denoted a thing indivisible in substance; Milton in his *Animadversions* speaks of the 'individual' Catholic Church. Hence, it also

meant inseparable; cf. *Paradise Lost*, iv., 406, 'an individual solace.' Later it was used, as opposed to the word collective to mean pertaining to a single person, as in the phrase 'individual effort,' or to anything of a striking and original character. In colloquial speech it is often used as a noun to denote man or person.

Individualism, see ANARCHISM and SOCIALISM.

Individual Psychology, see under PSYCHOLOGY.

Indo-China, or Farther India, also known as Chin-India, S.E. peninsula of Asia, extending southwards into the Indian Ocean. It comprises Tongking, Annam, Fr. Cochín-China, Cambodia, Laos, Siam, the Shan country, Burma, and Malacca. See under all these names, and also INDO-CHINA, FRENCH.

Indo-China, French, name under which were incorporated the Fr. colony of Cochín China, the Fr. protectorates of Tongking, Annam, Cambodia, and Upper and Lower Laos, and Kwangchau-wan, leased from China. Even before the Second World War Fr. Indo-China was in practice a federation of the Fr. colony of Cochín China, with its own governor, and of native states with varying forms of gov. After the capitulation of Japan (1945), when France resumed her relations with Indo-China, the political institutions had changed: a republic had been founded in Tongking which sought, by force of arms against the Fr., to exercise its authority over Annam and to extend its influence to Cochín China. The mechanism of the Fr. administration, destroyed by the Jap. invaders, was only partially re-established by the returning Fr. authorities (1945-46). Cochín China had ceased to be a colony under direct Fr. administration: a local gov. had been constituted and France was represented by a Commissioner of the Fr. Republic. Following a conference at Fontainebleau (Sept. 17, 1946) France appears to have recognised the formal status of the native republic of Viet Nam, comprising Annam and Tongking, but subject to that republic forming part of the Fr. Federation of Indo-China. Before the entry of the Jap in 1911 the whole of Fr. Indo-China was under a governor-general, whose seat was at Hanoi (Tongking) and who was assisted by a secretary-general. Each protectorate had, as its head, a resident-superior, but Cochín China, being a Fr. colony (represented in the Fr. Chamber by one Deputy) was administered by a governor. There was a Grand Council for Economic Affairs, and a Gov. Council for the whole ter., and also a Grand Council for Economic Affairs for each state. In the protectorates, matters concerning natives come before a native tribunal, and a Fr. court tries matters affecting Europeans. In Cochín China, Fr. magistrates are responsible for justice to both Europeans and natives. Before the Second World War there was a military force of three divs., and a naval force of sloops, gun-boats, and surveying vessels.

Though Annam lies in the torrid zone,

Tongking on the whole enjoys an excellent climate. The heat, however, in June and July, is sometimes almost intolerable. Tigers, buffaloes, rhinoceroses, and elephants abound in the mts. of Annam, and much fishing is carried on. Rice is the chief crop of both Annam and Tongking. The products of Cambodia include rice, maize, beans, sugar, cotton, tobacco; also silk and pepper. There are schisto forest-clad tracts in the N.E., producing teak, bamboo, and other valuable timber, and in the N. and W. there are mts. containing iron, limestone, phosphate, sapphire, sandstone, and some copper. The prin. native industry is salting and smoking fish left in ponds when the Great Lake empties, and which is filled up by the overflow of the Mekong R. The total value of Fr. imports in 1939 was 2382 million fr. and of exports, 349.5 million. Of the exports France normally took nearly one-half. The univ. of Indo-China, situated in Hanoi, was organised in 1917. Area and pop.: Cochín China, 24,000 sq. m., pop. (1926) 4,616,000 (cap. Saigon, 111,000); Annam, 58,000 sq. m., pop. 5,660,000 (cap. Hue, 40,000); Tonking, 43,000 sq. m., pop. (1940), 9,261,000 (cap. Hanoi, 135,000); Cambodia, 87,550 sq. m., pop. 3,046,500 (cap. Phnom Penh, 103,000); Laos, including Luang Prabang, 100,000 sq. m., excluding Luang Prabang, 90,000 sq. m., pop. 1,000,000 (cap. Vientiane, 10,000). Total 235,886,500 (including 41,000 Fr. 236,000 Chinese).

*History.*—It was owing to the work of missionaries that Fr. influence began in S.E. Asia. Siam was the first place in which it was felt, and from there it gradually spread to Tonking and Annam in the seventeenth century. Cochín China, the original colony, did not come under Fr. influence until 1861, and then only as an indirect result of the Anglo-Fr. punitive expedition of 1860, which culminated in the sack of the Winter Palace at Peking. Anglo-Fr. co-operation in this, the second China War, prevented seizure of Chinese ter. by either; but ill-treatment of Fr. and Sp. missionaries in Cochín China gave a pretext for a Franco-Sp. expedition, and after the Sp. withdrew, the Fr. admiral stayed on at Saigon, administering the land through naval officers. This, the so-called 'rule of the admirals', marked the true foundation of France's Far E. Empire and the real beginnings of Indo-China. A protectorate was then estab. in Cambodia (of recent years considerably expanded at the expense of China). The Revolution more or less retarded progress and the Third Republic was opposed to further expansion. But Jules Ferry, Prime Minister from 1882 to 1885, determined to give France an empire in spite of herself, and backing up the adventurers on the spot, set out to acquire all Indo-China. Annam, Tongking, and Cambodia were united into a customs union in 1887. From 1893 to 1896 France gradually annexed portions of Siam E. of the Mekong R., and in 1900 the ter. of Kwangchow-wan, on the Chinese coast, was placed under the

authority of the governor-general of Indo-China. Thus, from the time of Jules Ferry the Fr. steadily pressed their conquests until they obtained possession of the whole country E. of the Mekong. Of the protectorates, Cambodia and Laos are Hindu States, decadent outposts of Indian expansion; Annam and Tongking, Chinese in civilisation and sympathy. It was in these Indo-Chinese protectorates that Paul Bert, greatest of Fr. colonial initiators, founded the system of indirect rule, or association, later applied also in Morocco. The native rulers were preserved and all gov. was in their name; native law was modified, not abolished; and industry was promoted without expelling the cultivator of the soil. In a word, Indo-China was the greatest and most successful part of the Fr. overseas empire. It was surrendered to the Jap. during the world war in 1941. The Jap. had long recognised the strategic importance of Fr. I-C. (The most important strategic points are Saigon, Cam-ranh and Haiphong.) A submarine base was under construction at Cam-ranh in 1940, in order to avoid the long, enclosed passage to Saigon. When France collapsed in 1940, I-C. fell under the Fascist influence of the Vichy Gov. (see FRANCE—History) and in July 1941 this gov., apparently unable to resist Ger. pressure, yielded to Japan's demand for bases in Fr. I-C. At the end of that month a force estimated at 40,000 was landed, the intention of the Jap. being, evidently, to attack the Burma Road (q.v., and also BURMA, SECOND WORLD WAR CAMPAIGNS IN).

During the Jap. occupation the Court of Huế (Annam) supposed that it would benefit by being on good terms with the invader, and the mandarins followed its example. A desire for independence on the part of the immature Annamites lay at the root of the violent and unjustified criticism of Fr. administration, for even to-day the whole of Indo-China still needs the technical, financial, and cultural help of France. But with the Jap. in general occupation it proved easy for the revolutionary parties to increase their influence in the inland regions, which were not effectively occupied by the Jap. The most important of these parties was the Viet Minh (an abbreviation for the name of the League for the Independence of Annam) of nationalist and communist tendencies. After the Jap. surrender, the S. part of I-C. was occupied by the Brit. and the N. by the Chinese. Probably the Annamites believed that the Fr. were to be excluded permanently. They did not wish to become vassals of China. Hence they proclaimed their independence. The revolution broke out in Tongking, where a provisional gov. was constituted under the presidency of Ho Chi Minh, chief of the Viet Minh. From that moment the political situation became very confused, the authority of the Hanoi Gov. being insecurely estab., while in Cochín China the Brit. had a hard task to maintain order in the presence of the rebel troops which had received part of their arms from the Jap. and were still, in some

cases, commanded by Jap. officers and gendarmes. In Tongking the disorganised administration resulted in floods and famine. In Cochin China most of the inhab. wished their country to remain independent of Annam and Tongking or the Viet Nam Republic and the Fr. to continue the work they had begun. In Cambodia and Laos the Fr. were received back again with open arms by sovereigns and people, who had remained staunch friends of France throughout the war. As regards Tongking and Annam, a provisional agreement was concluded (March 1946) with the Ho Chi Minh Gov., ensuring the pacific return of the Fr. troops in the larger tns. and maintaining the autonomy of those countries within the Indo-Chinese Federation and the Fr. Union (see FRANCE, *Constitution*). There was, however, bitter fighting between Viet Nam and the Fr. throughout most of 1947. Offers of settlement made by the Fr. (Sept. 1947) were rejected, and military operations began in Tongking (Oct.). Further attempts to reach a settlement concerning the defence and foreign relations of the newly-formed Federation of Indo-China were unsuccessful (1948). The Viet Nam republic, while not objecting to membership of the Fr. Union, looked for the autonomy characteristic of membership of the Brit. Commonwealth. See P. Doumer, *L'Indo-Chine Française*, 1915; M. Happ, *L'Immense Indo-Chine*, 1928; T. E. Ems, *French Policy and Developments in Indo-China*, 1936; S. Levi, *Indo-China*, 1931; Virginia Thompson, *French Indo-China*, 1937; N. Smith, *Burma Road*, 1940.

**Indo-European Languages.** This term, first employed (in 1813) by the gifted physician, Egyptologist and philologist, Dr. Thomas Young, of Emanuel College, Cambridge, is to be preferred to 'Indo-Germanic,' as it is called by patriotic Ger. philologists, or Aryan (so termed by super-patriotic Gers.), which is now technically reserved for the Indo-Aryan branch (see below). This family comprises most of the languages spoken in Europe and some of those of Asia, particularly the Indian sub-continent. The speakers of these languages have for many centuries been the leaders in the hist. of the world; their literatures are amongst the greatest. The development of these languages has been the most varied and the most rich. The languages belonging to the three main branches of this family, Germanic, Romance, and Slavonic, nowadays are spoken by c. 325 million people, c. 250 million and c. 200 million respectively. On the basis of a great deal of evidence, philologists have succeeded in constructing the Proto-Indo-European language and a 'family-tree' of the well-attested Indo-European languages, although not all the scholars agree as to the place in which one or another of these languages (e.g. Hittite or Armenian) should be placed.

The main features of the I.-E. L., at least in their early stages, are as follows: A word normally consists of three elements, root, prefix, and ending; the grammatical relationships are generally expressed by means of inflection; and the

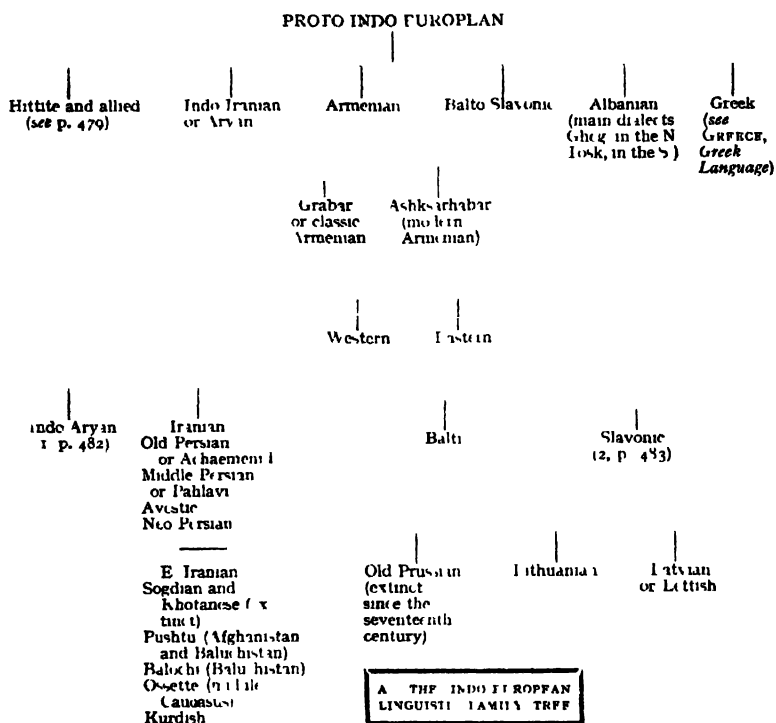

main morphological features are reduplication of the verb-stem and the vowel-gradation, known by its Ger. term *Ablaut*. The Indo-European family falls into two sub-families, torned from the word 100, in Latin *centum* (pron. *kentum*), and in Zend, *satem*. These two groups are distinguished from one another by their treatment of certain guttural sounds. The *centum* group (Gk., Lat., Celtic, Germanic) has *k*, *g*, *kh*, and *gh*, where the *satem* group (Indo-Iranian, Armenian, Balto-Slavonic, Albanian) generally has *s*, *z*, *k* or *g* or *h*.

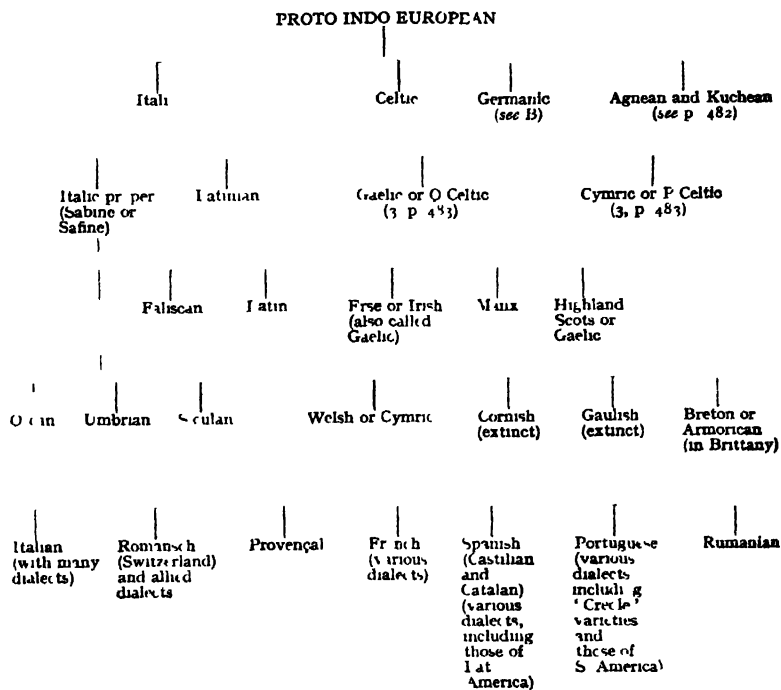

One of the many vexed problems of the Indo-European languages is that of Hittite. The Hittites inhabited Asia Minor and N. Syria from the third to the first millennia B.C., and during the fourteenth and thirteenth centuries B.C. constituted one of the chief empires of the Near East. The most important stage in the recovery of the long forgotten empire of the Hittites was the discovery in 1906-07, at Bogaz Koy (Boghaz Keui) the anct. Hattushash, cap. of the empire, of the rich royal archives containing over 20,000 documents written in cuneiform (see CUNEIFORM WRITING) on clay tablets. Some of these documents are written in Accadian language, but the bulk is written in Hittite. This language has been recognised as an Indo-European speech since its decipherment in 1915 by the Czech scholar Bedřich Hrozný. The eminent Hittitologist Emil Forrer, on the basis of 'archaisms' in Hittite as compared with other anct. I.-E. L. has suggested, since 1921, that Hittite broke away from the parent speech before any of the other known I.-E. L. The Amer. linguist E. H. Sturtevant accepted and developed this suggestion. According to him, Hittite and 'Proto-Indo-European' are both descended from an earlier language, by him termed 'Proto-Indo-Hittite'. Besides, in Sturtevant's opinion five other languages of Asia Minor, known from various inscriptions or from citations in the Hittite documents, are closely related with Hittite. Apparently all these early Anatolian languages preserve certain features that have been lost in all the I.-E. L. Sturtevant, thus, suggests the following family tree.

It may be noted that until recently Lycian and Lydian were considered as non-I.-E. L.

Recent excavations and studies have recovered other forgotten languages belonging to the Indo-European linguistic family. In the first seven or eight centuries of the Christian Era, Chinese

Eastern Turkestan (now called Sinkiang) almost wholly a sandy waste to-day was 'a land of smiling cities with rich sanctuaries and monasteries stocked with magnificent libraries.' This anct. 'melting pot' of peoples of quite different forms of speech, script and religion, is now inhabited by a sparse pop. mainly of Turkish tongue and Muslim religion. MSS. discovered since 1890 revealed that in the latter part of the first millennium A.D., the pop. living between the R. Tarim and the Tien-shan Mts., including the ters. of Turfan, Qara-hahr and Kucha, spoke a language belonging to the *centum* group of the Indo-European family. This language, however, presents sev. features not paralleled in the other I.-E. L., and its relationship with the other groups has not yet been sufficiently cleared up. It was assumed, at first, that the new language was the speech of anct. Tokharistan and it was, therefore, termed Tokharian, but apparently anct. Tokharian was a non-Indo-European form of speech. Besides the new language is not uniform; two dialects or languages can be distinguished, which nowadays are termed *Agnean* and *Kuchean*. Other newly recovered languages preserved in MSS. discovered in Turkestan, are *Khotanese*, which was spoken in the anct. kingdom of Khotan, and is now known to have been the easternmost Middle Iranian (or Persian) form of speech; and *Soghan*, another E. dialect of Middle Iranian, which was widely used in Central Asia for many centuries, and particularly in the second half of the first millennium A.D.

The Indo-European 'family-tree' with particular reference to the Italic and Celtic languages is printed on p. 480, with the 'family-tree' of the Germanic languages. Various detailed questions are not taken into consideration; amongst others, the problem of the Thracio-Phrygian group of languages, which certainly were Indo-European, but too little of them is known to give them the exact place in the 'family-tree.' Also very little is known about the linguistic affiliations of anct. Illyrian, which was spoken on the E. coast of the Adriatic Sea: the Messapii, who inhabited in pre-Rom. times the E. region now known as Apulia; the Piceni, who lived on the central It. coast of the Adriatic, and the Veneti, who inhabited the N.W. coast of the same sea, apparently belonged to the same linguistic group as the Illyrians. Some scholars consider Armenian and Albanian, which apparently are isolated independent branches of the Indo-European family, as remnants of a large group, termed Thracio-Illyrian, including anct. Thracian, Illyrian and allied languages, anct. Phrygian, and Scythian, to the N. of the Black sea.

The following are a few major points to be considered in connection with the Indo-European 'family-tree.'

(1) The linguistic problems of India are rather complicated. Her numerous languages and dialects belong to at least three main linguistic families (without taking account of the still undeciphered written documents of the pre-Indo-

European people of the Indus Valley). Indeed, besides the Indo-European languages, there are various Dravidian languages (see under LINGUISTIC FAMILIES) and Kolarian or Munda languages spoken over the whole of Central India, which are considered as having the Austro-Asiatic common substratum. Even the Indo-Aryan branch is the most numerous and complicated of all the Indo-European branches. In the last centuries B.C., Sanskrit, which was originally a refined form of the language of the 'Madhyadesa' (the Indian homeland), developed into an artificial, literary language, the language of the Brahman civilisation. For many centuries it was the exclusive literary language of N. India. The Muslim invasion of India after A.D. 1000, followed by the final conquest, towards the end of the twelfth century, extinguished the Hindu political power (revived only in 1917) in N. India, and brought into use the Arabic-Persian script and the Persian influence on the Indian languages. Roughly about this time, the Indian Prakrits or vernaculars began to develop into literary languages. The most important of them is W. Hindi (71 million speakers); one of its various dialects, Hindustani, which was primarily the language of the N. Doab, was carried over the whole of India by the Moslems. The literary Hindustani became the modern literary language of India; early in the seventeenth century it was already known in England that Hindustani was the *lingua franca* of India: it is believed that nowadays it is spoken by some 65,000,000 people, and it is understood by nearly 150,000,000 people. One form, Urdu, which makes a free use of Persian and Arabic words, and employs the Persian-Arabic script, is used chiefly by Moslems and has become the official language of the new State of Pakistan. The other form, Hindi, is free from Persianisation, and owes more to Sanskrit: it is used by Hindus and is usually printed in the Deva-nagari character, the script of Sanskrit.

Hindi (21,000,000 speakers) has three main dialects, Ewadihi, Bagheli, and Chhattisgarhi. The chief languages of the central group are: (1) Punjabi (c. 17,000,000 speakers) also spoken by the Brit. Sikh soldiers. The dialects are W. Punjabi or Lahnda, c. 7,000,000 speakers with twenty-two dialects. (2) Sindhi c. 3,500,000, with a dozen dialects. (3) Rajasthani, c. 18,500,000 with the dialects of Malvi (1,000,000), Marwari, and many others. (4) Gujarati, spoken by c. 11,000,000 people. (5) Kashmiri (c. 2,000,000 speakers whose main dialect is Kachawari), is the most north-westerly language of this branch. Pahari ('of, or belonging to, the mountains') is spoken by c. 2,500,000 people in *Sapa Jalaksha*, that is the lower ranges of the Himalaya, from Nepal in the E. to Bhadravai in the W.: it can be classified into E. central and W. Pahari, the last having many dialects, such as Mandi, Mirmauri, Jaunsari, Chameali, Kuthali, Kulai, etc. More important is the eastern group of the Indo-Aryan languages: Bengali

(divided into sev. dialects) is spoken by c. 50,000,000 people; Bihari (main dialects: Maithili or Tirhut, Magahi and Bhojpuri) is spoken by c. 40,000,000 people; Oriya, comprising many dialects, is spoken by c. 10,000,000 people; and Assamese, the most E. Indo-Aryan language, is spoken by c. 2,000,000 people.

Only three Indo-Aryan languages are spoken in S. India, the most important of them being Marathi with c. 19,000,000 speakers; interesting is Konkani, a Marathi speech, over 1,500,000, spoken in the Portuguese colony of Goa and surrounding dists., and mainly written in Rom. characters as adapted by the Portuguese priests; Saurashtra is spoken by c. 125,000 people, mainly in Madura and Madras; and Hindustani is mainly spoken by the Moslems. Sinhalese (the language of Ceylon), spoken by c. 4,000,000 people, must also be mentioned: although there are still some who maintain that it is essentially a Dravidian language, it is generally admitted by serious scholars that it is an Indo-Aryan speech strongly influenced by Dravidian. Finally, Romani, the language of the gypsies, in various parts of Europe and Asia, comprising numerous dialects strongly influenced by local languages, is generally considered as an Indo-Aryan language.

(2) *Slavonic*. The earliest, extant Old Slavonic documents belong to the end of the tenth and to the eleventh centuries A.D. They are couched in a language termed 'Ecclesiastical Slavonic,' or 'Old Church Slavonic,' or else 'Pannonian Slavonic,' or 'Old Bulgarian,' and are written in the Glagolitic or the Cyrillic scripts (see under ALPHABET). The modern Slavonic languages can be divided into three geographical groups: Eastern (Russian, White Russian, and Ukrainian), Western (Polish, Czech or Bohemian, Slovak, Wend or Serbian, and Lusatian), and Southern (Bulgarian, Serbo-Croatian, and Slovene).

(3) *Celtic*. The Celtic branch is commonly divided into two groups of languages, the Gaelic and the Gynric, which, respectively, are also termed Q-Celtic and P-Celtic: In the former group, the 'Proto-Celtic' combination of a guttural with a *w*-sound (like *kw* or *qu*) remains *kw* or *q* or changes to *c*; in the latter, it changes into *p* or *pu*.

Indo-Germanic Languages, see INDO-EUROPEAN LANGUAGES.

Indonesia (Indo- and the Gk. word *νησος*, an island) is a term sometimes used to designate the E. Indies, comprising Borneo, Indo-China, Java, and the Dutch E. Indies, Johore, New Guinea, Malay, Penang, Perak, Philippine Is., Singapore, Sumatra, and Tongking. Archaeological research in I. has been carried out under both Eng. and Dutch supervision. In the Malay Peninsula stone axe-heads of neolithic culture have been discovered, but no knives or spear-heads. These instruments were probably made of bamboo, owing to the lack of suitable stone, and bamboo spear-heads are still in use among the Malays to this day. The exploration of Malayan caves has revealed, often within about 4 ft. of the surface, parts of skeletons—remains of feasts, all seemingly of extant animals—cord-marked pottery, and ground stone implements. Archaeological research has estab. a considerable similarity between these remains and those found in Indo-China. Bronze adze-heads have been discovered in Negri Sembilan, and anc. iron tools, probably mining implements, are also found, but are extremely rare. Indonesian art is practically restricted to design, and among the is. very little sculpture remains, while what there is shows the religious influence of Indian art. Design has found expression in the patterns with which bamboo combs are decorated and also the belts worn by the women, who attribute to them a magical significance. The pottery also is rudely decorated. Gold and silver filigree work, of extreme intricacy, is made in Malay, Upper Perak, and the Patani States. Filigree work is used to ornament dagger-hilts, rings, brooches, buttons, kris-sheaths, pendants, ear-studs, and beads, being often coloured a dark red or deep yellow. Button-making is a craft widely practised in I. The buttons are made of silver on which a design has been indented. The background is then filled in with an extremely durable black enamel, which, after firing and finishing, will neither crack nor bend. The enamelling is known as niello ware. See also INDONESIA (DUTCH); and BORNEO; DUTCH EAST INDIES; JAVA; MADURA; SUMATRA, etc.

Indonesia (Dutch), the Netherlands E. Indies considered in the light of the independence movement, more particularly associated with Java and Sumatra as the strongholds of Indonesian republicanism. A widespread movement of local nationalism was encouraged, especially in Java, by Japan during the Second World War,

when her defeat became inevitable. This movement made further progress in 1945 taking advantage of the time lag between the sudden Jap. surrender and the arrival of such allied troops as could be made available to disarm the Jap. forces of occupation. Having obtained arms and assistance from the Jap. garrisons the Javanese proclaimed an independent gov. Guerrilla fighting broke out in Java and in Feb. 1946 the Netherlands Gov. declared its readiness to recognise Indonesian independence and to further the estab. of an Indonesian state possessed of full partnership rights within the Netherlands kingdom. The Dutch Gov. also declared that the new 'Indonesian Commonwealth' should manage its domestic affairs in complete freedom through its own cabinet and a democratic legislative body in which Indonesians would hold a majority. Formal discussions initiated in Java, through the mediation of Sir Archibald Clark Kerr, were continued in Holland, where, however, they made next to no progress. Law and order were estab. in Java, however, as the number of places taken over by Brit. and Dutch troops increased. The ters. of the 'Great East', Borneo, Bangka and Billiton were handed back to the Dutch E. Indies administration (July 13, 1946) and a conference was convened by Lieut. Governor General van Mook (July 16) to enable the ls. outside Java and Sumatra to discuss their future relationship with the Netherlands Gov., the real purpose of the conference being to check the Republicans' claim to speak for the whole of 'Indonesia'. Resolutions, however, were passed in favour of a federation of the whole of Dutch Indonesia with the maximum of autonomy for each of the four constituent states—Java, Sumatra, Borneo, and the Great East. In the meantime Dutch Indonesian negotiations had been long suspended but in Nov. the two sides agreed on terms of settlement embodied in the 'Cheribon Draft Agreement', a political accord as it was described by the Dutch Gov., which was initiated by both sides on Nov. 15. This agreement for the formation of the 'United States of Indonesia' held out an illusory promise of a new era of peace and co-operation, for there were those on both sides who were opposed to any compromise. In Holland, e.g. the Catholic and Calvinist parties were strongly opposed to any concession to the claims of a secular Asiatic nationalism. The Agreement was, nevertheless, signed by both sides on March 25, 1947, and a truce agreement which had been concluded in Oct. 1946 was formally implemented by a cease-fire order, which however, did not stop acts of violence by separatist movements in W. and N.W. Java. On May 27, 1947, the Dutch commissioner-general in Java sent a Note to the Indonesian Republican Gov. demanding that the gov. be reconstructed to form a central apparatus of the future Federation and that organs be created for co-operation with the Dutch Gov. in regulation of foreign relations and economic questions and the control of

relations with all parts of Indonesia not belonging to the republic. The republican gov. agreed to co-operate but blamed the Dutch Gov. for the continuation of hostilities. The Indonesian premier (Sjahrir) was unable to get the support of his own Socialist party for the acceptance of these proposals and resigned. The next day President Soekarno announced his acceptance of the general lines of the Dutch Note and the new premier (Sjahrifuddin) also agreed to the proposals.

But the republicans failed to keep law and order in the areas nominally under their control with the result that Dutch troops then occupied all republican buildings and public services in Batavia. Van Mook's defence of this action was that the Republicans were unable or unwilling to honour either the truce or the agreement or to liberate the 100,000 persons (Chinese, Indians, Dutch, etc.) still gathered in concentration camps. The Dutch forces made rapid progress in occupying areas in N.E., and central Java, and on July 31 President Soekarno broadcast an appeal to solve the problem without war saying that the republican gov. were prepared to put their case before the United Nations. On the request of the Indian Gov. through Paudyal Nehru, the Indonesian case was taken up by the Security Council (July 31) and a United Nations' committee was sent out to report. The committee put forward proposals (Dec. 2) but these were rejected by both sides. During 1948 it continued to be the aim of the Dutch to create a 'United States of Indonesia' that would be both stable and independent, and to that end they made plans for setting up an appropriate federal constitution. But they could not secure the co-operation of the republicans, nor did any greater measure of success attend the efforts of the United Nations' Good Offices Committee, which remained in Indonesia for many months. The Dutch Gov. contended that they had suffered provocation at the hands of the republicans and that the subversive forces inside the republic would, unless promptly suppressed, endanger the whole foundation of the United States of Indonesia. This contention, however, gained no support from the United Nations any more than did the Dutch offer to seek a ruling of the Court of International Justice on the Security Council's competence to intervene in what the Dutch regarded as a domestic dispute. No compromise seemed possible, for the Dutch case and that of the republicans were poles asunder: the Dutch argued that the development of the Indonesian Federation was threatened by the unwillingness of the Republic to join with the other Indonesian states as an equal partner, whereas the republicans, as always, wanted a unitary state under republican control. This forced the Dutch gov. to press for a speedy solution of the problem and, accordingly, on Dec. 19 the Dutch, in violation of the truce which had been arranged by the Good Offices Committee, resumed military action against republican ter. at Jakarta

was quickly captured by airborne forces and Dr. Soekarno and sev. republican ministers were arrested. By Dec. 30 all major tns. were in Dutch hands, the whole operation having been cleverly planned and executed. These military operations were, however, strongly condemned by most members of the United Nations Security Council. In Jan. 1949, the Gov. of India invited the govs. of thirteen Asian countries to a conference in Delhi to consider the Indonesian problem—Pandit Nehru describing Dutch action there as 'unabashed aggression.' The conference, held on Jan. 23, made firm but moderate recommendations to the Security Council of the United Nations, among them being that all Dutch troops should be withdrawn from the whole of I. by a date to be determined by a United Nations' authority and that power over the whole of I. should be completely transferred by Jan. 1, 1950 to the United States of Indonesia, whose relationship with the Netherlands should be settled by negotiations between the two parties. After discussions lasting sev. weeks, a preliminary agreement was reached (May 8) between the Dutch and the Indonesian Republican delegations which met at Batavia under the auspices of the United Nations committee for Indonesia. The proposals under consideration were the return of the Republican gov. to Jogyakarta, the cessation of all guerilla warfare, and a round-table conference at the Hague. This compromise seemed to be the first step on the road to a settlement of the Indonesian question.

**Indoor Gardening**, see UNDER WINDOW GARDENING.

**Indore**, native state of Central India in the dominions of the Maharajah of Holkar. It covers an area of 9900 sq. m., and is bordered S. and W. by the ters. of the Bombay Presidency, and N. and E. by those of Scindia and the rajahships of Dhar and Dewas. It is traversed in the S. by the Satpura range, and in the N. by the Vindhya Mts., and between these are the dists. watered by the Nerbudda. There are some fertile plains, and most of the country is well wooded. The prevailing religion is Mohammedan. The chief products are wheat, timber, tobacco, raw cotton, and opium. The chief tn. and cap. is Indore, situated in a fine undulating plain. It has a new first-grade college, a Sanskrit College, sev. high schools, and a scheme for compulsory primary education is estab. A Botanical Institute for the improvement of cotton has been estab., and a number of spinning and weaving mills. Other places of note are the old garrison tns. of Mhan and Melhidpur, Mhoyaur, and Mandesar, and the ruined city of Mandu. The present Maharajah, who succeeded to the throne in 1926, on the abdication of his father, Maharajah Tukoji Rao III., was educated at an Eng. school and Oxford. He married, in 1924, the daughter of the Junior Chief of Kagal. The maharajahs have shown great loyalty to Britain, and during the two world wars I. gave all the help it could to the Brit. Gov., both in money and men,

who fought on many fronts. There is a state railway, with the prin. station at Indore tn., and sev. other railways cross the country. State savings banks have been introduced. The ann. revenue is £900,000. Pop. (1941) 1,514,000.

**Indorsement**, writing on the back of an instrument something relative to and affecting the transaction evidenced by the instrument, e.g. the l. of a bill of exchange or cheque payable to order operates to transfer the right to payment to the indorsee or person to whom the indorser hands the bill or cheque. The l. of a negotiable instrument may be in 'blank,' i.e. where the name of the indorser only is written on the instrument, the effect being that the instrument becomes payable to bearer; or 'conditional,' i.e. the property in the instrument is transferred subject to some contingency being fulfilled; or 'qualified,' i.e. which enlarges, restricts, or otherwise qualifies the liability of the indorser; or 'special,' where the name of the indorsee is inserted; or 'restrictive,' i.e. it restricts the negotiability of the instrument to some particular purpose or person.

**Indra**, in Indian mythology, the ruler of the bright firmament who stands at the head of the heaven of the gods. In Vedic poetry he is represented as performing wonderful deeds for the benefit of good men, at the same time possessing all the attributes of a warlike god.

**Indre**, dept. of Central France, lying S. of the dept. of Cher, and covering an area of 2661 sq. m. It was formed in 1790 from parts of the old provs. of Berry, Orléannais, Marche, and Touraine, and is named from the riv. flowing through it. The surface consists of a large plateau divided into three dists., viz. the Bois-chant, a well-wooded plain abounding in marshes in the S., comprising nearly seven-tenths of the entire area; the Champagne, a fertile dist. in the N., producing cereal crops; and the Breune in the W., between the Cher and Creuse, a region of moors, marshes, and ponds, formerly unhealthy, but now considerably improved by means of drainage and afforestation. The Champagne dist. affords excellent pasturage for sheep, which produce first-rate wool. The chief products are chestnuts, grain, the vine, sugar-beet, wheat, oats, potatoes, turnips, etc. Much poultry is also reared. Amongst the prin. manufs. are paper, leather, cloth, and pottery. The dept. is divided into the arrons. of Châteauroux, Le Blanc, Le Châtre, and Issoudun. Châteauroux is the chief tn. Pop. 252,000.

**Indre-et-Loire**, dept. of Central France, comprising small parts of Anjou, Poitou, and Orléannais, and nearly the whole of the old prov. of Touraine. Area 2811 sq. m. It is drained by the Loire and its tributaries, the chief of which are the Indre, Cher, and Vienne. The chief dists. of the dept. are the Gâtine, a plateau region, diversified by woods and plains, to the N. of the Loire; the Champagne, a chain of vine-clad slopes between the Cher and the Indre; the Veron, a dist. of

orchards and vines between the Loire and Vienne; the hilly and unproductive plateau of Ste. Maure; and the marshy ter. of the Breune. The chief products are grapes, apples, beetroot, grain, and hemp, and there are manufs. of paper, silk, rope, and bar-iron. Metallurgic monuments are numerous in the dept. The dept. is divided into the arrons. of Tours, Chinon, and Loches. The chief tn. is Tours. Pop. 319,600.

**Indri** (*Indris brevicaudata*), sub-family of the Lemuridae, large monkey-like lemurs inhabiting Madagascar, especially the E. coast forests, first discovered 1780. They are black and white in colour, of diurnal habits, and live chiefly on fruit. See LEMUR.

**Induction**, Eng. Church ceremony for giving possession of a benefice to a clergyman. The I. is performed after a mandate from the bishop to the archdeacon (or dean and chapter). The inductor takes the clergyman's hand and lays it on the key of the church door. The clergyman is then admitted, and tolls a bell as a public notification to his parishioners. The incumbent's possession is completed by 'reading himself in,' reading the Thirty-nine Articles, and making formal vows to accept them and conform to the rules of the Church. Scottish ministers are ordained by the Presbytery ceremony. The ceremony which includes a laying on of hands, is conducted by the 'Moderator,' the clergyman appointed to look after the church during the interregnum or vacancy.

**Induction**, in logic, the process of real inference, or the proceeding from the known to the unknown. This operation of *discovering and proving* general propositions is contrasted with deduction, which is the method of *applying* general propositions once discovered to such particular cases as are considered to be within the scope of the estab. propositions. The great exponent of deductive principles, Aristotle, neglected I., and only identified it with a complete enumeration of facts. Bacon's *Novum Organum* contains little true I., though it contains directions for drawing up the various kinds of lists of instances. Whewell's *Philosophy of the Inductive Sciences* (1840) marks a distinct advance, and shows a due appreciation of the cardinal point neglected by Bacon—the function of theorising in inductive research. He shows that science advances only in so far as the mind of the inquirer is able to suggest organising ideas whereby experiments and observations are made to dovetail into an intelligible system. J. S. Mill in his *System of Logic, ratiocinative and inductive* (1843) ignores the constitutive work of the mind, and regards knowledge as the merely passive reception of impressions. Recent advances in mental science have estab. the great importance of I., and clearly show that the most valuable faculty in scientific inquiry is that of suggesting new and valuable hypotheses. See also LOGIC. See J. S. Mill (above) and A. Lalande, *Les Théories de l'induction et de l'expérimentation*, 1929.

**Induction and Induction Coil**, see ELECTRICITY—*Electro-Magnetic Induction*.

**Induction Furnace**, see under METALLURGY (METALLURGICAL FURNACES).

**Indulgence**. This term, in Rom. Catholic theology, signifies the remission of the temporal penalty of sin, granted to a repentant sinner by Church authority. The I., however, is never considered a sacramental remission of the sin itself. Although the first recorded instance of the use of the word indulgence was in the eleventh century by Alexander II., the institution was found in full development during the wars of the Crusades, the serving in which was accounted an equivalent substitute for penance, provided always the service was from motives of devotion and not from mere greed or love of glory. Later, military service as a condition for Is. was replaced by pilgrimages to certain great shrines. I.s may be given by the Pope, and by primates and bishops within the limits of their jurisdiction. In modern times they are usually attached to works of devotion or good works of any kind in the form of remission of part or all of what would have been the old canonical penance for sin.

**Indulgence, The Declaration of**, issued by James II. of Great Britain in 1687. It had for its ostensible object the suspension of all laws tending to force the consciences of the king's subjects—its real object being to relieve the Rom. Catholics. It was very unpopular, and the culminating point of the universal dissatisfaction was testified in the refusal of the seven bishops to order their clergy to read it aloud from their pulpits.

**Indus**, S. constellation between Grus and Pavo, first noticed by Bayer in his *Uranometria*, pub. in 1603. The chief star (of 3.2 magnitude) gives a solar spectrum. Near by are the clusters of Tucana and Telescopium.

**Indus**, great riv. of N. India, rising in the Kailas mt. group, near the sources of the Brahmaputra, Sutlej, and Gogra. For upwards of 500 m. it flows in a N.W. direction; at first by the foot of the Himalayas on the Tibet plateau, then through Kashmir, between the chains of Ladakh in the N., and of Zaskar in the S., amid mt. scenery unmatched by any in the world. Here it receives the waters of the Shyok, the largest trib. of this its upper course. As it leaves Kashmir to enter the Punjab it turns to the S.W., and emerging from the mt. regions is joined at Attock by the Kabul R., from Afghanistan. From this confluence it continues to run in a S.W. direction for another 1000 m. till it enters the Indian Ocean. About the middle of this lower course through the plains it receives one great affluent, composed of the united waters of the Sutlej, Chenab, Ravi and Jhelum, which, with the I. itself make the Five Rivers or Punjab. It loses much water from passing through desert regions, but is navigable up to Attock at all seasons. During the melting of the mt. snows, from May to August, destructive floods often occur. It is spanned by sev. bridges, even in its upper mt. courses—the iron railway bridge at Attock and the cantilever 'Landsdowne Bridge' at Sukkur being triumphs of

engineering skill. The total length of the I. is nearly 2000 m., its minimum width is 500 ft., and depth 9 to 10 ft. See Hall, *The Indus Delta Country*, 1894. See also INDUS VALLEY CULTURE.

**Industrial Accidents.** According to the Workmen's Compensation Act of 1923 industrial accidents are 'accidents rising out of or in course of employment.' Such accidents are classified according to their severity whether the results are fatal, and if non-fatal whether permanent or temporary. A table of frequency rates for 779 factories employing 820,525 persons (or 12.8 per cent of all Brit. factory employees) gives a rate of 2.27 for all the listed industries during 1917 and is useful as a guide to the industries producing most accidents. The tables show the percentage relationships of totals of accidents for 1942 and 1947 to the accidents in 1937.

ciency (1921); H. W. Heinrich, *Industrial Accident Prevention* (1931); *Annual Report of the Chief Inspector of Factories for 1947*. Cmd. 7621. H.M.S.O. 1949.

**Industrial Court**, permanent court set up as a result of the Whitley Committee of 1918 in which disputes between workmen and employers can be investigated and referred for arbitration or other solution in the event of no mutual agreement.

**Industrial Design**, Council of, organisation set up in 1941 whose purpose is to promote by all practicable means the improvement of Design in the products of Brit. industry. It is financed by the Brit. Gov. The word design is taken to cover the many processes in the planning of goods for hand production or, more usually, for quantity production by machine and to include structure, texture, form, and decoration. Good design is

Number of Fatal Accidents

Year	Factories	Docks and Warehouses	Building Operations	Works of Engineering Construction	TOTAL	Total per cent of 1937
1937	716	105	182	—	1,003	100
1942	991	124	219	29	1,363	136
1947	516	70	218	35	839	84

Number of Non-Fatal Accidents

Year	Factories	Docks and Warehouses	Building Operations	Works of Engineering Construction	TOTAL	Total per cent of 1937
1937	176,013	8,303	8,223	—	192,539	100
1942	295,613	8,308	7,758	1,558	313,267	163
1947	185,231	7,819	8,251	1,096	202,397	105

Typical figures of direct causes of accidents in Brit. factories are as follows (percentage of total accidents for 1947): power-driven machinery, 16.7; molten metal or other hot or corrosive substances, 4.4; hand tools, 9.9; struck by falling body, 8.8; persons falling 12.0; stepping on or striking against objects, 7.0; handling goods, 29.2; other causes 12.0. These figures show that what are known as non-machinery accidents accounted for 83.3 of the total.

An important statutory reform in the law of Compensation for I. A. was introduced in 1946 when on July 26 the royal assent was given to the National Insurance (Industrial Injuries) Bill, framed by the Churchill Gov. to place compensation for industrial accidents on the basis of a contributory social service. Under this Act the basic rate for injury benefit for 100 per cent disablement is 45s. with the right to claim an addition of 25 per cent to his medical assessment if the worker can show that by reason of his injury he is no longer able to fill his previous occupation or be retrained to fill an occupation of an equivalent standard.

**Consult:** The Human Factor and Industrial Accidents' (*International Labour Review*, 1936); *Industrial Fatigue and Effi-*

taken as meaning both practical convenience and beauty. The main functions of the council are to help industries to set up design centres which operate on a co-operative basis, supported by contributions from the firms in each industry, with the addition of a grant from the Exchequer, to hold and take part in exhibitions, to publish good design both independently and in collaboration with those adult education and voluntary associations which are concerned with design appreciation; to co-operate with education authorities and others in the training of industrial designers; to advise gov. depts. on the design of goods which they purchase; and to be a centre of advice and information on all matters of industrial design for industry, gov. depts., and other interested bodies. The industrial div. of the council offers manufacturers, designers, and interested bodies a general advisory service or the promotion of improved industrial design; the information div. includes sections which offer specific services to educational bodies of every kind, to industry, and to the public. The offices are at Tilbury House, Petty France, London, S.W. 1.

**Industrial Hygiene,** see under HYGIENE, and INDUSTRIAL WELFARE.

**Industrial Insurance.** In its beginning I. I. consisted of 'burial societies' through which the working classes, by payment of small weekly sums to a mutual society, received sufficient money to defray funeral expenses when the need arose. From these comparatively obscure societies the great business of I. I. of today developed. A demand for whole-life insurance followed the modest requirements of 'burial funds,' and this demand was satisfied by the innovation of premiums which could be paid weekly or monthly and the issuing of policies for smaller assured sums. These premiums are collected at the houses of the policy-holders, and it is this 'collection,' coupled with the weekly or monthly payments, which distinguishes I. I. from ordinary insurance, where premiums are usually paid annually for larger assured sums. The official limit which marks insurance as industrial is that the premiums must be collected at intervals of less than two months, while the sum assured must be less than £1000. This demarcation was embodied in the Act of 1923. Associated with the I. I. companies are the Friendly Societies: the administration of both is governed by the statutory measures of the same Act, and the Industrial Assurance and Friendly Societies Act, 1948. All such companies must be registered and pay a substantial deposit to the Chief Registrar, who has authority to hear and judge disputes arising out of claims, criticise balance-sheets, hold inspections, reject unsound valuations, and even direct the winding up of unsatisfactory companies. The Industrial Assurance Act of 1923 was further extended by the I. I. and Friendly Societies Act of 1929 which is concerned with the computation of the minimum sum payable at death under the age of ten, and (2) the validation of the 'life of another' endowment insurance. But important amendments of the law were made by the Act of 1948. This Act (section 6) contains a prohibition of insuring money to be paid on the death of a child under ten or, in other words, it prohibits insuring so as to render any sum payable under the insurance on the death of any person at any time before he or she attains the age of ten years (otherwise than by repayment of the whole or any part of premiums paid). This prohibition also applies to registered or unregistered friendly societies or trade unions. By section 2 power is given to insure the life of a parent or grandparent for not more than £20, but only in respect of a person who at the time of the proposal is ordinarily resident in Great Britain; and the Act prohibits alienation of such insurances. The former power conferred on I. I. companies (and Friendly Societies) to insure money for funeral expenses is also abrogated by the Act; while, by another provision, liability on policies will not be restricted on grounds of health of the person upon whose life the assurance is taken out, if the proposer

knowledge and belief has been properly disclosed.

Like many other Brit. institutions, industrial life insurance has completely changed its purpose during its existence, besides being radically reformed. It began, as implied above, in the desire of every working-man to guard himself and his family against the danger of a pauper's grave. It was to permit the inclusion of the family that Parliament allowed in this sphere alone the insurance of the life of another—an exception to the general and salutary rule that no one might insure so as to benefit financially from another's death. With the payment under the National Insurance Act, 1916, of death benefit as from July 1, 1919, the whole original cause of I. I. comes to an end. Some thought that on the principle of *cessante ratione cessat* the institution of I. I. should be ended. But its potentialities for good in the future should guarantee its continuance, especially as the worst abuse has been removed by the Act of 1948. I. I. to-day has been transformed into a flexible system which enables the wage-earner (already compulsorily insured so as to guarantee him a minimum standard of living in all the changes and chances of life and a decent funeral when he dies) to assure for himself and his family all those infinitely various benefits at various monetary levels which he desires and for which he is willing to pay. The main remaining criticisms of I. I. to-day are its relatively high cost and the number of forfeitures. No fewer than 910,000 policies were forfeited in 1918, but this was a great improvement on 2,610,000 in 1938 and 3,160,000 in 1929. It may be added that the size and importance of I. I. are shown by the fact that the institution draws annually more than £110,000,000 from the pockets of wage-earners.

As administrator of the Industrial Assurance Act of 1923, the Chief Registrar of Friendly Societies is styled the Industrial Assurance commissioner (Offices: 17 North Audley Street, London, W.). See ANN. Reports of the Industrial Commissioner.

In the U.S.A. and Canada a similar system of I. I. operates. In the former country the administration is directed by the Gov. of the separate States, and not by the Federal Gov., while in the latter control is vested in the Dominion Gov. under the provisions of the Dominion Insurance Act of 1927.

**Industrial and Provident Societies.** Societies which can be registered under the Industrial and Provident Societies Acts of 1893-1928 are those formed to carry on any industry, business, or wholesale or retail trade authorised by the rules, including dealings in land. To a certain extent the rules of registration and general statutory regulation of these societies are assimilated to those of friendly societies (see under FRIENDLY SOCIETIES). Modern I. and P. S. are divisible into co-operative and building societies. (See also BUILDING SOCIETIES). The primary characteristics of an I. and P. S. are indicated by the

description: 'Industrial' connotes the making of a profit by the mutual personal exertions of the members, while 'provident' emphasises the providing for the future of the members by the distribution of the profits. The history of I. and P. S. shows that it was long before they gained public confidence, or even met with legal recognition. According to Irlabrook, they became associated with ever wider schemes enunciated by promoters who probably looked upon them as socialistic organisations. Robert Owen's projects were especially illustrative of this idea. The first legal recognition of co-operatives societies was in the Friendly Societies Act of 1846. The basis of the law of I. and P. S. is now to be found in the Consolidated Industrial and Provident Societies Act, 1893. No member of an I. and P. S., other than a registered society, may hold more than £200 in shares. The society must make an annual return of its receipts and expenditure, funds and effects to the Registrar of Friendly Societies. On the application of one-tenth of the members or of 100 where the membership is 1000 or more, the registrar may appoint an inspector to investigate the affairs of the society. The Prevention of Fraud (Investments) Act of 1939 requires some societies of the investment trust and property type to transfer their registration under the Industrial and Provident Societies Acts to registration under the Companies Act, 1929, and in consequence they must conform to the prospectus provisions of the latter Act; but they are free of the normal companies' registration fees and stamp duties on paid-up share capital. From the passing of the Act of 1929 registration under the Industrial and Provident Societies' Acts was restricted to bona fide 'co-operative' organisations, including societies 'conducted mainly for the purpose of improving the conditions of living, or of otherwise promoting the social well-being of members of the working classes'—the principle which underlay the old I. and P. Acts although not expressly enacted. Before the Second World War there were 5693 registered societies, with a total membership of 9,283,000 and funds of £281,507,000. See under CO-OPERATION.

**Industrial Psychology**, branch of psychology which investigates the effects, mental and physical, produced by their occupation on workers in the various industries, directed to the elimination of causes which lessen industrial efficiency. Among matters which come under review are the duration of working periods, pauses for rest, environment, monotony, meal times, fatigue, lighting, heating, and ventilation. A section deals with vocational tests designed to aid the selection of workers for particular trades or tasks. There is a chair of National Institute of Industrial Psychology which specialises in the study of vocational fitness (Aldwyck House, Aldwyck, London). There are also a chair of Industrial Medical Psychology in London Univ. and a Group for Research in Industrial Psychology, one of many

units in the Medical Research Council. With the great increase in the use of machines and large-scale production methods, particularly in the textile industry, it becomes of great importance that materials and methods of work and general working conditions should be designed specifically in view of what the greatest possible number of normal people could do with the least strain, fatigue and threat of ill-health. Machines and working conditions should be designed in the light of a sound knowledge of what the normal human senses, muscles and mind were fashioned and developed to do easily and well.

**Industrial Relations (Britain).** In Britain, unlike the position in many foreign countries, the relations between employers' and workers' organisations have been developed on a voluntary basis over many years. Collective bargaining between employers and workpeople has for many years been recognised in Britain as the method best adapted to the needs of industry and to the demands of the national character in the settlement of wages and conditions of employment. It has produced a well-co-ordinated system of conventional working arrangements affecting in the aggregate large numbers of work people and driving, generally with great precision, almost every aspect of I. R.

**Historical and legislative development of organisations of employers and workpeople.**—Organisation of employers and workers grew with the development of modern industry from the eighteenth century. In the sixteenth century the State regulated wages and conditions, and at the same time prohibited combinations both of workers and of employers from altering wages and conditions of work. But with the increasing complexity of industry and the div. of labour and wages this State system of regulation fell into disuse, and conditions in the *laissez faire* economy of the day, were left to be fixed by employers. During the eighteenth century, further laws were passed prohibiting combinations in various trades and, as the result of the report of a parl. committee of inquiry, the Combination Laws Repeal Act, 1824, was passed. This legalised trade societies and the immunity thus granted to combinations for the regulation of wages and conditions led to the widespread formation of unions. This led to disputes and strikes and to agitation for the repeal of the Act of 1824. An amending Act in 1825 limited the activities of the trade societies, making it difficult for them to take effective action without infringing the law; but the Act legalised the right to withhold labour by collective action, and this fundamental right has never been abrogated despite many changes in the powers permitted to Trade Unions. The immediate result of these developments was an expansion of union organisation, and the conception of one big union with a political bias emerged. Later, there was concentration on industrial amelioration through smaller but stronger organisations whose aims were confined to securing recognition and improvement in

wages and conditions of work. Strikes were frequent from 1825 to 1871. A Royal Commission of 1867 reviewed the position of Trade Unionism, and consequent on their recommendations two important Acts were passed in 1871—the Trade Union Act and the Criminal Law Amendment Act. The Trade Union Act of 1871 is the prin. Act on which the present-day status of unions is founded. The Criminal Law Amendment Act qualified the freedom conferred under the Trade Union Act by providing penalties for violence, intimidation, molestation, and obstruction of any person in order to coerce him for trade purposes. Since then there have been many subsequent Acts, supported by a great body of case law, and the law has been codified. These measures and judgments include the Conspiracy and Protection of Property Act, 1875 (*see CONSPIRACY*); the Employers and Workmen Act, 1875, dealing with disputes between employers and workmen arising out of breaches of contract and allowing courts to adjust claims for wages or damages; the Trade Union Amendment Act, 1876, amending the definition of Trade Unions given in the Act of 1871; the Taff Vale Judgment of 1901 and the consequent Trade Disputes Act, 1906 (*see under TRADE UNIONS*); the Osborne Case, 1909, and the Trade Union Act, 1913 (*ibid*); the Trade Union (Amalgamation) Act, 1917 (modified by the Societies (Miscellaneous Provisions) Act, 1940); and the Trade Disputes and Trade Unions Act, 1927 (*see TRADE UNIONS*). A period of trade depression followed the year 1875 and lasted for two decades during which trade unionism lost some of its strength. Strikes were common and nearly always unsuccessful. The unions confined themselves mainly to establishing such relations with employers as would ensure the maximum benefit in wages and conditions to the workers. When this phase passed a new unionism arose with a tendency towards a more active industrial policy and a reversion to the earlier idea of one big Union. But the statutory position of the Trade Unions was unchanged throughout this period, though the historic judgments above mentioned resulted in the further legislation indicated. Since 1868 the trade union movement has been centralised in the Trade Union Congress, the objects of which are 'to promote the interests of all its affiliated organisations and generally to improve the economic and social conditions of the workers.' Although the origin and main activities of Trade Unions lie in the industrial field, they have also a direct association with politics because of the connection between the Trade Union Congress and the political Labour Party. A joint body, the National Council of Labour, which is composed of representatives of the General Council of the T.U.C., of the Labour Party, of the Parl. Labour Party, and of the Co-operative Union is responsible for the consideration of questions which have both an industrial and a political implication.

Employers' organisations in the form of merchant guilds (*see GUILDS*) and livery

companies (*see COMPANIES, CITY*) have been in existence in Britain since the Middle Ages. These bodies which once dealt in some measure with both trading and labour questions affecting their craft differed materially from employers' organisations under present-day conditions. These employers' organisations, like most other Brit. institutions, have developed to meet particular circumstances and do not conform with any uniform plan. Employers' organisations fall into three groups: those constituted for dealing with I. R. questions, including collective bargaining with Trade Unions and the avoidance of disputes; those which fulfil that purpose and, in addition, deal with trading questions; and those which deal only with trading questions and which are therefore irrelevant to this article. As regards the first two groups, the repeal of the Combination Laws and the development of Trade Unionism in the nineteenth century stimulated both an increase in the number of these employers' organisations and the expansion of their activities. The extent of the industrial field they cover is estimated at about eight million workers. Some of these organisations are local in character and deal only with a section of an industry; others are national in scope and deal with the whole field of a particular industry; while in many of the chief industries there are local or regional organisations combined into national federations, but the degree of authority exercised by regional organisations over individual members, or by federations over affiliated organisations, varies considerably. Just before the Second World War there were about 270 national federations concerned with matters relating to the employment of labour and in addition about 1,550 other employers' organisations consisting mostly of local or regional branches of the national federations (an analysis of these 1820 organisations classified according to industrial groupings will be found in the *Abstract of Labour Statistics of the United Kingdom (1822-36)*). The corresponding total at the end of 1943 was approximately 1900, with the same ratio of local to national bodies. By 1919 there had been formed the National Confederation of Employers' Organisations (now called the Brit. Employers' Confederation) to secure the co-operation of the national federations in dealing with all questions arising out of the relations between employers and their workpeople. This Confederation, consisting of federations employing about 70 per cent of the total industrial population of Britain, is the employers' counterpart of the T.U.C. for dealing with labour questions affecting industry generally. In that capacity the Confederation has represented Brit. employers at the annual conferences of the International Labour Organisation since 1919. This Confederation and the T.U.C. have long been recognised as the authoritative channels of consultation between gov. depts. and organised employers and workpeople on matters affecting their respective interests, and at the outbreak of the Second World War the need for the

closest co-operation was at once recognised. Accordingly there was established in Oct. 1939, a National Joint Advisory Council of fifteen representatives nominated by each organisation. It was agreed that the scope of the Council's functions was to include all 'matters in which employers and workers have a common interest,' while, at the same time it was not to encroach on the jurisdiction of organisations concerned with particular industries. In May, 1940, the Council appointed a Joint Consultative Committee consisting of seven representatives of the Brit. Employers' Confederation and the T.U.C. respectively to advise the Minister of Labour and National Service on all matters arising in the period of emergency.

*Collective Bargaining and Development of Joint Negotiation between Organisations of Employers and Workpeople.*—In the early days of Trade Unionism the outlook of the Unions reflected both industrial aspirations and political ideas; but by about 1850 they were concentrating much more on the improvement of working conditions. The next stage was the establishment of some agreed relationship with employers' and employers' organisations. Conciliation Boards, with a form of procedure confined to the treatment of disputes, were set up in many industries; but with the development of industry the scope of this arrangement was widened and, by 1900, a number of the staple industries had adopted the practice of collective bargaining. The term 'collective bargaining' is applied to those arrangements under which the wages and conditions of employment are settled by a bargain in the form of an agreement between employers or associations of employers and workpeople's organisations; but in unorganised trades the individual workman accepts or refuses the terms offered by the employer without reference to any one else's interests than his own. For many years collective agreements have played a most important part in the regulation of working conditions in Britain, embracing a great variety of matters including not only wage rates but also hours of work, piece work arrangements, holidays, etc. The terms and conditions laid down in the agreement are applied not only to members of trade unions but also to non-unionists. Trade agreements are also largely observed by employers who are not party to them. This system of collective bargaining includes also agreements regarding the procedure for settling questions as they arise, and in no other country has so much been achieved towards evolving machinery for the avoidance of strikes and lock-outs. The whole of this collective system rests on the principle of mutual consent. This acceptance is purely voluntary depending solely on the sense of moral obligation. Loyal acceptance has in fact been the rule in all the trades concerned. Certain steps have, however, been taken in the interests of the community to encourage joint voluntary machinery where such does not exist and to assist where necessary in the settlement of disputes. There are two main legislative measures, the Conciliation

Act, 1896, which was passed as a result of the recommendations of a Royal Commission of 1891; and the Industrial Courts Act, 1919. In addition, however, much has been done through the conciliation officers of the Ministry of Labour to strengthen and support existing joint machinery and to promote new voluntary machinery as organisation developed in industry (for details see under ARBITRATION, CONCILIATION IN INDUSTRY). The first modification of the voluntary principle was made by the Trade Boards Act 1909, which set up Trade Boards empowered to fix minimum wage rates. This Act was confined to certain unorganised trades where 'sweated' conditions obtained, but the Act was extended in operation in 1918 by the Trade Boards Act of that year. Again, during the First World War, the Munitions of War Act, 1915, made strikes and lock-outs illegal so far as munitions work was concerned, unless the dispute had been referred to the Board of Trade which dept. could, in general, enforce arbitration, though it was understood that arbitration was merely supplementary to the agreements in various industries. Generally speaking, however, as the war progressed, arbitration became the practice, and this war-time national arbitration gave encouragement to the regulation of wages on a national basis during and after the war. But despite the legal prohibition of stoppages of work and the acceptance of compulsory arbitration, there developed industrial unrest throughout the country which seems to have had its origin in the 'shop stewards' movement and the theory of industrial unionism, notably on the Clyde and in Sheffield. The essence of this theory was devolution of authority to the workshop and the establishment of workers' control therein on militant lines with the ultimate object of securing control of industry generally. As a result of the recommendations of the Whitley Committee's Report there was an extension of the trade board system and the development of statutory machinery for the prevention and settlement of industrial disputes. The Committee laid down as an over-riding consideration 'the advisability of a continuance, as far as possible, of the present system whereby industries make their own agreements and settle their differences themselves,' and this is still the deciding factor of State policy in regard to intervention in industrial disputes (see WHITLEYISM or WHITLEY COUNCILS).

During the Second World War the emphasis on the voluntary principle was maintained as far as possible in the Conditions of Employment and National Arbitration Order, 1940. This Order prohibited strikes or lock-outs unless the dispute had been reported to the Ministry of Labour and had not been referred by him for settlement, and it also provided for the establishment of a National Arbitration Tribunal for dealing with disputes while laying down that if suitable collective joint machinery exists, the Minister would refer the dispute to that machinery for settlement and that the settlement

should have the legal force of an arbitration award.

The voluntary joint machinery for the regulation of terms and conditions of employment has evolved according to the varying needs and circumstances of the different trades and industries, but the better the industrial organisation the more effective and simple is the machinery of collective bargaining. In the early days of collective bargaining negotiation was generally confined to localities, but in most industries the scope of the machinery has been continually extended until national negotiations have largely replaced local interchanges on industrial questions. National negotiating machinery however varies considerably in form and in degree of authority over the local machinery and, moreover, the trend towards national negotiation does not mean that a national uniformity has been established. In regard to wage rates and conditions. Variety in the methods of collective bargaining as well as in wages structure is most to be found in industries where the principle of joint negotiation between organisations was well established before 1918. There is greater uniformity in industries where joint organisation is a more recent development and has been founded on the basis of the Joint Industrial Councils recommended by the Whiteley Committee. Consult *Industrial Relations Handbook*, H.M.S.O., 1934, and A. Beacham, *Economics of Industrial Organisation*, 1934.

**Industrial Revolution in Great Britain**, the compendious description given to the changes brought about in social structure by the inventions of the eighteenth century. In the later part of the seventeenth century Eng. industry had benefited by the immigration of foreign artisans, and many branches of cloth-making were learned from aliens, like the Walloons, and silk-weaving from the Huguenots, who came over in 1685 after the Revocation of the Edict of Nantes. Paper-making, glass-making, mechanical toy-making, and the making of clocks and watches were also among the activities established through aliens from the Continent. But the remarkable development of industry, due to the invention of machinery in the eighteenth century and to the exploitation of the coal mines, dwarfed the preceding progress into insignificance and resulted in a rapid and vast increase of the population and, incidentally, led to all the implications of the term known as *laissez-faire*.

Prior to the era of machinery, weaving had been a cottage industry, while yarn spinning was a spare-time industry practised all over the land by women and girls at home. Then in 1738 came the invention by Kay of Bury of the flying shuttle, which obviated the old and slow process of carrying the weft through the threads of the warp, and so enabled the weaver to double his output, and, in turn, led spinners to seek mechanical aids to meet the increased demand for yarn supplies. The next important inventions were the spinning jenny of James Hargreaves in 1764, the invention of the water-frame spinning roller of Richard Arkwright, Crompton's

'mule,' a combination of Hargreaves' jenny and Arkwright's water-frame—all of which inventions were at first applied to cotton-spinning only (see COTTON-SPINNING AND MANUFACTURE). Twenty-five years later came Cartwright's power loom in its perfected form, and by that year his Doncaster factory was equipped with a steam-engine, and a year or two after that hundreds of his looms were also selling to Manchester firms, while gradually the power loom was applied not only to the cotton, but also to the woollen industry. The next stride was the general supersession of water-power by steam, a change which came with the utilisation of the coal resources of the country, when James Watt patented his 'Watt' steam-engine, the revolutionary principle of which was the obviation of waste of power by the device of the separate condenser. Watt's various patents were taken out in 1781-85, by which time the change from water-power to steam made rapid progress, and mills and factories were set up near the coalfields, where fuel was cheaper. Later the iron-masters began to investigate the use of coal as a smelting fuel, and with improved methods the output from their furnaces increased by leaps and bounds.

All these inventions led to the elimination of the cottage or private worker and to the rapid growth of factories, and with them of the manufacturing towns of the N. of England. Pop. shifted and concentrated about the coalfields, so that places remote from the fields declined in prosperity, and from that time agriculture as a national industry suffered permanently. There were necessarily strikes and disorders as the result of these changes, but they were mere incidents in the general progress. Pop. increased by nearly 20 per cent in the first half of the century, and Brit. trade and wealth were augmented beyond measure, e.g. exports rose fivefold from 1720 to the end of the century. See J. L. and Beatrice Hammond, *The Rise of Modern Industry*, 1925; L. White and L. Shanahan, *The Industrial Revolution and the Economic World of Today*, 1932; H. Hamilton, *The Industrial Revolution in Scotland*, 1932; A. Dodd, *The Industrial Revolution in North Wales*, 1933; T. S. Ashton, *The Industrial Revolution, 1760-1830*, 1935.

**Industrial Schools**, see REFORMATORY AND INDUSTRIAL SCHOOLS; CHILDREN ACT.

**Industrial Welfare**. Since the First World War the question of I. W. has been increasingly important. It is concerned with the examination of the working and living conditions of industrial workers with the object of removing unnecessary hardships and providing amenities to mitigate the irksome nature of their work. There are many aspects to be reviewed in such services, including the study of health in industry, and the proper selection of workers for suitable employment. These depts. of I. W. concern the inside of the factory. Outside, such questions as housing, travelling, the visiting of the sick, recreation, etc., are dealt with. In a number of firms, elabor-

ate education schemes have been instituted, to provide both technical and social education so as to create better opportunities for advancement.

The modern movement may be said to have begun as a result of the impetus given to questions of health and welfare by the committees set up by the Ministry of Munitions in 1916 to safeguard the health of munition workers. Robert R. Hyde, who with Seaborn Rowntree was in charge of this work subsequently, in 1918, founded the I. W. Society. In its early days much of the work of the society and similar agencies was devoted to coal miners, and the increasing provision of pit head baths was one of the

professional organisation of personnel managers. While I. W. is still greatly concerned with health, amenities, recreation and the like, more recent developments which are likely to continue, have been in the direction of establishing joint consultation machinery between management and worker and making an effort to see that it works efficiently. Works councils, set up to promote co-operation between workers and management usually include in their functions the administration of welfare and social security schemes. Another subject which engages considerable attention is the selection and training of suitable men and women for posts of responsibility as foremen, super-

AMENITIES FOR THE WORKER. A DINNER HOUR SCENE ON ONE OF THE WORKS RECREATION GROUNDS AT BOURNVILLE.

results. Subsequently the work in this industry was taken over by the Miners' Welfare Committee. The connection between the I. W. movement and most of the nationalised industries, however, continues to be close. The emphasis of the work has changed with the years, since many of the provisions for which the I. W. Society contended in its early days, as, e.g., holidays with pay, have now been generally accepted in principle, and in many cases either within the national agreements or even incorporated in legislation. Moreover all firms of any size have now their own personnel departments with personnel officers trained to handle the human problems of industry. The Institute of Personnel Management is the

vises and so on. Attempts have also been made to extend the principle of I. W., which is recognised by all the larger firms, to the very many small ones, which in the aggregate represent such a large proportion of industrial workers, and where welfare provisions are not so fully developed.

Both in Britain and in the U.S.A. (where I. W. is termed Industrial Hygiene), examinations are conducted on the problems of injury by dust and poisons and of ventilation and lighting. The medical service attacks such questions as periodic examination of workers, the establishment of dental and eye clinics, rest-houses for fatigued workers, while sanatoria and private hospitals are maintained in many industries. Research is conducted with

assiduity and success, and that the movement is justified is proved by the fact that in both countries the days of labour lost by illness have considerably reduced. Modern methods in factory building and layout have of course much influence on the provision of amenities. See also *MENTAL TESTS*. See *Annual Report of H.M. Chief Inspector of Factories*; pub. and Jours. of Industrial Welfare Society and the British Indentured Institute of Management; and Cadbury Bros. Ltd., *Record, 1919-1939, 1939*; and E. Mayo, *The Social Problems of an Industrial Civilization, 1919*.

**Industrial Workers of the World**, organisation of revolutionary labour unions formed and operating chiefly in America. It was founded in 1903 at Chicago, and was the outcome of a meeting of Socialist and trade union leaders. The most prominent of its leaders were E. V. Debs, W. Haywood, W. Trautman and the Rev. T. J. Hagerty. The activities of the I. W. W. were generally characterised by extreme violence, and in many states a campaign of attempted suppression was launched against them, ending in the deaths of Joe Hill in Utah, and Little in Butte.

After the First World War communism absorbed many of the I. W. W. supporters, and organised opposition from the various states caused a further decline. Special laws were passed rendering such forms of

impersonation of unskilled labourers. In Great Britain minor branches have been formed at London, Liverpool and Glasgow.

**Indus Valley Culture**, term by which is known the auct. civilisation of the Indus valley. Excavations carried out in 1922 at Mohenjo-Daro, a large mound 23 m. S. of Larkana in Sind, revealed the site of an auct. city which had existed some five thousand years before. It appears to have been successively destroyed and rebuilt seven times over a period of perhaps a thousand years from 3500 to 2500 B.C. Other evidences of the civilisation of this time have been found at Harappa in the Montgomery dist. of the Punjab. These two sites, 100 m. apart, and others which have been discovered show that the civilisation was widely spread along the Indus valley. The ruins of the city of Mohenjo-Daro show a more advanced state of civilisation than existed in India in much later times. It had affinities with the auct. civilisations of Sumer and Mesopotamia, but although there was undoubtedly communication between them it is not known whether they were independent or whether one was the offshoot of the other. The racial origin of the Indus people cannot be determined with certainty. They lived in well-built brick houses of more than one storey, equipped with baths and drains. They were an artistic people, skilled in pottery, carving, and metal work, using copper, bronze, and silver. Iron was unknown. A number of seals beautifully carved on steatite gave representations of various animals, including the buffalo, elephant, sheep, and camel. These animals were probably domesticated. Horses and cows do not seem to have been known. No remains of a building have been identified as a temple. Religion seems to have centred on the cult of the Mother-Goddess, also of a male god from which the Hindu Shiva may have derived some of his attributes. The causes which led to the downfall of the civilisation and the extinction of its cities can only be surmised. It is probable that the prosperous cities were overrun by a foreign invader and the people massacred. See Sir J. Marshall, *Mohenjo-Daro and the Indus Civilization, 1931*; L. E. Mackay, *The Indus Civilization, 1935*.

**Indy, Paul Marie Théodore Vincent d'** (1811-1931) Fr. composer, b. at Paris. Member of a noble family of the Ardèche dist. in the Vivarais. His mother died at his birth and he was brought up by his paternal grandmother, a good musician. At the age of eleven he was sent to Méner for the pianoforte and Lavignac for theory, and later studied pianoforte under Marmontel. In 1870 he pub. his first composition and served in the defence of Paris against the Prussian army. To please his family he studied law, but was determined to be a musician and went for advice to Franck, who offered to teach him. He also joined Colonne's orchestra as drummer to gain experience. Paderewski gave the first performance of one of his works, the overture to Schiller's *Poëlonimi*, afterwards part of his *Valentin* trilogy.

INDUS VALLEY CULTURE:

syndicalism illegal, and in 1918 more than a hundred leaders were imprisoned after a trial in Chicago. Moreover, the restrictions imposed by later immigration laws reduced still further a membership hitherto largely maintained or augmented by the

Next to Franck he admired Liszt, with whom he spent sev. months at Weimar in 1873, and Wagner, whose first *Ring* cycle he attended at Bayreuth in 1876. In 1894 he joined Charles Bordes, together with Gullmunt, in founding the Schola Cantorum; he taught there until his death and had many pupils of the highest distinction. From 1912 he also directed the orchestral class at the Conservatoire.

His works include sev. operas (including *Pervault*), theatre music, symphonies, chamber music, songs, choral works, cantatas. See studies by A. Sorley, 1914, and L. Vallas, 1916; and A. Gabeaud, *Auprès du Maître V. d'Indy*, 1938.

Ineboli, seaport of Asiatic Turkey, on the Black Sea, about 70 m. S.W. by W. of Sinope. It possesses a roadstead, and exports wool, mohair, etc. Pop. 48,000.

**Inebriates and Inebriates Acts.** The term inebriate is generally used to denote an habitual drunkard. Clinically, drunkenness (*q.v.*) is no more than a temporary cerebro-spinal disorder induced by the absorption of much alcoholic drink in a short space of time. It varies in form according to such circumstances as the amount of alcohol taken, the state of the stomach, the climatic condition, and the reactions of the individual, and in its psychical effect on the individual there may be many degrees of perversion of the senses, vertigo, and confusion of the intellect. But when long persisted in, it may result in a diseased condition of the nervous system popularly termed inebriety. The symptoms are a craving for alcohol or an irresistible obsession and impulse to drink (dipsomania), which may be either chronic or periodical mental disorder of a depressive nature characterised by an undefined sadness, uneasiness, and apathy. The only chance of cure is to protect the subject against himself by enforcing total abstinence and by suitable treatment with alkaline bromides or other sedatives, or by psychiatric treatment to resolve the inner conflict which is driving the person to drink. It is now generally recognised that drunkenness is invariably a symptom of anxiety; if the cause can be discovered the symptom will disappear. The Inebriates Acts allow of two classes of institutions: State and certified inebriate reformatories, and licensed retreats. A list of retreats for inebriety will be found in *Burdett's Hospitals and Charities* (1930), where it is pointed out that any list of Inebriate Homes must necessarily be incomplete: only a few are licensed under the Inebriates Acts, and the majority of unlicensed homes are essentially of a private character with very few patients.

**Inebriates Acts.**—The object of these Acts is to make provision for the compulsory detention and special treatment of criminal 'habitual drunkards' in state or certified inebriate reformatories, and provide for the voluntary detention of non-criminal 'habitual drunkards' in licensed retreats. In connection with the Inebriates Acts it may be noted that by the English law drunkenness is no excuse for crime, though where intention is of the essence of the offence, it may well amount to

an extenuating circumstance; but drunkenness so far persisted in as to produce *delirium tremens*, or any other species of alcoholic insanity, renders a person incapable of committing crime in the eye of the law, though he may be confined as a criminal lunatic. (See further under CRIMINAL LAW; DRUNKENNESS).

The Habitual Drunkards Act, 1879, enables a co. or bor. council to grant to any person or persons jointly a licence to keep a retreat. One, at least, of the persons to whom a licence is granted must reside in the retreat and be responsible for its management, and the medical attendant of the retreat must be a duly qualified medical man. 'Habitual drunkard' (a term now changed in the later Acts to 'inebriate') in this Act is defined as a person who, not being amenable to any jurisdiction in lunacy, is, notwithstanding, by reason of habitual intemperate drinking of intoxicants, at times dangerous to himself or herself, or to others, or incapable of managing himself or herself, and his or her affairs. The Inebriates Act, 1898, which initiated the estab. of these reformatories, gives power to the court, where a person is convicted on indictment for an offence punishable with imprisonment or penal servitude, and who committed the crime while under the influence of drink, to order him to be detained in a state or certified inebriate reformatory provided: (1) The jury find, or the prisoner admits, that he is an habitual drunkard, and (2) the managers of the reformatory are willing to receive him. The commitment may be either in addition to or in substitution for any other sentence.

**Inequality, term in astronomy.** For the sake of convenience the average motion of a heavenly body (supposed to be made in a circle which has the average distance of that body from its primary for its radius) is the first object of calculation when the place of the body at some future time is to be predicted. All the alterations which are rendered necessary by the unequal motion of the planet are called inequalities.

**Inert Gases, see RARE GASES.**

**Inertia.** Newton's first law, 'That every body perseveres in its state of remaining at rest, or of moving uniformly in a straight line, except in so far as it is compelled by impressed forces to change its state,' is sometimes called the law of inertia. It has always been easy to understand that force is required to set a body at rest in motion, and the property of *I.* was recognised from this standpoint by the ancients. It was not until the time of Galileo, however, that it was recognised that the same property held true of bodies in motion, and that it was understood that were it not for external causes, a body in motion would never of itself come to rest. 'The *Moment of Inertia* is found by summing the products of every particle of a mass into the square of its distance from a given point or axis of rotation, or expressed as a formula  $I = \sum(mr^2)$ . See MOMENTS.

**Inez de Castro, see CASTRO, INEZ DE.**

**Infallibility, freedom from all error in the teaching of faith and morals claimed by the Rom. Catholic Church.** The ques-

tion of the I. of the Church has been a subject of dispute for many centuries, the dispute centring not in the question as to whether or no the Church is infallible, but in the question as to how and where its infallible utterances were made. The view of the I. of the Church held by the E. Or thodox churches is retrospective, their teaching being that all the acts of the councils received in the E. as oecumenical are infallible. In the W., the question has been one between the Gallican and Ultramontane parties (see GALLICANISM), and the latest decision of the Rom. Church on the subject was made at the Vatican Council of 1870. This council teaches 'That when the Rom. Pontiff speaks *ex cathedra*, that is, when he, using his office as pastor and teacher of all Christians, in virtue of his Apostolic office, defines a doctrine of faith and morals to be held by the whole Church, he, by the divine assistance promised to him in the person of blessed Peter, possesses that infallibility with which the Divine Redeemer was pleased to invest His Church in the definition of doctrine on faith or morals, and that, therefore, such definitions of the Rom. Pontiff are irrefragable in their own nature and not because of the consent of the Church.' No authoritative decision has yet been made, however, to say exactly when the pope is speaking *ex cathedra*, and it is disputed among Rom. Catholics as to whether certain utterances are to be regarded as infallible or not. It is quite agreed, however, that the I. does not extend to pronouncements on scientific and similar matters.

Infamy, not now a term of art in Eng. law, but formerly used to denote the loss of status consequent on conviction for an offence involving dishonesty or inhumanity, which loss entailed disqualification as a witness or juror. The prin. crimes which involved I. were treason, felony, all offences based upon fraud, piracy, subornation of perjury, and common law cheating. But neither past nor present moral heinousness now disqualifies anyone as a witness, though the evidence of such a person may well be discredited by a jury, and conviction for crime does not disqualify as a juror unless, of course, the person convicted is actually in prison.

Infant, in law, means a person, male or female, under twenty-one years of age. The status of infancy in law is of especial importance in regard to contractual capacity and responsibility for crime. (As to the effect of infancy on the validity of contract, see under CONTRACTS.) An adult who has made a contract with an I. can not make it void, though the I., generally speaking can. A male I. at fourteen may contract a valid marriage, and a female I. at twelve. If two I.s, below fourteen and twelve respectively, have married, they need not marry after attaining those years, provided they agree to or affirm the marriage that has taken place. Where the consent of parents or guardians is required a pub. of banns is void if any one parent or guardian publicly dissents. A licence cannot be obtained by an I. without swearing that he has obtained the

necessary consent, and the consent required is that of the father if living, and if dead the guardian or guardians. If no guardians, then that of the mother, if unmarried, and if not, of some person appointed by the court. A marriage, however is valid without consent although the parties may incur penalties, e.g. for false swearing. An I. husband may be sued for his wife's debts contracted before marriage, but would not be liable to a greater extent than the property he may have acquired through or from his wife. For the responsibility of I.s for crimes, see under CRIMINAL LAW.

Infanta, the Sp. and Portuguese title formerly given to the princesses of the royal family, the eldest princess being also called 'la princesa'. It corresponds to 'infante' the title formerly given to the princes of the royal house.

Infant Feeding, see CHILD.

Infanticide, The practice of I. was common to aet. nations, prevalent in India, especially among the high caste families of Rajputana, and in China down to recent times, and probably largely practised among aboriginal peoples at the present day. In the customs of savage races, I. is closely associated with exogamy, or the custom of marrying outside the tribal community. Female children especially suffered, for among savage tribes they were a source of weakness and danger, since they were useless as fighting units. With nations or peoples of a later date, especially the Hindus, the motives for I. were occasionally religious or superstitious, but far more often merely prudential. The virtual stamping out in India of this practice—only too glaringly evidenced by the extraordinary disproportion of the male to the female population for again it was the females that chiefly suffered—is associated with the names of Jonathan Duncan and Maj. Walker, who initiated measures which culminated in Acts authorising dists. whose percentage of female children fell below a certain average, to be placed under police supervision. No less terrible in its incidents was the custom in China, and although mitigated by the influence of Christian missionaries, there is reason to believe that it is still practised. As to classical times, it is curious that the *ius cæle necque* (right of life and death) over his children which the Rom. father had till late in the hist. of Rom. jurisprudence and the analogous right given to the Gk. head of a family, should have prevailed so late as it did in societies otherwise so highly intellectually endowed. Among the Spartans, too, there were laws positively enjoining the exposure of deformed children, &c. Indeed, at an earlier date among the Romans. The combined effect of the legislation of Constantine, Valens and Valentinian, at a period strongly under the influence of the Christian fathers, put an end to the practice of exposure and took away the paternal right of life and death. In England intentional or other inexcusable I. is either murder or manslaughter, according to the circumstances. To amount to murder

it must be proved that the infant was in the legal sense a human being, or, to adopt Coke's phrase, 'a reasonable creature and being.' This means that the child must have completely proceeded in a living state from the body of its mother, whether it has breathed or not, and whether the umbilical cord, or navel, is severed or not. Therefore, killing a child in the womb is not murder, although it may well be punishable under the Acts relating to abortion. But if a child die, after being born alive, as a result of drugs or wounds received while in the womb, such I. is murder. (See also ABORTION; CHILDREN, CRUELTY TO, SOCIETY FOR PREVENTION OF; CONCEALMENT OF BIRTH; and ILLEGITIMACY.) The Scots criminal law is not dissimilar to the Eng. in this respect. All over Europe, and in some Oriental countries, through the exertions and pecuniary assistance of Europeans, a great deal has been done to prevent I. by the institution of founding hospitals. See J. Pegg, *Infanticide's Cry to Britain*, 1844; A. M. Carr-Saunders, *The Population Problem*, 1922.

**Infantile Diplegia**, see BIRMI-PALSY.

**Infantile Paralysis**, popular name for acute anterior poliomyelitis. It is a form of spinal paralysis, usually confined to one limb and caused by an inflammatory affection limited to the anterior part of the grey matter of the spinal cord. It affects the function of motion but not that of sensation. It is commonest in the earlier time of childhood but is not actually confined to children. The beginning may be unsuspected, or often the onset is preceded by an acute febrile attack lasting some days; but in either case paralysis comes on, at first, in some cases, very extensively, but later becoming limited to one or other limb or to a group of muscles. The disease is not progressive and, when its limits become clearly defined within a few days of its commencement, recovery, so far as other parts are concerned, may be assumed; but in the paralysed parts incomplete recovery of power is the general outcome (*Black's Medical Dictionary*). Large epidemics are not a feature of the disease in Great Britain. It was announced in Jan. 1917 that two members of the chem. dept. of Stanford Univ., Dr. Hubert S. Loring and Dr. C. P. Schwerdt, had isolated in a state at least 80 per cent pure the virus of poliomyelitis, and thereby had opened the door to experiments for the development of a pure vaccine for use against I. P.

**Infantilism**, term applied to those conditions when childish characteristics persist into later life. Where I. is myxoedematous, it is due to atrophy or inactivity of the thyroid gland, and is then identical with cretinism. The term 'infantilism' includes many other groups of cases which are with difficulty reduced to a type. The special characteristic is absence or modification of some of the secondary sexual features; e.g. hair does not grow in the armpit or the pubic region, and the voice may retain its childish pitch. The individual may be fully adult in other respects, possessing normal sexual functions, but usually shows malnutrition, either

generally, or in some special direction. The cause is some constitutional derangement of metabolism, and the condition generally illustrates the tendency under such circumstance towards modification of the secondary sexual characteristics. Myxoedematous I., or cretinism, is due to the disturbance of a specific secretion, that of the thyroid gland. If the gland is absent at birth, or is congenitally diseased, the sexual characters remain undeveloped during life, and the condition may not be observed until the time of puberty. The face retains the chubby appearance of childhood, the voice remains of childish pitch, the second dentition may be absent or abnormal, the genitals are rudimentary, and the mental outlook and intellectual activity remain those of a child. When the thyroid gland is removed in adults, the resulting condition seems that of a partial reversion to childhood; the mental activities become slower and less complex, the patient is childishly irritable, and there is a marked loss of hair. The treatment of myxoedema, whether occurring in adults, or as a congenital condition, includes administration of extract of the thyroid gland, which has been found of particular efficacy in many cases. I. may also be due to nervous or emotional hold-ups, which can be resolved by psycho-therapy.

**Infantry**, name given collectively to a body of troops who fight on foot and who are armed only with hand weapons. The Gk., Rom., and Gothic armies all had their supplies of I., but the I. in most cases was simply that part of the fighting force which could not be mounted. The mounted men were the chosen warriors, the I. the rank and file. The armies of Greece and Rome were usually composed of more I. than anything else, and the I. fought in close serried masses, and gave by their closeness an added strength and weight to their tactics. The period between the fall of the Rom. empire and the end of the eleventh century was that of the feudal armies, when battles were decided not by I. but by cavalry charges, and the I. of the defeated side were indiscriminately slaughtered. But a change was brought about first by the introduction of the archer, and secondly by the introduction of I. tactics which were capable of overthrowing the feudal cavalry. The battle of Falkirk (1298), between Wallace and Edward I., although it was not a victory for the I., nevertheless illustrates very strongly the new methods. The 'schiltrons' of Wallace, i.e. the circles of spearmen, did much to hold the cavalry at bay. The best example, however, was Courtrai (1302), where the burghers of Bruges overthrew the feudal army of Count Robert of Artois. Creedy was essentially a victory for the new I. tactics. The age of the feudal army was declining; the combination of the resistance of the I. and the shooting of the archers seemed about to give it its death-blow. But the lessons which I. had taught during the Hundred Years' war were speedily forgotten, and cavalry again asserted its superiority. But from this time onwards I. became a definite part of the army. The introduction

of firearms naturally enhanced this result.

The period from the opening of the sixteenth century proved that the archer was no longer of any great value, and for a time the I were armed in Swiss fashion with long pikes. Finally, a combination of I armed with pikes and I armed with guns was adopted, and as these tactics commanded the enemy both at a distance and at close quarters, for a time, at any rate, the problem seemed solved. The sixteenth century and the early seventeenth was the age of the mercenary soldier. Against untrained rebels this type of soldier was invincible, and nowhere do we find a better example of this than in the 30 years' war in the Netherlands. The Thirty Years' war had great results in the tactics of the I of

and then pouring in a murderous volley and following this up with a bayonet charge. The next great epoch making war, as far as the I were concerned, was the Franco-Prussian War of 1870. The massed firing tactics were almost entirely relegated to the artillery, and the I, in extended order, and taking advantage of every inch of cover, slowly crept to the attack. These methods subsequently underwent some change, especially as a result of the S. African War, and later of the Russo-Japanese War, but the changes did not radically alter the principle and the attack in extended order still remained the basis of I tactics.

*Recruiting and Discipline.* The head of the 'other ranks' is the regimental

ENGLISH INFANTRY MEETING THE NORMAN CAVALRY

In this panel from the Bayeux Tapestry the infantry are seen with javelin, axe and bow.

Europe. The methods adopted by Gustavus Adolphus and the Swedes during that war were eagerly imitated by the rest of Europe. Especially noticeable is it that the arquebus used by the Swedes had been lightened and could now be fired without using a rest. At the end of the seventeenth century we find that the old pike tactics of the I pass away altogether. The bayonet fixed to the muzzle of the gun took the place of the pike. New tactics were adopted. The enemy were riddled with fire from the guns at as short a distance as possible, and then when the opposing ranks had been disorganised, the bayonet charge completed the attack.

From the year 1793 can be dated the beginning of modern I tactics. The change was due very largely to the methods of Napoleon, who, having poured an overwhelming artillery fire into the masses of the enemy, brought his I up to complete the attack. It was a combination of the two methods of artillery fire and I charge. The I methods of the Peninsular war were on the British somewhat different. They were modelled on the old platoon fire tactics of Frederick the Great, but they combined mobility and an ability to use cover with the massed strength of the former German type. The tactics consisted in reserving fire until the enemy were within easy striking distance,

sergeant-major (warrant officer, class 1), the four company sergeant-majors are warrant officers, class 2. Both classes hold warrants from the Secretary of State for War. Each regiment (except rifle regiments) carries two colours: the first is the 'king's' and the second the 'Regimental'. Each regiment of I of the line had two battalions in accordance with the 'Cardwell system' established in 1881. (See CARDWELL, EDWARD, VISCOUNT.) All regiments (except the King's Royal Rifle Corps and the Life Brigade) had territorial titles, the majority connected with counties. Before 1881 each regiment had a number. One battalion was always on foreign service and the other at home. Its units were partly trained at regimental depots situated in the county or area to which the regiment belonged as indicated by its title. They were then passed on to the Home Battalion which completed their training and, when required, passed trained men on to the battalion on foreign service to keep it up to strength. The Foot Guards are household troops, but their organisation and training correspond in their main features to the I of the Line. They provide guards over royal palaces, etc., and furnish royal escorts on ceremonial occasions. The standard of recruit is high and it would appear to be generally conceded

that the Brit Foot Guards are the finest I in the world.

Changes introduced in the organisation of the I in 1946 to meet the necessities of contemporary warfare altered the Cardwell system almost out of recognition. Under the test of battle experience the Cardwell system of linked battalions twice broke down. It was found, e.g. that one brigade of a div on an overseas front might suffer such heavy casualties that the reinforcements for its battalions on the lines of communication were inadequate to reform its ranks while other brigades may have suffered no serious losses and in such cases these battalions obviously had to be reinforced from other regiments. Today the Cardwell principle has been found to be too rigid even in time of peace. The foundation of reinforcement under the Cardwell system was that there was an equal number of battalions at home and abroad, but after the Second World War it was clear that fewer I battalions would be required owing to the development of airborne and armoured divs, and also because the army in India would be heavily reduced after power was handed over to the Indians. Possibly the most convenient reorganisation for reinforcement would have been the formation of a Corps of I, in which postings could be carried out without regard to regimental ties. But this suggestion was resisted and compromise reached (1941) whereby a system of groupings was effected by the formation of fifteen groups of regiments with territorial or traditional connections. Every battalion in each of these self-contained corps retains its separate identity. In order to reduce the total number of battalions it was decided to relegate some to temporary 'suspended animation' without officers or men on their strength, but ready to be recruited in emergency and in any case at the end of a stated period.

*Factual Organisation and Equipment of British Infantry*—The number of men which can be controlled in battle by one commander is strictly limited. The basis of I organisation is accordingly the section which is the largest group of men which can be personally controlled by its leader throughout the battle. Sections are grouped into platoons, platoons into companies, companies into battalions, and battalions into I brigades which are the largest unit which consist solely of I. This system known as the chain of command, ensures orderly manoeuvres by any number of units in accordance with a single plan, and enables the section commander to assist in giving practical effect to the plans and instructions of the commander in chief. An I battalion consists of head quarters company, support company, and four 'rifle' (in fact, light machine gun) companies. It is commanded by a lieutenant colonel, with a major as second in command. The headquarters company is commanded by a major or a captain. The platoon is the smallest I unit which can be divided into interdependent bodies each capable of fire and manoeuvre. It is thus the unit on which all I tactics are

based. The section is the fire unit. Companies of each battalion are designated by serial letters or numbers, platoons are numbered serially throughout each battalion.

After 1936 all I battalions of the Brit Army gradually became either 'machine gun battalions' or 'rifle battalions,' so as to provide I brigades consisting of three rifle battalions, and one machine gun battalion each.

During the First World War open warfare had soon become impossible, and the employment of cavalry was very much curtailed on the Western front and not only was the cavalry converted into I, but the proportion of I to other arms greatly increased. Before the introduction of tanks a battle was usually a contest between opposing I supported by artillery. As artillery could not advance to hold positions, offensive action fell entirely to I.

The modern Brit I is equipped with rifles, bayonets, grenades, Vickers machine guns, Bren light machine guns, Sten sub machine guns, mortars and anti tank guns and anti tank projectors. Anti gas equipment is also carried. The multiplicity of weapons and methods calls for a better type of recruit than formerly if he is to assimilate the knowledge for their efficient application. Consequently educational training now forms an integral part of the Brit soldier's life. More attention is also given in the modern army to physical and recreational training so as to ensure fitness for service under more strenuous conditions. The kit carried by the infantryman has been increased in order to provide him with the means of defence (1) against shrapnel by the provision of a steel helmet and (2) against gas by the provision of a gas respirator. These additions hinder mobility to a certain extent and I are now, if required to operate at a distance, transported either by road or by air. This fact has given rise to two specialised types of I battalion—the motor battalion which forms an integral part of armoured formations at the airborne or parachute battalions transported either by glider or by military aircraft. With these two exceptions Brit I battalions tend to be more uniform type than those of most armies since there is no special establishment for rifle (*Taeger*, *Chasseur*) or mountain (*Gebirgsjäger*, *Chasseur d'Alpin*) units.

A further characteristic of Brit tactical I organisation is that whereas the regiment of most armies consists of two to four purely 'rifle' battalions together with infantry gun, anti tank and sometimes engineer companies which all form an integral part of the regiment, the Brit brigade is essentially a team of three identical battalions. In action this can form a Brigade (group) U.S. Combat Team together with artillery, engineers, anti tank guns etc. allocated from other arms of the div, but in a division each battalion disposes, in its support company, of its own heavy weapons handled by carrier, mortar, anti tank, anti aircraft and machine-gun platoons. Where machine-gun battalions organised under the reform

of 1935 still exist, they are under the command of divisions or of higher formations.

**Infant Schools.** The Swiss reformer-pastor, Jean Frédéric Oberlin (1740-1826), was the founder of I. S. on the Continent, but Robert Owen (1771-1854), the Eng. social reformer, independently inaugurated the idea in Scotland by forming a crèche at his father-in-law's cotton-mills at New Lanark on the Clyde. This crèche became the nucleus of a school guided in 1816 by a headmaster, James Buchanan. In 1818 Buchanan was put in charge of an I. S. at Westminster, and on his adv. Samuel Wilderspin was given the headship of a school in Spitalfields in 1820. When the London Infant School Society was formed in 1821 Wilderspin superintended the opening of numerous schools. David Stow (1793-1864) was instrumental in forming the Glasgow Infant School Society in 1826, which performed pioneer work in Scotland. The influence of Friedrich Wilhelm August Froebel (1792-1852) (q.v.), the Ger. educationist, made itself felt in the middle of the nineteenth century in England, and the first Kindergarten (q.v.) school was opened in Hampstead in 1853. Physical exercises and games, story-telling, and the use of the Froebel 'Gifts' were now used in the education of children under legal school age. Dr. Montessori's system, signally successful in Italy, was introduced into England early in the twentieth century, with its revolutionary ideas of child-freedom, and the encouragement of individuality among children. At about the same time Margaret McMillan instituted her Open-Air Nursery School in the slum dist. of Deptford, naming it after her sister Rachel, who had shared her enthusiasm for child welfare, but had died before this scheme could attain fruition. In open-air shelters children are taught the elementary facts of health and cleanliness in addition to their juvenile lessons; they are taught personal service; certain stated times are given to rest; and good food is provided for them. See D. Salmon and W. Hindshaw, *Infant Schools, Their History and Theory*, 1904; P. B. Ballard, *Practical Infant Teacher*, 1929; J. W. Adamson, *English Education, 1769-1902*, 1930; Margaret McMillan, *The Nursery School*, 1930; Margaret Lowndes, *Play in Childhood*, 1935; Maria Montessori, *The Secret of Childhood*, 1936; P. E. Cusden, *The English Nursery School*, 1942.

**Infant Welfare, see MATERNITY AND INFANT WELFARE.**

**Infection**, distinguished from contagion (q.v.) by reason of the fact that it signifies the transmission of a disease without direct contact. Thus infectious diseases are usually contracted by breathing. In malarial diseases, e.g. ague, the disease poison is taken from the soil, air, or water in some way, but there is no conclusive evidence that the disease can be transmitted directly from one person to another. Typhoid fever is infectious, and is usually water-borne. The typical infectious diseases are, however, smallpox, measles, mumps, scarlet fever, whooping-cough, etc., and these are both infectious and

contagious. I. depends upon the presence of a germ (q.v.), and prevention is best effected by isolation. See articles on the diseases mentioned, and BACTERIA, CONTAGION, DISINFECTANTS, and HYGIENE.

**Infertment, or Saisine**, in Scots law means both the act or symbolical ceremony of giving to another the possession of heritable land and the writ or instrument of saisine in which such act or ceremony is expressed. I. being a feudal act, and the crown being the lord paramount of all Scottish feus or fiefs, an I. can only be under a grant from the Crown. This is interpreted in practice to mean, that to constitute a valid I. the transferee must show a feudal chain of title going back ultimately to the crown. But there may be real rights without I. These exceptions include leases, servitudes (analogous to rights of way or other rights over the land of another), feudal lands situate in the Orkneys and Shetlands, crown lands, and churches and glebe of the Church of Scotland. The chief methods of I. now in vogue are: (a) By direct registration. (b) By transmitted warrants, i.e. by a transferor who is not himself infert and can only transmit through another. (c) By notarial instrument, used where the disponent does not wish to record the whole of the conveyance. (d) By warrant of registration under the Land Registers Act, 1868, and the Consolidation Act of 1868. (e) According to the clause of direction in a deed to record the deed in the Register of Saisines. It has long been settled that a purchaser, or a lender on heritable security, is entitled to rely on the registers of saisines, and is not affected by any conveyance or encumbrance which is not recorded on the register.

**Inferior Courts** comprise in England all those that are below the dignity of the High Court of Justice, and whose decisions are subject to review by the High Court. The prin. I. C. exercising civil jurisdiction are the co. courts, from the decisions in which an appeal lies to the High Court where the amount involved exceeds £20. Where the plaintiff in the High Court has no visible means of paying the defendant's costs, the defendant may, on swearing an affidavit to that effect, get an order remitting the case for trial in the co. court. There are also certain local courts exercising a considerable civil jurisdiction, the most important being the Chancery Court of the County Palatine of Lancaster, the powers of which, within its local limits, are similar to those of the Chancery Div. of the High Court, the Mayor's Court of London, the Court of Passage of Liverpool, and the Salford Hundred Court, all exercising within their local limits a full common law jurisdiction. The courts of the univ. of Oxford and Cambridge have by anet. charters a jurisdiction in actions to which any member or servant of the univ. is a party, at least where the cause of action arose within the liberties of the univ. Other I. C., called the Eccles. Courts (q.v.) give redress in actions of an eccles. or spiritual nature. So great an authority as Stephen states that their jurisdiction rests entirely on the tolerance of the municipal law. The criminal courts of

inferior degree are (1) The general sessions or quarter sessions (*see* COUNTY SESSIONS), which is a court of first instance and of appeal against summary convictions by petty sessional magistrates. An indictment (*q.v.*) may be removed to the King's Bench Div. from quarter sessions by writ of *certiorari* (*q.v.*) in certain cases such as where an impartial trial cannot be had in the I.C., or some more than ordinarily difficult point of law is involved. (2) For quarter sessions, with judicial functions identical with those of the quarter sessions, and presided over by a recorder who becomes a borough magistrate *virtute officii*. (3) Petty sessional courts consisting of at least two justices or a police or stipendiary magistrate or the lord mayor or an alderman in the City of London. These courts have a limited jurisdiction to try indictable offences under the Summary Jurisdiction Acts. The King's Bench Div. can grant a *certiorari* to transfer a case to the High Court where the magistrates exceed their jurisdiction or there is some manifest informality, and on a *special case* stated by the justices can decide any point of law submitted for the decision. The High Court may issue a writ of prohibition to stop proceedings where the magistrates have no jurisdiction and generally speaking may I.C. which attempts to exceed the limits of its jurisdiction may I.C. prevented by such a writ and conversely a writ of *mandamus* may be issued to compel any I.C. to exercise its jurisdiction at all events in cases where I.C. is son hit in respect of the infringement of a *de jure* right or duty.

**Inferiority Complex**, in psychology, an emotional idea of the self or ego, whose unconscious activity gives the sufferer an affective attitude of inferiority toward himself. It has its origin in a weak narcissism or self-love and may lead to a neurosis which causes the person to doubt his capacity.

**Infidel**, term popularly used to describe a person who rejects Christianity as a divine revelation. The word does not properly apply to heathens or heretics. Moderns employ a similar term (*kaufur* 'kafir' etc.) to describe Christians.

**Infinite**, cannot describe the attribute of the Deity or Absolute Being but is also used to describe the boundlessness and immeasurableness of space, time or the universe. The use of the word in the Milesian school of Greek philosophers, and by Anaximander marks however crudely the beginning of an attempt to give a scientific statement of the universe. It is often assumed by modern thinkers that the Greek philosophers, and even such modern philosophers as Hobbes and Hegel, confounded the idea of the 'immeasurable' with that of the 'unbounded' because according to the methods of elliptic geometry, it is at least plausible to argue that space is as 'measurable' as the surface of any unbounded spherical body, or the necessarily unbounded circumference of a vast circle, and, again, because geometry can conceive of an immeasurable and unbounded straight line

becoming bounded by merely cutting off a small part and leaving the line bounded by the two terminals so formed. Whether these methods, which attempt to apply the rigid exactness of mathematical science to philosophical theories of space, are valid depends on the extent to which they may be said themselves to postulate such arbitrary assumptions as that space in any way analogous to a sphere or that in I line becomes finite by imagining a point of section.

**Infinite and Infinity** are perhaps the most difficult conceptions mathematicians have to make. Infinity is defined as being that quantity which is greater than every variable quantity and it is denoted by the sign  $\infty$ . It is most easily conceived as a limit, e.g. as the quantities  $\frac{1}{n}$ ,  $\frac{1}{n^2}$ ,  $\frac{1}{n^3}$ , etc. get smaller and smaller, so  $n$  gets larger and larger and the limit to which  $n$

tends as the infinitesimal  $\frac{1}{n}$  tends to zero, is  $\infty$ . In higher geometry parallel lines are those which meet at infinity, and the asymptotes of an hyperbola are the tangents to the curve at points at infinity. In I.C. all points at infinity are on the line at infinity whose equation is  $x + y + z = 0$  and all circles pass through two imaginary points known as the circular points at infinity.

**Infinitesimal**, in mathematics, is defined as a quantity smaller than every assignable quantity. The idea of an I.C. is obtained by supposing a quantity to decrease indefinitely but yet never actually to become 0. In calculations in general an I.C. may be neglected in comparison with finite magnitudes. If  $x$  is an I.C.,  $x^2$  is an I.C. of the second order and similarly may be neglected in comparison with  $x$ . A practical objection is obtained in astronomical problems, the distance of most fixed stars from the earth is very great, and the radius of the earth so small in comparison that it may be regarded as an I.C. neglected in the calculation without any loss of accuracy. The ratio of two indefinitely small increments or I.C.'s, of independent variables expressed as  $\frac{dy}{dx}$ ,

is the basis of the differential calculus.

**Infirmity**, *see* INFIRMITY.

**Inflammation**, term used to denote certain symptoms, which are accompanied by the symptoms of redness, swelling, pain and heat or sensations. It is primarily a protective process by which the body attempts to get rid of some irritating or injurious substance and is a feature of almost every disease and injury. Modern theories tend to attribute the symptoms known as I.C. to reactions between microbes and the white corpuscles. Where the tissues are injured and no germs are present the process often goes on without undue swelling or pain, while any invasion of bacteria is attended by the characteristic symptoms of I.C. sometimes followed by suppuration or the formation of abscesses. The process of I.C. begins with the presence of an excess of blood. The blood stream

is retarded in the region of irritation; this gives the red appearance and also accounts for the sensation of heat. The blood vessels become dilated and there is considerable effusion of white corpuscles through the walls of the vessels. The continuance of the irritating stimuli causes more and more blood to flow to the part with still great effusion of lymph and white corpuscles, so that the part swells, the feeling of heat becomes more intense, and the pain takes on a throbbing character owing to the communication of the motion of the heart to the dilated arteries. The white corpuscles are busy destroying germs, dead tissue is being detached, and new tissue built up; the products of I. are carried away in the blood, or discharged from abscesses, etc. The treatment of I. involves antiseptic dressings in case of skin I., lotions and gargles in the case of I. of the nose and mouth, while if the I. is situated in any portion of the alimentary canal, the natural processes by which waste and injurious products are got rid of may be helped by suitable drugs. To lessen the discharges and subdue the inflammatory process astringents are employed.

#### Inflammation of the Eye, see IRRITIS.

**Inflation and Deflation.** Where a rise or fall in the general price level is due to an increase or decrease, actual or prospective, in the supply of money we have inflation or deflation. Commonly, I. and D. connotes abnormal expansions or contractions of money associated with marked effects on the price level. Slight inflation tends to stimulate trade, since if people expect prices to rise tomorrow they hasten to buy today. Deflation works the other way, since if lower prices are expected buyers will wait. A fall of particular prices does not mean deflation: it may be due to increased efficiency.

Inflation, or rather the policy that makes it inevitable, has great attractions for the statesman. It is a thankless task to refuse claims, eminently reasonable in themselves, for more wages, more salary, more compensation, etc., and a great temptation to follow, in greater or lesser degree, the line of least resistance. But if 'the money is not there' concessions mean its undue creation, and the 'slippery slope' of inflation. While slight inflation may be innocuous if not advantageous, high inflation means total loss of faith in the currency, ruin to those dependent on savings, and general dislocation of business with wages and prices chasing one another in a 'vicious spiral'.

The terms I. and D. came into use in the latter half of the nineteenth century and into general use during the First World War. The paper 'greenbacks' of the Amer. Civil War represented a considerable inflation but the First World War and its aftermath produced inflations of quite a different order. Russia, Austria, and Germany all experienced high inflation. In Germany in 1923 a new mark, the Rentenmark, was introduced, exchanging for one billion old marks. In modern war nations find it increasingly difficult, not to say impossible, to pay

their way by taxation and savings and, to fill the gap, resort to borrowing from the banks (so causing the creation of bank-money) as well as to printing bank-notes. Even so Germany emerged from the First World War with relatively moderate inflation: it was in the special circumstances of the post-war years that the mark became practically worthless.

The following figures of percentage increases in wholesale prices give an indication, by no means precise, of the inflation which occurred in certain countries over a ten-year period (1937-47) covering the Second World War:—

	Per cent
United States . . . . .	76
United Kingdom . . . . .	77
Switzerland . . . . .	101
France (1938-47) . . . . .	889
Japan . . . . .	3,761
Italy . . . . .	5,118
Poland (Cost of living: War-saw only) . . . . .	11,953
China . . . . .	2,631,000

Beside paper inflations on the Ger. or even the Chinese model, metal inflations seem of small account. Nevertheless the Sp. conquest of America brought large quantities of the precious metals to Europe and fed the inflation that fanned trade in Shakespeare's day, besides helping to diminish the value of royal revenues and send the Eng. monarchy to Parliament for more and more money. Again, the discoveries of gold in California and Australia in the middle of the last century inflated the money-basis of the gold standard countries. Later, improvement in mining technique had a similar effect. On the other hand the demand for monetary gold may itself cause a gold deflation, as occurred notably in the latter part of the nineteenth century and again between the wars. Superimposed on such basic movements the 'Trade Cycle' brought its own alteration of I. and D., boom and slump. While the inflations of the Trade Cycle were in no way comparable to the extreme inflations of modern times the loss, unemployment and distress caused by the deflationary phase induced a search for less drastic ways of adjustment. Present hopes are centred in the International Monetary Fund. (See BRETTON WOODS AGREEMENTS, ECONOMICS, AND MONEY.) One point emerges; just as the stability of the paper £ depends on Parliament so, in the last resort, does the continuing decision to remain on a gold standard. A Parliament that in due time takes the necessary steps for remaining on gold should not, alternatively, fail to take the necessary steps to prevent an undue depreciation of the paper £. But Parliament is not uninfluenced by public opinion: under the gold standard deflationary measures were perhaps made more palatable to the wage-earner by judicious reference to the necessities of 'economic law' although this did not prevent strenuous opposition to the wage adjustments that were a part of the gold standard mechanism. If real income has to be cut there is no doubt that inflation will do it less painfully than the gold standard; but

inflation is the 'slippery slope,' and that remains the dilemma.

See H. J. Hawtrey, *The Gold Standard in Theory and Practice*, 1927, 1947; *Report of World Economic Conference*, Geneva, 1927; J. T. Peddie, *The Dual System of Stabilisation*, 1930; L. von Mises, *The Theory of Money and Credit*, 1934; F. Benham, *Economics*, 1938, 1948; G. Crowther, *Outline of Money*, 1911. See also BANKS AND BANKING, CURRENCY; and PAPER MONEY.

**Inflection**, or **Inflexion** (from Lat. *inflectere*, to bend), in grammar, the variations, changes, or modifications of form which words undergo to express various relations with other words of a sentence or clause. It forms an important div. of philology, and is subdivided into conjugation (verbs) and declension (nouns, pronouns, adjectives). Gender, number, and voice, as well as case, tense, mood, and person may be expressed by I., and some grammarians include comparison of adverbs and adjectives also under this head. I. is roughly speaking, a mark of Indo-Germanic and Semitic languages as opposed to agglutinative or analytic. It may be internal, initial, or final in Semitic, but is usually final in Indo-Germanic words, except in cases of 'I' declension. Modern Eng. has comparatively few Is left. See also GRAMMAR, PHILOLOGY. See O Jespersen, *Progress in Language with special reference to English*, 1894.

**Inflorescence**, in plants is the floral region, the mass of flowers, the botanical term to indicate the manner in which the flowers of a plant are grouped. The simplest form of all is a solitary terminal flower, e.g. daffodil, but more often there is a more or less complex system of branching (q.v.) in which the branches do not develop into foliage-shoots but bear flowers. The stalk upon which the flowers are borne is known as the peduncle or rachis; if the flowers spring directly from the peduncle they are said to be sessile, but if they depend from a secondary stalk they are said to possess pedicels. An I. found at the apex of a shoot is terminal, if found in the axils of leaves it is axillary. There are two distinct types of I.; indefinite or racemose, when the flowers at the base open first; and definite or cymose when the flowers at the apex first become mature. One of the commonest forms of the indefinite I. is the raceme, in which the flowers are connected to the peduncle by pedicels, e.g. lily-of-the-valley and birdcherry. The corymb resembles the raceme in being stalked, but the pedicels, produced at different levels, are all of different lengths and the flowers are brought to the same level, e.g. candytuft *Pyrus sortus*. The spike is an indefinite I. with sessile flowers, e.g. plantain and gladiolus, while the catkin is a long, deciduous crowded spike bearing unisexual flowers, e.g. hazel and birch. In the panicle the axis of the I. branches, and each branch forms a raceme, e.g. oats and traveller's joy. In the simple umbel all the pedicels are given off at one level owing to the abbreviation of the mother-axis, e.g. dwarf-cherry and cowslip; in the compound umbel the axis branches in an

umbellate fashion, each branch producing a simple umbel, e.g. hemlock and carrot. The type common to flowers of the family Compositae is the capitulum or head, in which the flowers are sessile and are borne on a shortened mother axis, e.g. *Olearia Haastii* and daisy. The curious I. known as a thyrus is mixed, being a raceme itself composed of short cymes, and is found in the lilac and horse chestnut. A dichasium such as is seen in *Euonymus* is a biparous cyme in which each axis produces two daughter axes and ends in a flower. The I. of the fig is a peculiar, hollow, pear-shaped capitulum, and the flowers are produced internally; this is called a hypanthodium. The verticillaster, common to the dead-nettle and Jerusalem sage, consists of what appear to be whorls of flowers, but these in reality stand one above the other and are borne in the axils of leaves on opposite sides of the stem. Finally, a globose I. consists of a number of cymes united to form a head, e.g. box and nettle. (See illustration, p. 504.)

**Influenza** seems to have been spread through Europe during the Crusades. Supposed to be an infliction of heaven, I. was named the *influentia celi*. From this was derived the It. name *influenza*, first used in Eng. by Huxham in 1767. I. is popularly confused with a severe cold in the head, but although it has many resemblances to catarrh yet there are points of difference. Thus I. brings with it an immediate depression of spirits, and sudden debility. The sense of taste and appetite are lost, the tongue may become white and creamy; while sneezing and running of the eyes are frequent accompaniments. Shivering fits commence the course of the disease, accompanied by a rise in temp., headache, pains and soreness all over the body, while the pulse becomes weak, and the skin, at first hot and dry, becomes moist. In ordinary cases the acute symptoms pass away after three days or more, when with care convalescence begins. There are always dangers of relapse, and premature exertion may easily bring on heart disease or even wreck the nervous system. I. is an epidemic (often a pandemic) disease, and spreads very rapidly. The atmospheric condition with which it is connected is not known. It may occur in all kinds of weather. It is known, however, to travel generally westwards or from S.E. to N.W. Thus the great epidemic of 1889-90 started in the Far East and spread rapidly over all Europe, and became the worst epidemic experienced for forty years in Britain. Since then it has appeared epidemically annually in some part of the Brit. Isles.

In treating for I. the patient is immediately put to bed in a warm room and fed with light food frequently. Complete rest is the main point, the remainder of the treatment being symptomatic. Thus warm bags of salt ease the aching limbs, while drugs such as phenacetin and antipyrin are sometimes used with great care. Stimulants are used, but only in small quantities after food has been taken. Purgatives are used at the commencement of the attack, and in cases where cardio

TYPES OF INFLORESCENCE

irregularity occurs, heart tonics are administered. Then in the convalescent stage, rest and the moderate use of stimulants, together with nerve tonics like preparations of iron, quinine, and strychnine, or hypophosphates, etc., are the best means of overcoming the resultant debility. A sea voyage or a few weeks at a watering-place is, however, the best cure.

During recent years, efforts have been made to collect accurate statistics relating to I. and to trace its cause. Recent pandemics have been preceded by scattered cases, and evidence shows that the first great wave of the disease is characterised by symptoms of severe and acute fever, with little affection of the upper respiratory tracts. These are much more definitely affected during the second wave, following about two months later, in which bronchitis and pneumonia are common secondary developments. Later may follow a third wave, usually less severe, and characterised by tendencies to catarrh and pulmonary trouble. In some pandemics there have been waves of gastro-intestinal and of nervous types. In epidemics of I. the predominant bacteria found in individuals suffering from the disease are *Bacillus influenzae*, discovered in 1892 by Pfeiffer, various streptococci, and *Bacillus pneumonius*, but none of these seems to be invariably present. Falk and his colleagues, working on the I. epidemic in Chicago (1928-29) identified a streptococcus which they believed to be the primary infective agent. It is known now, however, that the cause of I. is a filter-passing virus originally discovered by Dr. C. E. Andrewes. The viruses of influenza are minute creatures, a fraction of the size of germs such as those that cause boils, and they pass easily through the pores of such fine filters as earthenware rods which can hold up the larger bacteria. Immunisation, such as is practised for diphtheria, smallpox, and other illnesses, can be provided for I., but there are greater practical difficulties in making anti-I. vaccines. For the viruses have to be grown on hens' eggs and the supply of sufficient of these to produce sufficient vaccine for a whole pop. poses practical problems. The immunity against I. can, as yet, be made to last only a few months and would have to be renewed by injections several times a year. The I. Unit of the World Health Organisation is engaged in research on this subject.

Diagnosis of the disease, though comparatively easy during epidemics, is still unreliable in isolated cases because the symptoms of the various forms of I. are so diverse. The view that these diverse forms are manifestations of the same disease, varying in character and intensity, is an outcome of the work mainly of Brit. epidemiologists. See BACTERIA and EPIDEMIOLOGY.

**In Forma Pauperis** ('in the character of a poor man'). Any person may sue or defend an action as a pauper on proof that he is not worth £25, his wearing apparel and the subject matter of the cause only excepted. Before being allowed to appear *in forma pauperis* as a plaintiff a person

must lay a case before counsel for his opinion as to whether or not he has reasonable grounds for suing as a pauper; and no person may sue as a pauper unless the statement of the case laid before counsel for his opinion, together with the counsel's opinion and an affidavit by himself or his solicitor that the statement of the case sets out fully and truly all the material facts to the best of his knowledge and belief, are produced to the court or judge to whom the application to sue *in forma pauperis* is made. No court fee is payable by a person admitted to sue or defend *in forma pauperis*. Where a person is admitted to sue or defend *in forma pauperis*, the court may, if necessary, assign him counsel or solicitor, or both, to assist him, and these latter may not refuse assistance, except for good reason shown. Any person who agrees or endeavours to take or obtain any fee or reward from a person admitted to sue or defend *in forma pauperis* for the conduct of the business as to which he has been so admitted is guilty of contempt of court (*q.v.*); and if the pauper litigant agrees to give any fee, he will be at once disentitled to sue or defend in the same case as a pauper. It is the duty of the solicitor assigned to a pauper litigant to take care that no notice is served, or summons issued, or petition presented without good cause. See also POOR PRISONERS' DEBTLINE.

**Information:** (1) Mode of proceeding against persons accused of crimes other than felonies. It is a speedy process, which brings an offender to trial without a previous finding by a grand jury. Such criminal Is. are of two kinds: (a) Is. *ex officio*, and (b) Is. by the Master of the Crown Office. The former may be used in certain cases of misdemeanour, such as seditious libels, or riots, oppression, and bribery by magistrates or other officers, or other misdemeanours tending to the disturbance or danger of the gov., where the circumstances are such that the ordinary delays incidental to legal process must be avoided. In form an *ex officio* I. is a formal written charge of an offence filed by the attorney-general in the King's Bench Div. A Crown Office I. is filed in the King's Bench Div. by the Master of the Crown Office on the application of a private individual. Leave of court must first be obtained. Such Is. are only granted in the case of suggestions of the commission of misdemeanours of a gross and notorious kind, *e.g.* aggravated libel, bribery at elections. In practice Is. for libel are only granted where the person libelled occupies a public office or position. After a criminal I. of whatever kind has been filed, the accused is tried in the usual way by a petty jury. (2) A charge made to a justice of the peace or stipendiary or other magistrate of some offence punishable on summary conviction. A justice cannot issue warrant for arrest in the first instance, except upon an I. or complaint in writing made on the oath of the informant or other person on his behalf. Where a summons only is issued in the first instance the I. need not be on oath or in writing. See Archbold's *Criminal*

INIA RED PHOTO TALLY

This view was taken from the air over the Cumbria and Lancashire area. It was taken with a 16mm film camera and the film is in the hands of the Ministry of Information. The photograph shows the river and the island in the center. The island is covered in trees and is a very important part of the landscape. The river is very wide and the water is very calm. The surrounding land is flat and appears to be agricultural or undeveloped land. The photograph is a very good example of the type of photography that the Ministry of Information has been able to produce.

#### Plugging Inlet at 11 - General Russell, On Crimes

Information, Central Office of (established April 1, 1946) is a unit of the Ministry of Information. Its main functions are to act as the central government agency for the preparation of publicity material requested by departments, including advertisements, films, photographs and exhibitions. Its offices are at Norgby House, Baker St., London, W. 1.

Information, Ministry of (brought out of the shadow of the public eye and existed as a shadow organization for more than a year before it became an important government in Sept. 1939). Lord Macmillan in the first minister was in office in the outbreak of war until the fall of 1940 when he was succeeded by Sir John Perth. Five months later Mr. Duff Cooper took charge and continued till July 1941. There was considerable criticism when it was announced in Nov. 1939 that the staff numbered no fewer than 999, and there were allegations of time wasting and ineptitude. When Mr. Brendan Bracken became minister in July 1941, the staff in London and in the regional offices and abroad totalled over 5200 and the wage bill was £2,721,000 a year. By that time, however, the M.O.I. had become a smooth working and efficient organization. Almost every aspect of Brit. publicity was dealt with by the M.O.I. The depts. in Mallet Street,

London, included the press and censorship organization, film publicity and a reference library of newspapers from all over the world. On every important development of the war new paper representatives in the Ministry building were summoned to the war room where the information was read to them and from the conference hall of the leading personalities of the world then stories to the pressmen and replied to the questions raised by the latter. The govt. in Dec. 1941 decided to bring the M.O.I. to an end and to set up in its place a departmental information service. It was replaced by a central office with special services both for home and overseas. (M.O.I. INFORMATION CENTRAL OFFICE, 1941).

At the outset the M.O.I. was expected to bring home to German citizens the evils of the regime they were upholding by war. To put British policy before the neutrals and above all to win the fullest possible support in the U.S.A. and to keep up the spirit of our own people. To carry out these aims it was very properly decided from the start that the M.O.I. should send out plain truth and not seek to outdo Dr. Goebbels in his methods of blazen mendacity. If our methods did not at first seem to pay it was largely because no counter-propaganda could effect much in the days when Germany was winning cheap and easy victories against small nations. Moreover, these methods were often misconceived. It was often erroneously assumed that the opinions of all

of volatility of the substance. When it is necessary to boil the mixture the process is known as decoction; this is often accompanied by chemical changes in some of the substances concerned.

**Infusoria**, term applied to numerous classes of active protozoa appearing in stagnant infusions of animal or vegetable matter. The majority of them occur in great numbers, and are provided with vibratile locomotor processes of their living matter, which are practically permanent, and express the predominantly active constitution of these cells. When dirty water is held in a glass vessel between the eye and the light *I.* are generally quite visible, though most of them are microscopic. They occur both in fresh and salt water.

**Ingatestone**, small tn. of Essex, 6 m. S.W. of Chelmsford. It has an interesting Norman church with a fifteenth-century tower, and Rom. bricks have been set in the walls by the builders. An Elizabethan manor-house was a refuge for Rom. Catholic priests during the Reformation. Pop. 2300.

**Inge, Very Rev. William Ralph, Eng.** divine, *b.* 1860 at Crayke, Yorks.; eldest son of Rev. Wm. Inge, D.D., provost of Worcester College, Oxford. Educated at Eton and King's College, Cambridge—where his career was brilliant. He was assistant master at Eton 1881-88; fellow and tutor of Hertford College, Oxford, 1889-1901; Lady Margaret prof. of divinity Cambridge, 1907-11; dean of St. Paul's Cathedral, 1911-31. In theology, *I.* is an extremely liberal Protestant—holding miracles and all such materialistic adjuncts of religion very cheap. But what makes him one of the most prominent clerics in England is his insistence, in learned books and popular journalism, on Platonic principles as guides to Christian practice. His apparent opposition to democracy, combined with his dry and austere manner in the pulpit, earned him at one time the sobriquet of the 'Gloomy Dean.' His writings include: *Society in Rome under the Caesars* (1886), *Eton Latin Grammar* (with Rawlins, 1889), *Christian Mysticism* (1899) *Faith and Knowledge* (1901), *Studies of English Mystics* (1906), *Truth and Falsehood in Religion* (1906), *Faith* (1909), *Spectrum Animæ* (1911), *Types of Christian Sanctity* (1915), *The Philosophy of Plotinus* (1918), *Outspoken Essays*—(first series, 1919), (second series, 1922), *The Victorian Age* (1922), *Personal Religion and the Life of Devotion* (1921), *The Platonic Tradition* (1926), *Lay Thoughts of a Dean* (1926), *The Church in the World* (1927), *Christian Ethics and Modern Problems* (1930), *God and the Astronomers* (1933), *A Rustic Moralist* (1937), *A Pacifist in Trouble* (1939), *The Fall of the Idols* (1940), *Mysticism in Religion* (1947), *The End of an Age and other Essays* (1948). An excellent selection from his works is *Wisdom and Wisdom of Dean Inge*, by Sir James Marchant, 1927.

**Ingelheim**, two small mkt. tns. of Germany adjoining each other in the Rhine-land-Palatinate, formerly republic of Hesse-Darmstadt, about 8 m. W. of Mulnz. At

one time they were celebrated for the palace of Charles the Great. Pops. 5100 and 1100.

**Ingelmuuster**, tn. of Belgium in W. Flanders, situated 7 m. N. of Comtraal, on the canal from the R. Lys to Rooselare, with manufs. of carpets, linen, lace, velvets, and silk. Pop. 9000.

**Ingelow, Jean** (1820-97), Eng. novelist and poetess, *b.* in Boston, Lincolnshire. She pub. her first poem, *A Rhyming Chronicle of Incidents and Feelings* (1850), anonymously. Her poems are characterised by their novelty and charm, and her novels also are worthy of attention. Among her works are *Poems* (1863), which contained 'The High Tide on the Coast of Lincolnshire, 1571,' one of her best; 'A Story of Doom' (1867), 'Deborah's Book and the Lonely Rock' (1867), 'The Grandmother's Shoe' (1867). Among her novels are: *Mopsy the Fairy* (1869), *Off the Skellips* (1872), *Edna to be Free* (1875), *Don John* (1876). See *Some Recollections of Jean Ingelow and her Early Friends* (London), 1901.

**Ingenohl, Friedrich von** (1857-1933), Ger. admiral, a great favourite of the Kaiser Wilhelm II., whose yacht he once commanded. He was commander-in-chief of the Division previous to his appointment to the Supreme Command of the Ger. High Sea fleet in 1913. He was still in command on the outbreak of the First World War. His policy of raiding with cruisers such as the Dogger Bank (*q.v.*) was not approved owing to its costliness, and in consequence he was placed on the retired list, being succeeded by Adm. von Scheer.

**Ingersoll, Robert Green** (1833-99), Amer. lecturer and lawyer, *b.* at Dresden, New York, the son of a Congregational minister. He practised law in Illinois, and in 1867 went to Peoria. In 1862 he became a colonel in a cavalry regiment, and not long after was made attorney-general of Illinois. He became known by reason of his lectures directed principally against Christianity. Among his writings are: *The Gods and other Lectures* (1876), *Some Mistakes of Moses* (1879), *Great Speeches* (1887). See E. G. Smith, *The Life and Reminiscences of Robert G. Ingersoll*, 1901.

**Ingersoll**, tn. of Oxford co., Ontario, Canada. It stands on the Canadian National and Canadian Pacific Railways, and on the Thames R. It manufs. agric. implements and furniture. Cheese, butter, and grain are produced in the dist., and there are flour and planing mills. Pop. 5900.

**Inghirami, Tommaso** (surnamed *Fedra* from his success as Phædra in Seneca's *Hippolytus*) (1470-1516), poet, orator, and humanist of an It. noble family. Seven of his Lat. orations were pub. at Rome in 1777, and Erasmus says he was called 'the Cicero of his age.' Julius II. made him keeper of the Vatican library. He left MSS. of a *Commentary on Horace's 'Ars Poetica'*, and *Abstract of Roman History*.

**Ingleborough**, hill in the W. Riding of Yorkshire, England, about 17 m. S.E. of Kendal. On the S. is Ingleborough Cave containing stalagmites and stalactites, and

on the top of the hill are the remains of an old camp. Alt. 247 ft.

**Ingleford**, see HUNTERDON.

**Ingleton**, vil. of the W. Riding of York shire. Ingleton situated on the Great about 10 m. N.W. of Settle. In the vicinity are situated limestone caves. Pop. 2,500.

**Inglis, Charles** (1734-1816). Anglican bishop b. in New York. He was a clergyman during the War of Independence and went to Halifax when the Eng. evacuated New York. Consecrated in 1778, first bishop of Nova Scotia; he was thus the first Eng. colonial bishop.

**Inglis, Elsie Maud** (1864-1917). Scottish woman surgeon. b. at Nantulm, India. Second daughter of John and the David Inglis. Indian Civil Service. She spent part of her childhood in India. Qualified 1892. Joint surgeon, Edinburgh Disp. Hospital for Women and Children. On the outbreak of the First World War formed Scottish Women's Hospital. In Serbia 1915 she helped to aid the English wounded with wounded at Krushatz. On her return to England returned home in 1916. Sent to Arras to help the French with hospital work to attend the St. Mary Div.

**Ingolfsby, Thomas**, BAFHAM, LANC. AND HANTS.

**Ingoltsch**, a town of the Baviaria, Germany, standing on the left bank of the Danube, 15 m. N.W. of Munich. It contains an old castle and was famous in the 16th century, founded in 1122, when many great scholars were students. Pop. 10,000.

**Ingot**, cast mass of metal from a furnace, especially a cast mass of heavy silver metal, square or rectangular, a cast block of gold, silver or alloy, either for coinage or for working into other forms. Any mould is of use in which metal is cast into blocks.

**Ingram, Arthur Foley Winnington**, WINNINGTON, ENGLAND.

**Ingram, John Kells** (182-1907). Irish author and economist, regius prof. of Greek at Trinity College, Dublin, in 1866 and vice-provost in 1878. His *Political Economy*, contributed to the *Encyclopædia* was published in 1888, and from that time, eight European languages and into English. Other works are: *History of Slavery and Serfdom* (1888), *Outlines of the History of Religion* (1900), *Human Nature and Morals according to Aristotle* (1901), *Practical Morals* (1904) and *Final Transition* (1905). As an undergraduate he produced *The Memory of the Dead or Who Feels to Speak of Ninety Eight?* (1851), a poem adopted as the anthem. See C. J. Faulkner, *Memor. of John Kells Ingram* 1907. Sir R. Palgrave, *Dictionary of Political Economy* (App. 1908).

**Ingres, Jean Auguste Dominique** (1781-1867). Fr. painter b. at Montauban. In 1796 he became a pupil of David, and in 1801 was successful in obtaining the Grand Prix. In 1806 he proceeded to Rome where he studied and worked until 1820, leaving in that year for Florence. Here he stayed four or five years and then returned to Paris. While in Italy he had carefully studied Raphael, and he brought

the latter's influence to bear upon David's teaching. He again visited Rome and finally returned to Paris in 1811, having been made grand officer of the Legion of Honour. Among his pictures are 'The Vow of Louis XIII.', 'Apocryphus of Homer', 'Stratonicus', 'Odipus and the Sphinx', 'The Odipus'. He is

J. A. INGRES

the latter's influence to bear upon David's teaching. He again visited Rome and finally returned to Paris in 1811, having been made grand officer of the Legion of Honour. Among his pictures are 'The Vow of Louis XIII.', 'Apocryphus of Homer', 'Stratonicus', 'Odipus and the Sphinx', 'The Odipus'. He is

**Inghulph** (d. 1100), abbot of Crowland in Lincolnshire, conferred on him by Wm. of Normandy who executed his father, was a monk. He had before this visited the Holy Land on a pilgrimage and on his return had joined a monastery in Normandy. The *Historia Monasterii de Crowlandensis* printed by Henry Savile (1596), but which there is a letter by Riley in 1841. Antiquarian Library (1841) once attributed to him is a very old letter to be the work of some later writer and merely a forgery. See W. C. S. *Inghulph and Crowland* (1894).

**Inhabane**, a port situated on the bay of the same name, situated in Port Natal, East Africa. It has a large trade with India rubber and copal. Pop. 10,000.

**Inheritance**, in law, term restricted to the legal right to property by descent, or by extension to the property inherited from law differentially from Eng. law, two important subjects. (1) In Eng. law the word 'heir' and its derivatives is confined exclusively to the person who, prior to 1925, was entitled on an intestacy to the real estate and any title or dignity and hereditary passing with the estate, (2) the maxim *Nemo est heres viventis* (no one is the heir of a living person) is rigidly applied so as to exclude a prospective heir or possible heir from any rights in the

property until the death of the ancestor. As a corollary of (1), it is to be observed that a person named in a will of readyty is by Eng. law a *devisee* and not an heir; in Rom. law the term 'heir' applied indiscriminately to all who, being in the power of the head of the family, had a natural claim on his property. Irrespective of whether they took under a testament or on intestacy. To exclude effectually his own heirs, the testator had to do so by name in the will. But it was essential to institute an heir of some kind, for a Rom. testament was of no effect unless there was such a person to succeed to the *persona* of the testator, i.e. to continue his legal existence after death. Later, excluded children were given the right to impugn the will if omitted in it, and recover a certain share of the property. In Eng. law the fundamental difference in the canons of descent to real property from the Rom. and systems founded on the civil law is that the rule of primogeniture has prevailed from remote feudal times until the Administration of Estates Act, 1925. The old rules of descent to freeholds of 1. were these: (1) Descent is traced from the last 'purchaser' (a technical term meaning the person who last took in any other way than by descent); (2) descent is to the lineal issue in *in finitum*; (3) males are preferred to females; primogeniture determines the male entitled, but females succeed equally as co-parceners (*q.c.*). (1) Remoter lineal issue 'representing' their own parents (who would if not deceased have succeeded to the property) take *per stirpes*, i.e. as opposed to taking *per capita* or in their own right. (2) the nearest ancestor takes on failure of lineal issue. The rules of intestate succession are now uniform for both real and personal property. See SUCCESSION, INTESTATE. See also GAVELKIND, BOROUGH-ENGLISH.

**Inhibition**, used in a technical sense of the sentence passed upon a clergyman, by which he is prevented from the exercise of his eccles. functions. It can therefore be used as a weapon for enforcing the laws of the church, also a writ to prevent a judge from proceeding further in a case.

In psychology, the word used for a subconscious urge to express the personality in some way which the conscious mind forbids.

**Inia** (*Inia geoffrensis*), toothed freshwater dolphin, found in the lakes near the Cordilleras and in some of the upper tribs. of the Amazon, where it is regarded with superstition by the Indians. It is about 8 ft. in length, has a long cylindrical snout with stiff hairs, and only the merest rudiment of a dorsal fin. It is generally found in troops of three or four and is hunted on account of the oil it yields. It feeds chiefly on fish.

**Inisfail**, see INISFAILL.

**Inishkeel**, ls. of Ireland, belonging to co. Donegal, and situated in Gweebarra Bay, with a capacious harbour.

**Inishmaccourt**, par. of Ireland on the Erne, partly in co. Donegal and partly in Fermanagh. It is named from an abbey founded by St. Neen in the sixth century.

**Inishmore**, ls. of Ireland, situated at the mouth of Galway Bay. It is 9 m. in length and 2½ m. in breadth, possessing two natural harbours on the N. coast.

**Initial**, first letter of a word, especially of a name. Ornamentally arranged, they are a feature of Irish (see KEILS, BOOK OF), and Carolingian book decoration, often of full page size and rich in colour. In the text of the Incunabula (*q.c.*) they were usually inserted by hand, later with woodcuts (*e.g.* Holbein's *Dance of Death*) or copper engraving, fitted to the typographic style. See also CAPITAL; ABBREVIATIONS.

**Initials**. In some cases signature by 1. constitutes a good signature in law. Section 12 of the Civil Procedure Act, 1883, provided that in all actions upon written instruments it should be sufficient to designate any of the parties by their initials, but the section is now obsolete. There are decisions to the effect that signature by 1. is allowable in the case of memoranda and agreements comprised under the Statute of Frauds (see FRAUDS, STATUTE OF). By the Wills Act, 1837, a will or codicil may be validly signed by 1. only. Probably there are no documents which in the eye of the law must be signed in full, although it is clearly unwise from the point of view of identification not to do so. A deed certainly requires no signature, the traditional essentials of every deed being no more than sealing and delivery. In Scots law 1. also constitute a good signature of a deed, but the genuineness of the 1. must be proved.

**Initiative**, in legislation it is a commonplace of political science that very few constitutions are really so framed as to ensure the representation of the views of the majority of the electorate upon any one particular issue. Some deny that a representative chamber like the Eng. House of Commons is returned for the purpose of effectuating the will of the majority upon every single issue, on the ground that legislative authority and omnipotence rest with Parliament and not with the electorate, and it is further asserted that any relation of agency as may subsist between the electorate and its representatives subsists only so far as the latter can be said to be entrusted with a mandate for carrying out a general party policy. Sir A. Dicey points out that it is inconsistent with the legal notion of Eng. parl. sovereignty to suppose that parl. electors have any legal means of initiating, sanctioning, or repealing the legislation of Parliament, because the opinion of the electorate can only be expressed through Parliament. Not that this view of the functions of the electorate is by any means essential to a representative polity, for in Switzerland all parl. deliberation is regarded as purely preliminary, and by the process of the Obligatory Referendum of legislative proposals, a legislative measure even after being passed by the Federal Assembly, must on the demand of a certain number of citizens be submitted to the electors for formal approval before it can become law. This, indeed, was done in the times of anct. Rome in the question literally asked of the people, 'Jubetane 1'.

Some of the Swiss cantonal constitutions go even further than this by the device of the right of *I*. This right makes it incumbent on the legislature to publish proposals advocated by a certain proportion of the electorate, and cause them to be voted on at the local polling stations. It must be conceded that *I* ensures the literal observance of the will of the majority, but it is questionable whether it is a sound political expedient to cast on the people at large the actual business of law making. Practised politicians must almost of necessity be better able to formulate the general aims of the majority in detailed proposals than the people themselves. Moreover, the people are apt to be so blinded by prejudice or party passions as to be incapable of weighing up all that can be said for and against a proposed law, and certainly it must hamper indefinitely the work of legislation in every important amendment suggested at any stage of a Bill has to be referred to the electorate for approval. Sidgwick, inspired by Bentham, advances the ingenious solution of making a members' election annually renewable with a view to deferring the final ratification of the legislative measures of the year until the election so that in the interim the people may have an opportunity for cancelling any unpopular legislative innovation. For a full discussion of the question of the control of the people over government see H. Sidgwick *Elements of Politics* 1891 ch. xxviii.

**Injection**, act of introducing a substance into one or other of the cavities of the body, or of the substance injected. The substance is generally employed as an aqueous solution and is intended to have a curative effect by direct action on the organ into which it is injected or to which it is readily conveyed by the natural processes of the body. Hypodermic *I*s are made by piercing the skin and introducing the active substance into the subcutaneous tissues by means of a small syringe. Intravenous *I*s are the introduction of a solution directly into a vein. Intramuscular *I*s are the introduction of a solution into the substance of a muscle. Vaginal, rectal and anal *I*s are other forms.

**Injector**, apparatus for forcing water into a boiler against the pressure of the steam. M. Henri Coffard invented an *I* in 1858 which is now generally used. Steam from the boiler passes into a conical pipe the size of the opening of which can be regulated by an adjustable cone. As the steam rushes out of this it meets the feed water, and is condensed, so creating a partial vacuum, which causes the water to rush in with a very great velocity and to pass down another conical pipe. The escaping steam behind helps to drive it down this pipe. As it emerges from the narrow end of this conical pipe it passes into the narrow end of another one. So, as it passes on down this expanding cone, its velocity slackens and the pressure increases. So the water is forced into the boiler through a non-return valve. This *I* may be worked either by exhaust steam from the engine or by steam from the boiler.

**Injunction**, in Eng. law, a remedy given as a rule by a court of equity (*q.v.*) to restrain one or more of the parties in an action from doing or allowing their agents or servants to do an act which the court holds to be inequitable in regard to the rights of the other party. The *I* was one of the modes by which the chancery built up his whole equity jurisdiction (see CHANCERY CHANCERY, JUDICIAL). By this weapon the equity courts could override the common law whenever the latter was in conflict with the dictates of good conscience. The *I* in such cases was issued in the form of a prohibition commanding the plaintiff not to go on with his action at common law on pain of imprisonment for contempt of court if he disobeyed. It is either (a) *interdictatory* or prohibitory, or (b) *final* or *perpetual*. An *interdictory I* is satisfied on merely *prima facie* evidence, and for the purpose of preventing further damage to the plaintiff pending the ultimate decision of the dispute. It is usually only granted on the plaintiff giving an undertaking to pay damages if he does not succeed at the trial in making good his claim. *Final or perpetual I*s are the final and finally settle the right of the parties. *I*s are either negative or the command a person to forbear from doing an act. But a mandatory *I* is one which commands a positive act, e.g. to build a building erected in contravention of the rights of another. But even a *I* which is negative in form may have an indirectly positive effect, e.g. an *I* restraining A from performing in breach of his contract with B, for any other man, as than B will usually have the effect of enabling A fulfil his contract rather than be out of employment. *I*s may be granted to restrain the continuance or threatened infringement of almost all kinds of rights.

**Injuries to Property, Malicious**, see MALICIOUS.

**Ink**, material used for producing records on paper and similar substances. The earliest varieties appear to have been prepared by suspending some carbonaceous material such as soot in a sticky solution (gum or varnish) and either the secretion of the cuttle fish or sepia was used. In the Middle Ages there first came into use an *I* composed of a decoction of gill nuts or other tannin yielding substance, mixed with iron salt. The use of these depended upon the formation of a bluish substance which on oxidation (that is, exposure to the air) was converted into a black substance. The modern 'blue black ink' consists entirely of the same ingredients, but a ferrous salt is used, and the development of the black colour only takes place after a longer or longer exposure to the air. In order that the writing may be visible before oxidation a colouring matter usually some indigo derivative is added. This causes the blue appearance first noted and subsequent oxidation causes the black to appear. In the preparation of such *I*s, either China or Turkey galls are usually employed. These are ground, steeped in water, and to the aqueous extract a solution of ferrous sulphate (green vitriol or copperas) is added.

At first a clear solution of a dark blue colour is obtained, but from this there gradually separates a black insoluble precipitate. In order to keep this in suspension gum arabic or some other viscous material is added. The *I* soaks into the paper and is there oxidised, but the presence of the gum gives to the writing a 'shiny' appearance. In order to avoid this certain *I*s are made by using indigo sulphonic acid (prepared by dissolving indigo in strong sulphuric acid) to which is added metallic iron. Ferrous sulphite is thus formed and when the excess of acid is neutralised by means of chalk, the clear supernatant liquid obtained on allowing the mixture to stand, yields on mixing with a tannin solution a clear freely flowing *I*. Certain conditions require to be fulfilled before an *I* can be described as satisfactory. It should be non-corrosive, non-poisonous, permanent, not easily faded and non-fermentable. The last requirement is usually fulfilled by the addition of some antiseptic such as phenol or thymol.

**Coloured Inks**—These are usually aqueous solutions of the soluble coal tar colours. Thus solutions of the eosins and rhodanines give red *I*s, brilliant green and indigo preparations etc. are used for the printing of blue and blue *I*s respectively. Further blue *I* is made from Prussian blue dissolved in oxalic acid. So-called gold and silver *I*s are obtained by mixing the finely divided metals or their substitutes with gum and a solution of a soluble silicate. The initial colour of the ink is usually strengthened by the addition of blue aniline dyes, but these have not the permanence of the iron compounds. But inks for temporary purposes can be made by simply dissolving such dyes in water.

**Copying Inks** are made by the addition of gelatine, gum or dextrin to a concentrated soluble tannin *I*. Addition of the materials greatly retards the oxidation of the tannate of iron by forming a film over the surface of the writing. This dissolves when the damp tissue paper is applied and an impression is thereby obtained.

**Printer's Ink** usually consists of a varnish-like material made from resin, soap, and a drying oil in which is suspended a colouring matter. For black a mixture of lamp-black and indigo (the latter in small amount) is used. Reds, blues and yellows are obtained by means of curcume, Prussian blue, and lead chromate, respectively. Other colours may be prepared by suitable mixtures of the above.

**Marlin Inks** nearly always contain some silver salt as a basis. A solution of the salt mixed with gum gives on contact with organic matter, such as cotton or linen, a tan which on exposure to light or heat or both gradually becomes black. The stain is indelible, but in course of time fades to a brownish colour.

**Sympathetic Inks** are those which become visible only after suitable treatment. Thus a solution of galls may be used for writing. Thereby is produced a writing which on washing over with a weak solu-

tion of an iron salt becomes dark. If a solution of a cobalt salt be used for writing no characters are visible until the paper on which the writing has been made is warmed. The characters then appear blue. Such inks are of no practical use, but figure as of importance in fiction.

**Inkerman**, vil in the Crimea, lying E. of Sebastopol. Here on Nov. 5, 1854, the *I* met the Russians in battle, and after a brave resistance, and when defeat seemed imminent, were reinforced by the *I* and gained the victory. There are ancient cave dwellings at *I* and it is a noted place of pilgrimage.

**Inland Linoleum**, see under LINOLEUM.

**Inland Revenue, Board of**, had its beginning when Commissioners of Stamps were appointed in 1631 in the reign of Wm. of Orange. Twenty-five years later in 1719, Commissioners of Taxes were appointed. These commissioners worked independently of each other until 1854, when a Consolidated Board of Stamps and Taxes was established. The next big change took place in 1819 when the Commissioners of Taxes were absorbed by the Board, which now adopted its present title. In 1905, however, all matters connected with Taxes were transferred to the Board of Customs. The three sources of Inland Revenue are at present Death Duties, Stamp and Taxes, Salaries and expenses of the Board for 1916 were £16,200,000. The chairman is paid £2,000 per annum and deputy chairman £1,000. The seat of the Board is at Somerset House Strand London W.C. (S. E. of *I* and CUSTOMS DUTIES, INCOME TAX, ESTATE AND INLAND TAXATION).

**Inland Sea**, see of Japan situated between the main is. on the N. and the is. of Shikoku and Kyushu on the S. It is about 240 m. in length and its greatest breadth is 10 m. Its shores are especially beautiful, and the water is very calm.

**Inland Water Navigation**, see under CANALS.

**Inlaying**, method of ornamenting flat surfaces by the inserting in one material a substance differing therefrom in colour or nature. Thus the basis may be of wood, metal or stone and inlaid or encrusted material of different wood or of ivory, marble, tortoise shell, precious metal, etc. The art of *I* is practised in the fabrication of furniture and artistic objects of various kinds. *I* in wood is generally known as 'marquetry' (*q.v.*), in metals it is termed 'dunastaining' (*q.v.*) and in marble and precious stones it forms a variety of 'mosaic' (*q.v.*) work.

The word *I* is, however, generally understood to be limited to the first of these three. It consists in the fitting together, to form patterns, of differently coloured pieces of wood. In the Stuart period a good deal of *I* was executed in England upon cabinet, chests of drawers, etc. In Italy the most beautiful examples of the art are on junks or chest-stalls, and in Germany, musical instruments, chests, and cabinets are often lavishly inlaid.

**Inman, Henry** (1801-16), Amer. artist, b. at Litcha, New York, studied under Jarvis. Distinguished principally for his

portraits of Amer. and Eng. statesmen and men of letters.

**Inn, riv.** in Austria, one of the chief tributaries of the Danube. It rises in the Engadine, Switzerland, and flows through the Tyrol and Bavaria, its total course being estimated at about 310 m. Innsbruck is on its banks.

**Innate Ideas** in the philosophy of Descartes are the clear axiomatic principles whose certainty cannot be doubted. They are not only certain, but universal, and as they are not the result of empirical experience, they may be regarded as the primitive germs of or the irreducible minimum of truth, which nature has planted in the human intellect, and which, obscured in part by errors due to bodily conditions, the mind would find clearly within itself if it were freed from disturbing influences. Hobbes describes this kind of reasoning as merely metaphorical, and considers that there is no criterion for distinguishing this assumed clearness; to which objection Descartes replies that there is a distinction between a natural inclination to believe a thing which may nevertheless be false and a natural light which makes us know a thing to be true; which reasons he at first seems to be super-added metaphors. Descartes, eschewing all false reasons, applied his principles to the study of mathematics, and made remarkable progress therein; but the study of mathematics is one which peculiarly lends itself to mechanical application. In the study of the relation of mind to body, Descartes was not prepared to carry out his conception to its final consequences; since to do so would be to deny altogether the influence of the will upon our actions; hence he formulated a theory that the mind can and may interfere in reflex actions, but that the mind possesses the power of pure thought in its own right. Locke, as a typically Brit. practical philosopher, denies the existence of I. I., and asserts that all our knowledge comes from sense experience, the mind being only *tabula rasa*. Leibniz opposed this whole conception of images impressing themselves upon the blank mind from external objects as the basis of all our knowledge, though he agrees with Locke that, in point of time, sensations precede the relating activities of the mind. Locke practically ignores the reaction of the mind itself in knowledge; Leibniz deems this reaction the one essential thing. But while we may admit that all truths come to our knowledge only through experience, there may still be certain truths which may properly be called innate. In other words, the vague concept 'experience' demands a closer, more subtle definition than Locke gave it, and this was supplied by later philosophers like Hume and Kant. Locke's criticism of I. I. has, indeed, no force against the theories of Oer. Idealism; for, according to Kant, experience itself would be impossible unless it were possible for the mind to pass judgments transcending experience. With Kant, perception does not conform to the nature of objects, but the sensible object conforms to the constitution of our faculty of per-

ception. Eng. philosophical thought is essentially utilitarian, and therefore opposed to the theory of *a priori* and innate truths—an attitude which explains the popularity in England, for a time, of the positivism of Comte or any other system of philosophy which seems to favour progress irrespective of the forces of tradition.

**Inner House**, see COURT OF SESSION.

**Inverleithen par. and tn.** of Peebles and Selkirk, Scotland. The par. has an acreage of 23,981, and is intersected by the Leithen Water. There is a medicinal spring containing sodium and calcium chlorides. It is one of the centres of the Scottish woollen industry. Pop. 2300.

**Innes, James Dickson** (1887-1911), Eng. landscape painter b. at Llanelly in Carmarthen, of Catalan descent on his mother's side. He studied art at the Slade School, and exhibited chiefly at the New English Art Club. His earlier landscapes were painted in South Wales, and his later on the Mediterranean slopes of the Pyrenees. His ability and originality exercised a strong influence on the work of his younger contemporaries.

**Inner Temple**, see INNS OF COURT.

**Inness, George** (1825-91), Amer. landscape painter, generally regarded as the greatest; b. at Newburg, New York; studied in America, but travelled in Europe. Among his works are: 'Autumn Gold' 'Under the Greenwood,' 'Passing Storm,' 'Moonrise.'

**Innisfail**, used in poetry as a synonym for Ireland, and means 'the island of the fair.' The 'Fall' or 'Lac-fail' is the stone which, since 1296, when Edward I. carried it off from Seone, has rested under the coronation chair in Westminster Abbey. Legend tells that it was on this stone that Jacob fell asleep when he dreamt of the flight of stairs reaching to heaven, and that the Dedamans carried it to Ireland and set it up as the 'inauguration' stone at Tara.

**Inniskillin Fusiliers, The Royal.** Raised in 1790 from the forces which defended Enniskillen for Wm. III. The first and second battalions were respectively the 27th and 108th regiments of Foot. The regiment fought at the Boyne and Siege of Limerick, in the 1715 Rebellion in Scotland, and at Culloden, 1746. After the Maida campaign it went to the Peninsula then to Waterloo. It took part in two S. African campaigns before going to India for the Mutiny. During the First World War it fought in France, Flanders, Macedonia, Gallipoli, Egypt, and Palestine. After the war it was reduced to one battalion, and linked with the Royal Irish Fusiliers (q.v.) to form one corps.

**Innocent**, the name of thirteen popes:—**Innocent I.** (402-17), native of Albano. He upheld firmly the authority of the Rom. see, both in the W. and in the E., and was strenuous in enforcing the celibacy of the clergy. He was canonised.

**Innocent II.** (*Ingriorio Papareschi*) (1130-43) was elected on the death of Honorius II. He had, however, to flee from Rome on sev. occasions owing to Anacletus having been elected by a rival faction.

**Innocent III.** (*Lotario di Conti*) (c.1160-1216) succeeded Celestine III., and under him the power of Rome reached its greatest height. He exercised his papal jurisdiction (1198-1210) over the kings of France and Spain, and compelled King John of England to receive Stephen Langton as archbishop of Canterbury. See A. Luchaire, *Innocent III., la papauté et l'empire*, 1906; C. H. L. Plrie Gordon, *Innocent the Great*, 1907; L. E. Binns, *Innocent III.*, 1931.

**Innocent IV.** (*Sinibaldo Fieschi*) (1243-54), b. at Genoa. He was compelled to leave Rome on account of the quarrel which was being waged between himself and Frederick II.

**Innocent V.** (1245-77) b. at Tarantaise, was pope for five months in 1268, and was a native of Savoy and the successor of Gregory X.

**Innocent VI.** (*Etienne Aubert*, 1332-62) Frenchman, b. at Monts, in Languis, the successor of Clement VI. He brought about a number of reforms in the papal administration, and did a great deal for its benefit.

**Innocent VII.** (*Cosimo dei Migliorati*) (1404-06), some writers have given a favourable account of him, but most agree that he was guilty of nepotism.

**Innocent VIII.** (*Giovanni Battista Cibo*) (1484-92) b. at Genoa in 1452. In a bill of 1484, he instigated very severe laws against witches in Germany, the principles enunciated by him being, later, embodied in the *Malleus maleficarum* (1487).

**Innocent IX.** (*Giovanni Antonio Fachinetti*) was elected pope in 1591 and died just after.

**Innocent X.** (*Giovanni Battista Pamphili*) (1611-55), b. at Rome in 1574, did something towards reform, and was entirely opposed to Jansenism.

**Innocent XI.** (*Bindetto Odescalchi*) (1679-89), b. at Como in 1611. He was a zealous reformer, and most of his time was taken up with the quarrel against Louis XIV., who laid claim to the right of the king to appoint to benches. This led to the Declaration of Gallican Liberties.

**Innocent XII.** (*Antonio Pignatelli*) (1691-1700), b. at Naples in 1643, made peace between France and the Papacy.

**Innocent XIII.** (*Micheleangelo dei Conti*) (1721-24) was under the sway of Spain and France.

**Innocents' Day.** This is the Eng. name for the festival which is celebrated 25 Dec., in commemoration of the massacre of the children of Bethlehem by Herod. It was probably first celebrated towards the end of the fifth or early part of the sixth century. In the Lit. Church it is known as the Feast of Holy Innocents, Mass being said in purple vestments, probably because the Innocents 'did not enter heaven till Christ at His Ascension opened it to those who believe.' In the Gk. Church, the feast is celebrated on Dec. 29, being known as the Feast of the 14,000 Holy Children. Also known as Childermas.

**Inns and Innkeepers.** An inn may be defined as a place which supplies lodging,

accommodation, and food for passengers, travellers, and wayfarers. It is immaterial whether the place is called an inn, coffee-house, or by any other name, in fact it is an inn. An inn is to be distinguished from a tavern, the latter being strictly an alchouse and victualling house combined, but primarily and essentially a place where liquor is sold. The sale of liquor is not the characteristic of an inn, and there are great numbers of places in Britain which are inns although they have no licence to sell intoxicants. The proprietor of a tavern is under no obligation to supply even a traveller with refreshment, and indeed no one has a right to insist on being served in either a tavern or alchouse, but it is an indelible offence, and also actionable for an innkeeper to refuse to supply accommodation and victual at any hour of the day or night to a traveller who is ready to pay and who conducts himself properly. But the innkeeper may refuse if he has not room, or if the traveller or intending guest is an objectionable person, such as a thief, prostitute, or person suffering from contagious disease. An innkeeper is only bound to receive and lodge a guest so long as the guest retains his character as such. Merely purchasing temporary refreshment or putting up a man's horse is enough to make a man a guest. At common law the liability of innkeepers was so wide that a guest could recover for loss or damage to his property in almost all cases where the innkeeper was unable to prove that the loss was due to the guest's default. But by the Innkeepers Liability Act, 1863 (section 1) an innkeeper is not liable to pay more than £50 for loss or injury to articles or property brought by guest, unless the property (1) is a horse or other live animal, or a carriage and gear, (2) was stolen, lost, or injured through the willful act, default, or neglect of either of the innkeeper or his servants, (3) was expressly deposited with him for safe custody. To obtain the benefit of the Act an innkeeper must put up in some conspicuous part of the entrance hall of the inn a copy of Section 1 of the Act. If a guest refuses to pay his bill the innkeeper has a lien on his luggage or other articles brought to the inn by the guest, whether such articles are the property of the guest or not. Hence a commercial traveller's stock in trade can be seized. If the bill be not paid in six weeks, the innkeeper has, by an Act of 1878, the right, after advertising in a London and local newspaper his intention, at the end of that time to sell the articles and repay any surplus to the defaulting guest. See C. C. Ross, *Law Relating to Innkeepers*, 1928; and R. Watson, *A Scrapbook of Inns*, 1919.

**Innsbruck**, cap. of the prov. of Tyrol in Austria. It is named from the chief bridge over the Inn, on whose r. b. it lies. The situation is a splendid one, for the broad valley from which the city rises is guarded on all sides by lofty heights. Here the high roads from Bregenz in the Vorarlberg and from Germany on to Italy over the Brenner Pass cross one another, a fact which accounts for its strategic import-

ance. The interest of the tn. is mainly archaeological. The cenotaph of the Emperor Maximilian I. (d. 1519), which, with its marble sarcophagus and twenty-eight bronze mourners, is one of the finest illustrations of sixteenth-century sculpture, is in the Franciscan church (1509-93). There is also a univ. (originally founded in 1677), having 195 teachers and 1567 students. It also possesses a good library with 360,000 vols., and the Landhaus or the Diet is here. Pop. 62,000.

**Inns of Court.** There are four I. of C., Gray's, Lincoln's, Middle, and Inner Temple. To become a member of the Eng. bar it is necessary, besides passing certain examinations in law, to be admitted as a member of and to keep twelve terms (extending over a period of three years) at an I. of C. The I. of C. are a kind of legal univ. of London, in which the barristers and students correspond respectively to graduates and undergraduates. There were formerly a number of small inns, such as New Inn, Staple Inn, and (Wifford's Inn), all of these have either been bought up or in some other way acquired by the four remaining I. of C. With the dissolution of 'serjeants' inns disappeared the ancient status of 'serjeant', commemorated in the humorous characters of Serjeants Buzluz and Snubbin in the *Pickwick Papers*. All the existing I. of C. are corporate bodies owning (prior to the First World War) valuable property, and appointing from time to time 'benchers' out of their own members to form the executive bodies of the societies. Twenty benchers, five from each Inn, co-opted from time to time, form the Council of Legal Education. The benchers may disbar a barrister for professional or other serious misconduct. Intending equity and chancery practitioners usually join Lincoln's Inn, the two Temple Inns being the best for common law business. Gray's Inn apparently offers the best scope for scholarships and students' prizes. A time-honoured feature of the I. of C. is the keeping terms, not by residence or attendance at lectures, but by 'eating dinners' in the halls, the total number being six of each term; but there are certain exemptions; studentship and first class honours men gaining a remission of two terms, and univ. men need only dine on three nights each term. See also *LIA AT EDUCATION*.

Disastrous damage was done to property in the I. of C. by Ger. air raids on London (1940-11). Large portions of Gray's Inn were completely destroyed. The famous Hall of the Middle Temple and the libraries of both the Middle and Inner Temple were gravely damaged; while large blocks of chambers were completely demolished. The Round Church in the Inner Temple was also partly destroyed. Lincoln's Inn was hit by a flying bomb (Aug. 1941). Windows and woodwork of the Gatehouse of 1518 and of 'Old Buildings' sustaining damage.

**Innuendo**, in the language of pleading in an action of libel or slander, means a paragraph in a statement of claim which seeks to put on the words complained of a more defamatory meaning than is warranted by natural construction. The defendant may traverse or deny the I., and yet pay money into court by way of amends. But he must then make it clear that the money is paid in by way of reparation for the words in their natural meaning, and not in that alleged by the plaintiff.

**Innuity**, see *ESKIMO*.

**Innyootta**, see *HINGANHIAT*.

**Inoculation**, communication of disease accidentally or intentionally to a healthy subject by the introduction of certain products of disease into the body through the skin or the mucous membrane. The chief diseases so transmitted in man are anthrax, hydrophobia, smallpox, and syphilis. Before Jenner introduced vaccination (q.v.), I. of smallpox was practised. The disease as thus transmitted was far less dangerous than the ordinary smallpox, and, further, rendered the inoculated subject much less liable to a future attack. Its disadvantages are obvious, in that it tended to keep the disease alive, and further to increase its spread, but it was invaluable to those who had been inoculated, and was of great service prior to Jenner's discovery. In 1810 the practice of I. with smallpox was forbidden by law. Pasteur's treatment for hydrophobia and all serum injections are based on a similar principle to that explained above.

**Inonu, Ismet (b. 1881)**, Turkish statesman, original name Ismet, one of many children, of a prov. family of E. Anatolia. After a harsh youth, passed into the Cadet Corps. Politically suspect, he was virtually exiled as a second lieutenant in Tripoli. Stayed there for eleven years; then served with much distinction in the short disastrous war against it. Agression. Promoted captain and fought in the first Balkan war. As a major of the General Staff he reorganised the Dardanelles defences which made it possible for Kemal to foil the Brit. attack in 1915. In the First World War, served on all fronts, becoming major-general and a pasha, and as under-secretary for war being charged with the demobilisation of a beaten and demoralised and disease-ridden army. After the Gk. attack on Smyrna, he answered Kemal's call for resistance by making his way in the ranks of a peasant private to the conceded headquarters of Kemal, who appointed him his Chief of Staff. After a period of unrelieved misfortune came triumph, when on March 31, 1921, the Turks, under I. defeated the Gks. at Inönü a victory which marked the renaissance of Turkish national pride and self-reliance. Yet his greater service was really diplomatic; for as head of the Turkish delegation to Lausanne, he achieved a resounding success. I. had made himself a national hero; Lausanne made him an international figure. In

1924 Kemal made him prime minister and in the ensuing thirteen years he created Turkey's modern administration. The nationalisation and development of Turkey's railways was, perhaps, his outstanding internal achievement. His foreign policy was based on friendship with Russia, even against the convictions of his passionate chief Kemal. Resigned after the Alexandretta (*q.v.*) affair, but his restraint brought its reward. After Kemal's death I. was elected his successor without any serious competition (1938), and became known as Inonu. He was re-elected in March, 1943.

**Inosite**, or **Hexahydroxycyclohexane** ( $C_6H_{12}(OH)_6$ ), a sweet crystalline substance, melting at  $253^\circ C.$ , that is found widely distributed in the animal and vegetable organisms, especially in conifers.

**Inowroclaw**, see HONEN-SALZA.

**Inquest**, see CORONER.

**Inquisition** (Fr. *inquisition*: Lat. *inquisitio*, a seeking or searching for). In ordinary language, particular inquiry, search stimulated by curiosity or hidden motives. In law (1) a judicial investigation, inquiry, examination, an inquest; (2) the verdict of a petty jury under a writ of inquiry. 'An inquisition of office is the act of a jury summoned by the proper officer to inquire of matters relating to the crown, upon evidence laid before them' (Blackstone, *Comment.* bk. iv., ch. xxiii.). The institution known as the I. was an eccles. tribunal first outlined at the synod of Toulouse in 1229, and estab. by Pope Gregory IX. after the conquest of the Albigenes in 1233. A committee consisting of sev. respectable laymen and the parish priest was ordered to be set up in every parish to search for and bring heretics before the bishops. Soon afterwards inquisitors were specially appointed by the Pope from the Dominican and other orders, but these did not supersede the bishops' courts. Persons accused of heresy were examined privately, and if sufficient evidence was found against them they became liable to eccles. penalties. If they remained impenitent the severest eccles. penalty, *viz.* excommunication, was pronounced against them and they were handed over to the civil authority for capital punishment. The eccles. penalties ranged from the enjoining of certain good works (*e.g.* almsgiving) to imprisonment for life. Informers' names were kept secret; torture was resorted to to extract confession, while the death penalty usually took the form of burning. The I. was set up in Italy, Spain and its dependencies, Portugal, and France, but not in England, where heretics were tried by the ordinary tribunals. It flourished chiefly in Spain, owing to the numbers of Jews and Mohammedans settled there, who, while outwardly conforming to Christianity to avoid persecution, practised their own religion in secret and plotted extensively against the unity and safety of Christendom. According to Peschel's calculations about 2000 persons suffered death between 1181-1501 when Isabella

died. This was the period of the Grand Inquisitor Torquemada (1181-98). The Sp. I. was suppressed by Napoleon in 1808, revived by Ferdinand VII. in 1814, and was finally abolished by the Cortes in 1831. In France it was used by Philip le Bel for the suppression of the Knights Templars, but soon fell into disuse. In modern times the I. in Rome is called the Holy Office, and is composed of cardinals, judges, consultants and other officials, under the presidency of the Pope, but its activities are confined to the censorship of books and matters relating to church law and eccles. offences. Death was regarded as the penalty for heresy by Catholics and Protestants alike in the sixteenth century, but the Sp. I. has come to be regarded almost as a synonym for religious bigotry coupled with gross inhumanity.

**Insanity**, unsoundness of mind. It is hardly possible to provide a satisfactory definition of I., as it includes many widely differing states of body and mind, and excludes many forms of aberration which are associated with more or less transient diseases. When any injury is sustained by the cortex of the brain or when poisonous matters are carried to it by the blood stream, clinical experience tells us that a disturbance of consciousness occurs. The delirium of the fever patient is due to his brain being temporarily poisoned, and a number of cases of more permanent forms of I. can be traced to definite lesions of the brain. Such conditions are often accompanied by purely physical symptoms, so that the hypothesis that I. depends ultimately upon physical causes is not altogether unjustifiable.

**CAUSES OF INSANITY.** Mental defect or disease is associated with some inherited or acquired peculiarity of brain constitution. If statistics be of any value at all, the relation of I. to hereditary nervous weakness is well estab. The descendant of insane parents may be normal and even extraordinarily capable, but there is great likelihood of some indications of want of nervous balance showing themselves, and his general condition may be represented as a susceptibility to invasion by the agents that produce mental instability, just as a child of consumptive parents, though apparently healthy, is assumed to be less likely than others to resist invasion by the tubercle bacillus if he allows the conditions to become favourable for its development. Among other general causes of I. may be mentioned the increasing stress of civilised life. There is a fear that I. is increasing rapidly among civilised nations, and although statistics do not show that any real increase has taken place, there undoubtedly is a greater tendency to nervous diseases which demonstrates that the nervous mechanism is being over-wrought in a number of cases. The belief that there is a relation between the stress of modern life and the incidence of mental disorder was apparently confirmed by the great increase of mental disorders during the First World War particularly among soldiers. The general body of expert opinion, however, inclines to the view that the conditions of warfare were the occasion, rather than the

cause, of the 'war shock' (traumatic neurosis). The report of the Board of Control for 1930 (pub. in 1931) comments on the continued increase in lunacy, the number of notified insane persons under care in England and Wales showing, in the six years under review, an average annual increase of about 2000. But the Board found no justification for the suggestion so commonly made that the pace of modern life conduces to mental breakdown, though present day conditions of urban life might and probably do, tend to increase the frequency of some minor nervous disorders. Opinion as to the place of alcoholism in the causation of I is divided. So many cases show a history of alcoholism, and its effects on the nervous system are so pronounced that many claim alcohol to be the commonest cause of I. On the other hand the cause may be confused with the effect, the lack of control which makes the confirmed drunkard a characteristic symptom of an unsound mental constitution. Consanguinity, or marriage of near relations is adduced as another cause. Here again, the probability is that if the parental lust is free from I, there is no particular tendency in that direction. The offspring. Mental feebleness is perpetuated in many of our families by the intermarriage of related persons with this or that deficiency, such persons are often responsible for much larger families than the average. The immediate cause of I may be toxic poisoning through defective metabolism or through actual infection by micro organisms. Such forms of I as follow certain fever, influenza, typhoid fever, or syphilitic infection, are undoubtedly due to the presence of toxic substances in the blood. It has been further suggested that worry, violent emotion, etc. by their effect on metabolism induce changes in the blood which may ultimately cause a physical condition of the brain involving I.

**General Symptoms.** Of the mental symptoms the most definite are persistent delusions or hallucinations. A delusion is a false idea, as when a patient thinks he is some great personage, or that there is a conspiracy against his life. A hallucination is false perception, as when a patient sees visions, or hears voices which have no foundation in reality. It must not be thought that all insane persons suffer either from delusions or hallucinations of a definite type. Mental instability shows itself in extreme impulsiveness in action, leading sometimes to sudden attempts at suicide. In some forms of I it is almost impossible to keep the patient's attention for more than a few seconds; he is at the mercy of every chance impression. On the other hand, some patients cannot be roused out of an obstinate introspection. Memory is often disturbed, being either abolished or restricted to remote events. Of bodily symptoms the most characteristic is sleeplessness, and the recurrence of the habit of sleep is generally a sign of improvement. A rapid pulse rate and general lack of control of muscles are usually to be found in most types of I.

**Classification.**—There is no universally accepted classification of the types of Insanity, but the following outline of a simple scheme (Henderson and Gillespie) is similar to that adopted by the Royal College of Physicians (England) in its Nomenclature of Diseases.

- 1 *Affective reaction types* (a) Manic Depressive, (b) Involutional Melancholia
- 2 *Schizophrenic reaction types*
  - 3 *Paranoid and Paranoid reaction types* (a) Paranoid, (b) Paraphrenia, (c) Paranoid states (with or without hallucinations)
  - 4 *Idiocy*
    - 5 *Mental Deficiency* (a) Idiocy (b) Imbecility (c) Feeble-mindedness
    - 6 *Organic reaction types* (a) Acute (b) Chronic (c) *Unsettled* (e.g. some cases of alcoholic delirium)

The *Organic reaction types* are subdivided as follows: (1) Psychoses with focus: (a) Endotoxaemia (diphtheria, typhus, etc.) (b) Exotoxaemia (alcohol, organic metal poisons, etc.) (2) Psychoses with infections: (a) General (b) Local (brain infections comprising Syphilis, General Paralysis, Cerebral Syphilis, etc.) (c) Local (Tuberculosis, Meningitis, tubercular meningitis, etc.) and Abscesses. (3) Psychoses with primary degenerative brain changes: (1) Psychoses with general metabolic deficiency: (a) Pellagra (b) Myxoedema (c) Cretinism (4) Psychoses with brain trauma (5) Psychoses with organic brain diseases, e.g. brain tumours (6) Psychoses with chronic general diseases, e.g. cardiovascular diseases, infectious diseases, etc.

The term *Manic Depressive Psychosis* is applied to disorders of affect either of the mania or depression which were formerly termed *Mania* and *Melancholia* in the belief that they were quite separate diseases. The characteristic symptom of Mania are: (a) a state of speech and activity, (b) without any justifiable cause either in the conscious content of the external circumstances. In addition suspicion, irritability, a clouding of consciousness, delirium, depression and hallucinations may all be present for a time, particularly at the height of the illness. The onset is usually acute and the bodily manifestations are restlessness, insomnia and loss of weight.

*Melancholia* is characterised by persistent depression. The patient is miserable, introverted, solitary and retarded. Hallucinations and delusions (usually hypochondriacal, self-acusatory or persecutory) may be present. The most important consideration from the point of view of cure and treatment is the danger of suicide.

*Involutional Melancholia* is a term, which in its strictest application is reserved for a group of cases of both sexes occurring at the involutional period, who have never previously suffered from any form of mental illness. Its features are

depression without retardation, anxiety, a feeling of unreality and hypochondriacal and nihilistic delusions.

*Paranoia* is a chronic form of mental disease which has an insidious onset and is characterised by delusions, which are closely related, unchangeable and bound up together into a system. The term Systematised Delusional Insanity is sometimes given to Paranoia and distinguishes this psychosis from other mental diseases in which the delusions are multiple, variable and unsystematised. Delusions may be of grandeur and power or of persecution or jealousy. When delusions of persecution are present, there is considerable danger of violence as the patient may attack his supposed persecutors or attempt suicide to escape from them. *Schizophrenia* is a psychosis which occurs most typically in adolescents and young adults and is characterised by emotional apathy, absorption in phantasy to the exclusion of normal social activities, by delusions and hallucinations, and a deterioration in mental efficiency which may terminate in severe dementia. In its typical form it consists in a slow steady deterioration of the entire personality and manifests itself in disorder of feeling, conduct and thought and in an increasing inability to make effective contact with reality. Four varieties have been described: (1) Simple, (2) Hebephrenic, (3) Katatonic, (4) Demential paranoïdes. *Paraphrenia* is a progressive delusional condition, accompanied by hallucinations of various senses and, in due course, by a varying degree of mental deterioration. The condition has been said to lie midway between dementia paranoïdes and paranoia in the age of onset and the severity of its symptoms. *General Paralysis of the Insane* is an inflammatory and degenerative disease of the brain of syphilitic causation, which is characterised by progressive mental deterioration and definite physical signs and serological findings. It usually manifests itself from five to twenty years after infection but a few cases have been recorded where the disease made its first appearance thirty or more years after infection. It is commoner in males than in females, develops insidiously and its course is frequently marked by remissions. The earliest signs are usually changes in the patient's personality, (changes in behaviour, character and mood) of which the patient is commonly unaware. There is increasing disorientation, particularly for time and progressive impairment of memory. A feeling of euphoria, coupled with grandiose delusions of bizarre type may be present or the patient may exhibit intense depression, even amounting to stupor and mutism. In the depressed type the ideas expressed are frequently absurdly nihilistic and grotesque. In the terminal stage of dementia the patient leads a purely vegetative existence. The disease is world wide and its appalling social significance cannot be overstressed. Syphilis transmitted to the offspring may give rise to juvenile general paralysis.

**TREATMENT.**—Studies of mental disorder carried out in connection with hypnotism led to the attempt to use suggestion, and persistent suggestion still plays a great part in the treatment of mental patients. Progress towards an understanding of the true character of mental disorder resulted in the realisation that the insane man was a sick man, in need of care and supervision in place of discipline (or as in former times, punishment) and restraint. A welcome change appears to have taken place in the attitude of the general public towards 'nervous' and mental disease. There is an increased readiness to seek expert advice and treatment early and the old fear of social stigma appears to be almost eliminated. Probably more than any other single factor, the extensive use of psychiatry in the three Services during the Second World War contributed to this desirable development. For the first time, psychiatry in the Services was fully organised and developed. Special hospitals for the treatment of neurosis and psychosis were established both at home and overseas. At home, psychiatrists were attached to the various Military Hospitals, area psychiatrists worked in each command, Military Prisons were visited and psychiatric opinion and advice made available at Officers' Selection Boards, Intake centres, Courts Martial etc. Overseas, the work was often carried out in the extreme forward areas. The result was that in the Services large numbers of the Medical profession and an immense cross-section of the general pop. became familiar with the aims, uses, methods, and benefits of psychiatry, and after their return to civilian life they were not slow to take practical advantage of this knowledge. Further, the experience gained in the organisation of war-psychiatry proved of great value in organising the extension and elaboration of civilian psychiatry which took place after the end of the war. The modern mental hospital provides its inmates with as great a measure of freedom as possible, and with great variety of occupation.

Besides rest and occupational therapy special methods of treatment have recently been introduced, which have yielded valuable results. The methods of treatment now in use include (1) Insulin therapy, (2) Cardiazol therapy, (3) Electric convulsion therapy, (4) Prefrontal leucotomy, (5) Continuous paroxysms, and (6) Narco-Analysis. Insulin therapy, which involves the production of a hypoglycaemia by means of insulin, has proved especially valuable in schizophrenia, particularly in young patients treated early in the disease. Cardiazol also has yielded good results in certain cases. With electric convulsion therapy the best results have been obtained in depressions, including involuntary melancholia. This treatment, which can be given as an outpatient procedure, is now practised at the psychiatric clinics at most large general hospitals. The operation of prefrontal leucotomy involves the severance of the association paths between the frontal lobes and the thalamus. The general aim

of the operation is to modify the disordered behaviour of those psychotic patients whose illness has been of prolonged type. Generally speaking the possibility of serious and permanent damage to the mental functions renders it advisable to reserve the method for cases where all other suitable methods have been tried and failed, where there is no reasonable hope of spontaneous recovery, and where the patient is quite incapable of useful occupation or a modest enjoyment of life. Modern practice involves the attempt on the part of the medical man to understand his patient, and to learn through the discovery of the purposive character of his symptoms, obsessions, and delusions, the real character of the inner conflict which they simultaneously express and conceal (cf. the psychological teaching of Freud and his followers). There is still a difference of opinion as to whether there is a distinct break between the neuroses or nervous disease and the psychosis of insanity proper, or whether the psychoses which are not due to actual lesions are merely developments of the neuroses. According to some writers there is a mental difference between the two though it is admitted that in the end stages of dementia praecox, manic depressive insanity, paralytic insanity, diagnosis is very difficult and judgment who are really in one may be regarded as different. On the other hand it is undeniable that many patients who were diagnosed as insane have been considerably benefited by psychoanalytic treatment and some have even been cured. These differences of opinion, however, have not stood in the way of the acceptance of the view that mental disorder of any kind calls for psychological understanding, and psychological treatment. The psychological study of abnormal mental functioning has developed into a specialised branch of medical science under the name of psychiatry (1).

#### DEFINITION OF INSANE PERSONS—S. LUNACY ACT.

INSANITY AND CRIMINAL RESPONSIBILITY.—It is a fundamental principle of English law that every person of the age of discretion is sane and is accountable for his actions until the contrary is proved. The burden of proving the incapacity or mental defect is placed on the prisoner, and it is for the jury to determine as a question of fact whether the defence have proved that the prisoner was insane at the time when he committed the crime. The tests to be applied by the jury were formulated over a century ago in consequence of a plea of *Insane* in the case of *R. v. M'Naghten* (1843). The Rules formulated by the judges to whom the House of Lords addressed a series of questions on the law of insanity laid down four propositions which could be used as a guide where *Insane* is pleaded and which can be summarised (1) the fact that a person who knows that he is acting contrary to law does so under an insane delusion of revenge, or a delusion that his act is a benefit to the public, is no defence if that person, even though

partially deranged, knows that he is doing something unlawful at the time of the commission of the act. (ii.) the test of *Insane*, which ought to be submitted to the jury, as a direction from the judge on the law, was held to be that 'To establish defence on the ground of insanity, it must be clearly proved that at the time of committing the act the party accused was labouring under such a defect of reason, from disease of the mind, as not to know the nature and quality of the act he was doing, or if he did know it, that he did not know that he was doing wrong.' (iii.) if a person is under a delusion as to the facts which excited at the time of his wrongful act but is not otherwise insane his liability for those acts must be considered on the basis of his liability had those circumstances been real. (iv.) a medical witness who has been present throughout the trial cannot properly be asked his opinion as to the state of the accused's mind at the time of the commission of an alleged crime as this would be usurping the question which it was for the jury to decide, but it is still convenient to allow such a question where the facts are not in issue and the question is substantially one of matter of science.

The rules have long been subject to criticism by legal and medical writers. The non-acceptance by the law of the defence of uncontrollable impulse (for example in cases of shoplifting where a person is clearly suffering from kleptomania but still knows that he is doing wrong) which has often been strongly attacked by eminent members of the medical profession. Similarly the law has not accepted a defence of moral insanity where the intellectual faculties are sound, and where there is knowledge of the acts performed, but the moral appreciation is affected or affected. Moral insanity is, however, recognised under the Mental Deficiency Acts, 1890 and 1912. Where a person is mentally defective and has a predisposition to criminal propensities which have existed before the act of commission the court has power to order confinement in an institution or place for defectives under the care of a guardian. Moral delinquency or sadistic or sexual perversion is not full within the Rules or M'Naghten's case unless the person either does not know what he is doing, or does not know that what he is doing is wrong and therefore cannot form good grounds for a defence. (1) The defence of *Insane* in answer to a criminal charge is one of general application and is not confined to cases of murder. It is, however rarely pleaded as a defence to charges of less gravity because the consequences to verdict of guilty but insane, for a finding of this special verdict entails an order that the accused be kept in custody during His Majesty's pleasure. See also CRIMINAL LAW, LUNACY ACTS, MENTAL DEFICIENCY ACTS.

**Inscribed Stock**, see REGISTERED STOCK. **Inscriptions** (from Lat. *in*, 'upon' and *scribere*, 'to write') is the term given to records, cut, engraved, or moulded upon hard material such as stone, metal, or clay. They are found on rocks, on slabs of stone, on temples, tombs, or anct. buildings, on vases, seals or gems, on copper plates, on iron or bronze tablets, on gold, silver, brass, crystals, ivory, and so forth. In the Bible, there are numerous references to writing on stone: the 'tablets' on which Moses received and afterwards re-wrote the Law on Mount Sinai were slabs of stone (*Exod.*, xxxi, 18 and xxxiv, 1), and (in *Deut.*, xvii, 2-3) Moses was bidden to 'set up great stones and plaster them with plaster' that they might have a surface capable of taking a legible text of the Law; also Joshua 'wrote upon the stones' a copy of the Law of Moses (*Josh.*, viii, 32). Clay was the most common writing material among the anct. Mesopotamian peoples (see under CUNEIFORM WRITING) and was also used in Syria (at Ras Shamrah, the anct. Ugarit, a particular cuneiform alphabet was employed) and in Crete, where many thousands of clay tablets have been unearthed, as well in some other Near E. countries. Bronze was used by Gks., Etruscans, and Romans as a material on which to engrave votive f., laws, treaties, and other solemn documents. The Chinese earliest extant written documents are either on bronze or on bones. The most noteworthy characteristic of the 'pre-historic' Indus Valley civilisation (q.v.) in the middle of the third millennium B.C. is the still undeciphered script preserved in about 500 finely cut seals of stone or copper. India, and especially S. India, is particularly rich in inscriptions of all kinds. The importance of the S. Semitic f. can be gauged when we consider that practically all we know of early S.-Arabian hist. and that of pre-Islamic N. Arabia, is based upon them. Indeed, these numerous S. and N. Arabian f. are our main source for the study of the once flourishing kingdoms, whose splendour has been immortalised by the Biblical account of Solomon and the Queen of Sheba. Also the numerous inscribed *stelae* and stone 'altars' and the inscribed polychrome clay pottery of the anct. Mayas (Central America), as well as the wooden tablets of Easter Island inscribed in a 'mysterious' script may be mentioned.

Until the end of the nineteenth century when people spoke of 'ancient history' they usually meant the hist. of anct. Greece and Rome; it was thought that nothing could be known about the earlier times except what is found in the pages of the Bible. In the early nineteenth century very little was known about

the early Near E., the cradle of our W. civilisation. The general reader hardly realises that during the last century the fields of space of time open to the eye of man have been wonderfully extended owing largely to the discovery and the decipherment of numerous f. The civilisations of Egypt, Mesopotamia, Indus Valley, Syria, Asia Minor, Arabia, Crete, etc., previously entirely unknown, or at best known only from the facts transmitted through the Bible or Graeco-Rom. writers have been brought into the full light of hist. Scores of scripts and languages, some of which are not connected with any surviving tongue, have been deciphered; grammars and dictionaries of previously unknown languages have been written; and many aspects of historical cultures have been constructed only on the basis of f. For example, we know vastly more about the reign of Hammurabi of Babylonia, eighteenth century B.C., than we know about the reign of King Alfred of England.

**Insect Bites and Stings.** The greatest danger from insect bites and stings lies in the disease-producing organisms that the insect may carry. In this way mosquitoes carry malaria; fleas, plague; lice,

typhus fever; and so on. The biting insects which directly give most trouble to man are gnats, mosquitoes, fleas, lice, and bed bugs. With their piercing mouth parts these insects puncture the skin and then suck blood through the proboscis. Gnats and mosquitoes pour a little saliva into the wound, so irritating it and promoting the flow of blood to the surface. Biting of gnats and mosquitoes may be reduced by drainage of marshy places and standing water. Fish and aquatic insects that will eat the larva should be kept in standing water that is needed for any purpose. Strong essential oils such as oils of lavender and eucalyptus will keep away gnats, mosquitoes, and fleas. Bites should not be rubbed. Irritation may be allayed by bathing with a cooling lotion and the application of ammonia. If the wound becomes septic hot treatment should be applied. To drive away fleas clothes and even the body may be dusted with fresh pyrethrum powder. The modern insecticides (*see*) such as D.D.T. are also very effective. Dogs should be frequently washed with a good disinfectant dog soap. Bugs may be exterminated by fumigation with sulphur. In Great Britain, stinging insects are bees, wasps, occasional hornets, and ants. If the stinging insects in the flesh it should be flicked off with a quick lateral movement of the finger nail and ammonia or sodium bicarbonate solution applied. Pressing on, or rubbing, the wound is to be avoided so forcing the poison quickly into circulation. The wound should not be sucked because the poison may affect the mouth. Some insects are covered with stinging hairs. The larva of the Brown tail moth has barbed hollow hairs containing a fluid which in contact with the skin sets up a rash resembling eczema. The hairs may be blown by the wind to clothing and cause great discomfort. An alkaline lotion containing menthol, zinc oxide, and a disinfectant gives relief.

**Insecticides** are indispensable to all farmers and horticulturists. A specially prepared mixture of flowers of sulphur and quicklime in the proportion of one to four makes a good white wash for fruit trees in the spring and also effectually prevents blight on pear trees. It kills the insect pests by means of the sulphurous fumes which are given off. An application of lime is similarly effective and in no way interferes with the vegetable growth. Many recommend also dry tobacco powder or tobacco soaked in hot water, a soft soap solution with one ounce of soap to the gallon, a substance containing arsenic and known as Paris green, and what is called the Bordeaux mixture which consists largely of copper sulphate. Wasps' nests may be destroyed by pouring a ladleful of tar down the entrance hole and also by a solution of cyanide of potassium (2 oz. to the pint). But extreme caution must be observed with this latter as it is a violent poison. The caterpillars which attack gooseberries and currants are best removed by the tedious process of hand-picking, but they will soon die if subjected to a spraying or syringing with

London purple, which is an arsenite of lime, and therefore, like Paris green, highly poisonous. A thoroughly mixed dressing of lime and soot if liberally applied soon gets rid of the saw fly which eats into pears and cherries. Injections of pure chlorine gas did away with an ant plague at La Rochelle. Fly tapes and fly reels smeared with honey gum or some other sticky substance like treacle and blime rapidly reduce swarms of house flies. In recent years organic compounds, complex derivatives of benzene, have been used as fly with very good results. The best known are D.D.T. and gamma-hexane. Derris powder is also useful in the garden.

**Insectivora** (*Lat.* for insect-eating) order of placental, non-volant mammals. They are small, and derive their name from their common food. All have teeth particularly well adapted for eating insects, with tiny conical tubercles on the top of the molar teeth. Many have a full complement of teeth, incisors, canines, premolars, molars, and even temporary milk teeth. The actual number varies with different families, but forty-two is an average total. I put the caterpillars of the cicadas on the ground when they walk and are therefore said to have plumed feet. There are five toes on each one armed with a claw. They occupy an exceedingly low place in the scale of biological development and are certainly no higher than marsupials. Many zoologists indeed regard them as being more or less representative of the primitive mammalian stock. The skull is of a most backward type, and the brain cavity is relatively small. In habit the Insectivora are generally speaking both terrestrial and nocturnal, a few, however like the *Antrozous*, are aquatic, and others like the tree shrews or tupias of India and the Malay Peninsula, are arboreal. Quite common but as *e.g.*, the huge group of moles and *Talpids* burrow in the ground. Many of them have been discovered especially in the Tertiary strata and more than 200 living species are known. Members of the order multiply with a astonishing rapidity, the hedgehog may have a litter of eight, whilst that of the tenrec sometimes numbers over twenty. Their circulatory system is well developed, their fur is thin and shrews and other species are provided with scent glands at the bases of their bodies. Australia and S. America are the only large areas of the globe where there are no Insectivora, in all other tropical and temperate zones there are many representatives.

**Insectivorous Plants.** One of the most important of the essential elements of plant food is nitrogen. Usually it is obtained from the nitrates of the soil, parasites receive it from the bodies of their host plants. Leguminous plants living in symbiotic relationship with bacteria probably exchange some of their carbon for the nitrogenous compounds of the bacteria. *L.P.*, however, adopt the simple expedient of entangling tiny animals and absorbing their nutritious juices. A well known *L.P.* of S. America is *Thonaria muscipula*, or Venus fly trap. The leaf-blade forms

and have many nerve-endings which make it probable that they serve as organs of touch, by which impressions are conveyed from one I. to another, and perhaps also as organs of smell. Secondly, there are the mandibles or biting and upper jaws, which in insects with the masticatory type of mouth are simply hard plates adapted for crushing and cutting. Below these are the anterior (1st) maxillæ, or lower jaws, which are provided with jointed palps, that is, sense organs, and which often have quite a complex structure. The posterior (2nd) maxillæ are the fourth pair of appendages. These also are complex and furnished with palps, and are, moreover, usually united at their base to form the labia. The mouth is formed of the mandibles and the two pairs of maxillæ, and may be of the sucking or chewing type. Thus moths and butterflies have suctorial mouth arrangements, and whilst their mandibles are only slightly developed, their 1st maxillæ have become proboscises by being protracted into a spiral tube. The mouths of beetles are masticatory. The trunk appendages are the three pairs of legs already referred to. Each limb is divided into five parts, namely hip (coxa), trochanter, thigh (femur), shin (tibia), and foot (tarsus) with claws and pads at the extremity. Sometimes there are tarsal hairs and glands, which enable the I. to grip a smooth surface: the legs of a daddy-long-legs, hunk and long, whilst the water boatman can swim with his, and other insects use theirs for making a noise.

**Skin and glands.**—The chitinous cuticle or integument, which forms a kind of ensheathing skeleton, often bears bristles, tubercles, scales, or hairs the last of which may be tactile or olfactory. Is. are subject to moultings, since the cuticle itself cannot expand to allow for growth, and cast their whole skins many times before reaching their greatest size. The skin serves as a firm support for the highly-developed muscles which work the wings, legs, trunk segments, and organs of the mouth and further control circulation and respiration. Bees, cicadas Is., etc., have wax glands near the bottom of the abdomen or on the back; a number of larvae, especially such as weaver cocoons, have spinning glands opening near the mouth; bugs have odoriferous, and wasps and stinging ants poison, glands, and few Is. are without salivary glands, which also open near the mouth.

**The nervous system** differs, broadly speaking, from that of vertebrates by having a ventral instead of a dorsal nerve cord. The nerve centres, called 'ganglia,' which are usually masses of nervous matter, lie lengthwise along the lower part of the trunk and are connected together by a double chain of nerves. From each ganglion branch nerves are despatched to different parts of the body, and in the extreme front is a larger pair of ganglia, usually called the 'brain'. From the 'brain' the two nerve chains, or cords, divide so as to enclose the gullet, after which they reunite. As regards their sense organs it is certain they have some

of them more highly developed than those of human beings. Is. which visit flowers are wonderfully sensitive to fragrance and to colour, and it is largely by smell, it seems, that I. recognise friends and foes. Some entomologists credit them with a sixth and dermatoptic sense, because their skin seems able to appreciate minute differences of light and shade. Is. hear by means of nerve-endings, called tympanal and chordotonal organs, which lie on various parts of the body surface and greatly surpass human beings in their auditory faculties. Many, like ants and bees, which lead a social life, show signs of extraordinary powers of intelligence and ingenuity in adapting fresh means to compass a particular end. On the other hand, much of what appears to be their most intelligent behaviour is purely instinctive, and when this is interfered with, the insect is unable to adapt itself intelligently to the new situation.

**The circulatory system** centres round the dorsal blood-vessel, or heart, which lies lengthwise along the upper surface of the body, just below the chitinous casing, and which is a tube composed of segments with valves between. Behind, this tube is closed, but in front it is prolonged into a fine channel, the aorta. The blood, which is a colourless, pale green, red, or yellow fluid with amoeboid cells, is pumped out from the heart into the various tissues until a muscular contraction of the body forces the blood back into the heart. Lacunæ, which have no definite walls, take the place of blood-vessels properly so-called. The blood, unlike that of vertebrates, takes no part in the transport of oxygen.

**The respiratory system** of Is. is remarkably efficient. Air-conducting tubes, called tracheæ, are distributed net-wise all over the body, and open to the outer air by means of paired apertures called spiracles, or stigmata. There are usually two pairs in the thorax and ten on the abdomen, but the number varies considerably. The spiracles are often protected by hairs. In water Is. lateral or terminal outgrowths, known as tracheal gills, replace the stigmata; the oxygen dissolved in the water can penetrate through their thin surfaces. The tracheæ are ingrowths from the outer cuticle; they are lined with chitin, and appear silvery and glistening; the air is probably driven through them by muscular contractions, easily seen in the abdomen of a wasp, and continuing even when this part has been cut off from the rest of the body. By the development of spiral bands of strengthening material, the tracheæ are prevented from collapsing, while the diffusion of oxygen through the thin parts of the walls into the surrounding tissues can proceed freely.

**The alimentary system** varies with different species and also to some extent with different diets. The alimentary canal, which passes from front to back usually with sev. loops on the way, may be divided into fore-, mid-, and hind-gut. Mouth, pharynx, and gullet compose the fore-gut; sometimes the gullet is swollen into a kind of crop, the honey-stomach of the bee; sometimes it is prolonged into a

gizzard with grinding plates to promote mastication, and sometimes it has a pouch called the sucking stomach. The fore- and hind-gut are lined with chitin; not so the mid-gut. This is a chyle or digestive and absorptive stomach, and leads into the hind-gut or intestine, which is often coiled and glandular; it is longer in *I.*, which take solid than in those which take liquid food. The intestine absorbs digested food and the soluble waste products leave the body by means of a set of winding threads or tubes, the Malpighian tubules, which usually grow from its upper part. Solid waste products are excreted through the anus.

The reproductive system is represented by paired reproductive organs, the products passing out through paired ducts, the *vasa deferentia* of the male and the oviducts of the female. The sexes are quite distinct and differ in other points of structure as well as in reproductive organs. Thus the female of the butterfly *Orygia* has no wings, and among *Strepsiptera* (bee-parasites) the female never leaves the grub stage. Males can store up spermatozoa in pockets, and similarly certain females, like the queen bee, can preserve for years the spermatozoa received from the male, so that she can continue to lay fertile eggs long after her last sexual union. She does this by means of an internal seminal storage vesicle, the spermatheca. Some females have a well-developed ovipositor at the end of the abdomen. Sexual selection is practised among *I.s.*, a fact which has probably contributed towards more speedy evolution of strength and beauty. Sometimes the males fight for some feminine prize, whilst among bees and other *I.s.* the wooing is quite an elaborate process, the female in this case choosing her mate. Some *I.s.* are exceptionally fertile, as for instance the silkworm and queen bee; others, among them certain Aphides, are remarkable for parthenogenesis, or virgin birth, i.e. development of eggs without fertilisation, which sometimes occurs for a limited period only, and is afterwards followed by normal sexual reproduction. A hive of bees usually has only one perfectly mature female, the queen bee; the mass of females who carry on the work have an immature sexual development, and are therefore called 'neuters,' or 'workers.'

Metamorphosis is a phenomenon common to the majority of *I.s.* However, among Collembola and Thysanura the young, which, as in most *I.s.*, are hatched from the eggs of the mature female, differ from the adults only in point of size, and even among lice, locusts, cockroaches, and many bugs, the only distinction between the infant and parent is the immaturity of the reproductive organs and smaller wings in the infant. These species are therefore said to be 'ametabolic,' that is, not subject to change. Cicadae, Ephemeræ, and dragon-flies, on the other hand, are classed as 'hemimetabolic,' being subject to partial change. Thus a larva of the cicada lives on the ground and has anterior limbs suited to burrowing, whilst fully grown cicadas live among grass. The

dragon-fly is winged and aerial, and breathes with open air-tubes, but its larva lives in the water, and has tracheal gills for respiration. But a large number of species, including house-flies, beetles, and butterflies, are 'holo-metabolic' or subject to complete transformation. The eggs are deposited in such large numbers that they have individually only a very limited food-storage capacity. The result is that each larva is obliged to assume a shape which will allow of its better growth and development, and the form assumed varies a great deal among the different species. The larva of a fly is a maggot which has no distinct head; that of a bee is a grub, whose head is clearly marked; and the caterpillar is the larval butterfly. The normal growth of a larva of this class is as follows: At first, after it has emerged from its shell, it is very active and greedy for food. The body is segmented and supplied with all the organs except the sexual; there are no wings nor compound eyes. In every larva, moreover, what is known as the 'fat body,' that is, a mass of fatty tissues in the trunk-cavity, is peculiarly well-developed. Here, after a busy life of moulting and growing, it accumulates stores of reserve food for use during the coming metamorphosis. Larvae for the most part crawl about, and to aid them in movement they may have from two to five pairs of 'pro-legs,' that is, foot-like processes, on the abdomen as well as true legs on the thorax. The period of change is called the pupal or chrysalis stage. Some larvae, such as those of the silkworm, spin cocoons of silk to serve as a shelter during the metamorphosis. The larva now becomes a 'pupa,' which is quiescent and cannot absorb food, but sometimes, as with dragon-flies and grasshoppers, the larva is transformed into a 'nymph,' which eats and continues active. Wing, grow, and, what is still more marvellous, there is gradually taking place a complete reconstruction of the internal structure of the former larva. Amoeboid cells are fashioned out of the larval organs, and upon the ruin of the latter there grow new structures better adapted for the changed life that is to come. Finally, the pupal husk is broken, and there emerges the 'imago' or perfect *I.* The task of reproduction naturally rests with the fully grown *I.*, which sometimes dies after it is completed. The sexual organs of larva and pupa are usually imperfect.

The classification of *I.s.* is based upon variation in structure, especially upon the various types of wings and mouth arrangements. Some of the most distinctive orders are: (1) The Collembola and Thysanura, together forming the group Apterygota, the wingless insects with incomplete metamorphosis. These orders include the 'springtails,' certain plant lice, the 'bristletails,' and the 'silver-fish.' (2) 'Neuroptera' (nerve-winged): May-flies, caddis-flies, scorpion-flies, and dragon-flies, white ants, and book-lice all now usually regarded as forming separate orders. These have four glassy and membranous wings, an incomplete metamorphosis, and a mouth of the biting type.

## INSECTS INJURIOUS TO TREES AND SHRUBS

- 1 Jacky Moth (*Malacosoma neustria*) 11 Larva 12 Eggs, in 1 and stem 2  
 Mottled Umber Moth (*Hibermis tiliaria*) 12 Larva 3 March  
 Moth (*Asiopteryx asulata*) 13 Larva 4 Bl w Tul Moth (*Viburnum*  
*phacrinosa*) 14 Larva 5 Maple Moth (*Abnaya rossularata*) 51  
 Larva 6 Winter Moth (*Chimantolia brucei*) 6 Larva 7 W d Leopard Moth  
*(Luzena pyrausta)* 7a Larva 8 Goat Mct (*Callus hirsipertis*) 81 Larve in Willow  
 9 Green Oak Moth (*Tortrix viridana*) 9 Larva, descending fr rolled leaf 10  
 Codlin Moth (*Carpocapsa pomonella*) 10 Larva on Apple 11 Cockchafer Beetle  
*(Melolontha vulgaris)* 12 Row Chater Beetle (*Ceonia aurata*) 13 Pin Beetle (*Hylisus*  
*pumilio*)—enlarged 14 Garden Chater Beetle (*Phyllotreta horticola*) 15  
 Gooseberry Saw fly (*Nematus ribesii*) 151 Larve 16 Colorado B tile (*Leptinotarsa*  
*decimneata*) 16a Larve A Blackthorn B Oak C Gooseberry D Hawthorn  
 The drawings are life size, except of very small insects (actual sizes indicated by a line)

Most of these insects feed on others which are pests. (3) *Lepidoptera* (scale winged) butterflies and moths. These have four wings with delicate coloured scales. Metamorphosis is complete. The mouth is furnished with a proboscis, and the larva are characteristic. The pupa of most *Lepidoptera* is described as a chrysalis. (4) *Orthoptera* (straight winged) earwig, cockroach, locust, grasshopper, and cricket. These are ametabola have cerci appended to the abdomen, and have the front pair of wings leathery and smaller than the back wings which they protect. Sometimes both pairs of wings are absent to greatly reduced, and the hind wings may be modified particularly in the male and used for producing sounds e.g. the chirp of the cricket. Many *Orthoptera* seldom or never fly but such forms usually have extremely well developed legs and can like the grasshoppers run or jump very rapidly. On the other hand the locusts have very powerful wings, and are capable of prolonged flight. (5) *Hymenoptera* (membran winged) wasps, bees, ants, ichneumonids and gall flies (*gall*). Their mouths are both biting and suctional. They have four transparent membranous wings and undergo a remarkable transformation. An ovipositor retractile in some species is developed in the female and may be modified into a sting. Euthenogenesis occurs very commonly and sometimes there is a regular alternation of euthenogenesis and sexual generation. Euthenogenesis (ages of bees develop into males (drones) those of saw flies into males or females but those of some insects into females only. (6) *Diptera* or the (two winged) house fly, house fly and blow fly. They have diddly long legs and in some the mouth metamorphosis is very complete. Their mouths are mostly used and their two wings are transparent and membranous and their larvae are footless and headless (maggots). The hind wings are represented by a pair of small outgrowths the halteres which act as balancers. The mouth parts show great variety of structure, and frequently consist both piercing and suctional organs. The gnat and mosquito have a mandible and first maxilla modified to form piercing stylets, the labrum and a section of the pharynx are fused to form a deeply grooved structure which functions as a channel conveying the liquid food to the pharynx. All these parts are guided by the fork tip of the labium. The suctional mouth parts of such insects as flies are aided by a very muscular pharynx which acts as a suction pump. (7) *Hemiptera* (half winged) aphids (green fly), cochineal insect, water boatman like, bugs, and cicada. These undergo slight metamorphosis have suctional mouth parts and four wings which are either membranous or horny with a membranous vein. The *Hemiptera* do considerable damage to plants and animals and are consequently of great economic importance. (8) *Coleoptera* (sheath winged) water beetle, stag beetle, and tiger beetle, etc., glow worm, ladybirds,

and cockchafer. Members of this class experience a complete transformation and have biting mouths, but their salient characteristic is the horny sheath (elytra) of which their front or upper wings are composed so that the delicate membrane of the hind or lower pair is quite hidden from view, these elytra meet in a straight line when folded. Most *Coleoptera* fly very little and the wings are very reduced in many species. Sounds may be produced in various ways. By friction between the abdomen and elytra of weevils by the tapping movement of the 'death watch', *Anobium* and by friction between the scutellum and outgrowth of the second thoracic segment and the body of the longhorned beetles.

*Life and General Characteristics*—Insects have most diverse habits and frequent and ground caves, hot springs, and even the air nevertheless, the majority are aerial and dwellers on land. In tropical and temperate climates they abound but they are represented even in the polar regions. Many as for instance the pond skater, whirligig beetle, water scorpion and gnat are aquatic at least for the earlier days of their life. Generally speaking, adults are short lived and die within a few weeks with the adult *Phlebotomus* (*Mexico*) is an exception does not live less than twenty four hours but the queen bee lives for some years and a queen ant will occasionally last for this time. The food of insects is very various. Some like the pollen and nectar from the flower others feed on weaker species of their kind and others are parasitoid or predators of higher animals. Others again grow fat on putrescent matter and yet another section sucks juices secreted by living organisms. Parents will often gather a store to feed their young even though they themselves die before the larvae are hatched. A number of insects are able to express their anger or fear or to convey information or make love by means of sound. This may be produced by the rubbing together of the rough surfaces of the outer cuticle or by the buzzing vibration of the leaf like appendages near the stimuli of the antebes or by the quick flutter of their wings. Thus grasshoppers strike their legs against their wing ribs to make crickets chirp by rubbing their wing cases together. Many *Hymenoptera* produce their noise by the second maxilla whilst the whirling sound of bees and flies is due to wing motion. The diddly head moth emits a noise by blowing air out of its mouth. Sometimes the noise is purely automatic. If left undisturbed it would multiply with an alarming rapidity. Fortunately however, the difficulty of obtaining food, lack of water and the predation which birds, ants, cats, frogs, and fishes show for them as food counteract their amazing fecundity. As with higher animals so certain insects are naturally protected by having an outward appearance which exactly counteracts their actual surroundings. This is the case with moss and leaf beetles and humming bird moths. Other insects are saved from molestation by disgusting fluid dis-

charges, an unpleasant smell, a hard skin, or an offensive weapon like a sting. The social species, ants, bees, termites and wasps, offer a most instructive and fascinating field for study by reason of their 'intelligence', architectural skill, and developed communistic life.

**Economic value.**—Unconsciously, *Is.* play a great part in the cross-fertilisation of flowers as they carry pollen from one bloom to another. The 'myrmecophilous' (ant-loving) plants are actually guarded by ants from other and hostile intruders. Man owes a debt of gratitude to the hive bee for its honey and wax, to the silk moth for its silk and to the cochineal *I.* for a dye. But there are many species which seem purely harmful and destructive. Cattle, sheep and horses are unweaned and attacked by the bot fly, crops, orchards and vines are prey to a whole army of greedy parasitic *Is.* and the havoc caused by a locust swarm is often immense. House flies and fleas have been proved to be the agents which carry pathological or disease-bearing germs in a number of infectious outbreaks—the mosquito is responsible for malarial yellow fever and the horrible disease called *Elephantiasis ardens* and the bit of the tsetse fly is often fatal to human beings. In the fly *Is.* is very bubonic plague. It unweans prey to enlarge on the local mutations produced by lice fly and so on. **Scats.** Excretionary and under in hybrid insects.

**Insemination, Artificial** fertilisation of an egg by spermatozoa (sperm) reaching it through some artificial agency, i.e. not by normal transference of the sperm from the male animal during mating of male and female individuals. In laboratory experiment *A. I.* is frequently practised on such animals as the sea urchin and it is also carried out on a commercial scale in trout farming. Its most usual application is in mammals, where the earliest recorded experiments are those of Spallanzani (1780), who succeeded in fertilising dogs

by sperm introduced artificially into the vagina. *A. I.* is now employed in the rearing of farm animals, especially cattle (critics have been established at various places in Great Britain where semen collected from high grade bulls, is stored in vacuum ('thermos') flasks and dispatched through the post to small farmers who are spared the expense and trouble of maintaining male animals for service. *A. I.* sometimes establishes pregnancy in humans, when normal coitus fails through some defect in the reproductive organs. There can be no objection to its employment when the sperm is provided by the husband (*A. I. H.*) but *A. I.* by some outside donor (*A. I. D.*) is condemned as adultery by the Church, besides raising such problems as who is the legal father of the child, or indeed whether the child is legitimate. Nevertheless *A. I. D.* is carried out regularly in at least one London clinic. See Barton Walker and Walsner *British Medical Journal* p. 10 Jan. 1, 1941, and J. J. Perry (ed.) *The Artificial Insemination of Farm Animals* 1941.

**In-Shan Mountains**, range in Mongolia, on the N. side of the Hwangho. They rise to an altitude of from 3000 to 8000 ft. and are part of the extensive Khingan mts. from the N. of the Gobi Desert. *A. I.* set in the Mongolian of Manchuria.

**Insolvency, Insolvency.** **Insolvency** denote inability to pay one's debt. The term *solus* is English law is concerned for most practical purposes regulated by the term 'bankruptcy' (see Bankruptcy) and on the old distinctions between *I.* and bankruptcy. In Scots law bankruptcy is hardly a term of art, except in the phrase *a bonis bankruptis*, which implies a condition of *I.* attended with certain statutory effects restricting the insolvent's power of dealing with his property, but it is also commonly used in connection with the public bankruptcy notices of sequestration *ex cesso* under which an insolvent yields (*cessare*) his property up to his creditors. Taken in this latter sense the term does not differ essentially from the state of a debtor who has been adjudicated bankrupt under the law. The importance in Scots law of the condition of *I.* is distinct from bankruptcy which has become public, in that it has certain special effects on the debtor's power of granting alienations. The most important general effect of *I.* is that it is a step in the direction of notional bankruptcy, it being a necessary condition to obtaining a *cessio bonorum*. The special effects of *I.* above alluded to are that the insolvent is restrained from depleting an estate or fund insufficient to meet all claims by voluntary or gratuitous alienations or by alienations made for an inadequate consideration or by fraudulent preferences of one creditor over others. The only courses open to an insolvent failing his inability to regain his solvency are to go through with his public adjudication of bankruptcy or sequestration, or to try to provide some voluntary or extrajudicial arrangement of a more or less private character.

**Insomnia**, see under SLEEP.

**Inspectors, Factory, see FACTORY LEGISLATION.**

**Inspiration** (Lat. *inspiratio*, from *inspire*, to breathe into), term used in theology to denote that Divine influence on the writers of the Bible by means of which their writings became a Divine revelation. All orthodox theologians are agreed in regarding the Holy Scriptures as the revelation of God in some sense, but there is much difference of opinion as to the method and extent of the Divine inspiration. The dogmatic formula of the Church on the subject, to be traced through various councils and writers from a very early date, simply states, *Deus est auctor librorum sacra scriptura*, but this general statement is explained in some detail by the Vatican Council, where it was pronounced that the Scriptural writings are held as sacred and canonical by the Church, 'not because after being composed by merely human industry they were then approved by her authority, not simply because they contain Revelation without any error, but because, being written under the inspiration of the Holy Ghost, they have God for their Author.' The theory of I. generally known as *verbal* or *mechanical* was held for centuries by Protestants. This view does much to remove all variety and individuality from the writers of the sacred books, making them mere instruments upon which the breath of God plays. Their words are to be regarded as the very words of God as certainly as if a voice had announced them from the skies (see HIXALITION). Such a theory of verbal I. throws the whole weight of authority on the autograph MSS., which in no single case are extant, and makes trans., which must ever be more or less inaccurate, somewhat dangerous. The theory of *dynamic* I. in its various forms is that now generally held by Protestants as well as by Rom. Catholics. It is that the writers did *not* lose their own individuality, but were so under the influence of the Spirit of God that they could make no error in transmitting to mankind the truths which they were intended to convey. The theory of dynamic I. finds ample support in the Fathers. 'The Gospel,' says St. Jerome, 'is not in the words, but in the sense—*non in superfetis sed in medulla*.' Similarly, St. Augustine speaks of the writer as 'inspired by God, but yet a man—*inspiratus a Deo sed tamen homo*.' This theory is closely related to that of *essential* I. which holds that the I. of Scripture relates only to faith and morals. In support of some form of these theories may be advanced among others the names of St. Thomas Aquinas, Erasmus, Grotius, Baxter, Paley, and Dollinger. See B. F. Westcott, *General Survey of the History of the Canon of the New Testament*, 1896; W. Sanday, *Inspiration*, 1896; A. B. Davidson, 'Prophecy,' and A. E. Garvie, 'Revelation,' in J. Hastings's *Dictionary of the Bible*, 1898; D. Davidson, *Hidden Truth*, 1934; R. H. Malden, *The Inspiration of the Bible*, 1935.

**Insterburg**, tn. of the R.S.F.S.R. formerly of E. Prussia, on the R. Pregel, 57 m.

E. of Königsberg. It is noted for iron foundries, tanneries, breweries, machines, tiles, leather, hides, and linen. In the great Russian general offensive of 1945 against Germany I. fell to Cherniakovsky, advancing from the E. almost simultaneously with the capture of Allenstein by Rokossovsky (Jan. 22, 1945). Pop. 41,200.

**Instinct**. Everyone may be said to understand in a general way what is meant by I., despite the difficulty of formulating any satisfactory definition. Darwin himself, in his examination of the various distinct mental actions commonly embraced by the term, refrained from any attempt at definition. It may, however, be tentatively defined or rather described as those congenital or natural attributes of the mind which, though closely assimilated to, are distinct from, habit and which impel an animal under given circumstances to act in a certain way without experience, and frequently without a knowledge of the object with which the action is done. All the great scientific psychologists have rather naturally been greatly concerned with the origin of I. and the problems surrounding it, but no satisfactory conclusion has been reached (See also BEHAVIOURISM; EVOLUTION; HABIT). For the mass of evidence accumulated on the character or manifestations of I. see C. Darwin, *Origin of Species*, 1859, and *Descent of Man*, 1871; G. I. Romanes, *Mental Evolution in Animals*, 1883; C. Lloyd Morgan, *Habit and Instinct*, 1896; A. Weismann, *Essays upon Heredity and Kindred Subjects*, 1889; S. Alexander, *Art and Instinct*, 1927; D. Katz, *Animals and Man*, 1937; and the works of E. Haeckel.

**Institute**, in Scots law, the person in a deed of settlement or other instrument by which lands are granted (see GRANT) who takes the first or earliest estate (*q.v.*) or interest is called the I. Those who follow the I. are called the heirs or substitutes. If the I. dies before the disposer or grantor, the first substitute or heir takes without a service process or 'hancery upon a breve for completing the title of an heir'. Conditions annexed to the grant will only affect the substitutes, unless the grantor has made it clear that the I. is also to be bound. See BELLS' *Dictionary*; FRANKS' *Principles of Scots Law*.

**Institute of France**, estab. in 1795, was formed by the Directory to take the place of the four suppressed learned societies of that country: the Fr. Academy of Inscriptions and Belles Lettres, the Academy of Sciences, and the Academy of Fine Arts. The Academy of Moral and Political Sciences was added in 1832. Each academy has a separate organisation but participates in the advantages of the common library, archives and funds. Election to membership is by ballot and subject to confirmation by gov. Every member receives a salary. Membership of the Academy Française is limited to Frenchmen—popularly known as the 'Immortals.' See G. de Francqueville, *Le premier siècle de l'Institut de France*, 1895.

**Institute of International Affairs**, Royal, see ROYAL.

**Institute of Recorded Sound**, see SOUND.  
**Institute of Sanitary Engineers**, see SANITARY ENGINEERS.

**Institutes**, term borrowed from the civilians (civil law) to denote text-books containing the fundamental principles of a legal system. The I. ascribed to Gaius were discovered accidentally by Niebuhr at Verona, and on translation at once became a leading feature of the study of Roman law. Gaius' I. were found to be the basis of Justinian's I., which, with modifications to suit subsequent changes in the Roman law, are a mere imitation of the earlier I. Justinian's I. were expressly put to promote the study of legal principles. The four vols. of *Commentaries upon the Common Law*, written by Coke, were by him called I., such a term might also be applied to the commentaries of Blackstone and Stephen, and with greater appropriateness, for there is next to no scientific arrangement or comprehensive exposition of principles in Coke's work. John Erskine of Cunnock, prior of law, wrote *Institutes of the Law of Scotland* during the first part of the eighteenth century, and this book was for long the leading text book on Scots legal principles, and is even now often cited.

**Institution**, one of the necessary steps in the appointment of a parson or vicar. I., which comes after the taking of holy orders and admission by the bishop of the patron's presentation is a kind of investiture of the spiritual part of the benefice. Its purpose is the entrusting to the charge of the incumbent (q.v.) the care of the souls of the parish. It fills the vacant benefice with the result that no fresh presentation can be made until another vacancy (unless the king be the patron) and the incumbent may then enter on the parsonage house and globe, and take the tithes. But he cannot grant or let the tithes until induction, the last step in the process of becoming a parson or vicar. See Phillimore's *Ecclesiastical Law*, 1891.

**Institut Français**, educational centre in London, its object being to promote a knowledge of France among Eng. people—just as the purpose of the Brit. Council is to promote a knowledge of Brit. culture among foreigners. Its offices are in Cromwell Gardens, London, S.W.

**Institut Pasteur**, see under PASTEUR.

**Instrument of Government**, document which prescribed the powers of Oliver Cromwell when he accepted the office of Protector of the Commonwealth of England (Dec. 16, 1653). It provided for triennial parliaments, to be in session for not less than five months, with 100 members for England and thirty each for Scotland and Ireland; an army of 30,000 men; freedom of religion for all except Papists and Prelatists; and for an elective Protector. The first Parliament under the I. of G. sat for only five months, it not being altogether favourable to Cromwell's authority, and the Protector then followed Charles I.'s example and for some time ruled without a Parliament.

**Instrumentation**, see ONCHETRA.

**Instruments, Electrical**, indicating and

measuring, see articles on AMMETER, ELECTRICITY—Electrostatics, GALVANOMETER, VOLTMETER and WATTMETER.

**Insabres**, Gallic tribe who crossed the Alps, and were established in Cisalpine Gaul by the later part of the fifth century B.C. Shortly before the first Punic war the Romans reduced them to submission, but they regained their liberties after Hannibal's triumphant progress through Italy. In 196 B.C. they finally lost their independence.

**Insula**, see LAITI.

**Insulator**, see ELECTRIC CABLES.

**Insulin** is the active substance in the secretion of isolated groups of pancreatic cells forming the 'islands of Langerhans.' In the absence of this secretion, excess of sugar passes into the blood and causes *Diabetes mellitus*. In 1921, Dr. R. L. McKenzie Wallis claimed to have isolated this active substance from the pancreas of freshly killed pigs, and administered it in capsules to diabetic patients. In the same year Dr. I. G. Banting (q.v.) assisted by

Topical Press

Dr. I. G. BANTING

Post, at Toronto, isolated and named the active constituent insulin, and Collip (1922) purified the crude product. For medical purposes I. is now prepared from the pancreas of oxen, and is found to be beneficial only when injected. Excess of I. aggravates diabetes by causing the liver to discharge glycogen. Abel (1925-28) prepared crystalline I. and determined its properties, and more recently Sjögren at Upsala has determined its molecular weight to be approximately 35,000, and the shape of its molecule spherical. From these results, and the determination of other physical constants, he concludes that insulin is a protein belonging to the

same group as egg albumin and Bence Jones protein. In solution this crystalline insulin is stable provided the pH (hydrogen-ion concentration, *q.v.*) ranges from 4.5-7. Beyond this range it dissociates into substances of lower molecular constitution, but near the borders of the range of stability, the reaction is reversible. If the solution be too acid or too alkaline permanent dissociation will occur. I. is now used in courses of hypodermic therapy in the treatment of mental disorders. See also INSANITY.

**Insurance**, contract under which one party undertakes for a consideration to indemnify another against certain forms of loss. In the present day the practice of I. has become so general that practically every contingency which may arise as the result of accident may be covered, but the earliest and most widely practised forms of I. are 'Marine', which applies to ships and property at sea; 'Fire', which is the I. against fire of property on land; and 'Life'. This last differs from other Is. in that, although a contract to indemnify against loss by premature death, at the same time it provides a certain benefit. For this reason *Life* business is sometimes referred to as 'assurance', as distinct from 'insurance', but there is no rule for this, and the terms 'insurance' and 'assurance' are synonymous in the profession.

The first I. business to be practised was *Marine*, and it is probable that for commercial purposes it originated in Flanders, being introduced into England early in the sixteenth century. *Marine* business differs in one notable respect from other Is., in that, although it is done by a number of independent, self-contained companies, a large share is transacted by individuals known as underwriters. These underwriters are members of a society called Lloyd's, the name originating from a certain coffee house in Abchurch Lane, where the original members met. Their affairs are arranged by a committee, and the subscribers include the companies who also transact the business. The society has agents throughout the world who keep in touch with the shipping at all the principal ports, and render an account of the same, together with particulars of any casualties which may have happened. An I. is divided amongst a group of underwriters, each holding a small proportion of the total amount at risk. Policies are issued to cover vessels, their freight and cargo, against all maritime risks, which include risks of navigation, fire and seizure, during a certain period, not exceeding one year, or for a specified voyage. The I. covers the ship or cargo, and includes the cost of the I. upon the whole. Policies may be 'time' policies or 'voyage' policies, as specified above, and are either valued, in which case the sum insured is based upon a specific bill of lading, or open, when the value of the vessel is estimated as at the date of sailing, plus the amount she would have earned on the completion of the voyage and the cargo at its invoice price. The settlement of marine losses is of particular interest, as the question of salvage following a loss sometimes presents considerable

difficulty. It may happen that a vessel carrying a valuable cargo is sunk where it is possible to salvage a portion of the goods insured, and in such a case there are varying methods of effecting a settlement of the claim, and sev. courses open to adoption by the underwriters. For instance, they may pay the total loss and recover what they can of the salvage, themselves arranging with a firm to conduct the operations, or they may pay the insured's actual loss, after deducting the value of the goods salvaged, plus the expenses of the operations. The destructible nature of the goods insured is, of course, the principal factor, and the cost of the I. is largely affected by this. Demurrage charges and the principles governing them were revised in 1924 at a congress at Stockholm where a set of regulations arising out of the International General Average Rules of 1890 were redrafted and adopted internationally. In 1924 the Carriage of Goods by Sea Act was passed, which adjusted many anomalies arising out of the legal questions involved in contracts of affreightment between shipowners and shippers.

**Fire Insurance.**—A contract of indemnity in respect of loss or damage to material property by fire. The policy-holder (called the insured) pays a certain agreed amount (the premium) to the insurer, and is reimbursed his loss out of the fund accumulated by the insurer. Premiums are generally payable annually, and as a rule fifteen days of grace are allowed for payment of the amount due. Fire I. was first introduced into this country more than 200 years ago, but there is evidence of a type of fire I. at a much earlier date by means of levies on guilds, wards, etc. In the early days companies were formed for the sole purpose of transacting fire I. but at the present time most classes of I. are transacted by each. There are more than 100 Brit. companies underwriting fire I. in the United Kingdom, and most of them have extended their activities overseas, where they have an excellent reputation. It is estimated that over 75 per cent of the premiums paid to Brit. companies come from overseas, and of this amount more than half is from the U.S.A. The ordinary form of policy issued in respect of trade property covers damage by fire, lightning, explosion of coal gas (except on premises where gas is manufactured or stored), and domestic boilers. The private-house fire policy usually includes thunderbolt, subterranean fire, earthquake fires (not earthquake shock), and fires caused by rioters and strikers.

Practically any property that is capable of being damaged by fire can be insured, the premium charged being based on the hazard of the risk. For example, private houses, blocks of offices, and property of a like nature, where the risk of serious fire is slight, are termed non-hazardous, and rated accordingly, usually at about 18.6d. per cent. On the other hand, factories where inflammable goods are manufactured, buildings of flimsy construction, or situated in a neighbourhood presenting more than usual fire risk, are deemed

hazardous, and rated according to their merits. Companies tend now to calculate the premium for any one class of trade so that over a period of years the income is sufficient to meet the losses and expenses and show a small percentage of profit. The profits of a fire company are usually about 5 per cent of the premium income.

To obtain data on which to calculate premiums, officers depend on their loss experience in past years. Because the scope of each office's experience is not sufficiently general for accurate results to be obtained, a number of companies now combine

branch of work, not does it know of the time and money spent by the companies in testing and approving fire extinguishing appliances, fire ladders, and building materials. Officers have surveyors and experts who may be consulted on such matters. But fire brigades are now maintained by cops and cobbers, in the past the duty was undertaken by the fire companies. Each office had its own firemen and appliances, and fixed a special place of fire truck on every house it insured. It being the duty of a company's men only to extinguish fires in buildings insured by their employer, the brigade

THE SUN INSURANCE COMPANY FIRE BRIGADE IN 1820  
Illustration reproduced from the Sun Insurance Co. Magazine

their analysed record of different types of factories and shops, and charge similar rates based on the results of their joint experience. The association formed by them is known as the Fire Offices Committee, and because of the efforts of this committee premiums have been adjusted so that as far as possible each individual pays his equitable proportion to the fund. The members of this committee are called tariff companies, whilst those that remain distinct are known as non-tariff companies, and charge whatever premiums they think adequate based on their own underwriting experience. In this latter group are included underwriters at Lloyd's. By penalising bad features and allowing substantial reductions in premium for good, fire offices have effected tremendous improvement in methods of construction, lighting, heating, etc.

Many valuable lives are also saved every year through these improvements. The public is not generally aware of this

and it remains a sight-seeing if the building that was destroyed did not belong to their company's work. (See FIRE BRIGADES AND FIRE INSURANCE.) Fire offices in London, Liverpool and Glasgow still maintain at their own expense salvage corps. Fire companies must in accordance with the Assurance Companies Act 1909 make a deposit of £20,000 in cash or approved securities with the Board of Trade before they can accept business in this country, unless they have already made a deposit in respect of some other class of business included in the Act. Their annual accounts have to be lodged with the Board every year, and severe penalties are incurred if they fail to comply with the Act.

Comprehensive or all-in policies in respect of private dwellings have in the past been brought out and combine many forms of insurance in one document. The furniture and household effects are insured against fire, lightning, aircraft, burglary, storm, flood, and many other perils, and

domestic servants *I.* is also included. The rate of premium is usually 3s. per cent. Comprehensive building policies include certain of these risks at a lower rate.

Another form of fire *I.* protection now being placed before traders and manufacturers is loss of profits or consequential loss *I.* The ordinary fire policy indemnifies the trader in respect of the material damage to his property, but this does not represent the full amount of his loss by a fire. The loss of profits policy is designed to meet this need, and reimburses him for his lost profits and increased expenditure for a certain stated period (called the period of indemnity) from the date of the loss. The period of indemnity is arranged by the trader when effecting the policy, and represents his estimate of the time necessary to set the business on its feet after a fire. The usual period is from three to twelve months, although *I.* is often arranged for trades which do not overcome the effect of a fire for considerably longer periods. The amount payable by the insurers is normally adjusted on the basis of the decrease in turnover during the period of indemnity, as compared with the similar period in the preceding year. The amount recoverable is a proportion of this decrease, and is usually the ratio of profit and standing charges to turnover as shown in the accounts for the last financial year. Expenditure on increase in cost of working is also recoverable. The *I.* is adjustable to suit all types of businesses. The rates are based on the fire premiums paid for the contents of the premises. Percentages of fire loss, a form of loss of profits *I.*, is suited only to the requirements of one or two trades. The policy pays a fixed proportion of the amount recoverable under the ordinary fire policy. In most cases the amount of material damage is no index of the resultant loss of profits, as a comparatively small fire may entirely stop the business until the damage is made good.

Sprinkler leakage *I.* is now offered, as many factories, shops, and public buildings are fitted with automatic sprinkler installations for extinguishing fires. The premiums usually depend on the class of goods and the number of sprinkler heads.

Average clauses, which make the policyholder bear a proportion of the loss should the property be under-insured at the time of the fire, are seldom met with in policies for private dwellings or small trade risks. It may be unwise to under-insure, for the total liability of the company is limited to the sum insured, and the policyholder cannot recover any amount in excess of that figure. The policy is a contract of indemnity, and the amount recoverable is the actual value of the articles destroyed at the time of the fire, *i.e.* the *mrkt.* value of similar articles less a reasonable amount for depreciation and wear and tear. The sentimental value of an article cannot be covered. Valuable pictures, books, and works of art are usually insured for an agreed amount, because of the difficulty of ascertaining their *mrkt.* value. *I.* based on inventories made by licensed

valuers are satisfactory to both insurer and insured, provided that frequent revaluations are carried out to meet changes in *mrkt.* value.

Policyholders should note that their fire *I.* company must be advised of any change in circumstances which may affect the *I.* Notices should be given if the policy is to apply to a new address or the benefit is to be vested in another person; if any part of the premises becomes occupied for a purpose different from that in force when the policy was effected; if any additional or alternative method of lighting, heating, or ventilating the building is contemplated; or when any structural alterations are to be made. The *I.* company expect and require their policyholders always to act in good faith with them.

*Life I.* originally provided, as in the case of other forms of *I.*, against a contingency, but it has long since been extended to include a payment on a certain happening, such as death. The earliest *life I.* on record is dated 1585, when it is probable that *Is.* were granted to cover only short periods as a protection to creditors. The extension of the business was very gradual at first, but for the last century there has been such rapid growth that in 1870 the Life Assurance Companies Act was passed for the protection of policyholders. In 1909 the business was further regulated by another Act. This provides that a company transacting *life I.* must deposit £20,000 with the Board of Trade, and must pub. ann. balance sheets and revenue accounts. It is also laid down that there shall be periodic valuations, not less frequently than quinquennially, of the assets and liabilities of each company. The 1909 Act further governs the procedure to be adopted when amalgamation of companies is contemplated, and the rights and privileges of shareholders and policyholders are definitely established. The two main kinds of company are the proprietary and the mutual. With the former, there are shareholders who take a certain percentage of the profits as dividends, but with a mutual company all profits belong to the policyholders. Two distinct branches of *life I.* are known as 'industrial' (see INDUSTRIAL INSURANCE) and 'ordinary', but many companies transact only the latter type. In the industrial branch, policies are issued for much smaller sums, and premiums are collected by agents of the company either weekly or monthly. In the ordinary class policies are rarely issued for less than £100, and notices are issued for the collection of the premiums which are due yearly, half-yearly, or quarterly, except under a special scheme whereby an automatic system of monthly premiums is arranged. There is now a wide variety of classes of policy to choose from, but there are two main headings—namely, with and without profit. Policies under the former carry the right to share in the profits of the company, and this benefit is usually given in the form of a bonus added periodically to the sum assured, although it can, if preferred, probably be taken in cash. No such

right accrues in the case of without profit policies, the premiums for which are therefore smaller. A life policy in its original form merely provided the sum assured at death, possibly within a certain time. This would now be called a term policy. It has been followed by the whole life policy, securing the sum assured at death whenever it may occur, up to which time the premiums are payable each year.

An equally important class of policy is the endowment assurance, securing payment at the end of a fixed term or in the event of previous death. With any class of policy it is possible by paying a higher rate of premium, to limit the number of payments to a maximum, and this is frequently done in the case of whole life contracts, in order to prevent having to continue premiums throughout a long life. A modern addition in life I. is an annuity benefit in the form of a temporary annuity, payable should the life assured die within a certain time from the date of the policy.

This is a 'family income' policy, intended to give extra financial assistance before the assured has had time to make adequate provision otherwise. It is not necessary for any policy to be effected on one life alone. The amount required can be made payable on the first or other death of two or more persons, or on the death of one person before another. Such contracts have their uses for business or financial transactions. The premium for whatever policy is selected depends upon the age at entry into I., and it is usual to quote for the age next birthday. The calculation of premiums is a highly technical work, which devolves on the actuaries of the I. companies. They rely upon various statistics in the form of mortality tables.

**Actuaries.**—As each premium is paid, a certain amount is absorbed in expenses, and of the balance, part goes to cover the current risk, while the remainder is held as a reserve to the credit of the policyholder against the time when the claim will arise. Thus when a policy has been in force for sev. years, it begins to be of value, and if the I. is no longer required, it can be surrendered to the company for cash. Alternatively, the company may be willing to lend on the security of the surrender value of the policy. It may also be possible to cease paying premiums and convert the policy into a fully paid one securing a reduced sum assured. The rates of premium quoted by any company are for normal healthy lives, and evidence of good health must be furnished by each proposer for I. At one time it was necessary in all cases to submit to medical examination by a doctor nominated by the company, but within certain limits as to age and amount of policy, it is now possible to effect an I. without examination. A person may insure his own life for whatever sum he pleases, but he can insure the life of another only if he has an insurable interest therein. In all cases a proposal form has to be completed, and any fraudulent statement thereon would void the contract. Questions as to family history and previous illnesses are asked, and if the answers or the result of the medical exam-

ination are unsatisfactory in any way, a higher premium than that tabulated may be charged, or the I. refused altogether. At one time life policies contained many restrictions as to occupation, foreign residence, or travel, but few limitations are today imposed. The main exclusion is that of suicide for a fixed period from the effecting of the I. The period varies according to the company chosen, but it is generally about a year. It is usual, also, to exclude certain special risks, such as motor racing, flying accidents for those engaged in aviation, active service in time of war, tropical climates when the assured is at the date of the policy known to be proceeding thither, and so on. But many special hazards may be covered by the payment of an extra premium, and for some particular occupation, and climates an extra premium is always required. Life I. has been recognised as an essential provision, and the premiums have been made, within limits, eligible for rebate of income tax. Although formerly the full standard rate of tax was allowed in this respect, the provision has been amended so that now relief can be claimed only at a reduced rate. This is, however, still a valuable privilege which substantially cheapens the cost of life I.

**Casualty and Contingency Insurance.**—This class of I. has seen considerable developments in the past few years. It embraces a wide range of both home and foreign miscellaneous classes of I. commonly known as accident business, which includes personal accident, workmen's compensation, motor, burglary, all risks, public liability, fidelity guarantee, all classes of engineering insurances, live stock, plate glass, and others. The field thus provided for the activity of accident underwriters is a very wide one.

Personal accident I. is the oldest of the above classes of I., and at one time was confined practically to the I. of travellers by train, and took the form of the payment of a small sum to cover a single journey. This ensured the payment of a certain amount in the event of accident resulting in the death of the insured during that journey. The present form of accident policy takes much the same form, with the exception that the premium, which is generally paid yearly or half-yearly, is adjusted to cover certain varying sums in the event of death or disablement, the result of accident from any cause during the year.

Personal accident I. is not a contract of indemnity. From its inception provision was made, as in life assurance, for definitely stated benefits on the happening of the event insured against, thus in many cases covering either more or less than the actual loss to the person insured. There are three divs. of the business: (a) accidents only, (b) accidents and specified diseases, (c) accidents and all sickness. Rates of premium are based primarily on the occupation of the proposer. The selective scheme is one of the most attractive. This really amounts to an analysis of the benefits and relative premiums of an accident and all-sickness policy, it being

left to the proposer to decide, subject to certain guiding principles, which benefits and for what sums he will insure. Separate revenue accounts have to be kept by I companies for personal accident business in this country and yearly returns must be made with regard to claims.

Prominent sickness policies can also be obtained under which the assured has a contract which can, at his option, be renewed during the whole of a period which may represent approximately his working life and under which he can continue to claim benefits whatever the duration of his disablement. The main feature of this branch of sickness I is that only medically selected lives are accepted. The premiums vary according to the age of entry.

Employer's liability or workmen's compensation I is it is usually called is a direct outcome of legislation. The Employer's Liability Act 1880 rendered the employer liable in a far greater measure than had previously been the case for accidents to his workpeople during the course of their employment. In the year certain officers were formed to transact employer's liability business together with other liability. The Workmen's Compensation Act of 1906 which brought under the scope of the Act every employer of labour, still further increased the demand for this class of I and seven new offices were formed whilst in addition the old I companies extended their operations to the accident field. Since that date seven Acts have been passed which have added still further to the employer's obligations, and the Workmen's Compensation Act 192 with supplementary Acts of 1940 and 1941 consolidated the law regulating compensation to workmen. It is applied to workmen in any employment but persons excluded from the class "workmen" are those not engaged in manual labour whose remuneration exceeds £10 a year, an out worker a member of the employer's family dwelling in his house, casual workers whose employment is outside the employer's trade, members of a public police force and persons in the naval or military service of the Crown. The maximum liability for death of an employee is the result of an accident arising out of and in the course of his employment was £600 and the maximum weekly payment during the period of total disablement for work in consequence of such an accident was 10s. If the disablement is permanent compensation was payable for the life of the employee. The scope of accident I was considerably widened by the National I (Industrial Injuries) Act 1916 which made a contributory social service the basis of compensation for industrial accidents without income limits. The benefit for complete disablement was raised to 15s.

Workmen's compensation policies are designed to undertake on behalf of the employer his entire liability to his workmen both at common law and under statute. Premiums are based on the total wages paid by the employer, and a certain rate per cent., according to the

nature of the work done, is charged upon such total wages. As the necessity for this class of I business arises out of the legislation passed by various govts., it is not surprising that the gov. keeps a close watch on it. In the first place I companies are required to make returns to the Board of Trade every year and these show clearly whether or not adequate reserve have been made. In the second place returns are made to the Ministry of National I on behalf of employers under various industrial groups giving the number of accidents reported during the year and the compensation paid in respect thereof. In the third place some measure of control is exercised over the premiums charged by virtue of an arrangement with the I companies who are members of the Accident Officers Association. These companies are to charge premiums which, taken in the business as a whole, will produce a claim ratio of 24 per cent. In the event of the ascertained claim ratio falling below that percentage the difference is allowed to policy holders as a reduction in the renewal premium.

Motor I comprises an important part of a client's I. Comprehensive policies may be effected and the various risks covered are as follows:—*For Private Car*—Public liability, injury to third persons and damage to property arising by through collision with the car, loss or damage, loss of or damage to the car, and accessories and spare parts, personal accidents to the insured, payments for the loss of limbs or eyes in connection with the insured car or whilst in other motor cars, medical and surgical expenses of occupants of the car, legal defence of the insured or driver, contents, travel, sea transit. *For Trade Motor Cycle*—Public liability, loss or damage, loss of or damage to the motor and its accessories and spare parts, legal defence, sea transit and from the Continent. *For Commercial Vehicles*—General Motor Cycle and Traders. *For Public*—Public liability, injury to third persons and damage to property caused by the use of the vehicle including (except in motor cycles) loading and unloading, loss or damage, loss of or damage to the vehicle or its accessories and spare parts, legal defence.

Within the scope of commercial motor I is included every type of mechanically propelled vehicle used for business or trade purposes except motor cycles, any vehicle coming within the definition of a private car, railway rolling stock and tramway rolling stock. The following additional insurances are added to motor policies by endorsement where required:—*For Private Cars*—(1) Loss or damage by theft or fire and accidental damage to rugs, coats and luggage. (2) Legal liability under Workmen's Compensation Act in respect of chauffeur. (3) mechanical breakdown. (4) compensation for time taken in repair of car after accident, (5) personal accident benefits to occupants of the insured car, (6) caravan trailers. *For Motor Cycles*—(1) Additional drivers, (2) pillion riding (3)

passenger risk (legal liability); (4) personal accidents to insured, other specific persons, any driver of motor cycle, or side-car passengers; (5) Continental travel; (6) employer's risk (liability to the public); (7) reliability trials; *For Commercial Motor Vehicles*.—(1) Loss of use; (2) passenger risk (legal liability); (3) spark risk; (4) goods in transit (damage by impact); (5) Continental travel; (6) employer's risk (liability to the public); (7) trailers. All motor policies which include loss of, or damage to, the motor vehicle exclude wear and tear; even when mechanical breakages are specially insured at an additional premium, any damage by wear and tear is excluded. Rates of premium for private car comprehensive policies are based mainly on horse power and partly on value, and for private motor cycles mainly on cubic capacity and partly on value. With regard to commercial motor vehicles, broadly speaking one or more of the following factors affect rates of premium for each class of vehicle:—horse power, value of vehicle, scope of cover required, locality of use, nature of use, type of vehicle, weight of vehicle and load, passenger seating capacity, and number of vehicles owned by the insured. Companies undertaking motor I. have to deposit £15,000 with the Supreme Court, irrespective of whether or not they carry on any other class of business. A policy of burglary I. is a contract of indemnity only, and secures the insured against the results of a crime, so that in the conduct of the business regard must be had to the criminal law of the country. Subject to any special provision in the policy, the circumstances in which a claim may arise have to be interpreted and decided by the rules of criminal law. Having regard to the wide range of the terms 'burglary and housebreaking', many policies only cover the risks of theft following actual violent or forcible entry into and upon the premises. It is obvious that in the case of valuable portable goods the rate of premium charged is considerably higher than that for more bulky and less valuable articles.

Plate-glass I. covers glass in any property against breakage through any cause, except fire, explosion, riot, and war. In these days 'plate glass' covers all descriptions of glass, including plate, sheet, embossed, lettered, shop facias, signs, ornamental street-lamps and glass in shop fittings. The I. company usually undertakes to replace broken glass, instead of making a cash payment. In private houses glass in doors and windows may be insured, the premium depending upon the rental value of the insured premises.

Fidelity guarantee enables an employer to insure against loss through the dishonesty of his employees. It is a common practice on the part of employers to require fidelity guarantee policies from any of their servants holding a position of trust.

Gov. and Court bonds are given by I. companies. They may be said to be required whenever any person is placed in a position of trust in relation to any department of the gov., or to any matter which

is before a Court of Justice. The following are the principal classes of gov. bonds: (a) Trustees and special managers in bankruptcy; (b) Official Receivers in bankruptcy; (c) trustees under the Deeds of Arrangement Act, 1914; (d) liquidators under the Companies Act, 1929, engaged in the compulsory liquidation of a limited company; (e) passage brokers. Bonds are given to the Board of Inland Revenue on behalf of Collectors of Taxes and Distributors of Stamps. There are many different kinds of bonds given to H.M. Customs and Excise on behalf of merchants, shippers, traders, and others to secure the revenue against loss by the improper use of articles which are subject to duty.

*Public Liability I.*—The earliest third-party policies were issued in connection with horse-drawn vehicles, but other risks were gradually accepted, and are now of unlimited variety. In the usual form of third-party I. the event giving rise to a claim is an accidental injury to the person or property of some stranger, alleged to be due to negligence or nuisance. The owner of horse-drawn vehicles can insure against fatal accidents to his live stock or damage to vehicles, or against any claims which may be made upon him by the public through the carelessness of his drivers. I. against third-party risks is an important part of motor I. (see above under *Casualty and Contingency Insurance*). The Road Traffic Act, 1930, introduced compulsory third-party I. for the first time. A firm may insure against claims made upon them by the public, through accidents taking place on their premises. The provision dealer may insure against claims made upon him through ptomaine poisoning, the dentist against claims through defective work, and so on. Another class of I. has appeared as a result of the various Housing Acts dealing with the housing of the working classes. The Act of 1925 provides that houses of a rental up to £40 in London, and elsewhere up to £26, shall be kept by the landlord in a condition reasonably fit for habitation and policies are framed to cover this responsibility.

Under the category of Contingency I. special indemnity policies are issued indemnifying against claims by missing heirs, or beneficiaries, claims under lost documents, and in respect of defects in title.

Engineering I. includes electrical machinery I., Lift I., Engine I. (steam, oil and gas), and steam-boiler I. Boiler I. has only recently been taken up. The policy covers damage to the boiler and damage to surrounding property, or injury to persons caused through an explosion. This class of I., however, provides an additional benefit in the shape of a thorough annual examination of the boiler and more frequent internal inspections. The business is something more than the ordinary I., and is consequently a class apart.

Brit. companies effect a large accident I. business abroad. Of its total premiums 56 per cent comes from the U.S.A., while a further 20 per cent comes from other places abroad, leaving 24 per cent from

this country (1938). This is a striking tribute to the prestige of Brit. I. houses. Recently there has been an increased demand for I. against disasters due to natural causes, such as hurricanes, and during the last few years heavy claims have been met respecting damage done by tornadoes in America.

Agrie. I. is undertaken more extensively in America, Canada, and Europe than in the Brit. Isles. In America injury by tornadoes and hurricanes to growing crops causes most damage, and a special branch of I. is effected to cover this contingency, while hail damage comes next in consideration. In Canada hail damage is the risk most widely covered, and frost damage I. is in operation in both countries, though more considerably in the U.S.A., where eighty-eight companies issue such policies. Livestock I. forms an important part of agrie. I. in the United Kingdom, though it is usually undertaken in reference to pedigree stock, and is designed principally to cover animal diseases and compulsory destruction of such animals by order of the gov. in the case of foot and mouth disease.

**Insurance against Air Raid Damage.**—Early in the Second World War, associations were formed for the purpose of organizing mutual insurance schemes against damage to property by air raids. It was soon evident, however, that no private association or company could hope to meet more than a negligible fraction of the claims that would ultimately be made. No existing I. companies would have dreamt of embarking on such hazardous business. The only solution lay in State action and, early in 1941, the Churchill gov. announced a scheme of compulsory I. for land and houses and a voluntary scheme for insuring movables against loss or damage by enemy action. These proposals were later embodied in the War Damage Act, 1941.

**War Risks State Insurance Scheme.**—Under the War Damage Act, 1941 (Part I.) the owners of land, buildings, and other immovable property were required to pay ann. premiums for the period 1941–45, by way of contribution towards the sums required to recomp. property owners for loss or damage by enemy action occurring between Sept. 3, 1939, and Aug. 31, 1941 (further legislation was passed for subsequent risk periods). Part II. of the Act was a gov. scheme for the insurance of private chattels against war damage and came into operation on May 1, 1941. Part I. was, but Part II. was not, compulsory. The amount ('contributory value') on which the premium was calculated was usually the net Schedule A assessment (before deduction of personal or special reliefs) in force Sept. 3, 1939. In general each of the five premiums or instalments of contribution was charged at the rate of 2s. in the pound. Each instalment or ann. premium was due on July 1, and was collected from the person who was the owner of the 'proprietary interest' on the preceding Jan. 1; and 'proprietary interest' meant the freehold or any lease of more than seven years. A contributor

whose proprietary interest was mortgaged might, in certain cases, recover a proportion of his net liability for an instalment from the mortgagee.

The term 'private chattels' in the gov. scheme for insuring private chattels, covered the movable belongings of a household (furniture, clothing, valuables, etc.), and also motor cars and cycles, yachts and boats. The State allowed free compensation for householders as follows: £200, with an extra £100 in the case of a married man, and an extra £25 for every child under 16. Every other adult person, who was not a householder, was allowed free compensation up to £50. Persons who had not insured and relied only on free compensation, might not receive more than £25 on any one article. Over and above the limits of free compensation a person could obtain additional cover by paying a premium and taking out a policy of I. The terms: £1 per cent up to £2000; £1 10s. per cent for the next £1000; £2 per cent for the next £7000. There was a minimum premium of £1. On 'valuables' (works of art, gold and silver plate, jewellery, etc.), the cover was limited to £100 in the aggregate or 20 per cent of the total sum covered by the policy, whichever was the greater. No more than £50 or 5 per cent of the total sum insured (whichever was greater) could be recovered on any one article. This applied to luxury articles of furniture, expensive radiograms, and valuables.

See N. Young, *Insurer*, 1927; H. Loman, *Insurance Principles and Practices*, 1928; J. G. Sinclair, *The evils of Industrial Insurance*, 1932; J. G. Anderson, *Birthplace and Growth of Life Insurance*, 1937; A. Wilson and H. Levy, *Industrial Insurance*, 1937; H. E. Raynes, *A History of British Insurance*, 1948; R. H. Swatton, *How Insurance Works*, 1948.

**Insurance, National**, see NATIONAL INSURANCE.  
**Insurance, Third Party**, see THIRD PARTY.

**Intaglio**, strictly speaking, a gem on one surface of which a design has been hollowed out so that if this side is stamped upon some material like wax, the design is impressed and stands out in relief. Is. among the Assyrians and Babylonians were usually cylindrical in shape, like the chalcidony signet of Darius I. of Persia, the workmanship of which is so justly admired today. The Egyptians used to cut their seals on the flat bases of the 'scarabs' or sacred beetle—a form which is very common also in Gk. Is. Gem-cutters at first used serpentine, but as their skill increased they preferred to work in onyx and other harder stones. Is. exist of gods, mythical heroes, historical people, etc., the best dating usually from one of the first three centuries B.C.

The term I. is used to describe printing processes in which the matter to be reproduced is below the general surface or the printing plate, i.e., in photogravure. The ink to be applied to the paper lies in the recesses of varying depth on the cylinders or metal plates.

**Integration**, mathematical process of summation which makes it possible to find the areas enclosed by curves and the lengths of arcs, the velocities achieved by accelerations, the volumes comprised by areas, etc. From its definition as a summation I. may be proved to be the inverse process to differentiation. The sign

for I. is  $\int$ . Thus  $\frac{d}{dx} x^2 = 2x$ , whereas  $\int 2x dx = x^2$ . See CALCULUS.

**Intellectual Co-operation, International Institute of.** In 1922 the League of Nations appointed a Committee which should examine international questions on the subjects of literary, scientific, and artistic work with a view to intellectual co-operation whenever possible. The Committee, which was likewise the governing body of the Institute, consisted of fourteen members, two of whom were women: M. H. A. Louwiz (Holland), M. J. Destree (Belgium), M. A. Janssen (Germany), Prof. Gilbert Murray (Brit. Empire), M. Panleuve (France), M. G. de Reynold (Switzerland), M. A. Rocco (Italy), Mlle. K. Bonnevay (Norway), Sir T. C. Bose (India), M. A. de Castro (Brazil), M. I. Casares (Spain), Mme. Curie-Skłodowska (Poland), M. L. Izozog (Argentine Republic), Prof. R. A. Millikin (U.S.A.). The first seven members formed the Board of Directors, which met every two months. Such subjects as the unification of scientific nomenclature, the international organization of bibliographical and scientific information, the development of cinematography, the extension of the laws protecting works of art and rights of artists, were only a few of the ambitious schemes of the organization. Its place is now taken by the United Nations Educational, Scientific, and Cultural Organization (see UNESCO).

**Intelligence Corps, see under INTELLIGENCE, MILITARY AND SECURITY.**

**Intelligence, Military, and Security.** This knowledge is power, is a maxim assiduously followed by all countries with respect to providing their military leaders with the most complete information available regarding all other states, particularly those which are potential enemies. Details of the military economy and other prime resources of an enemy give valuable data upon which a plan of operations may be based. In peace, this information can be obtained in many ways, e.g. the publication of a country's research by persons interested in various aspects of public life or particular areas of the enemy's country, spies and general information contained in the Press and journals. In war the difficulties, though greatly increased, are not insurmountable. Spies and persons of neutral countries are employed. These can supplement information procured by air-reconnaissance by the interception and decoding of enemy wireless messages, examination of captured equipment and documents, interrogation of prisoners, deserters, and escaped civilians, and reports from 'resistance groups' in occupied territories.

Intelligence is vital to an army, but it is almost equally important to deprive the enemy of such intelligence as may be valuable to his military leaders. This is the responsibility of the Security Branch, and includes censorship. If he cannot be wholly deprived of it then false intelligence is usually supplied to him which, in certain circumstances, is more effective than letting him have no information at all.

Intelligence is a responsibility of the General Staff at all levels. In the Brit. Army the Intelligence Dept. of the Staff is organized in two branches, A, responsible for collecting, collating and distributing information about the enemy and B, responsible for security. While the bulk of the information used by A comes from the observation of its own forward troops of all arms, the special requirement of B can only be served by special troops organized in Field Security Sections which are under command of fighting formation and line-of-communication commanders. Both types of intelligence work are carried out by the Intelligence Corps. This was embodied as a separate unit in July 1940 under the ultimate command of the Director of Military Intelligence. The name and the R.A.E. maintain intelligence depts.

**Intelligence Quotient (I.Q.), see under MENTAL TESTS.**

**Intelligence Tests.** There are numerous systems of tests in existence today for estimating the mental ability of children and adults for various purposes. Francis Galton was the first to discuss these tests in his *Inquiries into Human Faculty and its Development* (1869), and Alfred Binet (1858-1911), the first experimental psychologist, gave a series of tests for the measurement of human intelligence which is still employed today. See also MENTAL TESTS.

**Intendant** (Lat. *intendens*, from *intendere* to watch over) name given in early 17th cent. to an official invested by the king with important commission such as the levying of taxes, the administration of financial matters generally, etc. etc. The *intendants des provinces* date from the last thirty years of the sixteenth century, and were sent by the king to restore order in the provinces after the civil wars. In 1789 the office was abolished by the National Assembly, but the dignity was restored by Napoleon under the title of 'prefect'. See G. Huet, *Origines de l'institution des intendants des provinces*, 1884.

**Interborough Rapid Transit Company.** The company which operates the overhead and subway railways of New York, much as the 'Metropole' serves Paris, and the 'Underground' London. There are at present 117 m. of road, with 401 m. of track, part of this being of the overhead description that traverses some of the main avenues at a higher level than the street, and part being the underground tunnel railway.

**Interbourse Securities, stocks and shares** which are of an international character, i.e. those that are bought and sold on the London Stock Exchange, Wall Street, the

Paris Bourse, or any of the various stock exchanges of the civilized world. The best examples of such securities are gov't stock or shares, like Gk or Brazil bonds (but not Brit. consols, which are held almost exclusively by people in the United Kingdom), great gov't loans, Amer. railway bonds, and Indian securities. The business of negotiating the sale or purchase of I. S. is done by arbitrage dealers, whose mode of conducting operations in I. S. is to purchase or sell on one stock exchange a certain quantity of securities and synchronously or practically synchronously to re-sell or re-purchase (as the case may be) on the stock exchange of another country similar stocks or shares to such an amount as from the price (ascertainable by wire) will suffice to cover not only the incidental expenses of interest, commission, etc. but also brokerage. The great benefit of this arbitrage traffic is the resulting equalization of and stability in the prices of the great majority of I. S.

#### Interbred Retriever, *see* RETRIEVER

**Intercalary Days, or Months,** term given to months or days inserted in the calendar between others to adjust the reckoning of the year into *annus* with the solar year. The word 'intercalary' thus means something inserted or placed between, and is used for anything interrupting a series.

**Intercostal Neuralgia,** *see* under NEURALGIA

**Interdict** (1) *In Scots law*—like the I. in Roman or civil law, and the injunction (*q.v.*) of Eng. law, the I. in Scots law is a decree or order of the court to restrain any act or proceedings alleged to constitute an infringement or threatened infringement of another's rights. Like injunctions is either interim or final. An I. may be granted either by the Court of Session, the sheriff courts, or the interior or burgh courts. For illustrations of the matters in which an I. may be obtained *see* under INJUNCTION. (2) *Ecclesiastical Law*—excludes excommunication which prohibited the divine services, either to particular persons or particular places, or both. Private baptism was allowed during the time of the I., but the Holy Eucharist was not, except in *articulo mortis*, and Christian burial was denied in any consecrated place except it were done without divine offices. These I. s. though frequently exercised in the Middle Ages upon whole villages, towns, and even kingdoms, have been abolished, so far as England is concerned, since the Reformation. The effect of the placing of England under an I. by Pope Innocent III. on March 23, 1209, in retaliation for John's expulsion of those monks who had consented to the appointment of Stephen Langton as primate, is graphically described by Hume.

*See* Burns' *Ecclesiastical Law*.

**Interest,** allowance made for the use of borrowed money or capital. The rate per cent per annum is the I. on 100 units for one year. I. is payable periodically, usually half-yearly in commercial transactions, but frequently monthly in the case of loans by registered money lenders. I. is either simple or compound: the

former being payable on the principal alone, the latter on the amount of the principal and interest as and when it falls due. The exaction of I. was prohibited in England as early as 1197, and the prohibition rested, as elsewhere, upon religious grounds. The old usury laws fixed a maximum rate of I., varying at different times from 10 to 5 per cent, long after everyone had been convinced that the most entire freedom in commercial matters was both the right of the private individual and the benefit of the community. Bentham was the first writer who openly and systematically condemned the usury laws, and since he wrote no legislature has ventured to do more than 'reopen an unconscionable bargain' and in other ways to regulate the strictness of moneylenders by means of formalities of registration. Bentham like Mill, scolds the usury laws to religious bigotry, but attaches too much importance to that source. Aristotle's condemnation of usury rested on the assumption that money is intrinsically barren, and that I. was the productive addition to an unproductive object, which law became traditional and is quoted in Bentham's works as a popular fallacy among the poor. An elaborate refutation of the dogma that free access to the money market tends to encourage projectors is also one of the most trenchantly successful criticisms in the *Defence of Usury*. All restrictions have been long since abandoned by the legislature, and the rate of I. left to the discretion of lenders and borrowers. But the courts may interfere on equitable grounds to prevent fraud and overreaching, and loans to infants are invalid (*see* CONTRACT, INFANT). Under the Moneylenders Act, 1900 the courts may reopen moneylending transactions of a harsh and unconscionable nature, and reduce the rate of I. Under the Moneylenders Act, 1927 compound interest on loans by moneylenders is prohibited, nor may the contract provide for the rate or amount of I. being raised by reason of any default in the payment of sums due under the contract. But the contract may provide that if the borrower makes default whether in respect of principal or interest, the money lender shall be entitled to charge simple I. on the sum due, from the date of the default until the sum is paid, at a rate not exceeding the rate payable in respect of the principal if it from any default.

It is an economic commonplace that the rate of I. is the same in all trades in the same country and at the same time—a law which rests for its validity on the elimination from profits of compensation for risk of dishonourable reputation, and everything but pure I. on capital. But the risk in some occupations being greater and some trades requiring more supervision than others, there must always be differences in the rate of I. or profits in different trades at the same time, and in those trades or businesses in which the rate is higher than the bank rate—the criterion of the average rate—some economists contradictorily distinguish higher rate by the name *false* I. It is an accepted

position in economics that as wealth and pop. increase the rate of I. declines, because, among other causes, wealthy and populous communities afford less and less scope for any given quantity of labour and capital, a tendency which is the root principle of the Ricardian theory of rent; and again the increasing export of capital tends to produce a uniform rate for all countries. See J. Bentham, *Defence of Usury*, 1790; I. Fisher, *Theory of Interest*, 1930; J. Meade, *Rate of Interest in a Progressive State*, 1933; K. Wicksell, *Interest and Prices*, 1936; B. W. Dempsey, *Interest and Usury*, 1918. See also MONEY-LENDER and USURY.

**Interference**, term which in physical science indicates a phenomenon depending upon the action at one place of two sets of waves or vibrations. A familiar example which can be used to illustrate this is obtained by dropping two stones into a still pond at the same time. Circular ripples will be set up from each stone, and will eventually meet, causing disturbance. It is almost axiomatic that the greatest disturbance will occur when trough meets trough, or crest meets crest. And were the waves set up by the dropping of each stone equal in length, then when crest met trough, or vice versa, the wave motion would be entirely annihilated. It can be seen, therefore, that it becomes a fundamental principle in the science of light, sound, and electricity in particular. In these cases, however, the waves are usually too small for I. to be detected or observed by the senses, unless there is a continual succession of the two waves, reproducing the phenomenon at the same place for a long while. Thus in light it is necessary, in order to study I. effects, to obtain the two sources from the same ray. For the great complexity of light waves, and the fact that the waves act in all directions at right angles to the direction in which they are propagated, are conditions which prevent I. effects which are visible to the naked eye being obtained from two trains of equal waves, vibrating in mutually perpendicular planes. A simple experiment, demonstrating I. in light is, however, that known as Grimaldi's, as modified by Young. A simple ray of light, which we shall regard as homogeneous, is introduced into a darkened chamber, through two small apertures which are close together. These two divergent rays will interfere, with the result that on the screen opposite will be shown a series of bright bands separated by dark ones. The central one, which is the brightest, is placed so that all points on it are equidistant from each aperture, and is formed by the meeting of crest with crest and trough with trough. Theoretically the series of I. bands is composed of an indefinite number, but the fading away in brightness of those bands in practice is explained by the great difficulty of obtaining pure homogeneous light. See SOUND, NEWTON—*Newton's Rings*; SOAP BUBBLES; SPECTRUM; DIFFRACTION; POLARISATION OF LIGHT; and ELECTRICITY—*Electro-magnetic Waves* and *Maxwell's Theory*.

**Interferometer**. Optical instrument for producing interference fringes by the superposition of two beams of light originating from the same source, and for measuring the displacements of such fringes caused by a slight increase of path difference between two beams. The I. is the most accurate instrument for the measurement of the wave-lengths of light. Michelson's and Fabry and Perot's Is. are the best known instruments. The principle of the former has been applied since 1920 to the measurement of the angular diameter of some stars that were not near enough to be resolved by the most powerful telescopes then known. Another I. is Rayleigh's which is used for measuring small differences in the refractive indices of gases. See also INTERFERENCE and SPECTRUM AND SPECTROSCOPE. See A. Schuster, *Theory of Optics*, 1901.

**Interim** (Lat., in the meantime), name given during the Reformation to certain attempts made in Germany to draw up a formula which would serve as a basis of agreement between Catholics and Protestants, until such time as a general council could be held. Three attempts were made to bring this about, resulting in the 'Ratisbon Interim' in 1511; the 'Angsburg Interim' (q.v.) in 1518; and the 'Leipzig Interim' in 1518.

**Inter-Imperial Relations Report**, report of a committee of Prime Ministers and heads of delegations to the Imperial Conference, presided over by Lord Balfour, and unanimously adopted by the Imperial Conference of 1926. As regards its general principles, the report states that equality of status is the root principle governing inter-imperial relations so far as concerned Great Britain and the dominions, which are described in the report as 'autonomous communities within the Brit. Empire, equal in status, in no way subordinate one to another in any respect of their domestic or external affairs, though united by a common allegiance to the Crown, and freely associated as members of the Brit. Commonwealth of Nations.' The report points out, however, that the principle of equality and similarity appropriate to status does not universally extend to function. See further under DOMINION STATES. See also WESTMINSTER, STATUTE OF (1931).

**Interior Decoration**, see under HOUSE; and PAINTING and DECORATING.

**Interlaken** ('between the lakes'), in the canton of Berne, Switzerland, a health resort much frequented by visitors, with an elevation of about 1863 ft. It is 26 m. S.E. of Bern, between lakes Thun and Urien, on the R. Aar. It has magnificent mt. scenery, the Hoheweg commanding a fine view of the Jungfrau. Pop. 1000.

**Interlineations**, in law, additions to or alterations of a written instrument made either before or after the execution of the instrument. As a rule, I. made after execution having the effect of altering or amending the instrument in a material particular will prevent the enforcement of any rights created under the instrument. It is otherwise with I. made before execution, provided they were made with the

consent of parties whose rights are affected by the instrument. The rule of evidence is that I on the face of a deed are, in the absence of evidence to the contrary, presumed to have been made prior to execution, but in a will I are presumed to have been made after the testator signed his will. I which do not affect the rights of parties who are under any liability created by the instrument are immaterial. I made in a will should always be signed and attested, as in the case of the body of the will, and a similar precaution should be observed in regard to those made in a deed or other instrument.

**Interlocutor**, in Scots law strictly a judgment or judicial order pronounced in the course of a suit which does not finally determine the issue (cf. **INTERLOCUTORY PROCEEDINGS**). But in practice it appears to be applied to all judgments or orders of the court, whether they finally dispose of the case or not.

**Interlocutory Proceedings**. Applications or motions before a judge, master or district registrar in chambers, for some preliminary order, decision or judgment in an action, are called I. P. An order made in I. P. does not finally dispose of the case but, as a rule, decides some matter incidental to the proper conduct of an action. Interim injunctions (see **UNDER INJUNCTIONS**) however, although not final, have the effect of final judgments if on the trial it is established that a proper case has been made out for an injunction. Application in chambers must be made by summons, or by notice of application under the summons for directions (or summons which asks the master to give directions as to the future conduct of proceedings in such matters as discovery of documents, pleadings, etc.) unless made *ex parte* when no such formality is required. Applications to the court are made by motion and as a rule at least two clear days' notice of motion must be given unless the court gives leave to the contrary.

**Interlude** (Lat. *inter* between, *lulus* play), a short piece of musical performance formed between the acts of a play or between the verses of a hymn. In drama a short performance given between the acts of a play or in the intervals of a banquet or court pageant. The characters were as a rule merely personified qualities such as Mercy and Youth. This kind of stage production, as well as moralities and mysteries, succeeded the older miracle plays and in the early part of the sixteenth century, with the comedies of Nasal and the tragedies of Sackville and Norton kept the dramatic field until the appearance of the new school created by the Elizabethan dramatists. John Heywood (1477-1580) wrote 16 and introduced a notable change into his characters by making them represent types and classes of men, such as pedlars and friars instead of qualities. His prin. 15 were *Johan, Iub his Wife* and *Sir John the Preeste* 1533, *A Merry Play betwene the Pardoner and the Friere the Curate and Neighbour Pratte*, 1533 and *The Play called four P's a new and very Merry Interlude of a Palmer, a Pardoner, a Policar, and a Pedlar*, 1543-17.

**Intermarriage**, see **CONSAQUINITY** and **MARRIAGE**.

**Interment**, see **BURIAL ACTS** **BURIAL CUSTOMS**.

**Intermezzo** (It., interlude). Originally any musical piece played between the acts of a larger work, musical or theatrical. e.g. Purcell's 'act tunes' serving as interludes to plays; the entr'actes in Schubert's *Rosamunde*. Later a short concert piece not necessarily designed for any purpose implied by the name. e.g. Brahms's *Intermezzo* for piano. An I. may also be an instrumental piece played during an act of an opera while the action is arrested (e.g. in *Misericordia* (*avallera rush*)).

**Intermittent Fever**, see **MALARIA**.

**Internal-Combustion Engine**, is one in which the chemical energy latent in the fuel is released by combustion or explosion in the engine itself instead of being converted in a furnace into heat used to generate steam in a boiler. The expansion of the gases produced by the combustion constitutes the mechanical driving force acting directly on the piston in the reciprocating engine or the blades in the gas turbine. In the simplest of all I. C. is the rocket motor, the gases escape through a nozzle at the rear end and the reaction or recoil on the body of the rocket drives it forwards. In actual practice the term I. C. I. covers the reciprocating (cylinder and piston) type only. The gas turbine (see **AIR PROPULSION**) is of recent origin and at present being actively developed in connection with jet propulsion of aircraft, and for use in locomotives, motor cars (71) and as prime mover in electric power stations. The reciprocating engines are conveniently classified according to the fuel used, as oil engines (71) using heavy oil, petrol engines (see **MOTOR CARS**) using light oils and gas engines (71) using gaseous fuels. No heat engine can convert into mechanical work more than a fraction of the heat content of the working substance (see **ENTROPY** **THEORY**). In I. C. I. the working substance is the fuel, mixed with air since no fuel can burn except in contact with air. The thermal efficiency of an engine is the fraction of the heat input which is converted into mechanical work, it varies according to the type of engine and is largely dependent on the compression ratio which is the ratio of the cylinder volume above the piston when at its lowest position (expansion) to the volume above the piston at its highest position (compression clearance or compression space). The calorific value of a fuel is the amount of heat (in B.T.U.) liberated by combustion of 1 lb. of liquid or 1 cu. ft. of gas fuel. see **British Standard Specification**, 201. The gas fuels in common use are:

	B.T.U. per cu. ft.
Natural gas	cal. value 700-1 000
Coal (tar) gas	" " 400-500
Producer gas	" " 161
Blast furnace or	
Coke oven gas	" " 100

Oil fuels are liquid mixtures of hydrocarbons (compounds of hydrogen and

carbon in various ratios) mostly obtained by fractional distillation of petroleum. The light oils (gasoline fraction, petrol) of specific gravity 0.68-0.78 have a boiling point of  $40^{\circ}$ - $200^{\circ}$  C, calorific value 19,000 B.Th.U./lb. They may also be obtained by cracking, a chemical process whereby higher boiling fractions are broken into lower boiling compounds. Benzol is obtained by distillation of coal tar and consists mostly of pure benzene. Heavy oils have a specific gravity 0.78-1 and boiling point above  $275^{\circ}$  C. Coal hydrogenation and coal and coal oil distillation also yield both light and heavy oils, and these processes are likely to become of great importance in the future. Besides the calorific value the anti-knock value of a fuel is a most important characteristic. When the compression ratio exceeds a certain limit the fuel detonates on ignition instead of burning with a steadily progressing flame and this

provided with inlet and exhaust valves at the top end, the opening and closing of which are accurately timed and operated by the engine itself through the camshaft. In the gas engine the mixture of gas and air is sucked into the cylinder at nearly atmospheric pressure during the induction, the inlet valve being open, the exhaust closed. As the piston begins to rise, the inlet is also closed, the mixture being compressed. When the piston approaches its highest position the mixture is ignited, usually by an electric spark and the expansion of the combustion products drives the piston down. Just before it reaches the bottom the exhaust opens and the rising piston sweeps the burnt gases out (scavenging). The cycle is then repeated. Some engines, especially of smaller size (1-5 h.p.) work on the 2 stroke principle. As the piston rises on the compression stroke a fresh charge is drawn into the

INTERNAL COMBUSTION ENGINE

knocking results in excessive wear of all moving parts. The anti-knock value of a light oil fuel is expressed in octane number, i.e. the percentage volume of iso-octane in a mixture of heptane and iso-octane having the same knocking tendency as the fuel in question. The higher the octane number of a fuel, the higher is the compression ratio that can be used without knocking. Generally the compounds with the most compact molecule (in saturated and aromatic hydrocarbons) have the higher octane numbers, while the paraffins are less good. The light oils obtained by cracking have higher octane numbers than those obtained from straight run distillation. By addition of 'dopes' certain chemicals such as lead tetraethyl the octane number may be increased. The heavy oils are characterized by their cetane number, the percentage of cetane in a mixture of cetane and a methyl naphthalene producing the same ignition lag.

Most I.C. engines work on the 4 stroke cycle, i.e. power is supplied to the piston during one out of every 4 strokes, the flywheel keeping the engine running during the remaining 3. This cycle was first successfully applied to the gas engine by N. A. Otto (1876). The strokes are known as induction, compression, expansion (power), and exhaust. The cylinder is

crankcase and when the piston descends on the power stroke the charge in the crankcase is compressed. Towards the end of the power stroke the piston uncovers a port in the cylinder wall connected with the crankcase through a by-pass through which compressed charge enters the cylinder sweeping the burnt gases out through an exhaust port, likewise uncovered by the piston. A ridge on the top of the piston guides the entering charge towards the top of the cylinder and prevents its being mixed with the exhaust gases. Thus the compression stroke is also an induction stroke and the power stroke is also a compression stroke. The 2 stroke engine has no valves and is simpler in construction, but owing to imperfect scavenging and loss of fuel, it is less efficient than the 4 stroke engine. In the petrol engine the volatile liquid fuel is broken up into a fine mist and mixed with the correct proportion of air in the carburettor (q.v.). Thereafter the engine behaves as a gas engine. In the modern compression ignition (heavy oil) engine first practically realised by Rudolph Diesel (1892), pure air only is drawn into the cylinder on the induction stroke, and this is compressed to about 400-600 lbs. sq. in. whereby the temp. rises to  $1000^{\circ}$  F. At the end of the compression stroke the oil is injected into the cylinder under high

pressure, through a fine nozzle, and ignites on coming into contact with the hot air. Expansion and exhaust follow as for the other I C Es. The I C E has a higher thermal efficiency than the petrol engine, 30-36 per cent as against 22-25 per cent, the compression ratio being of the order of 12-16 as against 6 in the petrol engine. It exerts a higher torque at slow speeds, the fuel is less easily inflammable and so fire risks are less. The oil is also less volatile and loss through evaporation is insignificant. On the other hand, the oil engine is heavier in weight per horse power, it is not as smooth in running at low load and has not the accelerating characteristics of the petrol engine. Oil engines are now built for speeds of 1000-2000 r.p.m. whereas petrol engines are available for speeds up to 6000 r.p.m. See J. O'Kall *Internal Combustion Engines*, 1922; J. Lamb, *Running and Maintenance of the Marine Diesel Engine*, 1939; H. R. Ricardo *The High Speed Internal Combustion Engine*, 1911; S. J. Young and R. W. Pryor *The Testing of Internal Combustion Engines*, 1914; I. T. Vincent, *Supercharging the Internal Combustion Engine*, 1948; H. F. Wimpers *The Internal Combustion Engine*, 1931.

**International Affairs**, Royal Institute of, see ROYAL

**International Bank for Reconstruction and Development**, was established by the United Nations Monetary and Financial Conference held at Bretton Woods (see BRETON WOODS AGREEMENT) U.S.A. in July 1941. Its function is to assist in the reconstruction and development of members by facilitating the investment of capital. The authorised capital stock is \$10 million, divided into 100,000 equal shares available for subscription only by members. An Act giving effect to the Bretton Woods Agreement in the United Kingdom was passed in Dec. 1941. The bank may operate either by making or participating in direct loans out of its own funds, or out of funds raised in the market of a member, or otherwise borrowed, or by guaranteeing loans made by private institutions. The bank consists of a board of governor-executive directors who are responsible for the conduct of the bank's general operations, a president and staff. The first chairman, Dr. Hugh Dalton (Britain) was succeeded in Sept. 1941 by O. K. Yu (China). The U.K. representatives are Sir Stafford Cripps, governor, with Sir Gordon Munro as executive director; T. W. Snyder as U.S. governor and Eugene Black (provisional chairman) executive director. The president and vice-president are John McCloy and Robert L. Garner, U.S.A. The staff numbers about 13. Its first loan was \$250,000,000 of seq. to France in May 1947. This was followed in Aug. 1947 by three more loans to Europe—\$19 million to the Netherlands, \$10 million to Denmark, \$12 million to Luxembourg. After that the pace of lending decreased and only two small loans were made in 1948—\$16 million to Chile for hydro electric development and agric. machinery and \$12 million to four Dutch shipping

companies to buy ships in the U.S. In Jan. 1949 \$34 million was lent to Mexico and \$7 million to a Brazilian traction, light and power company, both largely for hydroelectric schemes. By the end of 1948 the European situation had disintegrated so far that the European Recovery Plan (I.R.P.) had taken the place of reconstruction loans from the bank as the source of European reconstruction. In the early stages of the discussion of the Marshall Plan (see EUROPE, *Marshall Plan*) it was expected that the bank would be able to supplement the I.R.P. grant with unspecific projects. But as I.R.P. has developed the possibility of any significant bank lending to Europe during the four years of the programme has declined. The difficulties of divided responsibility for the financing of European recovery made it unlikely that the hopes entertained as recently as 1948 would be realised until the Marshall Plan period was near its end. With one of its original functions (loans for reconstruction) taken over by the U.S. go., the bank turned from reconstruction to development. But up to 1945 it was unable to find as many projects ready for financing as it would have liked to handle, while other promising projects took longer to put into shape than expected. One defect lay in the narrowness of the articles of agreement of the bank which made no provision for technical assistance. For not only were the countries of S. America, parts of Africa and the Middle East underdeveloped but they were also so short of technicians that they were unable to put its schemes in such a form as to make it possible to appraise their prospects without much additional work for which the bank was not equipped.

**International Bureau of Commercial Statistics** was established in 1913 at Brussels and was instituted for the purpose of unifying commercial statistics from all countries with a view to their publication annually. Its chief interest is the study of imports and exports and the issue of complicated and valuable tables of statistics showing the relative positions of countries and their productions viewed from nearly every conceivable aspect. An annual bulletin is produced affording matter relevant to the study of the progress of commercial and trading development.

**International Chamber of Commerce** was founded in 1923 at Brussels in order to further the welfare of international trade. Most of the important States are represented on it. The range of its functions extends to the development of trade between nations, the adjustment of hampering restrictions and, generally, the regulation of international business relations. Its administration is in the hands of an elected council representative of the affiliated nations. The decisions of the council are carried out by a secretary-general and a committee, who are under the supervision of the president. Its meetings take place every two years, when reports are submitted and trade questions discussed. It has London offices at 14 Queen Anne's Gate, Westminster, and 14 Queen

International Court of Justice, in all essentials is the old Permanent Court of International Justice under a new name. Its Statute which forms part of the Charter of the United Nations (*q.v.*) is the Statute of the Permanent Court with a few unimportant changes and contains provisions designed to ensure continuity between the two.

Like the old court, the new contains fifteen judges of different nationalities, elected for a nine year term by simultaneous voting in the Security Council and the

methods. It therefore did but little to develop international law. The P. C. of I. J. was constituted during the second Assembly of the League, formally opened Feb. 15, 1922, and held its first session June 15, 1922, in the Peace Palace at The Hague. The Charter of the court was founded on the scheme provided by Article 11 of the Covenant of the League of Nations (*q.v.*). Some notable cases to come before the court were *The Wimbledon* (1921) a dispute between France and Germany over a vessel which was carrying

The court at The Hague on July 26, 1948 when the case was presented by Britain, Greece, and Albania over the rights in the Corfu Channel. The British and Greek cases in October 1946.

General Assembly, which in this context succeeded to the functions of the Council and Assembly of the defunct League of Nations. The Statute also contains similar provisions for safeguarding the independence of the judges (*q.v.*), that they may not exercise any political or administrative office or practice a profession. They are removable only by a unanimous vote of their own colleagues on the bench. Prior to the First World War there had existed no convention for the creation of a permanent court, but it remained in abeyance because the conference of 1907 could not agree on the method of appointing judges. Thus the only previous provision for settling international disputes was by way of arbitration, a method which, while effective to meet the demands of a particular and momentary situation, lacked the essential qualities of a tribunal proceeding according to precedent and systematised

methods. It therefore did but little to develop international law. The P. C. of I. J. was constituted during the second Assembly of the League, formally opened Feb. 15, 1922, and held its first session June 15, 1922, in the Peace Palace at The Hague. The Charter of the court was founded on the scheme provided by Article 11 of the Covenant of the League of Nations (*q.v.*). Some notable cases to come before the court were *The Wimbledon* (1921) a dispute between France and Germany over a vessel which was carrying munitions for Poland through the Kiel Canal. The *Maritime Concessions* (1921-23), a case between Greece and Great Britain relating to concessions in Lae-tine, a dispute between Bulgaria and Greece involving the interpretation of the Treaty of Neuilly (1921), and the court also had a long list of advisory opinions to its credit, the most notable being the Mosul dispute (1925) between Great Britain and Turkey over the Iraq-N. boundary. (See also Mosul.)

Only States may be parties to the I. C. of J., but though individuals have no direct access, a State may take up the claim of its national, and in international litigation this is a familiar kind of case. As in the Permanent Court, the submission of cases is still voluntary, but the so-called 'Optional Clause' (*q.v.*) has been incorporated in the new Statute. Under this States may declare in advance their

willingness to recognise the Courts' jurisdiction as compulsory, in relation to any other State accepting the same obligation, whenever a dispute falls under certain heads, the most important being the interpretation of treaties and questions of international law. Under the old Statute acceptances of this clause were numerous and where these are still in force they are deemed acceptances under the new Statute subject to such reservations as existed previously. But acceptance of the Optional Clause does not create a truly compulsory jurisdiction; it means merely that a State has agreed that in certain circumstances it will allow itself to be sued without the necessity for concluding a special agreement after an actual dispute has arisen. The question of a truly compulsory jurisdiction for the Court remains the most controversial issue of its future (Prof. J. L. Brierly). The new Statute expressly states, what was implicit in the old, that the function of the court is to decide the disputes submitted to it in accordance with international law. Conventional language describes disputes which a court can decide as 'justiciable' and those which it cannot as 'non-justiciable,' misleading terminology, since any dispute is justiciable if the parties choose to make it so, it being for the court to decide whether or no any particular claim is well founded in law. Generally speaking it is evident that political methods of settlement will always be necessary internationally just as they are nationally, and the judicial method can never replace them.

The Court itself has no means of enforcing its judgments; but all the members of the United Nations have bound themselves to comply with its judgments, and Article 94 of the Charter provides that if a party fails to obey a judgment against it the Security Council may 'make recommendations or decide upon measures to be taken to give effect to the judgment.' What sort of measures or sanctions the Council could or might put into force and what would be the precise effect of its 'decision' is left uncertain.

**International Date or Calendar Line,** the line where the change of date occurs. It is a modification of the 180th meridian, and is drawn so as to include islands of any one group on the same side of the line, or for political reasons. It is indicated by joining up the following nine points:

Latitude	Longitude	Latitude
60° S.	180°	154° S.
51½° S.	180°	5° S.
45½° S.	172½° W.	18° N.

**International Institute of African Languages and Cultures,** estab. at a conference held in London, June 29-30, 1926, to which were invited representatives of some twenty-three scientific, educational and missionary associations in various countries. A draft constitution was adopted for the society, whose first trustees were Sir Frederick Lugard (q.v.), Sir Humphrey Leggett, and Mr. Harold

Godfrey Judd. On the original executive council were a number of persons distinguished in African sociology, including Sir Frederick Lugard, C. M. G. Seligman, a distinguished anthropologist, Prof. Levy Bruhl, Rev. Edwin Wm. Smith and others. The objects of the Institute, whose headquarters are at 22 Craven Street, London, W.C. are: to study the languages and cultures of the natives of Africa; give advice and aid in the pub. of studies on African languages, folklore and native art; estab. a bureau of information for persons interested in linguistic and ethnological researches and educational work in Africa; assist in producing an educational literature in the vernacular; encourage international co-operation in all questions connected with the mental development and technical advancement of the people of Africa. The Institute pub. a memorandum on a wide range of topics relating to African social anthropology and linguistics. Its *Journ. Africa* is pub. quarterly.

**International Institute of Intellectual Co-operation,** see INTELLECTUAL CO-OPERATION.

**International Labour Organisation.** The I. L. O. of the League of Nations arose out of the treaty of Versailles. One of the first decisions of the Peace Conference of 1919 was the formation of an Industrial Commission under the chairmanship of Mr. Samuel Gompers, President of the Amer. Federation of Labour. Their deliberations resulted in Part XIII. of the treaty by which the I. L. O. was set up declaring the following general principles:—(1) That labour should be regarded not merely as an article of commerce; (2) The right of association by the employed as well as by the employers; (3) The payment to the employed of a wage adequate to maintain a reasonable standard of life; (4) The adoption of an eight hour day or forty-eight hour week; (5) A weekly rest of at least twenty-four hours, including Sunday where possible; (6) The abolition of child-labour and the imposition of such limitations on the labour of young persons as shall permit the continuation of their education and assure their proper physical development; (7) The principle that men and women should receive equal remuneration for work of equal value; (8) The standard set by law in each country with respect to the conditions of labour should have due regard to the equitable economic treatment of all workers lawfully resident

therein; (9) Each state should make provision for a system of inspection, in which women should take part, in order to ensure the enforcement of the laws and regulations for the protection of the employed.

The composition of the I. L. O. consists of a General Conference of delegates of all Member States, a governing body, and an International Labour Office which is the permanent Secretariat. Each State sends

four delegates to the annual Conference, two for the gov., one for the employers, and one for the employed. These delegates are chosen by the gov., with the approval of the predominant organisation of their respective groups.

The Conference embodies its decisions in three ways: a Draft Convention, a Recommendation, or a Resolution; but since International Law is based on the first two, they are the most important of the three. The first, the Draft Convention, resembles a treaty, and is submitted to the national authority; but it requires for ratification a two-thirds majority and

were adopted between 1919-39. Of the sixty-three countries thirteen have not ratified a single convention. Except for the Soviet Union, which was a member only for a short time, these countries were of minor industrial importance, but a number of progressive countries have recorded very few ratifications. The U.S.A. have ratified only five, Canada nine, Australia twelve, China thirteen, Czechoslovakia, India, and Switzerland fifteen, and so on. No country has ratified more than one half of the conventions. Great Britain and Spain leading with thirty-four. Still more revealing are the statistics showing

League of Nations Union

#### THE INTERNATIONAL LABOUR OFFICE, GENEVA

in any case it must be brought before the parliament concerned within a year from its adoption by the organisation. A Resolution consists of a statement of general policy and is clearly of but small practical value. The Executive Board of Management is the governing body of the I.L.O. and consists of twenty-four members, half being gov. delegates and equal numbers of employers' and workers' representatives. The International Labour Office of Geneva is the Secretariat.

The twenty-ninth Session of the International Labour Conference held in Montreal (1946) discussed constitutional changes which if finally adopted, may profoundly influence the effectiveness of the I.L.O. as a working body and as a means of raising world labour standards. A draft agreement was drawn up defining the I.L.O.'s relations with the United Nations. The I.L.O. in 1946 had fifty-two members (as against sixty in 1940, Italy, Germany and Japan having by then withdrawn) but at one time or another sixty-three countries have been members and altogether sixty-seven conventions

the disparity between the number of conventions voted for by gov. delegates but not ratified by the gov's. These show that the gov. delegates of Czechoslovakia have voted for forty-six conventions which were not afterwards ratified, those of Denmark forty-three which were not ratified, Brazil forty-two, Canada and Norway forty, Poland thirty-seven, France thirty-five, Sweden thirty-four, and Belgium thirty-three. The figure for the U.S. was sixteen and for Great Britain thirteen. The obvious implications of these figures were that delegates were obtaining a reputation for a progressive attitude by supporting proposals which the gov's. they represented had no intention of putting into effect, or that they were not giving sufficiently serious consideration to the practical implications of the adoption of conventions. There is a considerable difference of view between labour standards in the more advanced countries and in others, especially in the Far East and in colonial dependencies. Whether it is sounder policy to adopt conventions which will be of practical value in western

countries but which cannot be expected to secure ratification by the less advanced nations, or to adopt lower standards and hope to raise world working standards more nearly to the same level, with the concomitant risk that delegates from the advanced countries will lose interest, is not easy to say. Doubtless much would depend on the state of public opinion in the various countries at the particular moment and the extent to which that opinion can find expression. There are differences of opinion as to whether the changes proposed at the last Conference go far enough: the less practical would like to see the enforcement of conventions made compulsory for all members—an ideal which can hardly be reached before the apotheosis of national sovereignty begins to lose some of its force. But it may be reasonable 'to hope that in some sort they will make gov. delegates consider more carefully the practical implications of their votes and help to turn the mt. of words piled up by the I. L. O. into bread and butter for workers everywhere' (*The Times*, Sept. 18, 1946).

Attempts had been made by advanced reformers long before 1919 to organise labour internationalism. Robert Owen was one of the first in Great Britain. He unsuccessfully addressed a memorial to a Conference of the Holy Alliance at Aix-la-Chapelle in 1815. In 1837 Daniel Legrand, a Lotharingian employer, addressed all the European Govs. similarly. Later from 1880 to 1890 Albert de Mun of France, Kopp and Winterer in Germany, Helleputte in Belgium, and Prince Liechtenstein in Austria worked to such purpose that in 1893 Pope Leo XIII. issued his famous *Rerum Novarum* on 'the Condition of the Working Classes.' In 1897 a great International Labour Conference was held at Zurich, and in 1900 an International Association for Labour Legislation was formed in Paris under the chairmanship of M. Millerand; associated with him was M. Albert Thomas who became the first director of the International Labour Office when it was set up in Geneva. The I. L. O. pubs. many documents and periodicals, among them being: *The International Labour Review* (monthly); *Industrial and Labour Information* (weekly); *Bibliography of Industrial Hygiene*; *International Labour Directory*.

**International Law**, comprehensive term (coined by Bentham) denoting the sum of those rules of conduct which obtain among modern civilised nations, and which regulate their mutual relations and intercourse. The 'persons' or 'parties' known to I. L. are states, and normally such sovereign independent states as are recognised members of the family of nations (on the nature of the artificial conception of state, see GOVERNMENT, STATE), or that 'aggregate of states which, as the result of their historical antecedents, have inherited a common civilisation, and are at a similar level of moral and political opinion' (Prof. Holland). The question how far this international or rather interstate code of morality may appropriately

be designated 'law' has formed the subject of an extraordinarily prolific literature. One school of jurists follows the narrow but logical Austinian analysis of law, maintaining that no rule can be a law positive unless set by a given sovereign to his subjects and sanctioned by force, and that international 'law,' which must not be confused with the *jus gentium* (q.v. and see also EQUITY) of the Romans, is no more than a body of principles, adherence to which on the part of individual states or nations is sanctioned by the fear of war. But another school of publicists and jurists, while not for the most part venturing directly to controvert the Austinian analysis, asserts that laws are not necessarily sanctioned by force so much as by the play of public opinion, and that the want of an actual authority to enforce observance will not deprive of their legal character rules which men habitually and conscientiously obey without any thought of fear inspired by some controlling authority. The mere fact, however, that no modern civilised state would openly declare its unwillingness to be bound by such rules as have now received the seal of international approval at The Hague conferences, and that many have submitted to arbitration with at least a show of good grace, does not alter the fact that treaties or conventions are frequently violated and immunity gained only at the price of fear of superior armaments. In Germany, for some years before the Second World War, the Ger. Gov. broke treaties without scruple, and during the war showed that they felt bound by no 'laws' other than those of expediency. The true view would seem to be that positive or municipal law and a rule of international morality have points of resemblance, but differ essentially in point of promulgation and enforcement. There is a similarity from the fact that conformity to each does to a great extent rest upon consent freely given from the recognition of an inherent and sound ethical standard. The jurisprudential aspect of I. L. is neatly summarised by Prof. Holland as the 'vanishing point of jurisprudence,' since it lacks any arbiter of disputed questions, save public opinion, beyond and above the disputant parties themselves, and since, in proportion as it tends to become assimilated to true law by the aggregation of states into a larger society, it ceases to be itself, and is transmuted into the public law of a federal gov.' An ambitious but ill-fated attempt to provide international rules with definite sanctions was made in the sanction clauses of the Covenant of the League of Nations (see COVENANT). The Covenant provided a wider sphere of I. L. with a coercive power such as it had not hitherto possessed, and in jurisprudence is the most significant part of the Covenant. A further, if less striking, attempt to give international rules definite sanction was made in the Treaty of Washington, 1922. The treaty provides that belligerent submarines shall be subject to the rules that govern surface warships in visit, search, and capture, and that violation of these rules is declared to be piracy punishable

by the civil or military authorities of any Power within the jurisdiction of which the pirate may be found. Thus the treaty endeavoured to remove from the sanctions of the laws of war the fatal defects which the First World War made so patent. Experience in the Second World War afforded no evidence of any neutral availing itself of this power. While Britain stood alone, the sole defence against the ocean-wide and illegal activities of the Ger. U-boats was the Brit. Navy and its Fleet Air Arm.

*Agencies or Sources of International Law.*—These according to Wheaton, are: (1) Text writers of authority on the approved usage of nations, such as Avala (*q.v.*), Grotius (*q.v.*), Puffendorf, Bynkershoek and Vattel; (2) treaties of peace, alliance, and commerce; (3) ordinances of particular states prescribing rules for the conduct of their commissioned cruisers and prize tribunals; (4) the adjudication of international tribunals, such as boards of arbitration and courts of prize; (5) written opinions of official jurists given confidentially to their own govts.; and (6) the hist. of the wars, negotiations, treaties of peace, and other transactions relating to the public intercourse of nations. All these sources are invoked by Wheaton as guiding the modern publicist and statesman in the search for a rule so generally recognised as to amount to a rule of I. L. Paradoxically enough, though there was until recently next to no written I. L., there has for some considerable time existed an encyclopedic bibliography of opinions on the principles underlying its now generally recognised usages. But too much importance must not be attached to the opinions of jurists, because, while some rely upon practice and precedent, or the decisions of a court and the act of a gov., others prefer the theoretical speculations of eminent predecessors. The latter, however, are in a minority in these days of precedents, though it was otherwise in the days when the works of Grotius, Avala, and a few others were almost the sole source of information. Treaties are the most important source, if we include under that term every form of convention, contract, or declaration made between or ratified by different states. The Declaration of Paris, 1856, the Geneva conventions of 1861 and 1906, the conventions drawn up by the representatives of most of the leading nations at the various Hague peace conferences have by their combined effect led to the evolution of a tolerably comprehensive body of express I. L. purporting to regulate the usages of war, ameliorating the condition of the sick and wounded in war, whether on land (the Geneva Convention) or at sea (Hague Convention, 1899). These sources have, since the First World War, been considerably supplemented by the provisions of the Treaty of Versailles creating the League of Nations, and by various later agreements arising out of the amendment of the Articles on the Covenant. The convention of July 29, 1899, was an especially epoch-making document, for it represented the agreement of no fewer than twenty-

four states to submit certain disputes to a permanent court of arbitration, an innovation which still further assimilates I. L. to law proper. Provision was also made for international commissions of inquiry on disputes 'arising from a difference of opinion on facts', although as to these last-mentioned bodies it was further provided that their reports should leave entire freedom of action to the parties concerned. Such an inquiry was held in the case of the Dogger Bank outrage on Brit. fishing vessels at the time of the Russo-Japanese war. In the express recognition of arbitration as the most efficacious and equitable means of composing differences, it is to be noted that, although most European powers bound themselves to submit to the arbitration tribunal for a period of five years, there is an express condition, 'qu'ils ne mettent en cause ni les intérêts vitaux, ni l'indépendance ou l'honneur des deux états contractants et qu'ils ne touchent pas aux intérêts des tierces puissances.' This principle finds more definite expression in the Covenant of the League of Nations, where it is limited by considerations of aggression. Thus work of consolidating or codifying the usages of I. L. and creating a tribunal was supplemented by the Declaration of London (*q.v.*), which created an International Prize Court of Appeal and further regulated the law of contraband and blockade.

*The Subjects and General Principles of International Law.*—The subjects or persons of I. L. are normally sovereign and independent states. Sovereignty is a fact depending on nothing else than the objective existence of all the ordinary phenomena of political independence; though such external sovereignty may require recognition by other states to enable the new sovereign state to enter the society of nations. The characteristics or elements of international personality may be summarised thus: 'Every society claiming admission to the law of nations must satisfy the following requirements: (1) It must be represented by a gov. which receives a *de facto* allegiance from its subjects; (2) it must be a sovereign independent state, though it is not necessary that there should be complete independence (see Lord Finlay in *Duff Development Co. v. Kelantan Gov.* (1921), A.C. 797); (3) it must exhibit reasonable promise of durability (internal instability was one reason for delay in the recognition of the U.S.S.R. or Soviet Russia); (4) it must possess definite territory; and (5) it must be recognised as a member of 'the family of nations.' In the theory of I. L. a state under suzerainty is no different from an individual state in a federal system, its subjects being in effect those of the suzerain state. A protectorate occupies an anomalous position midway between an independent sovereign state and a state under suzerainty, for it remains independent and owes no allegiance to its protector, although a part of its rights have been surrendered either temporarily or permanently.

As consequence of the First World War certain territories ceased to be under the

sovereignty of the defeated states and were *mandated* to various powers. The mandatory representation marked a new and progressive principle in I. L. The question of the sovereignty of the mandated ter. raised juristic difficulties; for it might lie in the League of Nations, in the mandatory state, or in the mandated ter. Class 'A' *mandated* ter., however, appeared to be largely assimilated to protected states; but 'B' (e.g. Tanganyika Territory) and 'C' (e.g. South West Africa) ters. would appear to await appropriate juristic definition. (See further *MANDATES*; and also *IRAQ*; *PALISTINE*; *SYRIA*.) Again, the self-governing dominions of the Brit. Empire occupy, in I. L., a position difficult to define. Before the First World War they had traces of individuality or 'international personality,' in that they had their own colour, their own flag in the shape of a modified Brit. ensign, and they had the right to make treaties independently with foreign states on minor matters like tariffs. The effect of the First World War was to emphasise these previously tentative steps towards international personality; for the Dominions secured separate representation at the Peace Conference in 1919, and became original members of the League of Nations, with separate representation on the League Assembly; while Canada, in 1921, was given the right to accredit to the U.S.A. a representative who was to be appointed by the king on the advice of the Canadian gov., and whose duties were to deal with questions between the crown and the U.S.A. affecting Canada. Also Ere more than ten years ago had a Minister Plenipotentiary to represent Free State interests in Washington. Today the sev. dominions exchange representatives with a number of foreign govts. (As to the relations *inter se* of the members of the Brit. Commonwealth of Nations, see under *IMPERIAL CONFERENCE*; *INTER-IMPERIAL RELATIONS REPORT*.)

Some encroachment on sovereignty seems to be implicit in the right of intervention. The question of peaceful intervention has been brought into prominence by the rights possessed by the League of Nations under the Covenant (q.v.) and under treaties containing Minority Clauses. Jurists do not concur on the precise scope of the right of intervention; but the tendency of opinion prior to 1938 was towards agreement on the basis of the grounds mentioned in Articles 11 and 15 (6) of the Covenant, the net effect being that the Great Powers of Europe would no longer claim under treaties the right to intervene in the affairs of other European states while there existed in the League of Nations a means to that end. But in 1938 and the immediately succeeding years, the totalitarian technique, as developed by Germany and Italy, reversed this tendency completely and without intervention but invasion without ultimatum became so common that the entire structure of I. L. was threatened.

*League of Nations.*—The League, called into being on the ratification, in 1920, of the treaty of Versailles, and by the pro-

visions of that treaty, was by no means novel in its conception. But it was a novel subject of I. L., for it aimed (vainly, as the Second World War proved) through the Covenant, at the promotion of international co-operation and maintenance of international peace (see *LEAGUE OF NATIONS*).

I. L. recognises the right of any state to place itself under any form of gov. it may choose, and to regulate its domestic concerns as it will. Again, a state may pursue any commercial or fiscal policy and maintain what armaments it may choose without thereby infringing any rule of I. L., and its judicial tribunals may assert exclusive authority over all persons and things within the ambit of their jurisdiction, whether such persons and things are foreign or not. But in a case of conflict of legal principles in regard to the rights of private individuals, the dictates of international comity may be said to have occasioned the habitual application of the appropriate law to each case (see *COMITY*). This application of foreign law is sometimes called *Private I. L.*; but strictly the word 'international' is inapplicable, and the rules and principles relative to the subject will not therefore be further referred to in this article.

It is also an underlying principle of I. L. that whether an independent nation be strong or weak does not affect its right to equality of treatment and respect in all matters directly or indirectly concerning its interests. Included in the ter. of a state are the so-called territorial waters extending for 3 m. out, measuring from low-water mark. It follows also from the general freedom of the high seas that men-of-war and other public vessels on the high seas are essentially and in every point treated as though they were floating parts of their home state. Included in such national parts of foreign ter. are the official residences of diplomatic envoys and ambass. A movement for the recognition of free navigation on international rivers set in at the beginning of the nineteenth century and developed in the case of a number of great European rivers in conventions between the various riparian states concerned. By the stipulations of the Congo Conference at Berlin in 1884-85, the Congo and the Niger are free, and there is a special international commission called the International Congo Commission to regulate navigation on those rivers.

The detail of I. L. relates to belligerency, or the rights and duties of states in time of war, neutrality, and the process of the pacific settlement of international disputes by arbitration. In regard to belligerency I. L. lays down rules for the commencement of hostilities, and for determining 'enemy character,' whether of goods, ships, or persons (see *ENEMY*); it prescribes the permissible modes of warfare, and provides for the proper treatment of prisoners of war and wounded belligerents, though, in this connection, the policy of 'frightfulness' habitually adopted by the Germans has involved in its application the abrogation of these rules (see also *DEPORTATIONS*, *SUBMARINE WAR*).

FARE, AERIAL WARFARE). Further, it lays down restrictions on the conversion of merchant into war vessels on the high seas, interprets the effect of conquest upon liabilities, and the general operation of treaties, and regularises the practice of pacific blockade. The rights and duties of neutral powers find expression in the rules as to contraband (see DECLARATION OF LONDON), the supply of arms by neutral states, the right of asylum, passage through neutral ter., blockade, and the visit and search of neutral merchantmen. As to what acts on the parts of its subjects a neutral gov. is bound to restrain and what acts its subjects may do at their peril, the *Alabama* case showed that there was no clear principle before the award of 1907 as to whether a gov. might acquiesce in the preparation and sale of an armed vessel: the analogy to the principle upon which a gov. incurs no legal responsibility for the supply of guns being very close. Now neutral govts. must use due diligence to prevent the arming or equipment of such vessels within their jurisdiction.

**International Law and War Crimes.**—The critics of the Nuremberg judgment of 1946 allege that there is no precedent for establishing the crimes with which the prisoners were tried and imposing the punishment. But the crimes and atrocities committed by the Axis Powers were beyond anything in hist. in regard to both their range and their enormity. They were international in character and therefore to be judged according to the rules of I. L. The killings charged at Nuremberg were killings which the Tribunal held could not be justified under I. L., that is the laws or customs of war. The killing of hostages, the murder of prisoners of war, the extermination of Jews and others, the slaughter of millions in concentration camps (*q.v.*) and in occupied countries by manifold means, were all accomplished in flat breach of the Hague and Geneva Conventions. These are Conventions which had been solemnly agreed by all the assembled nations, including the Axis Powers, for the amelioration as far as possible of the horrors of war. None of the prisoners at the Nuremberg trial received the death sentence unless he was found guilty of murder, that is on the counts of war crimes (see CRIMES, WAR) or crimes against humanity, and the modern laws and customs of war—the validity of which cannot be doubted for they date back to Grotius and even earlier. What was to some extent novel was that the heads of the Hitler Inner Council were individually indicted and punished for initiating and waging a war of aggression. But those who aver that there is no law against aggressive war ignore the existence of I. L. Since 1919 at least the nations have deliberately sought to outlaw war. Their final pronouncement was the pact of Paris, the Kellogg-Briand Pact of 1928, a most solemn treaty made by sixty-six nations which agreed to renounce war as an instrument of national policy, and the aggressors in the Second World War were among these nations. The Pact was a declaration of I. L. by practically the

whole of the civilised nations and the Gers. were guilty of a breach of that treaty and of I. L. by initiating and waging war. Hitler and his followers were therefore individually principals in the common plan of breaking that international law and, as the Tribunal said, the crime against peace was the most atrocious crime of all; for it let loose the whole mass crimes of slaughter, terrorism, and cruelty. That was the common plan of crime which the Nuremberg Tribunal condemned and for which they punished the individuals responsible. I. L. for international crimes must be found in conventions or treaties like the pact of Paris, which the nations entered into in order to define the I. L. on the point. It was expressly intended to put the matter beyond controversy. The novel and arresting thing is that these declarations were at length put into use. There is thus no ground for describing the decisions of the Nuremberg trial as *ex post facto* law. The trial is a landmark in I. L. It estab. the right of the world to inquire into the acts of military men and into the acts of govts., statesmen, and politicians charged with bringing about a war and with concerted and calculated breaches of treaty and of faith and of the laws of war. See also NUREMBERG TRIAL. See F. Bauer, *Die Kriegsverbrechen vor Gericht*, 1945; R. H. Jackson, *The Case Against the Nazi War Criminals*, 1946; and H.M.S.O., *War Crimes Commission: Law Reports of Trials of War Criminals*, 1948.

tries where they may be needed. The headquarters of the bank are in Basel. Control of the Bank is in the hands of a Board of Directors which is composed of the governors of the founding Central Banks, *ex officio* a corresponding number of persons nominated by them, and the governors of certain other Central Banks selected by the Board. During 1930-4, no Board meetings were held and the Bank confined itself to routine functions. The British directors are Lord Catto and Sir Otto Niemeyer.

**International Telephone and Telegraph Company**, with main offices in New York City, is one of the biggest of its kind in the world. It operates telephone systems in the Argentine, Brazil, Chile, Cuba, Mexico, Porto Rico, and Uruguay. Seventy years ago with the consent of the Spanish government it bought up all the telephonic companies in Spain and installed American machinery and methods. It maintains a telegraph service all over America and this connects with services in the U.S.A. and Europe. It also has a cable between the U.S.A. and South America.

**Internationale**, name given to an international association of Labour and Socialist organisations. Karl Marx with Engels founded the first I in 1864 in London. A second I was established in 1889 after the demise of the first due to divisions between Marx and the Russian Bakunin (q.v.), and in 1912 issued a manifesto calling upon all workers to secure peaceful foreign policies from their governments. Among their associates were Stanning, Britting and Ma Donald, all of whom became prime ministers of their respective countries: Denmark, Sweden and Great Britain. After the First World War meetings were resumed but it was not until 1923 that the Second I was completely re-established. Meanwhile a Third I had been formed at Moscow composed of Communist elements who had been excluded from the Second I. It was officially founded in 1919 by Lenin, who proclaimed its aim to be world revolution and who genuinely believed such a world revolution to be imminent. The various Communist parties of each nation receive direct instructions from the Bureau of the Third (Communist) I. See K. Marx and F. Engels' *Manifesto of the Communists* 1848; N. Bukharin, *Progress of World Revolution* 1920; A. Loynhoe, *Survey of International Affairs*, 1924; J. Price, *The International Labour Movement*, 1931.

**Internationale, L'** communist anthem and national anthem of the Soviet Republic, written by Eugene Pottier in 1871 and set to music by Pierre de Geyter (d. 1934). An English translation of the opening lines runs: 'Arise ye starvelings, from your slumber, Arise, ye prisoners of want! For reason in revolt now thunders And at last ends the age of cant. Now away with all your superstition, Sorville masses arise, arise! We'll change forthwith the old conditions And spurn the dust to win the prize. Then, comrades, come rally And the last fight let us face, L'Internationale Unites the human race.'

**Interplanetary Society, British**, founded in 1933. Its objects are to promote the development of interplanetary travel and exploration by the study of rocket engineering, astronomy and associated sciences. The Society has over 100 fellows and 1 members, including many British and foreign workers prominent in these fields. In 1935 the Society published provisional designs for a lunar spaceship in the light of the information then existing. Further recent papers have dealt with expendable tank ship rockets, atomic propulsion for rockets, and earth satellite stations. The first Honorary Fellow of the Society, elected in 1949, was Prof. Hermann Oberth, noted rocket pioneer, whose studies initiated the great technical achievements by the Germans in the Second World War. The Society is particularly interested in the question of lunar navigation and landing, since these represent the first objectives in interplanetary flight. At present the problem of directing a rocket to the Moon and obtaining information by telemetering and television is no easy practical solution, but investigation of the physiological problems involved before manned rocket flight is possible is still to be undertaken. Also the engineering difficulties involved in building a rocket capable of return journey are immensely more greater than those of a mere one-way trip, it is nevertheless believed that they will be overcome before the end of the present century.

The Society does not itself undertake practical research work in rocket propulsion and allied subjects, this being done by the large government and industrial agencies and research centres now established, in many of its members are employed. Its function is rather to act as the learned society for scientists working in the fields, to hold lectures and publish material concerned with interplanetary flight and to study the consequences, extending far beyond the purely technical sphere of the conquest of space, for interplanetary travel and spaceships. See under **ROCKET**.

**Interpleader**. When a person finds himself in the position of being sued for the recovery of money or goods in his possession in which he claims no interest but to which some third person besides the plaintiff has a claim, he is not compelled either to incur the cost of defending the plaintiff's action or run the risk of an action at the instance of the other claimant by handing over the property to the plaintiff. His proper course is to take out an Interpleader summons under Order LVII (rules of Supreme Court), on the hearing of which the action against him is summarily stopped and the two claimants are made parties to an issue. This is called a stakeholder's Interpleader. The latter case arises when a third person claims goods which have been seized by a sheriff under an execution (q.v.) for a judgment debt. The sheriff's course is to serve an Interpleader summons on both the claimant and the executive creditor, and in the case coming on before the master, an issue will

be directed for trial, unless the amount in dispute is under £50, when he will himself summarily dispose of it. Where the master directs an issue, the claimant must pay money into court to abide the event of the trial; if he declines the master will make an order for sale (if goods) or payment (if money) to satisfy the judgment creditor's claim. See Calabré, *Interpleader*.

**Interpolation**, mathematical process of filling in values intermediate between those given in a set of tables, e.g. the finding of log 2765173 from logarithm tables which give only log 2765100 and log 2765500. In most simple cases like the example given, it is sufficiently accurate to use the method known as the method of proportional parts. Thus the tables give:

log 2765100	6.1117580
log 2765500	6.1117737
∴ a difference of 100 is equivalent to	0.0000157
∴ a difference of 1 is equivalent to	0.0000157
	100
∴ a difference of 73 is equivalent to	0.00000157 × 73
	= 0.0000115 to seven places
∴ log 2765173 =	6.1117695

A very accurate result may sometimes be obtained from a graph by plotting out the series of tabulated values and then joining up the points by means of a curve as smooth and continuous as possible. This method is especially suitable in many physical examples where the resulting graph takes the form of a well-known curve, and also gives as good a result as we can hope to get in such cases as the estimation of the pop. of a country at some date intermediate between two centuries (see *GRAPHICAL METHODS OF REPRESENTATION*). As a rule, so long as the successive differences vary very slowly, a simple method is good enough, but where the differences alter rapidly (as for example the differences for  $1'$  as the tangent of an angle approaching  $90^\circ$ ) another method must be resorted to which involves more advanced mathematical work from the theory of finite differences.

**Interpretation Act.** Act passed in 1889 repealing and re-enacting Brougham's Act of 1850 for shortening the language used in Acts of Parliament. As to Acts passed after 1850 the Interpretation Act provides that words denoting the masculine shall include the feminine, the singular the plural, and that statutory references to the sovereign or crown in Acts of any date shall be construed to refer to the sovereign for the time being in the absence of an apparent contrary intention; and also that where any Act repeals and re-enacts with or without modifications, any provisions of a former Act, references in any other Act to the repealed provisions shall be construed as references to the re-enacted provisions. According to Webster the Brit. dominions by the I. A. of 1889 are forbidden to call themselves colonies.

**Interrex** (Lat. *inter*, between, and *rex*, king), official of auct. Rome, appointed by

the senators on the death of a king to hold the supreme authority in the state during an interregnum, i.e. a vacancy of the throne, or suspension of the usual gov. In auct. Rome an I. was appointed to hold office between the death of a king and the election of his successor. He held power for five days, and had to belong to the patrician party. The first I. appointed named a successor, and sometimes the nomination continued to a third and even a fourth. Thus the fiction of personal selection was kept up, held to be essential to the proper transference of the religious power of king or consul.

**Interrogatories.** In interlocutory proceedings (q.v.) in an action at law, either plaintiff or defendant may apply, as soon as the latter has delivered his statement of defence, to a master in chambers for leave to administer I. to his opponent. Before being allowed to deliver I., a sum proportioned to the length of the I., but in no case under £5, must be paid into the security for costs account by the party delivering the I. The other party must answer the I. within ten days or such other period as may be allowed. The I. before delivery are submitted to the master, who may disallow all or any in his discretion. Only such I. will be permitted as appear to the master necessary for disposing fairly of the case or for saving costs. The object of I. is to obtain admissions from the other party with a view to proving one's own case and to ascertain as far as possible the case of the other party. But it is not, at least in theory, permitted to a litigant to institute a 'roving commission' of inquiry so as to work up a case out of his adversary's forced admissions or to defend a just cause by a similar process. I. must relate strictly to the matters or facts in issue (see *under EVIDENCE*), but, unlike pleadings, are not confined to the material facts upon which the parties intend to rely, for they are generally directed to the evidence. The party interrogating is entitled to ask 'anything that can be fairly said to be material to enable him either to maintain his own case, or to destroy the case of his adversary.' But he cannot ask the names of his opponent's witnesses, nor, indeed, is he entitled to find out on what evidence his opponent proposes to rely to prove his side of the case. In legal slang this is expressed in the prohibition of 'fishing' I. There are sev. forms of objecting to answer I., but generally objections must be by affidavit. The customary objections are on the ground of irrelevancy, that the I. are fishing, that the matter is privileged, and that the contents of a document are asked.

**Inter-State Commerce Commission**, see *COMMERCE COURT*.

**Interval**, in music, is the name for the distance in pitch between two or more musical sounds. The smallest I. used in practical music are semitones which, in a keyboard (but not in a string) instrument, have always the same distance in pitch between them, and it is the number of tones contained in the I. between two notes of different pitch which determines the 'size' of the I. Is are primarily divided

into two classes, consonant and dissonant, but the lines of demarcation between the two have been very differently fixed. The Gks. considered the unison, octave, fifth, and fourth more perfect than the other 19. In medieval treatises 19 were divided into perfect, medium, and imperfect the unison belonging to the first class, the fourth and fifth to the second, and the third and sixth to the last. The division into perfect and imperfect is followed by many writers at the present day. The simplest classification is one used in Germany and is on the following system. 19 are reckoned upwards inclusively and by number of names of notes which they contain. They are in their normal state when reckoned from the first note of the major scale considered, for the time as the 'tonic'. 19 is one semitone less than 'major', 18 is 'minor' and one semitone more than 'major' are augmented while 19 is one semitone less than 'minor' are 'diminished'. See INVERSION.

**Intestacy** denotes the decay of a person without having made a will, or where though a will has been made it has been either revoked or annulled for irregularity. A person so dying is said to have died intestate, and such real property as he may have died possessed of descends ultimately to his heir in law and his personality to the next of kin under the statutes of distribution. See SUCCESSION. **INTESTATE**. See also DISTRIBUTION, STATUTES OF and INHERITANCE.

**Intestina**, or **Entozoa** name formerly given to an order composed of worms which live in the intestines of other animals. It included nearly all Metazoa as distinguished from Protozoa but has now no technical significance.

**Intestines**. The term the portion of the alimentary canal between the stomach and the anus (*q. v.*)

The Small I. is a slightly narrowing tube from 22 to 25 ft. long and commences at the pylorus end of the stomach and after many convolutions terminates in the large I. It occupies the lower and middle part of the abdomen (*q. v.*) and is surrounded by the large I. The small I. is arbitrarily divided into three portions, viz the duodenum, jejunum, and ileum. The duodenum, about 10 in. long and from 1½ to 2 in. in diameter, is the shortest and widest part of the small I. It resembles a large C-shaped curve its concavity embracing the head of the pancreas. It is only partly covered by the peritoneum. The middle descending portion of the duodenum receives the common bile duct and pancreatic duct. The jejunum, about 8 to 9 ft. in length and 1½ in. in diameter occupies the upper and left part of the abdomen below the subcostal plane. It joins the duodenal section on the left side of the vertebral column, and is continued into the ileum which is about 12 to 14 ft. in length and 1½ in. in diameter. This portion occupies the lower and right part of the abdomen and is highly convoluted. Both the jejunum and ileum are attached and supported by an extensive fold of the peritoneum (the mesentery). At a point

about 3 ft. from the termination of the ileum a small pouch (Meckel's diverticulum) is occasionally found, and is probably connected with the persistence of a part of the vitelline duct of early fetal life.

**Large Intestine**.—This portion of the alimentary canal is 5 to 6 ft. long and extends from the ileum to the anus. It is divided into three parts, viz the cæcum (with the vermiform appendix), the colon, and the rectum. Its diameter varies from 2½ in. in the cæcum to 1½ in. in the lower part of the colon, diminishing gradually throughout its length with the exception

VERTICAL SECTION THROUGH A FRAGMENT OF THE SMALL INTESTINE

V, V, V, are three villi, each covered by columnar epithelium. C, C, C, are the little tubular glands (crypts of Lieberkühn) between the villi which secrete intestinal juice. L, is the central lacteal which conveys the chyle into the lymphatic vessel with villi in the submucous coat. In the villi on the left the central lacteal is not shown but here the blood vessels are depicted. The capillary network is immediately under the epithelium. It originates from a small artery. A, in I, leads into a small vein. V.

of the well marked dilatation of the rectum referred to later. The cæcum is a blind sac occupying the right iliac fossa immediately behind the anterior wall of the abdomen and extending some 2 or 3 in. below the ileo-cæcal junction. Normally this junction contains the ileo-cæcal or ileo-colic valve, though cases of the absence of this valve have occurred and no inconvenience has been recorded during life. The cæcum is covered by the peritoneum in front, below, and at the sides. From its posterior and left surface the vermiform appendix protrudes and usually is directed upwards and to the left, though it not infrequently hangs down into the true pelvis. Its opening into the cæcum is about 1 in. below that of the ileum. So far as is known, this appendix is peculiar to man, certain of the higher apes, and to

the wombat; but in some animals a peculiar formation of the distal part of the cæcum may represent a condition of the appendix. Its susceptibility to disease has been dealt with elsewhere (see *APPENDIX*). At birth the cæcum is a cone and the appendix is its apex; it is bent upon itself to form a *c*, and this form may persist throughout life. The colon is subdivided into four parts: (a) The ascending colon, a portion of the canal about 8 in. long. It is situated in the right lumbar region and ascends vertically to the under surface of the liver. (b) The transverse colon describes a bow-shaped curve, the arch of the colon, and passes across from the right hypochondrium to the left. It is invested by the general peritonæum, which forms a separate fold for it (the transverse meso-colon). (c) The descending colon is continuous with the previous portion by a sudden bend, the splenic flexure, where is situated a remarkable fold of the peritonæum (costo-colic ligament). It descends vertically for about 6 in. to the left iliac fossa, and is usually empty and contracted, while the rest of the colon is filled with gas. The peritonæum forms a covering to it only at the front and sides. (d) The sigmoid flexure is the narrowest part of the colon. Treves and T. Jones have pointed out the inapplicability of the term 'sigmoid flexure,' and it is now usual to subdivide this portion into the iliac colon and the pelvic colon. The rectum, the lowest portion of the large I., extends to the anus. It bears its name in the human subject as it has a marked concavity forward corresponding to that of the sacrum and coccyx. It is some 8 in. in length and ends in a dilatation (rectal ampulla) which is in contact with the back of the prostate in the male and of the vagina in the female. The peritonæum covers only a portion of the rectum, being reflected down and forming a pouch between the bladder and the rectum in the male, or between the uterus and rectum (pouch of Douglas) in the female.

**Structure and Glands of the Intestines.**—The I. are composed of an external serous or peritoneal coat and three others: muscular, submucous, and mucous. The muscular coat consists of two layers of fibres, a longitudinal and a thicker inner circular set. The progressive contraction of the fibres of the muscular coat produces the peristaltic movement by which the contents of the I. are forced onwards. The sub-mucous coat of strong loose areolar tissue is connected more firmly with the mucous coat than with the muscular coat. The mucous coat is thick and vascular and consists of: (1) An epithelial layer forming the intestinal glands; (2) a layer of retiform tissue which supports the blood vessels and lactenils, and (3) a thin layer of unstriated muscle (muscularis mucosæ). In the duodenum and jejunum the mucous membrane is thrown into a series of closely placed transverse plates (valvule conniventes). The largest are about 2½ in. long and ½ in. wide at the broadest part and they materially increase the absorbent surface to which the food is exposed. The surface of the small I. is velvety, due to the

presence of minute closely-set protuberances termed villi. Two kinds of small secreting glands are found in the I., viz., the crypts of Lieberkühn and Brunner's glands, the latter being peculiar to the duodenum. Throughout the whole length of the intestinal tract are minute masses of lymphoid tissue (solitary glands). They are especially numerous in the cæcum and appendix; in the ileum they are collected into large oval patches known as aggregated glands or Peyer's patches, the long axes of which, ½ in. to 4 in. long, are arranged length-ways in that part of the tube most distant from the mesentery.

**Vessels and Nerves.**—All parts of the I. are supplied with a very complete system of blood and lymphatic vessels (dacteals) minutely sub-divided. The nerves of the I. are chiefly derived from the superior mesenteric plexus and at first they and their subdivs. cling very closely to the larger arterial vessels; finally they reach the I. in very numerous branches to be distributed and redistributed in the muscular and sub-mucous coats. See II. Smith, *Acute Intestinal Obstruction*, 1948.

**Intimation, in music,** the opening phrase of any plain-song melody. The term is usually applied to the first two or three notes of a Gregorian psalm-tone, generally sung by one or more selected choristers, or by the officiating priest. Its use is, as a rule, confined to the first verse of the psalm or canticle, though occasionally in the *Magnificat*, *Benedictus*, and *Venite* the opening phrase of each successive verse is sung in this way to give a greater solemnity.

**Intoning,** custom of rendering prayers in the form of a musical recitative, similar to chanting, the greater part of the prayer being recited on one note. It can, however, be varied by the introduction of certain simple inflections. In cathedrals and larger churches, I. greatly simplifies audible utterance. The practice of I. is undoubtedly of ancient date, and obtaining among the great majority of barbarous nations, as well as in the Græc., Rom., Anglican, and Lutheran churches.

**Intoxication,** see ALCOHOL, ALCOHOLISM, and DRUNKENNESS.

**Intra,** *in* of N. Italy in the prov. of Novara, situated on the W. shore of Lake Maggiore, about 25 m. N.W. by W. of Como. There are ironworks, and manufs. of silk, cotton, and felt. Pop. 7000.

**Introduction** (It. *introduzione*), musical term signifying the preliminary to a following movement. Strictly speaking, it is the piece of music with which an opera opens, and is preceded by the overture, but many composers make it take a more important place, and introduce it in the place of the overture proper. Gounod does this in most of his works, Mozart in *Don Giovanni*, and Meyerbeer in *Robert le Diable*. In a wider sense, the introduction is the prelude to a symphony, rondo, waltz, etc. Beethoven made use of it in sev. of his symphonies, quartets, and overtures, such as in his *Egmont*, and in *Learners*, Nos. 2 and 3. The majority of Wagner's operas also begin with an

introduction, and a short one is often prefaced to the second and third acts as well.

**Introit**, part of a psalm, with antiphon and gloria sung in the Rom. Catholic Church at the beginning of the Mass, as soon as the priest begins the introductory prayers. Other passages of Scripture are sometimes used. The introduction of 1s. is ascribed to either Celestine (123) or to Gregory the Great (590). Some of the 1s. in the present misal are taken from uninspired writers.

**Intromission**, in Scots law, the assuming possession of the property of another either on legal grounds or without authority. I. I. the latter case is contradistinguished as vicious. One of the commonest forms of legal I. is that of an adjudger, or creditor, who has obtained an adjudication by process of diligence against his debtor for the payment out of the rents of his debt and interest. See Bell's *Comment.*

**Intrusive Dyke Rocks**, see under **IGNOUS ROCKS**.

**Intuition**, in philosophy, a term signifying the mental faculty of spontaneous knowledge of the truth as opposed to its discovery by any ratiocinative process. The concept and word are taken from the terminology of medieval scholasticism. In particular, I. in scholastic theology meant a knowledge of God in the beatific vision. The term 'intuition,' as used later in the science of ethics, is of the first importance in that it denotes a school of thought diametrically opposed to the utilitarian. The intuitionists define the principles and method upon which are to be determined right rules of conduct by reference to a supposed moral sense, or, in other words, duty is to be measured by certain fundamental axioms or intuitively known principles of moral reasoning. The utilitarians, on the other hand, adopt no such subjective standard of good conduct, but estimate the moral value of an act by reference to an objective standard of human duties, whether utility, general happiness (universalist hedonism), or individual happiness (egoistic hedonism). The authority of the conscience or moral sense as opposed to what may generically be termed the social affections was first advanced, among Eng. philosophers, in a distinct form by Butler in his *Dissertation on Virtue*, 1739, and carried further by Reid in the *Essays on the Active Powers of the Human Mind*, 1788. Reid insists on the essential difference between self-love, or regard for one's own good, and sense of duty, or conscience, where Butler seems to have leaned to a belief in their identity in a future life. Whewell in *Elements of Morality*, 1845 endeavours to formulate a list of intuitive principles exclusive of all regard for happiness and referable to the sole governing principle of conduct, the moral reason. These 1s. are compendiously defined as the principles of benevolence, justice and truth, purity and order. The introduction into the system of the term 'reason,' which, as we have seen, is directly antithetical to the primary notion of I., connotes merely the supremacy of reason over purely non-rational impulses

or instincts (*q.v.*) Kant's use of the word *Anschauung* (literally 'beholding') is practically equivalent to perception, and he gives as instances of true forms of beholding, time and space. But, regarded subjectively, Kant names such 1s. transcendental (unknowable), though objectively they are empirically knowable. See A. J. Balfour, *Defence of Philosophie doulte*, 1920; N. O. Lossky, *L' intuition, la matiere et la vie*, 1928; K. W. Wild, *Intuition*, 1938.

**Inundations**, see **FLOODS AND INUNDATIONS**.

**Intussusception**, or **Invagination**, condition in which one part of the intestine passes into the adjoining portion, telescopically, just as the finger of a glove may on taking it off the hand. The contained portion is nipped and strangled, with the result that all the dangers of hernia (*q.v.*), but in a much more acute form, are present. It is a frequently fatal cause of obstruction of the bowels in children, but is not very common in adults. Surgical treatment is usually imperative. In the early stages a copious enema of oil may restore the normal condition, but the use of purgatives can only make the condition worse.

**Inulin** ( $C_6H_{10}O_5$ ) starch-like substance which is found in dahlia and like tubers, where it forms a reserve food supply. It is coloured yellow by iodine, and is quantitatively hydrolysed to the sugar fructose by dilute acids.

**Invar**, steel alloy, containing 35 per cent of nickel and some manganese. Used for measuring rods and pendulum bars.

**Invasion**. In the theories of the rights conferred by international law (*q.v.*) on invaders it is necessary to distinguish between military occupation and conquest. Occupation may imply no more than the placing of ter, under the authority of a hostile army by way, as it has been expressed, of sequestration, without any intention of appropriating it. Conquest on the other hand, means acquisition. No such distinction was drawn until the middle of the eighteenth century, with the result that the inhabs. of a ter. in the possession of a foreign army were bound not only to swear allegiance to the invader, but to assist him in all respects as if he were the legitimate sovereign. After the Seven Years war juristical writings, notably those of Vattel, began to advance the doctrine that a sovereign does not lose his territorial rights in war until a formal cession at the close of the war by treaty. The prevalent modern theory appears to be that the occupying army merely takes temporary possession for certain purposes, while the sovereignty of the original owner continues for all other purposes. But until recently the practice of belligerent govs. differed from the theory which presupposes that since the invader is invested with no more than a substituted or quasi-sovereignty, the national character of the people and soil remain unchanged. The practice is a corollary of the mere rule of might, that the lives and property of the inhabs. being necessarily at the disposal of the occupant, the inhabs. acknowledged his

sovereignty in consideration of his foregoing the extreme rights vouchsafed by superior force. The question of what acts an occupying army may legitimately do depends on circumstances. The general principle is that everything is prohibited which is not calculated to contribute to success in the military operation concerned.

The articles of the Declaration of Brussels prohibit (1) any compulsion of the pop. of occupied ter. to furnish information about the army of the other belligerent or his means of defence; (2) any pressure on the pop. to take oath of allegiance; (3) confiscation of private property, but without prejudice to the right to confiscate by way of punishment or under stress of military necessity; and (4) pillage; and enjoin (a) the respect of family honours and rights, individual lives and private property, together with religious convictions and liberty, and (b) the general duty of taking all steps to re-establish, and ensure, as far as possible, public order and safety, while respecting, unless absolutely prevented, the laws in force in the country (for full information on these points, see Lord Birkenhead's *International Law*). The rights of conquest are, of course, much wider. Birkenhead defines conquest as the permanent absorption of all or part of the ter. of a defeated enemy, but lays it down that a title by conquest is only complete if the conqueror has the material strength to make his conquest good and has exhibited the intention of appropriation. The effect of the Nuremberg Trial, which followed the Second World War, is to give a new juristic conception of I. when all the circumstances estab. that it constitutes the initiating and waging a war of aggression. If this be proved, the invader has no rights at all in international law but, on the contrary, both individuals and bodies responsible for launching such an I. may be tried on the capital charge. See **CRIMES, WAR**; **INTERNATIONAL LAW—INTERNATIONAL LAW AND War Crimes**; **NUREMBERG TRIAL**.

**Invention**, see **PATENTS**.

**Inventions Board**, see under **FISHER OF KILVERSTONE**.

**Inventory and Inventory Duty**. An I. in regard to the administration of the estates of deceased persons is a list or schedule in which are enumerated all the articles comprising the personal property of the deceased. It also denotes a detailed descriptive list of the assets of a bankrupt, and the property comprised in the schedule to a bill of sale on personal effects. The duty of making an I. of a deceased's effects falls upon the executor or administrator, who should make it in the presence of at least two of the creditors of the deceased or next of kin, or any two credible persons, and it should describe the articles serially, with the value at which each has been appraised, especially as it may afterwards be admitted as evidence to show what is due to the beneficiaries or creditors. But to be admissible as evidence it should on completion be signed and sworn before a commissioner

for oaths. It may be noted that any person interested in the estate may call upon the executor or administrator to exhibit an I., and to render an account of his administration. In Scots law the term I., besides the above applications, is used to denote the schedule made by an heir of the heritable estate of his ancestor with the object of limiting his liability for his ancestor's debts to the amount of the value of the estate so inventoried.

**Inveraray**, cap. of Argyll, Scotland, and altoval bor., 15 m. N.N.W. of Greenock, on Loch Fyne. Inveraray Castle, the chief seat of the duke of Argyll, lies N.W. of the tn. It was built in 1744 as the seat of the Argyll family, the head of the Campbell clan, and rebuilt in 1880. Pop. 450.

**Inverbervie**, seaport of Kincardineshire, Scotland, 13 m. N.E. of Montrose. Pop. 2000.

**Invercargill**, Cap. city of Southland Prov., New Zealand. Area 5911 ac. including 516 ac. of gardens and reserves. Centre of rich arable, and pastoral dist. The city is well laid out with good buildings, and picturesque suburbs with fine homes and well-kept gardens. The chief industries are frozen meat, wool, butter and cheese, flour-mills, timber, and coal. There are excellent sporting facilities. I. is at the gateway to the wonderful National Park and Fiordland area. The port of I. is at Bluff, 17 m. distant, and handles a large export trade. Pop. 29,000.

**Inverclyde**, **Sir John Burns**, first Baron (1829-1901), ship owner, elder son of Sir G. Burns, and eventually succeeded his father in the management of the Cunard Steamship Company. In 1840, on its conversion into a limited liability company, he was appointed chairman. In 1897 he was raised to the peerage as first Baron Inverclyde. His pubs. include: *Something about the Cunard Line*, *The Adaptation of Merchant Steamships for War Purposes*, *Glimpses of Glasgow Low Life*, and *Wild Night*, etc.

**Inverell**, tn and railway station of New S. Wales, Australia. It is situated in Cough co., 280 m. N. of Sydney. Silver, tin, and diamonds are mined in the neighbourhood, and vines are cultivated. Pop. 1800.

**Inveresk**, par. and vil. of Edinburgh, Scotland, situated on the firth of Forth. Mann's. paper. The battle of Pinkie (1577) was fought in the par. Pop. 21,000.

**Invergordon**, bor. and watering-place of Ross-shire, Scotland, situated on Cromarty Firth, with a trade in farm stock and dairy produce. There are dockyards and a pier. I. castle is one m. to the N.W. Pop. 1500.

**Inverkeithing**, par. and municipal bor. of Scotland in Fife co., on the firth of Forth, 10 m. from Edinburgh. It forms one of the Dunfermline dist. parl. bors. Has a good harbour and shipbuilding yard, and there are mills, tanneries, and brickworks. Pop. 3400.

**Inverlochry**, ruined castle in Inverness-shire, Scotland, on the R. Lochy, 1½ m. N.E. of Port William. The scene of the defeat of Argyll by Montrose in 1645.

**Inverness**, municipal bor. and seaport, and co. tn. of Inverness-shire, Scotland, situated at the mouth of the R. Ness at the junction of the Beaully and Moray Firths, 108 m. W.N.W. of Aberdeen. On account of its beautiful environment and fine buildings, it is the headquarters of an immense tourist traffic throughout the summer. The chief buildings of note are the cathedral, royal academy, and co.-hall, and it has a fine suspension bridge, and the famous Clach-na-Cudain, regarded as the tn. palladium. Railway repair works, shipbuilding, iron-founding, distilling, and the manuf. of woollen goods are the prin. industries, and the tn. has good roads and a fine harbour and docks. The open spaces of the tn. include Victoria Park, and the famous ground where the most important athletic event of Scotland, the N. Meeting, is held towards the end of Sept. It is a tn. of great antiquity, having been one of the Pictish caps. Pop. 24,000.

**Inverness-shire**, co. in the Highlands of Scotland, stretching from the Moray Firth to the Atlantic Ocean. It is the largest co. in Scotland, and includes sev. of the Outer and Inner Hebrides. Covers an area of 4211 sq. m. For the most part it is wild and mountainous, and characterised by the most impressive scenery. Sev. of the mts. exceed 3000 ft. in height, and Ben Nevis, the highest mt. in the Brit. Isles, reaches an altitude of 4106 ft. There are a few fertile tracts in some of the glens and by the shores of the sea lochs, and in the N. on both sides of the R. Ness. About 5½ per cent. of the shire is cultivated, and sheep-farming is extensively carried on. Herring-fishing is also an important industry on the W. coast. The chief branches of industry are rope-making, shipbuilding, tanning, distilling, brewing, etc. The three great rivs. of I. are the Spey, Ness, and Beaully, and the number of lakes and hill tarns is great, Loch Ness being the most beautiful and best known of the larger lakes. The co., with Cromarty and Ross, returns three members to Parliament. Pop. 84,200. See J. Cameron-Lees, *History of the County of Inverness*, 1897.

**Inversion**. If P and Q are two points, such that the rectangle OPOQ = the square on radius OA, then Q is said to be

O, fixed centre; P, Moves along given curve;  
Q, tracing point.

the inverse of P with respect to the given circle. If P moves along a given curve, the process of finding the locus of Q (the inverse curve) is called inversion. A simple hinged framework of freely jointed rods affords a mechanical construction for the inverse curve. In more advanced work curves are often inverted with respect to conic sections.

**Inversion**, in music, a term applied to chords and intervals when the relative position of the component notes is changed. Perfect intervals remain perfect when inverted, but major, minor, diminished are reversed by I, major becomes minor, augmented

THE INVERSION OF THE CHORD OF THE DOMINANT SEVENTH

become diminished, and *vice versa* in all cases.

**Invertebrates**, collective term for all those animals which agree in not possessing that combination of attributes which make a vertebrate, but have a dorsal nerve chord, a notochord, gill-slits on the pharynx, a ventral heart, and eyes which are out-growths of the central nervous system. The chief groups of I. are Protozoa (uni-cellular) and the Metazoa (multi-cellular), further divided into Porifera, or sponges; Ctenophora, unsegmented worms; Annelids, or segmented worms; Echinoderms; Anthropoda, including Crustacea, Insecta, and Arachnida; Mollusca.

**Invertebrate Embryology**, see under EMBRYOLOGY; PROTOZOA.

**Invert Sugar**, equimolecular mixture of dextrose and levulose (*D*-glucose, and *L*-fructo-*s*), obtained by hydrolysing cane sugar with dilute acids. It readily ferments, and is used in the preparation of sparkling wines.

**Inverurie**, municipal burgh of Aberdeenshire, Scotland, 16½ m. N.W. of Aberdeen, at the confluence of the Urie and Don. It forms one of the Elgin group of parli. burghs. Pop. 900.

**Investiture**, in eccl. and eccl. hist., the act of giving possession of a manor, office, or benefice, accompanied by a certain ceremonial such as the delivery of a cload, a banner, more or less designed to signify the power or authority which it is intended to convey. Temporal sovereigns claimed the right of investing the bishops with their sees by the formal presentation to them of the ring and crozier, a claim which led to the famous 'Investiture Dispute' between Henry I. and Anselm in England, and to the bitter struggle between the pope and the emperors of Germany in the eleventh and twelfth centuries. At the Diet of Worms (1122), it was finally decided that the emperor should confer I. by a touch of the sceptre only, thus making no claims to confer spiritual power but merely the temporalities of the see.

'**Invincible**,' Brit. battle-cruiser (17,250 tons) carrying eight 12-in. guns, which could be dired broad-side to right or left. She was a unit of Adm. Sturdee's squadron which defeated Von Spee's at the Battle of Falkland Is. (*q.v.*), in which she suffered no casualties. The I. was sunk at the Battle of Jutland (*q.v.*) where she belonged to Adm. Hood's squadron.

**Invincibles** (Lat. *in*, not, and *vincibilis*, conquerable), members of an Irish secret society, composed of assassins and the worst of the Fenian associations. The main object of the society was the assassination of officials. The chief member was known as No. 1, and each was acquainted with but two others—the member by whom he was nominated, and the one whom he in turn nominated.

**Involute and Evolute**, see CURVE.

**Involution**, mathematical process of raising a quantity to any power. Its inverse process is evolution, the finding of a root. Whereas a quantity has one square, one cube, and generally one *n*th power, it

has two square roots, three cube roots, and generally *n* *n*th roots. In algebra, expressions of one term only are dealt with in indices (see INDEX). For expressions of two or more terms, the binomial theorem and multinomial theorem give formulae. In higher geometry the name I. is given to a series of pairs of points on a line, any pair of which  $P, P'$  are connected by a relation  $OP \cdot OP' = k^2$ , where  $O$  is the centre and  $k$  the radius of the I. If  $D_1$  and  $D_2$  are points given by the relation  $OD_1^2 - OD_2^2 = k^2$ , each corresponds to itself and they are known as the double points of the I. If  $AA', BB', CC'$  be three pairs of corresponding points, the anharmonic ratio of any four, *e.g.* (ABBC'), is equal to the anharmonic ratio of the four corresponding points, viz. (A'B'B'C'). Also (D<sub>1</sub>D<sub>2</sub>PP') form an harmonic range. I. ranges are of two kinds—overlapping, where the radius and the double points are imaginary and  $O$  lies between each pair of corresponding points, and non-overlapping, where the radius and double points are real, and any two corresponding points are both on the same side of  $O$ .

**Inwood, William** (c. 1771-1813). Eng. architect and surveyor. In 1821 he planned the new galleries for St. John's church, Westminster; in 1832-33 designed, with his second son, the new Westminster Hospital and sev. other London churches. His chief work is St. Pancras New Church (1822), designed after Gk. models by him and his eldest son. He pub. *Tables for the Purchasing of Estates, annuities, and compound interest* (1811).

**Io**, in Gk. legend, the daughter of Inachus, the first king of Argos. Under the name of Callithyia Io, she was regarded as the first priestess of Hera. She was loved by Zeus, who, to protect her from the anger of Hera, transformed her into a white heifer (according to some authorities, the transformation was the work of Hera herself). The hundred-eyed Argus was then set to watch her, but Zeus despatched Hermes to kill him, and Io was released. But Hera's wrath pursued her, and tormented by a gad-fly, she wandered all over the earth, till at last she reached Egypt, where she was restored to her original form and became the mother of Epaphus. Eschylus gives a different version of this myth in his *Prometheus*. See H. Engelman, *The Ione*, 1868.

**Iodic Acid** (HIIO), white crystalline solid, obtained by the oxidation of iodine with concentrated nitric acid. On gentle heating it loses water and becomes converted into iodine pentoxide, which on further heating breaks up into its elements. I. A. is acid to litmus, forming salts, the iodates of which sodium iodate occurring in caliche (Chile salt-petre), is the prin. I. A. is a strong oxidising agent, readily giving up its oxygen with the liberation of iodine.

**Iodine**, (symbol I, atomic number 53, atomic weight 127), non-metallic element which belongs to the halogen group (*q.v.*). It occurs as iodide in sea-water from which it is collected by certain seaweeds, notably *Laminaria digitata* and *L.*

*stenophylla*, which contain as much as 0.5 per cent. It is also present in crude Chile saltpetre as sodium iodide.

**Extraction from Sea weed**—The weed is burnt in pits and the ash or *celp* boiled up with water and the solutions concentrated. The less soluble salts separate on cooling whilst the iodide remains in solution. The liquor is then distilled with sulphuric acid and manganese dioxide the *I* which is evolved being collected in cooled earthen ware jars.

**Extraction from Caliche**—The mother liquors from which the sodium nitrate has been separated as far as possible are treated with a solution of sodium hydrogensulphate which precipitates the *I* as a black muddy substance which is purified by sublimation. When pure *I* is a greyish black crystalline substance with a metallic lustre and peculiar odour. It has a sp. gr. of 4.0 and melts under pressure at 111° C. On heating it sublimes, giving rise to a purple vapour. It is only sparingly soluble in water, more freely in alcohol, and especially in potassium iodide solution, forming brown solutions. In carbon disulphide and chloroform the solution is purple. With starch *I* forms an intense blue coloration and by means of this test one part of *I* in a million parts of water may be detected. Chemically *I* is the least active of the halogens but nevertheless combines directly with many metals phosphorus etc. and also to a certain extent with hydrogen to form hydrogen iodide. Medicinally *I* and its compounds are of great importance. Its solution in alcohol (tincture of *I*) is used externally for subduing inflammation. The iodides of mercury, iron, and especially potassium are used to increase the activity of the absorbent system generally and in certain forms of chronic rheumatism, in scrofulous affections, mercury and lead poisoning, etc. Compounds of *I*, such as iodoform (*q.v.*) and allied substances, are largely used as antiseptics, silver iodide in the making of photographic plates, and large quantities of *I* and its compounds are of use in technical chemistry. In the form of a complex compound known as thyroxin, *I* is present in the thyroid gland. Deficiency of *I* in the diet causes enlargement of the general health and appears to be associated with goitre. It is a common modern practice to use table salt to which small quantities of iodides have been added, though in most countries sufficient iodine for the general requirements of the body is present in normal diet. In a few cases iodides are introduced into the public water supply.

**Iodoform, or Tri-iodomethane (CHI<sub>3</sub>)**, pale yellow crystalline substance melting at 119° C. and having a peculiar smell. It is best prepared by adding slight excess of a dilute solution of sodium hypochlorite to a solution of 50 parts potassium iodide, 6 parts acetone, and 2 parts sodium hydroxide dissolved in 1,000 parts water. Commercially it is frequently made by an electrolytic method, in which a direct electric current is passed through a warm solution of sodium carbonate, potassium iodide, and alcohol. *I* is slightly soluble

in water and has strong antiseptic properties. It differs from chloroform (*q.v.*) only in having iodine in place of chlorine and in the form of vapour acts as an anæsthetic.

**Iodole, or Tetriodopyrrol (C<sub>4</sub>I<sub>4</sub>H<sub>3</sub>N)**, yellow crystalline substance melting at 110° C. which is used as an antiseptic in place of iodoform. It is equally effective but devoid of odour.

**Iola**, city of Kansas, U.S.A. seat of Allen Co., on the R. Neosho 80 m. S.E. of Topeka. The riv. furnishes considerable water power and the town possesses an extensive medicinal mineral well. Pop. 7,200.

**Iolaus**, in Greek mythology, half brother and charioteer of Hercules, with whom he was worshipped as hero at Thebes. He aided Hercules to destroy the Lernaean hydra and helped Hercules' children in their contest with Eurytheus when the latter made war on them.

**Ion**, (1) legendary ancestor of the Ionian branch of the Greek race brought up in Apollo's temple at Delphi. Euripides takes the story as the theme of one of his tragedies. (2) Greek poet of Chios, living in the reign of Pericles and one of the lesser of Attic tragedians. He flourished at Athens between 480 and 422 B.C. His first tragedy was produced between 482 and 449 B.C., and he subsequently gained both the tragic and dithyrambic prize. He is also the reputed author of a philosophical treatise in the same number three and is credited with various epigrams, poems, elegies, encomia and comedies. He also wrote five historical or biographical works, including an account of the antiquities of Chios. See 1. Allegre *De l'ion Chio*, 1890.

**Iona**, or **Icolmkill**, one of the is. of the Inner Hebrides, Argyllshire, Scotland, separated from Mull by the Sound of I. It is about 4 m. long and 1½ m. broad, and covers a total area of about 2,000 ac. 600 of which are under cultivation, oats, potatoes and barley forming the chief crops. The coast is fairly level on the E., but rocky on the W. The inhabitants support their lives by agriculture and fishing. *I* is celebrated in hist. from its connection with Saint Columba, who about 637 A.D. came here and founded a monastery which became very famous. Later the is. was made the seat of a bishop. Its most curious feature of interest the most noted being St. Oran's Chapel attached to which is a burying ground containing the tombs of Scottish kings before Malcolm Canmore and four Irish and eight Norwegian kings. There is also the cathedral church of St. Mary. In 1905, it was restored and opened for public service by the Church of Scotland and the I. Community has since restored the monastic buildings. Pop. 200. See A and I. Ritchie *Iona Past and Present*, 1930. Lucy Mearns, *St. Columba of Iona*, 1949.

**Ionia**, city of Michigan, United States, and the cap. of Ionia Co. It is situated on the Grand R., 34 m. E. of Grand Rapids. Pop. 7,000.

**Ionia**, in ancient geography, the littoral district and is. of W. Asia Minor, adjoining the Aegean Sea. It was inhabited by Ion-

migrants from the Peloponnesus, and derived its name from the Ionians, one of the anct. tribes of Greece. The country was very flourishing, and out of it arose twelve great cities; Miletus, Myus, Priene, Ephesus, Colophon, Lebedus, Teos, Erythrae, Clazomenae, and Phocaea, together with Samos and Chios, which formed a league more of a sacred than political character. It held a periodic festival in the shrine of Panionium on Mt. Mycale near Priene, when religious worship was observed and games celebrated. Subsequently Smyrna was admitted to the league. The cities gradually fell under the sway of Lydia, but about 550 B.C. became subject to Persia. They became the independent allies of Greece after the Gk. defeat of Persia in 479, but in 387 with other Gk. cities again became subject to Persia. They were finally subdued by Alexander the Great after the fall of Miletus (334). I. was included in the Rom. empire after 64 B.C. It was later invaded by Turks and became part of the Turkish empire.

**Ionian Islands**, chain of is. extending along the W. and S. coasts of Greece, and comprising Cephalonia, Corfu, Cythra (Cerigo), Ithaca, Paxos, Santa Maura, and Zante, with several other dependencies. Total area 1100 sq. m. All the is. except Corcyra were included in the later Rom. empire; Corfu and Cephalonia were captured by Robert Guiscard (1081); in 1101 Corfu fell into the hands of the Venetians, who extended their sway over the is. but finally ceded them to France (1797). After coming under the influence of Russia and Turkey they accepted Brit. protectorate (1809-15), which continued to have influence over them until 1861, when they were annexed to Greece under King George. Pop. 260,000.

**Ionian School of Philosophy**, which fl. during the sixth and fifth centuries B.C., was chiefly interested in the primordial constitutive principle of the universe. The first of them was Thales, his chief successors being Anaximander and Anaximenes. The earlier philosophers sought to explain the material universe in terms of matter and force, finding material substance in everything that exists. About the time of Heraclitus a new thought sprang up. Anaxagoras asserted that everything existed from the beginning in an infinite number of infinitesimal atoms which were the seeds of all things which have since been produced. Diogenes of Apollonia elaborated on the universal homogeneity of nature, the universal substance of all things being air. The later Ionians, Archelaus and Hippo, reverted to the earlier thought of Thales.

**Ionian Sea**, in the Mediterranean, lies S. of the Adriatic and divides Italy from Greece.

**Ionie Dialect**, was one of the four varieties of Gk. language. It was principally spoken in the Ionian colonies of Asia Minor, but was not uncommon in some of the is. of the Aegean Sea. Out of the old Ionic arose the language of epic poetry. Herodotus distinguished four varieties of the New Ionic, in one of which

he wrote. The I. D. is not very different from Attic, but has a richer vowel-system which gives it a certain softness of sound.

**Ionie Order of Architecture**, see ARCHITECTURE—Greece.

**Ionidium**, genus of violaceous plants, inhabits tropical and sub-tropical countries, especially America. Sev. species are used medicinally on account of their emetic roots; the chief of these is *I. Ipecacuanha*, known as the white Ipecacuanha to distinguish it from the true Ipecacuanha of Brazil.

**Ionone** (C<sub>11</sub>H<sub>16</sub>O), ketone of the terpene series. It has a fine odour of violets and is used for the production of the artificial perfume.

**Ions**, in science the electrically charged particles present in solutions of electrolytes, or in gases subjected to electrical discharges. The term was introduced by Faraday, adopting a suggestion of Whewell. See ELECTRICITY, DISSOCIATION.

**Iorga, Neculai**, see JORCA, NICOLAE. **Ios**, one of the Cyclades Is. of Greece, with a fine port. According to tradition Homer was buried here. Pop. 2000.

**I O U** is, without additional words, an acknowledgement of debt. It differs from a promissory note in that it requires no stamp; and it need not be addressed to the creditor by name. Far from being a negotiable instrument like a bill of exchange or promissory note, an I O U is merely evidence of an account stated between the parties to it; but it is not evidence of money lent by the person who signs it.

**Iowa**, N.-central state of the U.S.A., popularly known as the 'Hawkeye State,' covering an area of 36,280 sq. m., 55,986 being land surface. Bounded on the N. by Minnesota; on the S. by Missouri; on the E. by Wisconsin and Illinois; and on the W. by Nebraska and S. Dakota. The surface is undulating, nearly four-fifths comprising rich prairies, forming good pasturage. The soil is generally fertile, the chief crops being Indian corn, hay, oats, wheat, barley, and potatoes. Linseed and sorghum are of importance commercially. Among the fruits are apples, cherries, grapes, plums, and strawberries; beetroot is cultivated for sugar. The state is the richest in arable land in the Union, and about one-eighth is composed of natural forest—oak, walnut, hickory, pine, cedar, elm, maple, and cotton-wood. In the E. portion of the state minerals abound, including coal, lead, zinc, iron, limestone, gypsum, clay, sandstone, and gravel. The leading industry is meat-packing; while dairy produce, including butter, cheese, and condensed milk, is of great value. Flour-milling and the manufacture of farm implements are important, and wool is a valuable commodity. All the rivers are direct or indirect tribs. of the Missouri or Mississippi, but only a few are navigable; there are sev. small lakes in the state. The climate is one of great extremes of heat and cold, generally with a dry winter and a wet summer. There are no very great cities. The negro pop. forms a very small percentage and the

foreign-born peoples are mainly of Ger. or Scandinavian origin. Iowa was formerly populated by Indians, but in 1788 the Fr. came to Dubuque to work the lead mines there; they later claimed the state, which was purchased in 1803, settled by a white pop. in 1832, and organised as Iowa Ter. in 1838. It was admitted to the Union as a state in 1846. It is divided into ninety-nine co., and the cap. is Des Moines, 159,800, other important tns. are: Sioux City, 83,000; Davenport, 66,000; Cedar Rapids, 62,000; Waterloo, 52,000; Dubuque, 41,000; Council Bluffs, 42,000; Ottumwa, 32,000; Mason City, 27,000; Clinton, 27,000; Burlington, 26,000; Fort Dodge, 23,000; Marshalltown, 20,000. The pop. in 1910 was 2,538,268 (negro 16,694). The Governor and the chief officers are chosen for a term of two years; legislature consists of a Senate and a House of Representatives. I. sends 2 senators and 8 representatives to Congress. The College of Agriculture at Ames is the finest of its kind in the U.S. It has over 5000 students. There are over 9800 m. of railway line. See J. Brigham, *Iowa*, 1915; I. B. Richman, *Ioway to Iowa*, 1931; Federal Writer's Project, *Iowa: A Guide to the Hawkeye State*, 1938; C. Cole, *Iowa Through the Years*, 1910; W. J. Petersen, *A Reference Guide to Iowa History*, 1912.

**Iowa City**, cap. of Johnson co., Iowa, U.S.A., on the Iowa R., 23 m. from Cedar Rapids. It is the seat of the Iowa State Univ. It has foundries and machine shops. It is a rich farming and stock-breeding dist. Pop. 15,000.

**Iowa River**, rises in Hancock co. in the state of Iowa, and flows in a S.E. direction entering the Mississippi in Louisiana. It is navigable to Iowa City and is about 350 m. in length.

**Iowa, State University of**, co-educational institution founded in 1847, but not opened until 1855, when the gov. moved from Iowa City, and the old capitol became the Univ. headquarters. Many new buildings were added; the Iowa R. flowing at the foot of the campus provides aquatic sports for the students. There are about 6000 students, and the teaching staff is over 500.

**Ipecacuanha**, emetic substance obtained from the roots of sev. S. Amer. plants. The true I. is a species of Rubiaceae known by the various generic names of *Cephaelis*, *Psychotria*, and *Uragoga*, and occurs in damp forests of Brazil. It is a small herbaceous plant with a prostrate stem and an annulated root. In medicine it acts as an emetic and stomachic, aids respiration, and increases perspiration. The white I. is a viscidaceous plant, known botanically as *Ionidium ipecacuanha*; the bastard I. is a species of Asclepiadaceae bearing the name *Asclepias curassavica*. The active principle of true I. is an alkaloid known as emetine, now used in the treatment of amebic dysentery. 'Dover's powder' is I. and opium.

**Ipek** (Pekia, Ped, or Petak), see *Pec*.

**Iphicles**: (1) Son of Amphitryon and Alcmene, and twin brother of Hercules. While the two babies were in a cradle,

Juno sent two serpents to kill Hercules, who strangled them. (2) Was a son of Phylacus and Olynene, whose cattle were famous for their size.

**Iphiorates** (c. 420-318 B.C.), celebrated Athenian general, the son of a shoemaker. He changed the dress and arms of the Athenian soldiers, and introduced the *pellaste* (αι πελταστai), or targeteers. These light troops were originally composed of Thracian mercenaries. He fought in the Corinthian War, and defeated the Spartans in 392. After 371 he assisted his father-in-law, Cotys, king of Thrace, in war against Athens, but was subsequently pardoned, and took joint command of the Social War.

**Iphigenia**, according to Gk. tradition, the daughter of Agamemnon and Clytemnestra. Agamemnon had provoked the goddess Artemis (Diana) by killing her favourite hart. When the Gks. were going to the Trojan war Artemis produced a calm, so that the fleet in Aulis was detained from sailing. The sooth-sayer Calchas advised Agamemnon to sacrifice I. in order to appease the goddess, and Agamemnon ultimately consented. According to one legend she died on the altar; but, according to another, Artemis put a hart or a goat in her place at the last moment, and carried her off to Tauris. There I. became priestess in the temple of Artemis, and saved her brother Orestes with his friend Pylades from being sacrificed to the goddess by fleeing with them to Greece, carrying away the statue of Artemis from the temple. I. was worshipped in Athens and in Sparta, and it is probable that she was really the goddess under another name. See A. Verrill in *Europides the Rationalist*, 189; F. Ernst, *Iphigenia and Andere Essays*, 1933.

**Ipomoea**, genus of Convolvulaceae, consists of about 400 species of herbaceous and shrubby plants growing wild in warm and tropical countries; many are cultivated in milder climates for their showy flowers. *I. Batatas* is the sweet potato; *I. purpurea*, the morning-glory; *I. purga*, the jalap; *I. pandurata*, the wild potato vine.

**Ipsambul**, or Abu-Simbel, ruins in Nubia, Upper Egypt, on the R. Nile. There are two rock temples, which were built by Rameses the Great, in the sides of steep cliffs. They contain numerous statues and sculptures. See *Eufrat*.

**Ipsus**, in anct. geography, was a tn. of Phrygia, in Asia Minor, where in 301 B.C., Antigonus was defeated and killed.

**Ipswich**, municipal co., and parl. bor., and the co. tn. of Suffolk, England, at the head of the Orwell estuary, 69 m. N.E. of London. I. was once a tn. of narrow anct. streets, jettied bath-and-plaster buildings, and storied inns; but is now a tn. of old and new, where Elizabethan oak mingles with fabrications in steel and concrete. Among its antiquarian remains are: the Ancient House, in the Butter Market, now used as a bookshop, the architectural show-place of the tn., reputed to have been built in 1567 by George Copping for Robert Sparrowe, a ballif of I. It has a wealth of oak carving

throughout, with fine oak-panelled rooms and richly decorated ceilings; Christchurch Mansion, built between 1548-50 by Edmund Witherpoll, with extensive rebuilding in the seventeenth and eighteenth centuries; it is now maintained by the Corporation as a museum of domestic antiquities, period furniture, and pictures, some by Gainsborough and Constable; Wolsey's Gateway (1528) in College Street, the only fragment remaining of Wolsey's ambitious plan to found a college in I. as a nursery for his Cardinal College at Oxford, with the aid of revenues derived from the suppression of monasteries; in 1530 work on his great College of St. Mary came to an abrupt end and the buildings were razed to the ground. The centre of the town and of its communal life is the Cornhill. Here are the town hall, general post office, and the banks. The town hall occupies the site of the old Moot Hall and the general post office that of the Shambles or butchers' mart. The Moot Hall was a ramshackle building with an outside stairway to the upper storey and with the stocks in front and the Market Cross on its right. Some of the streets leading into the Cornhill are narrow, but others have been widened. The main thoroughfare comes into the Cornhill and out again and runs by White Horse Hotel. Many of the finest shops are in the Butter Market near the town hall. In High Street to the N. is the Corporation Museum which originated in a museum opened (1817) by a society founded for the encouragement of the study of natural hist. amongst the working classes. It now includes depts. of general and local natural hist., archaeology, and ethnology.

There are sev. fine churches, mostly Perpendicular in style: St. Margaret's, built in the early fifteenth century with simple stone and flint panelled S. porch, embattled clerestory, and oak Tudor hammer beam roof; St. Peter's, near the site of Wolsey's ill-fated college, in Decorated style; like St. Margaret's this church suffered much from the iconoclast Will Dowsing; both also suffered exterior damage from air raids; considerable renovation and extension were carried out in St. Peter's in 1875 under Sir Gilbert Scott; St. Nicholas, with a fourteenth-century nave and aisles of particular interest architecturally. Other churches are St. Mary-le-Tower, the Corporation church in the churchyard of which King John's charter was received in 1199 by the bailiffs and burgesses; the church was almost entirely rebuilt in 1860-70 and all that remains of the sixteenth-century structure is the nave piers and arches; St. Mary-at-the-Quay, built or rebuilt about the middle of the fifteenth century; this church, too, was severely damaged by bombs; St. Lawrence, a lofty church in the Perpendicular style built of flint and brick with an embattled tower and 5 medieval bells. Of the I. inns which, though they have undergone many architectural changes, have yet stood beneath their same signs for over 4 centuries, the most famous is the 'Great White Horse.' A 'White Horse Inn' stood on the same site

in 1518, when it was probably one of the pilgrims' inns. Numerous personages, illustrious or disreputable, have spent a night there, but it was Dickens's disparaging allusions to it in *Pickwick Papers* (Chapter 22) that prompted the Amers. to build a replica of the inn at the World's Fair, Chicago. Other well-known I. inns are: the 'Crown and Anchor' of comparatively recent date; the 'Coach and Horses' first built as a private residence and only becoming an inn in the eighteenth century; the sixteenth-century 'Black Horse'; the 'Golden Lion' in Cornhill; the 'Old Bell', 'Half Moon', 'Golden Pleece'—in the yard of which bull-baiting was a popular pastime, and the 'Neptune', also once a private residence and noted for its carved ceilings and oak-panelled rooms. The first public library of I. was built in 1887. The present Central Library in Northgate Street was built in 1924. It is a noted depository for Suffolk records and has a growing collection of these original sources of social hist. There are also four branch libraries. There are 9 secondary schools situated in the various dists. of the town, 4 each for boys and girls, and the Northgate Grammar Schools. For further education there is a school of technology, the School of Arts and Crafts, the School of Commerce, and Christchurch Evening College. I. School, which has a continuous hist. from 1477 or even earlier, now ranks as an independent public school. Formerly estab. in Blackfriars monastic precincts and elsewhere, the school moved to its present site in 1851; the foundation stone was laid by the Prince Consort. The general hospitals of I. are the E. Suffolk and I. Hospital and the Bor. General Hospital. I. has six public parks in addition to many recreation grounds (182 ac.); Christchurch Park and arboretums, a richly wooded park of 70 ac., purchased by the Corporation in 1891, and containing the Christchurch Mansion Museum; Chantry Park and Mansion (124 ac.) presented in 1927 by Sir Arthur Churchman, Bart. (Lord Woodbridge) and opened by Princess Mary in 1928; Bourne Park (76 ac.) also presented in 1927 and opened by Prince Henry (Duke of Gloucester); Gypsyway Park (15 ac.) opened in 1910; Holy Wells Park and Mansion (61 ac.) also given by Lord Woodbridge and opened in 1936; and Alexandra Park (11 ac.) opened in 1904.

**Industries.**—The industries of I. include large engineering and agric. implement works (especially ploughs, tractors, harrows, threshing machines, and lawnmowers); tobacco; fertilisers; yeast; clothing; artificial silk underwear; boot and shoe manufs.; railway plant; tanneries; printing works; breweries; maltsters and flour mills. Among the industrial products are: electrical products—motors and dynamos; industrial trucks and trolley buses; mobile cranes; excavators; water control equipment; concrete mixing machinery; roller mills; grain dryers; air compressors; structural steel-work; iron and non-ferrous castings; beet sugar factory, and food factory plant; steel-framed buildings;

heating radiators and boilers; malleable iron and gunmetal fittings and gunmetal and cast iron valves for the heating, oil and sanitary engineering trades; brass and copper base alloys; metallurgical plant for the manu. of bearings, etc.; cigarettes; lotterpress and lithographic printing and stationery; sawing and planing machines; plywood, wall boards and plastics; domestic engineering articles; refrigerating plant; sacks, bags and tarpaulins; garden seats and other garden furniture.

**Dock and airport.**—Vessels drawing 19 ft. can enter the dock (area 26 ac.) at I. and ships up to 7000 tons can berth at Cliff Quay. Following on the passing of the first I. Dock Act, 1837, work on a new dock began in 1839 and, by 1843 I. had the largest wet dock in Great Britain. In 1852 the dock commissioners became a corporate body with much increased powers. In 1881 a larger entrance lock was opened and in 1904, 800 ft. of new quay was built. In 1923-2, came a new deep water quay (1800 ft.) on the E. side of the Orwell. The docks and quays are equipped with modern electric cranes and all rail facilities. The airport (opened in 1930) of I. on the E. outskirts of the tn. is one of the finest municipal airports in the country.

**History.**—Anc. relics indicate that I. was the site of a Brit. settlement 2000 years ago or before the Rom. occupation. Throughout the Saxon period, I. or Gypseywyk as it is called in the *Anglo-Saxon Chronicle*, began a steady development which at length attracted the attention of Dan. marauders. The Danes were defeated at sea off the mouth of the Orwell in 880 by King Alfred; but in 991 and 1000 they invaded and set fire to the tn. and levied a fine of £10,000 upon the inhabs. But these raids do not appear to have had any lasting effect on the tn., whose port rapidly outgrew those of the rival townships on the E. coast. At the time of the Domesday Survey I. had as many as 9 churches. In 1199 I. received its first charter, granted by King John (see above) which gave to the inhabs. liberties and privileges they had never previously enjoyed and exempted them from many taxes. By 1280 the traffic through the port was of sufficient vol. to justify the appointment of a collector of customs. I. was in fact a flourishing port when Hull was still an insignificant vil., and Liverpool merely a swamp. It was at I. that Robert de Beaumont, earl of Leicester, landed with a force of Flemish mercenaries to attack the King's armies near Bury St. Edmunds in 1173. In 1338, the tn. sent 12 ships, in addition to men and supplies, to join the earl of Leicester's fleet before the battle of Sluys. It was to Edward III. that the tn. owed the introduction of an industry that brought it new prosperity; for he brought over to England 70 families of Wallons, who were weavers and wool-workers, and the woolen industry grew rapidly in Suffolk generally. In 1446 occurred the election of the tn.'s first representatives in Parliament; from 1446 I. continued to send

2 members to Parliament, until 1918 when the number was reduced to one. In 1518 Henry VIII. granted to the corporation jurisdiction over the Orwell estuary as far as what is now the port of Harwich. The course of the seventeenth century saw the migration of the woolen industry northward and westward, and by 1650 the trade of I. had declined by one third, but as a set-off the tn. had begun to participate in the profitable coal importing trade between Newcastle and London. More skilled foreign artisans came to I. in the reign of Charles during the religious persecutions of the Huguenots. Shipbuilding became a major industry of the port in the seventeenth century and many E. Indiamen, as well as warships, were launched from its yards. It was still being carried on as late as the middle of the nineteenth century. But the size of the ocean-going ships increased beyond the capacity of the I. yards, so that the industry declined and ultimately disappeared. Among the famous names associated with I. that of Wolsey (b. in St. Nicholas Street 1171) is pre-eminent. Horatio, Lord Nelson, was High Steward of the bor. from 1800 to 1805. Adm. Lord Vernon was the tn.'s parl. representative in 1741, 1747, and 1754. Viscount Kitchener of Khartoum and of Aspal (Suffolk) was High Steward, 1909-16. Thomas Gainsborough and John Constable both spent part of their lives in I. Francis Bacon was sev. times member of Parliament for I. Yet other names are those of Sir Christopher Hatton, after whom Hatton Court is named; Thomas Clarkson, after whom is named Clarkson Street; Thomas Cavendish, the navigator, after whom Cavendish Street is named; David Garrick, who began his stage career in I.; Jean Ingelow, Rider Haggard, Bernard Barton, the Suffolk poet, and the Rev. Richard Cobbold, author of *The History of Margaret Catchpole*, 1845. Pop. (estimated, 1947) 101,000.

**Iquique**, city and seaport in Chile, cap. of the prov. of Tarapaca, 820 m. N. of Valparaiso, on the Pacific coast. Owes its commercial importance chiefly to the export of nitrate of soda and borax. Until 1830, when the export of nitrate began, I. was only a small fishing vil. of little importance. It is now connected by rail with the inland tn. of Tarapaca and various mining centres and is well provided with tramways, electric light, telephones, etc. It was founded in the sixteenth century, upon a peninsula between the Colorado and Cavancha headlands. Twice, in 1668 and 1875, the tn. was nearly destroyed by an earthquake and tidal wave, and in the war between Chile and Peru it was ceded to the former by treaty in 1883. Water is brought to the city from Pica, 60 m. away, a vil. settled by Sp. soldiers in the sixteenth century. Large deposits of guano are found on the coast. The climate is rainless. Pop. 39,200.

**Iquitos**, tn. of Peru, and cap. of the dept. of Bajo Amazonas de Loreto, situated on the Marañon, a branch of the Upper

Amazon, 2300 m. from the mouth, and 1268 from Lima. It is a Peruvian flotilla naval base. There is a wireless station and a regular air service. Pop. estimated at 20,000.

**Iquitos**, tribe of S. American aborigines, in the region between Peru and Ecuador, on the N. part of the Upper Amazon.

**Irak-Ajemi**, central prov. of Persia, almost corresponding to the ant. Media. Its surface consists very largely of elevated table-lands, but there are numerous fertile valleys, rich in cereals and fruits, but only partially cultivated. The E. part is occupied by the great salt desert of Dasht-i-Kavir, or Khorassan. It comprises the modern dists. of Kurdistan, Ardiclan, Luristan, Isfahan, and Kashan. The prov. contains the prin. tns. of Persia, including Teheran, the cap., and Isfahan. The industries consist in the weaving of carpets, most of which are exported to Europe, and the manu. of glass and porcelain. Area, 138,190 sq. m. Pop. (estimated) 3,000,000.

**Iran**, or **Eran**, originally the name of the great plateau bounded on the N. by the Caspian Sea and Turanian Desert, on the S. by the Persian Gulf and Indian Ocean, on the E. by the Indus and on the W. by Kurdistan and the Tigris. The name, which is now the official designation of the Persian kingdom, is derived from *Aryāna*, 'the country of the Aryans.' Strabo declared that the name and language extended to the Persians, Medes, Sogdians, and Bactrians, as well as to the inhabs. of the S.E. of I. *See* PERSIA.

**Irapuato**, tn. of Mexico in the state of Guanajuato. It is an important railway junction, and is situated on the railway between Mexico and Guadalajara. Pop. 29,700.

**Iraq** (*Mesopotamia*, 'the land between the rivers'). A kingdom in the Middle E., extending from Kurdistan on the N. and N.E. to the Persian Gulf on the S. and S.E., and from Persia on the E. to Syria and the Arabian Desert on the W., the position being between 37° and 48° E. long., and from 37° to 30° N. lat. The country has an area of 160,600 sq. m. and includes the former Turkish vilayets of Mosul, Bagdad, and Basra.

The pop. according to the census of 1915 was 1,611,350. The pop. of the chief towns is: Bagdad, 1,009,098; Mosul, 553,488; Basra, 400,078; Diwanich, 331,909; Muntadig, 281,617; Arbil, 273,197; Diyala, 269,752; Hilla, 263,837; Kirkuk, 262,209; Amara, 183,911; Kut, 180,145; Sukemani, 175,812; Dulaime, 157,616; and Karbala, 140,356. Of a total pop. of 3,560,500 in 1935, there were 313,600 Moslems; 101,300 Christians; 90,900 Jews; and 41,100 of other religions.

**Physical Features**.—I. may be divided into three main divs.: the Plain, the Uplands, and the Highlands. The Plain consists of the delta of the Tigris and Euphrates, and extends roughly from the Persian Gulf to a line joining Falujah with Khanaqin. The soil is alluvial, and there is no stone. The rivs. run along ground a few ft. higher than the rest of the Plain,

which is consequently liable to be flooded when the rivs. are high. This happens each spring when the snows in Kurdistan and Armenia melt, local rain having but small effect on the rivs. The rise of the Tigris at Bagdad is sometimes as much as 23 ft., and that of the Euphrates as much as 14 ft., at Falujah. At no point is the Plain higher than 150 ft. above sea level. The ann. rainfall on the Plain averages 6 in. only, and cultivation depends almost entirely on irrigation. There are three chief forms of irrigation: (i.) perennial, in which form the land is planned and the canals from the riv. to the land to be irrigated are designed in such manner that the water in the riv. will always 'command' the land, or, in other words, flow on to the land; (ii.) from inundation canals, in which form irrigation canals are excavated from the rivs. to the land in such manner that the water, during spring, will command the land, and so give enough water for summer crops—a very unscientific form of irrigation; and (iii.) lift irrigation, in which form water is lifted by pump and engine or other mechanical means from the riv. or canals up on to the bank, whence it flows down a small water channel on to lands closely adjoining the riv. This last form of irrigation has become more popular recently with the cheapening of oil through the development of oil in I. The chief irrigation works are in the Hindiyah Barrage, the Daghurrah Barrage, the Beldi Regulator, and the Diahah Weir at Table Mountain. There is a rich date-palm area around Basra, and the date trade there is large, 75 per cent. of the world's consumption being produced in this area. The Uplands div. forms the area between the Plain and the Highlands, and consists, in the S.W. portion, of an uncultivable gypsum desert, but in the N. and N.E. of rolling plains with good soil and with a rainfall thrice as heavy as that in the Plain. Mosul, Kirkuk, and Amil, the chief tns., are situated on rich soil between 700 and 1200 ft. above the sea level, the rain being heavy enough for growing winter cereals extensively. The best time to tour these areas is in April and May, when the country is very beautiful. There is no irrigation to speak of, though around Arbil and Kirkuk it is carried on in a small way by the ant. system of 'Karez,' a system known in the Middle E. and Afghanistan for centuries. This mode of irrigation is by a series of wells connected by tunnels, the tunnels being skillfully directed, and so inclined as to bring the water to the surface at the desired spot. The Highlands lie N.E. of a line drawn from Falsh Khabour to Khanaqin, and are crossed by a number of ranges of mts. rising at some points to 14,000 ft. There are many beautiful valleys and plains among these mts., and the valleys are full of flowers. Rainfall is heavy in winter, and may continue till May. The mts. are covered in snow throughout the winter. Fruit is grown in the N., tobacco in the S. Highlands, especially in the dists. of Sulaimanlyah and Hanla.

*Iraqi Tribes*—Outside the cities the pop. of I. is almost entirely tribal, and divided into communities of kindred families under their own chiefs or sheikhs. It is easy to observe in I. the various stages of tribal development from the nomad of the desert to the riverain cultivator, and in the transit from desert to tin (where that has taken place) the tribes have lost little of their tribal characteristics and customs. In the Plain there are Bedouin or Biduin tribes, nomadic pastors of camels, sheep and horses, others are semi-nomadic or semi-settled and marsh tribes. The three chief I. down tribes of I. are the Shammar living between the Euphrates and the Tigris, the Dhafir in the S. and elsewhere the Aruzah. Blood feuds still prevail and the tribes have their own unwritten codes and methods of punishing offenders or settling quarrels, and the I. Gov. in its administration has to pay due regard to tribal custom. Wealthy cultivators still take a pride in dwelling in black tents, reminiscent of the time of Abraham, while the modern man's guest house is but a well-lighted even though he and his family may live in a house.

*Constitution and Administration*—By a treaty of alliance (1930) between Great Britain and I. King Faisal bin Husain (the first king of I.) (the I. Britain undertook to give I. such advice and assistance as might be required without prejudice to I. sovereignty) to support the armed forces and financial etc. of I., and to use its good offices to secure the admission of I. to membership of the League of Nations as soon as possible. I. was admitted to the League of Nations in 1932. To effectuate this treaty, there was a Brit. adviser to each Minister of the I. Cabinet, and also a number of Brit. officials in each ministry, all being responsible to the I. Gov. Legislative power is vested in Parliament with the king of I. and the Parliament consists of the Senate and the Chamber of Deputies. The Senate has twenty members or elder statesmen nominated by the king of I. and the Lower House 112 deputies elected on the basis of one deputy to every 20,000 male subjects. I. is divided into fourteen main administrative divisions, each being administered by a *Mutasarrif*, who is responsible to the Ministry of the Interior but is also the agent and representative of the other ministries. Each *hwa* is divided into two or more *qadhas*, administered by a *Quim Maqqam*, and each *qadha* is divided into two or more *nahiyas*, administered by a *Mudir*.

*The Iraq Army*—The decline of I. during the years following the First World War was mainly in the hands of the R.A.F. and sev. Brit. squadrons were stationed in the country. But after 1922 the R.A.F. command was transferred to Hinaidieh, where it is stationed solely to safeguard Brit. interests. In 1939 the Iraqi army contained two *divs* (twenty-eight infantry battalions, three cavalry regiments, six batteries of mt. artillery, etc.). The air force comprised two army air co-operation squadrons, one bomber transport squadron, and one fighter squadron.

The total strength of the army and air force was then 28,000 officers and men. Compulsory military service for all men between nineteen and twenty-five had come into force in 1936. The bulk of the rank and file are Shi'ah tribesmen of S. I., but Kurds and Turcomans are enlisted in considerable numbers, together with Assyrians (Chaldeans and others) and others. There is also a police force of 10,000 men, half on foot and half mounted. There is a camel corps which patrols and garrisons the W. and S.W. frontiers in co-operation with twenty armed cars. In certain districts which are inclined to be turbulent a system of police post in helicopter-like touch with one another has done much to isolate kings of murderers and to bring peace and prosperity to the area.

*Education*—There is a Ministry of Education staffed by Iraqis. Primary schools are established in the *hwas* and elementary schools in the vil. There are about 103 elementary and primary schools and 71 secondary and intermediate schools, the chief being at Bagdad and Mosul and in I. schools have a troop of boy scouts. There are also two technical schools for boys, a home arts school for girls, and seven training colleges for elementary school teachers. There is no university, but certain schools or colleges such as the College of Medicine, the Law School, the School of Agriculture, and the Engineering School provide specialised courses after completion of the secondary courses.

*Medical Services*—The organisation of modern hospitals staffed by personnel from the Royal Medical College and the Ebnuna College at Bagdad is one of the triumphs of the Brit. mandatory or treaty regime. Gradually the tribesmen who had hitherto resented such aid in their own ignorant tribal doctor required the help of coming into the hospitals attended by the stories of wonderful cures. The Gov. Public Health Service controls all medical practice and maintains a score of hospitals and some seventy dispensaries.

*Agriculture and other Resources*—Agriculture is the chief occupation, and yields the bulk of the revenue. Most of the agric. pop. is engaged in the extensive (i.e. a light amount of work put into a large extent of country) cultivation of wheat and barley in winter and in summer such crops as rice, dates, maize, sugarcane, and sesame. The cultivator class is quite distinct from the pastoral, which latter is the nomad Arab. Cotton has been added as a summer crop, and good quality Amor types of cotton give profitable yields. In 1915 there were 6000 ac. under cotton. The flocks of sheep, goats, and camels cover enormous areas of grazing ground, and the desert, after good rains, provides plenty of nutritious grasses. The oil resources of I. are most important, and are jealously guarded by many European Powers. They are developed by two companies—the Turkish Petroleum Company, and the Khanaqin Company, the latter being a subsidiary of the famous Anglo-Persian

Oil Company. The Turkish Petroleum Company is operating wells under a Concession granted by the I Gov in 1925. An oilfield, 30 m<sup>2</sup> of Khanaqin near the Persian frontier, is worked by the Khanaqin Oil Company. The Brit Oil Development Company (Mosul Oilfields Ltd) holds a concession for oil covering Iraq ter W of the Tigris and N of lat. 33°. The Basra Petroleum Company hold a concession for oil covering the southernmost part of the country. Oil production in I averages over 4½ million tons annually. The Company's pipe line bifurcates after some distance, one branch

vailing N.W. wind acts with the current so that sailing craft have to be towed upstream, and again, the rvs are very shallow in autumn. Between Mosul and Bagdad flat bottomed boats and stern-wheel steamers carry freight during April and May, and rafts of skins and poles are used for produce carried down stream to Bagdad. Motor boats are also used. No steamers ply on the Euphrates, which is too shallow, and sailing craft carry the local freight. The Shatt el Arab, which is formed by the combination of the Tigris and Euphrates at Qurnah (the traditional site of the Garden of Eden) is navigable to

THE TOMB OF ZULAIKHA IN IRAQ

ending at Haifa, and the other at Aleppo. The chief exports are dates, wool, grain (barley for the most part), hides and skins, cotton, liquorice, and gill nuts; oil will no doubt take an important place in the future. There is also a large transit trade amounting to the ann value of £1,000,000, this trade being chiefly with Persia.

**Transport**—There are four main railway lines radiating from Bagdad. These terminate at Mirat (the port of Basra) at Khanaqin (near the Persian frontier) at Kirkuk, and at Baqi. The Khanaqin and Kirkuk routes branch apart at Qaraghau Junction. The Bagdad-Basra line has short branch lines to Karbala and to Nasiriyah. A standard gauge line from Bagdad to Tel Kutchik passes along the r b of the Tigris via Mosul. The main Basra-Bagdad line passes the ancient sites of Ur, Babylon, and Kish, and special railway facilities exist to enable travellers to visit these cities. The total mileage of track is 950. (See also BAGDAD RAILWAY.) There are some 4000 m. of roads and tracks, but only 750 m. of metalled track roads, and yet it is possible to motor to almost every part of the country over the earth roads, except the mountainous regions and the marshes. Riv transport plays an important part in the life of the country, but navigation of the rvs. is difficult owing to the fact that the pre-

vious steamers is far as Basra. Air mail is dispatched and received in mails conveyed by the Brit Overseas Airways Corporation. Air mail communication with U.S.A. is maintained from Hong Kong to San Francisco by the Pan-American Transpacific Air Service.

**The Holy Cities of Iraq**—The Holy Cities of Nejat, Kerbela, Kadhnan and Samarra are focal points of importance to all devoted (Shi'ah) Moslems, who come into them on pilgrimages from Persia, India and other countries as well as from I. The Shrine of Ali at Nejat is erected on the historical spot where, according to tradition, halted and rested a camel which had been set loose from Kufah carrying the body of Ali the son in law of the Prophet. Ali was told, had been killed at prayer in the famous mosque at Kufah 6 m. distant from Nejat. At Kerbela are the shrines of Hussain and Abbas. Hussain the son of Ali, was killed slain with his following of 300 men at a battle at Kerbela.

**Antiquities**—A valuable collection of antiquities is housed in the I Museum, which was erected by the celebrated (critic) Lowthian Bell (qv), who organized and for many years directed the Antiquities Dept. of the Museum. The colossal statues of the scribe gods Nabu and the winged bulls now in the courtyard were brought from the palace of Ashur-nasirpal II and Shalmanasser, at Calah (Nimrud),

in 1928, and there are, besides, antiquities from the earliest period down to 1700 B.C., the whole illustrative of the continuous hist. of I. These antiquities include painted pottery from Kish (q.v.) and elsewhere; inlaid friezes from Ur and Kish; gold, silver, and copper vessels and weapons from Ur; statues from Adab and other places; ivory combs, toilet boxes, pins, etc. from various sites; terra-cottas and numerous other objects of a fascinating character. At Eridu in S. Iraq, a few miles S. of Ur excavations have revealed a temple dating, perhaps, from about 1000 B.C., and a cemetery said to be at least 6000 years old. It is divided into brick compartments pointing S.E. and each of these contained implements evidently intended for the future life. Other finds nearby included the remains of ten temples at different levels. The lowest of these levels also contained a temple of the fourth millennium B.C., and the highest a Sumerian tower dating from about 2200 B.C.

For the results of archaeological excavation, see BABYLONIA:—Recent discoveries; UR.

*History of Iraq since 1914.*—In 1914, after Turkey had declared war on the Allies, a Brit. force was landed at Basra to protect Brit. interests in the Persian gulf. The force was not originally intended to drive out the Turks, but, attack being often the most effective means of defence, the force advanced up the Tigris. Flushed with their initial success, they advanced too far, and eventually capitulated at Kut-al-Amara (see MESOPOTAMIAN FRONT; TOWNSHEND, SIR CHARLES). Reinforcements were then obtained and pushed forward in 1917 under Sir Stanley Maude (q.v.) to recapture Kut, which place, after heavy fighting was occupied by the Brit., who then rapidly pursued the routed Turks. They entered Bagdad on March 11, 1917. Gen. Maude then issued a proclamation to the people telling them that the Brit. had come to liberate them from the Turks: that the Brit. wished the people of I. to regain their past prosperity. Hence in 1921 the Brit. Gov. implemented these promises, and after election by the people, King Faisal acceded to the throne of I. on Aug. 23, 1921. This was not, however, accomplished without opposition and bloodshed. Amidst a welter of conflicting interests—Britain's enemies playing off Indian against Arab—Great Britain announced her acceptance of the mandate for I. under the League of Nations. Meanwhile the Arab Gov. at Damascus had encroached on the Euphrates boundary, with the result that the tribes N. of Bagdad and around Mosul broke out into revolt. This precipitated a general Arab rising in the Mosul region (1920). Reinforcements arrived, however, and order was speedily restored in that part of the country. The Arab tribes in the middle Euphrates region and around Hillah and Bagdad, including the most turbulent in the country, then agitated against the Brit. mandate, and, after the announcement that Sir Percy Cox would be

appointed High Commissioner with power to create a Council of State under an Arab president and an elective assembly, the whole of Central I. rose in arms, and a body of young troops of the Manchester regiment, numbering about 300, were massacred, and numerous Brit. officials were either murdered or made prisoner (1920). Troops were rushed from India, many of the leaders of the revolt were deported, and order was gradually restored, agitation by the Iraqis being further discouraged by the fact that the Fr. had in the meantime occupied Syria, and so ended the régime there of King Faisal. Sir Percy Cox, having assumed office, invited the Naqib of Bagdad, one of the foremost Arab dignitaries, to form a Provisional Council of State. Soon afterwards it was learned that Faisal was journeying to I. as a candidate for the crown, and after a referendum on the rival claims of himself and Ibn Saud, Faisal was duly proclaimed elected King. Faisal then called upon the Naqib to form a Cabinet, or rather to continue the administration with the members of his Council. It now seemed to the outside world that 'Great Britain could lay down the burden she had hardly yet shouldered.' But, as subsequent events showed, the transformation was as yet merely on paper, and all the work of educating the country into the ethics of western institutions was to come. The years 1921-22 were marked by further disturbances, notably on the Kurdish border, in the S.W. of I., and, once again, in the Mosul prov. These disturbances were to a large extent fomented by agents of Turkey, with which country the Allies were still theoretically in a state of war, and, moreover, Britain had shown pro-Gk. sympathies in the Greco-Turkish war, 1921-22. Brigandage was rampant, and the desert tribes, particularly the Shammar, were creating further difficulty by seeking refuge in I. from the punitive operations of Ibn Saud, the Sultan of Najd. The Shammar were the hereditary foes of Saud, and the latter's forces followed them into I. and attacked the I. camel corps and shepherd tribes not far from the railway between Bagdad and Basra. All this trouble coincided with an agitation by Faisal and his prime minister for the complete abrogation of the Brit. mandate as being inconsistent with Iraq's sovereign independence. At this time I. wanted a treaty in place of the mandate, whereas Britain was aiming at a treaty within the mandate; so that the difference was purely technical, but the position was complicated by an Arab agitation against even a treaty relationship. Faisal, however, urged on by this agitation, refused to sign the treaty, with the result that Sir Percy Cox assumed sole authority, and by vigorous measures against agitators restored order. This accomplished, a treaty was at length substituted for the mandatory relationship, although, as between Great Britain and the League of Nations, the mandatory obligation necessarily still subsisted. Great Britain undertook to secure I.'s admission to the League in certain

events, the principle of this policy being the ability of I. to defend herself. Even if the I. Nationalists had some cause for raising a charge of breach of faith against Great Britain in regard to I.'s early admission to the League, the whole situation was obscured by the Turkish menace to Mosul, which prov. the Turks flatly refused to cede, trusting to the sympathy of France. Negotiations between Great Britain and Turkey having failed, an International Commission was appointed by the League to adjudicate on the Mosul boundary. The outcome of these deliberations was that Mosul was given to Iraq, and in Jan. 1926 a new treaty was accordingly signed between Great Britain and I. extending the period of the previously existing treaty from four to twenty-five years after the ratification of peace with Turkey (see LAUMANNE, TREATY OF), i.e. from Aug. 6, 1921, for twenty-five years, or until such time as I. might be admitted to League membership. In 1932, however, the mandatory régime came to an end with I.'s entry into League membership. King Faisal I. in 1933 and was succeeded by his son Ghazi, who d. in April, 1939, as the result of a motoring accident, and was in his turn, succeeded by his infant son, Faisal II. (b. 1935). I. now reverted to its habitual régime of intrigue and violence. Already the more enlightened parties of Gen. Nuri es-Said Pasha and Yasin Pasha, the Nationalist, had been ousted by the machinations of Hikmet Suleiman and Bakir Sidki, chief of staff, in 1936; but Sidki was assassinated by a soldier in 1938 and his colleague Hikmet resigned in favour of Nuri Pasha, who now returned from exile. I., under Nuri, sided with Britain in the Second World War and broke off diplomatic relations with Germany in accordance with the terms of the alliance. But a dangerous revolt was prepared by Rashid Ali in 1941 in conjunction with the Ger. gov.

**Revolt in Iraq.**—A coup d'état, dangerous in its possible repercussions on Brit. interests in the Middle E., was carried out on April 3, 1941 in Iraq by a group of military leaders, their civilian allies being Sayid Rashid al Gailani, prime minister, and Hajj Aunni, the ex-Mufti of Palestine, who had led the anti-Brit. revolt in Palestine sev. years previously (see PALESTINE) and had fled to Beirut and thence to Iraq. After 1936, when Gen. Bagir Sidki set up a dictatorship, ushered in by the murder of Janfar Pasha (q.v.) and terminated by his own assassination, military interference became chronic in the political affairs of Iraq. Rashid Ali tried to give the movement a pan-Arab flavour, but there is no evidence that he had much support in his own or in the neighbouring Arab countries. The leaders of the movement chose a moment when the Brit. Gov. had their hands full in the Balkans and in Africa and when the Regent, Emir Abdul Ilah, was absent from the cap. By treaty arrangements with Iraq, Britain had acquired bases in the country through which to defend her communications E. and W., and the coup

d'état which was fomented by Ger. influence and promises of military aid, was timed to coincide with Germany's attack on Libya and in the Balkans, and, no doubt, to enable Ger. agents to secure control of the Iraqi oilfields. For long Germany had been exploiting whatever might be to her advantage in Iraq, and her efforts in this direction were guided, as long previously as 1936, by Herr Grobba, the able,

L.A.A.  
A YOUNG KURD OF BAGDAD

if unscrupulous, Ger. minister in Bagdad. But apart from Ger. influence and the hostility of the ex-Mufti, the Brit. Gov. had long experienced difficulties with the Iraqi Army, which had no particular connection with Germany, first over conscription and then over armaments. Germany naturally exploited Iraqi disaffection on the armaments question which when the war broke out was still a stumbling block between Britain and Iraq. Ger. agents gradually succeeded in suborning the services of the four chief army commanders, who became known as the 'Golden Square.' The most remarkable of these was Salah-ed-Din, commander of the W. Army, who, like the ex-Mufti of Palestine, had once served in the Turkish army. But it was Rashid Ali who gave his name and political influence to the rebellion, a man who came of one of the oldest and noblest families of Islam, being a descendant of the eleventh-century saint, Abdul Qadir al Gailani, whose memory is still revered in these regions. Rashid himself was an obscure scion among many sons of a wealthy father and had spent the previous war in the Turkish legal service. He first entered the Iraqi cabinet in 1926 as minister of the interior. For a long time he had been regarded by the Iraqis as untrustworthy and a double-dealer. In 1933 he became prime minister for the first time and revolutionised his country's financial affairs; he became prime minister again in 1940 and then quarrelled with the Brit. Gov.

over the It. legation in Bagdad. The fact that Iraq never broke off relations with Italy as she had done with Germany enabled propaganda to be continued by It. and Ger. agents with It. passports, Berlin being the directing force. Rashid's actions were not inspired by anglophobia, but were rather the outcome of a gradual drift into hopelessness over any pro-Arab solution of the Palestine question (see BALFOUR DECLARATION; PALESTINE) and fear of a Ger. victory in the war. Gen. Wavell's great victory in the battle of the W. Desert (*see above*) had no effect on the Arab mind in Iraq, the It. as a military race counting for nothing in their eyes. Thus the rapprochement between Rashid Ali and the Gers. now began seriously to jeopardize Anglo-Iraq relations. The premier's party, averse from a breach with their traditional ally, Britain, left him, and early in 1941 Rashid, casting about for new friends, joined forces with the Golden Square and tried to force the regent to appoint puppets to the cabinet (Jan. 1941). The regent, however, escaped to Diwaniyah where the Army commander was loyal. This earlier crisis achieved little and Rashid Ali went out of office, being succeeded by Gen. Taha al Hashimi. The new prime minister's efforts to dislodge the Golden Square, however, proved abortive and while the four remained nothing could be done to dissipate the baneful influence of the It. legation. In April the Golden Square, aided by Ger. funds, took matters into their own hands and, marching by night into Bagdad, seized all the key positions. Taha resigned and the regent again fled, while the young king, Faisal II., was kept a close prisoner. Amidst these events Sir Kinahan Cornwallis, the new Brit. ambas., arrived in I. and skillfully made use of the rebel gov.'s superficial attitude of conciliatoriness to effect a peaceful landing of Brit. troops at Basra. But the arrival of still more transports soon afterwards precipitated the coup of April 3. The Iraqi military leaders, relying on the Ger. military aid which never reached them, now decided to get in the first blow. Without warning they made a second night march across the Tigris and Euphrates to the Brit. air base in the W. and took up positions on the low escarpments at Habbaniyah. Thence they attacked the R.A.F. aerodrome. The R.A.F. at once accepted the challenge and very soon their repeated raids on the military aerodromes of Mesopotamian Rashid and on the Bagdad airport had resulted in the destruction of most of the Iraqi air force and planes. Rashid Ali's brief Ger.-proped régime tumbled as Brit. troops came within 5 m. of the cap and he himself fled to Iran with his chief supporters. His revolt, in fact, had been premature. Meanwhile the regent had returned and exhorted the people to join in the fight against the Nazi hirelings who had plunged their country into war. The campaign was short-lived. A Brit. mobile column, having overcome the Iraqi positions at Habbaniyah, marched on Bagdad, Khan Buqta fell on May 28

and Fallujah soon afterwards. The revolt then completely collapsed. I. declared war on the Axis powers in 1943, but with little active participation. Sympathy with the Arabs over the Palestine question was manifest, and the Premier Nuri Pasha visited the heads of most Arab states in 1944, thus promoting the Pan-Arab Congress of Sept., from which, in 1945, developed the Arab League. In 1947 all Brit. forces were withdrawn except the two R.A.F. bases at Shaibah and Habbaniyah. On Jan. 13, 1948, an Anglo-Iraqi treaty was signed, but immediately widespread demonstrations against it took place, the cabinet of Sayid Saleh Jabr resigned, to be succeeded by that formed by Mohammed al Sadr; the treaty was rejected on Feb. 1, since it did not 'realise Iraq's national aims.' The end of the Brit. Palestine mandate and the proclamation of the state of Israel brought the Palestine situation to a crisis; on the night of May 14-15, 1948, Iraqi troops joined with those of Egypt, Transjordan, Syria, and Lebanon, in the invasion of Palestine.

Irawadi, or Irrawaddy, chief riv. of Burma, is formed by the confluence of the two arms of the Malikha and Mehkha, which rise in the N.E. of Assam, near the Tibetan frontier, a short distance above Bhamo. It follows generally a course from N. to S., a total distance of 1500 m., and falls into the bay of Bengal, between the bays of Martapan and Cape Negrais, through a wide delta with nearly a dozen mouths. The delta is a fertile rice-growing district, but only two of the mouths, the Bassein and the Rangoon, are navigable for big boats. The chief tribes are the Chindwin and the Shweli, and the chief towns, on its banks are Hasein, Rangoon, Prome, Ava, Mandalay, and Bhamo. The riv. is the great highway for commercial traffic, and drains an area of about 188,000 sq. m. of very fertile land. *See also* BURMA, SECOND WORLD WAR, CAMPAIGN IN.

Irbbit, tn. in the Sverdlovsk Region of the R.S.F.S.R. at the junction of the Irbbit and Nitsa, 110 m. N.E. of Ekaterinburg. It

is connected by steamboat lines with the prin. tns. of the Obi Valley, and has a large ann. fair in Feb., considered the most important, in Asiatic Russia, and attended by a number of European and Asiatic merchants. Pop. about 20,000.

**Ireland, John** (b. 1879), Eng. composer, b. at Bowden, Cheshire, son of Alexander I. He was educated at Leeds Grammar School and at the Royal College of Music, studying under Stanford. Began with concerted chamber music and songs. Two violin sonatas followed, and these estab. his reputation at once. His best-known subsequent works are a pianoforte sonata, *Mai-Dun*, a symphonic rhapsody (1921), and a piano concerto. Has also written a number of songs, one of the best being the setting of Maschke's *Sea Fever*, and shorter works for the pianoforte. Other works include the song-impression *Mare-gold*; *the Land of Lost Content*, being song settings to *A Shropshire Lad*. His work is characterised by its austerity, lyrical beauty and sincerity. See study by R. Hill in A. L. Bacharach's *British Music of our Time*, 1940.

**Ireland, William Henry** (1777-1835), forger, inherited the interest of his father, Samuel Ireland, not in the works of Shakespeare; but in him it took the form of inventing documents concerning the poet, and imitating his handwriting and signature. The forgeries were so well executed that they deceived, not only Samuel I., but such men as Dr. Parr, Sir Isaac Heard, and Dr. Warton. Encouraged by his success I. wrote two plays, *Vortigern and Rowena* and *Henry II.*, which he ascribed to Shakespeare. The former was produced by Sheridan at Drury Lane in March 1796. Malone exposed the fraud, which the perpetrator acknowledged in his *Authentic Account*, 1796. This was expanded (1803) into his *Confessions*.

**Ireland**, is. lying to the W. of Great Britain. It is separated from Great Britain on the E. by the N. Channel (13½ m. wide) and the Irish Sea (130 m.), and on the S. by St. George's Channel (47 to 69 m.). It is encircled on the N., the W., and the S. by the Atlantic Ocean. In shape the Is. is an irregular rhomboid, the greatest diagonal, from N.E. to S.W., being 302 m. in length. The total area is 32,605 sq. m. I. is divided into two states, N. Ireland and the Republic of I. (Eire), the former being part of the United Kingdom.

**Climate.**—The climate of I. resembles that of Great Britain, but is more equable. It is influenced by the Gulf Stream and by the S.W. winds. The prevailing winds off the ocean cause a greater amount of rainfall, and the rain is more evenly distributed over I. than over Great Britain. In the latter country the mts. in the W. present a barrier to the S.W. winds; but I. has no mt. ridge lying N. and S., which fact accounts for the more equal rainfall. The constant rain promotes luxuriant vegetation, which has given I. its name of 'Emerald Isle.' The mean temp. in Jan. is seldom below 40°, while in July the extreme mean temp. are 58° in the N. and 60° inland.

**Area and Population.**—According to the census of 1946, the following are the areas and pop. of the provs., cos., and co. bors. of the Republic. The names of the caps. appear in parenthesis:—

PROVINCES, COUNTIES AND COUNTY BOROUGH	AREA IN STATUTE ACRES	POPULATION
<b>Prov. of Leinster</b>		
Carlow (Carlow)	221,185	34,048
Dublin Co.	208,984	635,876

The following are the areas and population of the counties and boroughs of N Ireland, according to the census of 1937

COUNTIES AND COUNTY BOROUGHS	AREA IN STATUTE ACRES	POPULA- TION
Antrim (Antrim)	702,900	197,266
Armagh (Armagh)	312,767	108,815
Belfast Co. Bor.	15,259	438,086
Down (Down patrick)	609,057	210,687
Fermanagh (Luniskillen)	417,912	51,569
Londonderry (Londonderry)	512,580	94,921
Londonderry Co. Bor.	2,198	47,813
Tyrone (Omagh)	779,518	127,861
Total for N Ireland	3,552,211	1,279,744

**Physical Geography**—There are no dominating mt ranges in I but there are detached groups of mts generally reaching from the coast inland. The highest elevation is some 3000 ft, while the average height of the ls is about 400 ft. The chief ranges are the Mourne in co. Down (with as highest peak Slieve Donard (2796 ft), the Wicklow Mts (Lugnaquilla, 3039 ft), the Deriveagh Mts in the N.W. (Errigal 2466 ft), the Sperrins in the N. (Sawell 2240 ft), the Macgillycuddy Reeks in Kerry (Carraun 3414 ft), the Galtees of Limerick, and the Slieve Bloom the Knockmealdown (2609 ft) and Comeragh Mts (2470 ft) in Waterford, and the Twelve Pins of Connemara (2691 ft) and the low groups of Sligo and Galway. The central part of I consists of a wide plain about 250 ft in elevation, in which are many morasses. The largest of these is the Bog of Allen in Leinster. They are not unhealthy, and produce large quantities of peat, which is used by the inhab for fuel. The lakes of I (called loughs) form an important feature of its geography. Those lying in the centre are Derravaragh, Llanell, and Owel, the R. Shannon flows through Allen Rees, and Derg, Neagh, the largest (100,000 ac), and Erne are in Ulster, to the N.W. the Melvin, Gill, Carr, and Conn, and between the cos Mayo and Galway, the great Loughs Mask and Corrib. The Lakes of Killarney in Munster are renowned for their beautiful setting.

I. is watered by many rivers. The chief is the Shannon, the largest riv. in the United Kingdom. It rises in co. Cavan and flows in a S.W. direction into the Atlantic Ocean. The rivers flowing to the W. are for the most part short and rapid and of little use for navigation, the only other important one is the Erne, which empties itself into Donegal Bay. Along the E. coast the prin rivers are the Slaney, flowing from the Wicklow Mts. into Wex-

ford harbour, the Avoca, the Liffey, rising in Wicklow and flowing northwards to Dublin Bay, the Boyne draining the central plain, and passing through co. Meath into Drogheda Bay, and the Lagan, rising in co. Down and discharging into Belfast Lough. The rivers of the N. are the Brun and the Foyle, the former draining Lough Neagh and the latter emptying itself and the waters of its many small tribs into Lough Lyle. The S.E. coast is watered by the Nore Barrow and Suir, which unite in Waterford harbour. Other important rivers of the S. coast are the Blackwater, rising in Kerry and flowing in an easterly direction to Cappoquin, where it suddenly turns S. into Youghal harbour, the Lee, flowing through Cork into Cork harbour, and the Brandon, which empties itself into Kinsale harbour.

The coast line of the N.W. and S. is very much broken up with inlets, loughs, and rivers. The N. coast of Antrim and Londonderry consists of sheer cliffs, with many regular columns of basaltic formation including those known as the famous Giant's Causeway. The chief inlets of the N. are Loughs Foyle and Swilly, and on the S.W. the bays of Donegal and Sligo. From Malin Head the most northerly point westwards and southwards, the coast is fringed with many small is., the chief of Ulster being Forys Is. and Arran Is. The border close upon the sea down to the W. coast giving a rugged and wild appearance. The largest inlets of the W. are (from N. to S.) Killybegs Bay, Killybegs Bay, the mouth of the Shannon, Dingle Bay and the mouth of the Liffey, and Bantry Bay. From N. to S. are the is. of Inishkeena, Achill, Arran, and Valentia. The S. coast not so much fringed as the N. and W. contains the fine harbours of Cork and Waterford. The E. coast is still more uniform in character but is broken by Wexford harbour, Dublin Bay, Dundalk Bay, Carlingford Lough, Dundrum Bay, Strangford Lough, and Belfast Lough. To the N. lies Rathlin Is. in the N. Channel.

**Agriculture**—The soil of I. is rich and eminently suited to tillage, but political troubles have retarded agric. development. The number of small holdings allotted has been inordinately large and the average size of each extremely small. Moreover, the excessive moisture of the atmosphere in the S. and W. region is detrimental to the cultivation of cereal crops. In 1899 a report of agriculture was published whose duties include the provision of agric. instruction, as well as administrative work with regard to the improvement of live stock. Much of the land formerly used for tillage has been withdrawn gradually during the fifty years 1880-1930 for pasturage. The cause has been attributed largely to the emigration of the poorer classes resulting in a dearth of labour, but in more recent years there has been a strong effort to increase the area under tillage. The chief green crops grown are potatoes, turnips, carrots, mangel wurzel, beet, cabbage, etc. and the cereal crops include barley, oats, and wheat, and flax is grown in large quantities in Ulster. With

the increase of pasturage, there has been a much larger return of live stock with a smaller output of agric. produce.

Agric. policy in Eire has fluctuated in the past seventeen years. Until 1932 when the de Valera Gov. took office, the policy was to specialise in the production of live-stock and live-stock products. The area under corn crops declined from a maximum of 1,156,000 ac. in 1918 to 760,000 in 1932. But the output of starch tons of corn, root and green crops, and hay fell only from 2,761,000 tons in 1918 to 2,410,000 in 1931. Meanwhile the area under grass had increased as the area under the plough diminished. In 1932 the official policy was to speed the plough at all costs and encourage, by a system of guaranteed prices and import restrictions, the growing of food crops for domestic consumption, especially wheat and beet. But total agric. output, after a temporary spurt, began to show a downward trend and in 1938 was only 98 per cent of its volume in 1929. In the late 1930's the gov. found that its effort to promote a tillage economy, based on a declining animal husbandry, was disintegrating Eire's national economy as a whole and destroying its natural fertility of the soil. But the outbreak of the Second World War made it impossible to apply the lessons learnt. Eire was compelled by external circumstances to plough up an increasing acreage of pasture land in order to obtain a grain supply, the total of which failed to increase in equal proportion and was always inadequate. A million ac. of pasture land were sacrificed in the process. Inevitably the output of milk and cattle suffered. In 1929-1930 Eire exported 51.4 per cent of total agric. output, consisting almost entirely of live stock and live stock products. In 1942-43 the percentage exported was only 23.5 per cent. In 1942 a committee was appointed to report on the measures best calculated to provide for the agric. industry at the end of the emergency period. The majority report of the committee, pub. in 1945, recommended a policy of 'ley farming, a blend of 'plough speeding' and live-stock specialisation ideologies, and there is now substantial agreement between the gov. and opposition parties on this policy. Meanwhile the new grass policy is rapidly increasing the output of grass, fresh and preserved, and it seems likely that there will not be enough cattle to eat it all. Hay being the traditional method of preserving grass for winter keep, silage making is rapidly gaining ground. Mechanisation in Eire is making progress. Until 1939 Irish agriculture was comparatively little mechanised and until 1932 hardly at all. In 1939 there were 2067 tractors available; in 1948 there were 9781 tractors, and the number is rapidly growing. A number of creameries in the S. of I. have bought farms which they run on a commercial basis. They equip them in the most modern way and the machines they own can be hired out to members as well as used on the common farm.

Horses, cattle, sheep, and swine are bred

with great success, and during recent years there has been a marked improvement in the purity of the breeds raised. The fisheries form an important industry of the Irish people. In Eire in 1946, 3 steam vessels, 576 motor, 761 sail, and 2120 row boats were employed in the trade. The total crews amounted to 10,162 men and boys in 1945. Mackerel, hake, herring, sole, cod, lobsters, and oysters are among the fish caught and sold. There is, too, a good deal of roe- and line-fishing in the rivers, and salmon and trout are caught in large quantities.

About twenty-one species of mammals that occur in Great Britain are unknown in I. The mole, weasel, and pole-cat are unknown, and the only kind of reptile found is the lizard. The blue hare is indigenous, and frogs and toads are very common. It is probable that I. was isolated before the complete European fauna was able to enter it from the E. The flora of the S. region includes some Pyrenean types that are not found in Great Britain.

The mineral produce of I. is small when compared with that of Great Britain. Coal is mined near Lough Allen and at Cool Is. in co. Tyrone. Black marble is quarried in counties Galway and Kilkenny and red marble near Cork. Salt is made, being raised from the Triassic beds near Carrickfergus, and barytes, pyrites, and lead ore are also produced. Other minerals are limestone, which is chiefly found in co. Roscommon, iron ore, sand, clay, bauxite, and green Connemara marble.

Manufactures flourish chiefly in the N.E. of Ulster. The most important seat of the linen industry is Belfast, where it was introduced by Strafford in 1633. That town also employs about 40,000 men in engineering and shipbuilding. The woollen industry, which at one time was in a very flourishing condition, was later hampered by restrictions imposed by the Brit. Parliament. Other industries are brewing and distilling, embroidery, hand lace work, and other home industries. The chief exports are all kinds of agric. produce, live stock, fish, and linen.

Communications.—The 1st railway was opened in 1831, and ran between Dublin and Kingstown, a distance of 6 m. There are 741 m. of railway in N. I. and 284 m. in the Republic. The canals are very important for commercial purposes. The chief are the Grand and Royal, 208 and 96 m. long respectively, which afford communication between Dublin and the Shannon; and the Ulster Canal which connects Lough Neagh with the Shannon. There are 180 m. of canals in N. I. and in the Republic 650 m. of inland waterways. There are mail steamship services between Dublin and Holyhead; Belfast and Heysham, Fleetwood, Liverpool, and Ardrossan; Larne and Stranraer; Rosslare (also Waterford) and Fishguard. Many Amers call at Cobh (Queenstown) for Cork on the S., and others at Belfast, Londonderry or Moville on the N. The coasting trade is very active. Shannon Airport (*Íteannna*), 15 m. W. of Limerick, is an

important land plane junction on the main transatlantic air route, catering for traffic to and from the U.S.A., Canada, Great Britain and the Continent. A daily service to and from Dublin is operated. Dublin airport situated at Collinstown, 4 m N of Dublin, serves the cross Channel and European services operated by *Aer Lingus* (Irish Airlines Ltd) and

(Trinity College) was incorporated in 1591, and is the most important in I. It has now opened its degrees to women. The other univs are the National Univ of I at Dublin, the (Rom) Catholic Univ of I at Dublin, the univs of Cork and Galway, the General Assembly's College, Belfast and Magee College, Londonderry (both Presbyterian) and the Rom

continental airlines. The following private aerodromes are also licensed: Weston Airport 9 m W of Dublin, Dunmore East, 10 m S E of Waterford, Coonagh, 2 m W of Limerick, Oranmore, 5 m E of Galway, Manor Kilbride, 16 m S W of Dublin.

**Education**—In N I there are 1727 elementary schools, 75 secondary schools, 60 technical schools, and one university, Queen's University, Belfast. In Ire there are 5212 elementary schools (elementary education is free and is given in the national schools and, since 1922 the Irish language has been included as an essential part of the curriculum for all national schools). There are 329 recognised and state inspected secondary schools, all receiving grants from the State, and open to inspection by the Education Dept. Technical schools exist in all the prin tns. The Univ of Dublin

(Catholic colleges at Maynooth, Blackrock, Clonliffe, Carlow, etc.

**History**—The earliest hist of I is not unnaturally wrapped up in myth and legend. We have little evidence in any authors of note regarding I, and factors which contribute greatly to the hist of other nations are lacking here, hence we are compelled by the little we have to rely upon the probabilities suggested by research. Evidence of the inhabitation of I by Neolithic peoples indicates that even after the Celtic settlement of I great numbers of the earlier inhab survived, and intermarriage between the Celtic and pre-Celtic tribes took place to an even greater extent than was customary in other lands settled by Celts. The first Celtic settlement of Goldels occurred during the sixth century B.C., and about three centuries later we find a further Celtic settlement of Brythones. Ptolemy,

who gives us our earliest knowledge of I., states the names of at least sixteen tribes. These names bear a striking resemblance to the tribal names of the Celts in Britain, e.g. we find the name Brigantes in both countries. The div. of the country into Ulster, Munster (E. and W.), Leinster, and Connaught—seems to have been made by the earliest Celtic settlers.

By the beginning of the Christian era we may say that I. was populated by Celts (Goidels and Brythones), together with a sprinkling of the Neolithic people and some Picts, who probably came from Scotland, and who occupied but a small portion of the country. Such is the explanation that hist. gives of the early settlement of I. The Irish, however, account for it in a very different way—a series of legendary stories, in which mythical characters, who have become almost historical, play an important part. According to legend, the first invaders came under Partholau, occupied the is. for 300 years, and were then killed off by a great plague. They were followed by the Nemedians, who came from Scythia and had a great struggle with the Fomorians. The Fomorians were ultimately successful and the Nemedians were driven out and went away to Greece. From hence, after various adventures they returned to I., this time being given the name of Firbolgs, and this tribe settled in I. and have been held to be represented there down to the sixteenth century. The next set of invaders were the tribes of the God Dann, who finally overthrew both the Firbolgs and the Fomorians. The tribes of the God Dann are supposed to have come originally from Greece but to have been driven up to Scandinavia, and from thence to have invaded I.; they held supreme command of I. down to the time of the arrival of the Milesians. The Milesians are supposed to have come originally from Scythia, to have sojourned in Egypt, and to have finally invaded I. and conquered it. This myth is historically the most important since the Milesians are held by historians of the sixteenth century to have given the line of the high kings to I. down to the twelfth century. Names are given to the early kings and records of their deeds were kept, but of these we may take little or no notice until the appearance at the end of the fourth and beginning of the fifth centuries of Niall of the Nine Hostages. He is held to have finally set up the central kingdom of Tara, and to have led expeditions of the Irish overseas. It has not yet been fully recognised to what an extent I. and Wales were connected during this early period, and it must be pointed out here that the expeditions of Niall of the Nine Hostages synchronise with the departure of the Romans, and the raids of the Picts and Scots into Britain. Certain it is that colonies of the Irish were formed in Wales and in W. Wales (Devon and Cornwall), and it is to this period in Irish hist. that we can best trace the foundation of these colonies.

The foundation of Emania, c. 300 B.C., seat of the kings of the line of Ir in the N. is regarded by Tighernach, the famous

historian and abbot of Clonmacnoise in the eleventh century, as heralding the dawn of Irish hist. It may be said, generally, that Irish hist. is reliable as to genealogies and the broad features of the prin. events from the Christian era and that it is fairly reliable, from a remote period, as a guide to such outstanding events as the foundation of Emania and the victory of Labraidhe (Lowry), grandson of Laoghaire over the usurper Coffey at Dinn Iliogh on the Barrow. It is, however, not until the time of Patrick that there are definite political sub-divs. in I. as distinct from the mere supremacy of certain families in various parts of the country. A short time prior to the Christian era the most powerful kings in I. were those who ruled in Emania. Thus to Tuathal is attributed the foundation of the kingdom of Meath and the great dynasty of Tara, which governed the clans of the open plain from the sea to the Shannon and later appointed branches to rule over those of more than half of Ireland. There were two other dynasties the origin of which is assigned to the second century: the Leinster and Munster, whose kings were rivals of Conn, famous grandson of Tuathal; and these three leading dynasties supplied the independent rulers of all parts of I. except Ulaidh (Ulster) for centuries and struggled with each other for the supremacy of the country. Tara reached its zenith in the reign of Cormac MacAirt, a grandson of Conn, who is one of the prin. figures in the copious literature on the exploits of the Fianna or 'Fenians.' The kings of Tara had attained such power in the fourth century that they were then waging war in Britain and even sending military expeditions to the Continent. The Roman dominion was on the wane and the Gaels came over to make common cause with the enslaved Britons and Picts against the Romans. One of the most famous leaders of these expeditious was Niall, king of Tara, whom we have mentioned above, who was eventually slain on the banks of the Loire (A.D. 405). During Niall's reign his two half-brothers Brian and Fiachra estab. themselves in the palace of Cruachan (in Roscommon) and thenceforth the kings of the W. kingdom were chosen exclusively from their descendants. Other new kingdoms were founded in the N.W. near the site of the modern Derry. The state of Oriel was also founded at this time. It had been wrested shortly before the Christian era from the Clanna Rury, the most powerful kings in I. Their sway extended from Ulaidh and in early times spread over nearly all the N. and as far S. as Tallite in Meath; but following the seven years' war between Connor and Maere of Connaught, in alliance with Fergus of the Red Branch, the power of the Clanna Rury steadily declined.

Immediately before the introduction of Christianity we find the permanent estab. of four kingdoms ruled over by the posterity of Conn—Tara, Oirghialla, Aileach, and Cruachan. The normal head of this confederacy is the chief king in Eire, styled High King, a purely nominal title

but implying a superiority which was not recognised by the dynasties of Ulaidh, Laighin, or Calceal (Ulster, Leinster, and Cashel). These seven independent States into which the is. was divided at this time remained—albeit modified under changing conditions—the spheres of political influence in I. until the whole Gaelic fabric was destroyed at the battle of Kinsale in 1603; but to trace the fortunes of these seven dynasties is the purpose of any hist. of Gaelic Ireland. Their supremacy in their own kingdoms remained permanent and the rivalries which often convulsed them were between competitors of their own families. It is possible that Christianity conducted to this political stability. The traditional Five Provinces (Ulaidh, Connacht, Laighin, and the two Munhals) are popularly supposed to be represented by the modern four provs.; but the representation is not wholly accurate. The first div. into four provs. was eccles. when the Synod of Kells (1152) grouped the Church around the arch-dioceses of Armagh, Cashel, Tuam, and Dublin. The creation of prov. 'presidents' in the sixteenth century by the Tudors gave them definite recognition in political affairs. The accepted index to the internal political constitution of these Irish states is the 'Book of Rights' (Leabhar na g-Ceart) traditionally ascribed to St. Benignus, disciple and successor of St. Patrick.

The religion of early I. cannot be easily traced. The inhab. appear to have had many gods, in fact, to a certain degree, to have been pantheistic; there is evidence also to show that they were fire worshippers, and we know that right up to the fifteenth century the sacred fire at Kildare was kept burning. The most tangible side of the belief of the early Irish, however, is their undoubting faith in the existence of fairies. The tribes of the God Danu are held, after the invasion by the Milesians, to have disappeared into the hills and to have reappeared as fairies. We have also lists of the names of the Irish gods, but these gods seem to have been very shadowy beings concerning whom little is known. The priests or druids of the country play an important part as teachers, prophets, and wizards. Their powers were great, and it was supposed that they were able to perform miracles. One side of the belief of the Irish must not be overlooked here, since it survived for some very considerable time during the Christian period, and that is the idea that after death certain changes could be made by the dead person, and that he could appear now as a wolf, now as a fish, and again as a bird. Only certain people were held to have this power, but in one case at least it was held that all the inhab. of Ossory could change themselves into wolves at will.

Irish historians aver that the country had reached a high state of civilisation at the coming of St. Patrick. The Irish Milesians are described as a martial and cultured people who, in an age when most of Europe was still in an uncivilised state, held their ollamhs, poets and historians, in equal reverence with their royal chiefs.

Centuries before the Christian era, they are said to have estab. a Fels or central parliament which assembled triennially at the Ard Righ's or High King's court on the Hill of Tara. Thither came the Fíles or poets, the Seanchuidhes or chroniclers, the ollamhs or teachers, the Brehons or judges, the druids or priests (considered by some to have been rather magicians and teachers than priests), and the chieftains and kings of the various tribes, to approve or amend the old laws, make new laws, dispense justice, and to record their annals. The laws made in anct. I., known to-day as the Brehon laws were, for that remote period, so wonderfully just, wise, and equitable, as to win the admiration of modern law students. Again, the beautifully wrought brooches and other ornaments of the I. of pagan days, still extant and preserved in Irish museums, reveal their progress in art and refinement in dress.

Some of the Irish are said to have been Christians when St. Patrick arrived in 432, but it is a fallacy to suppose that the country had been partly converted before then. Christianity had already been the official religion of the Rom. Empire for a century, the Irish and Romans had for a long time been in close contact, both commercially and in warfare, there was a constant influx of Brit. slaves and continuous intercourse between the Brit. and the Irish: from all of which it is reasonable to suppose that Christianity was known and practised among the Irish before the coming of St. Patrick. Some of the Irish saints, such as Ailbe of Enny, Declan of Ardmore and others, are said to have been Christians when St. Patrick came, and to have submitted to him. But the number of Christians in I. then must have been small, and there was no organised Christian church before the time of St. Patrick. The relations between I. and Britain were very intimate. A Brit. Christian Church had certainly been founded long before this date. The growth of Pelagianism in Britain had, before the end of the fifth century, made it necessary for Rome to send missionaries to stamp out the heresy, and one of these missionaries, Palladius, was certainly sent to I. Christianity, however, whilst probably well known in the S., had made little progress in the N. and W., hence it was to these parts that Patrick gave his own personal attention. He himself, born in Britain, had been enslaved and had spent seven years of early manhood amongst the Irish, hence he was familiar with their language and customs (see PATRICK, St.). He took with him at least two followers who spent their time in the S., spreading the gospel and organising the churches. Patrick took for himself those parts which had been touched but little by the Christian faith. His success was great, but has probably been overrated; in any case he found great opposition; he allowed numberless practices which did not actually run counter to the doctrines of Christianity, but which had been accepted by the Irish in pre-Christian days. The system of society made it essential that

he should convert the heads of the tribes before the faith was accepted by the tribespeople, and he succeeded in establishing a system by which native Irishmen became priests and in turn converted their brethren. Schools and churches were erected, and the see of Armagh estab. I. in this way became definitely connected with the W. Church. Bishops were consecrated, the land divided into dioceses which probably coincided with tribal divs., and the Church definitely estab. throughout the land. The Church was, however, during the centuries which followed, to adopt a very different system from that set up by Patrick. The Irish Church has to a very great extent been regarded as a monastic church, but this was certainly not the system set up by St. Patrick. The Church was founded on practically a personal basis, religious colonies originating from one centre became and remained daughter settlements of the parent body. The head of a religious foundation was the possessor both of spiritual and temporal rights, and frequently it came to pass that the headship of a religious foundation passed entirely into lay hands.

The monastic system was early introduced into I., although it was not until Christianity had gained a firm hold on the country that the form usually associated with I. appeared. The earlier type seems to have been somewhat loose and to have led to much disorder. Further, the Irish bishops did not have any territorial jurisdiction and the consequence was that the number of bishops was very large. Each tuath, or tribe, had, however, a bishop who was recognised as an official member of the tribe and who had a considerable amount of influence and power. Judged by the standards of W. Europe the Church in I. was morally somewhat lax, but this was probably due as much to the struggle between the old and new religions as to anything else. Finlan was the founder of the famous monastery at Clonard which was the beginning of the foundation of that series of monasteries which made I. the centre of learning for W. Europe. Scholars flocked to these monasteries, which were simply encampments of students, i.e. a series of mud huts built by the students themselves. Here they lived and provided themselves with food by their own labour, and received also their learning in the open air. These monastic settlements were conducted on lines very much more severe than the earlier had been. The monks were shut off entirely from the laity, and the sexes were separated. This monastic movement seems also to have been accompanied by much missionary enterprise. Missionaries of the Celtic Church went everywhere—Columba to Iona, Aidan to Northumbria, Columbanus to W. Europe. In the Orkneys the Celtic Church was estab., and Iceland, when discovered by the Vikings, was found to have been visited previously by missionaries of the Celtic Church. The Saxon kingdoms in the N. and centre of England owed their conversion to Irish missionaries from Iona. St. Aidan became the first bishop of North-

umbria and was succeeded in Lindisfarne by two other Irish monks. The Irish missionaries had brought learning as well as religion, and Northumbria became the cradle of Anglo-Saxon literature. The greatest of the Irish missionaries to Europe was St. Columbanus, a native of Leinster, who laboured for twenty years in Burgundy. Numerous sermons, letters and poems written by him are extant and testify not only to his wide range of knowledge, but also to the high state of learning in the Irish schools where he acquired it. The Irish missionaries soon found themselves in opposition to those of Rome. The Roman tonsure had probably been introduced into I. by St. Patrick, but the Irish had certainly gone back to the old druidic tonsure, whilst on the matter of calculating Easter they had remained true to the Jewish method. The following were the more celebrated saints of I. and the schools with which most of them were connected: St. Benignus, a native of Meath, favourite disciple of St. Patrick and his successor as Archbishop of Ar-famous convent in I., at Kildare; St. Charan, of Meath, who founded the monastery and school of Clonmacnoise on the Shannon, in which many important Irish annals were compiled; St. Brendan, who founded the monastery of Clonfert; St. Finlan, of Moville, who founded the school of Moville (near Newtownards); St. Comhgall a native of Ulaidh, who founded in that dist. the monastery of Bangor, whose fame rivalled that of Clonard and in which many of the Irish missionaries were educated; and St. Carthach, of W. Munster, who founded the famous school at Lismore. The few prominent names mentioned here represent but a small part of the work for Christianity performed in Europe by Irish zeal. Most of it was done by unknown monks in the many monasteries scattered over W. and Central Europe. These were continually being recruited by monks from I., who for ages continued the labours of St. Columbanus and St. Gall. Irish influence on the Continent was the result of no transient effort, but was due to a great movement which endured for six centuries, from the sixth to the twelfth.

From the fourth to the eighth century the political hist. of I. is a long story of relentless and practically uninterrupted tribal warfare. The descendants of Niall of the Nine Hostages remained ardi of I. down to the beginning of the eleventh century, but were seldom powerful enough to be able to maintain peace in the country. The Church was not strong enough to perform the work of the ardi, and moreover, the personal character of Church gov. made the Church often a party to the quarrels of the tribes. The descendants of Niall of the Nine Hostages were divided into two great branches, the S. Hy Niall and the N. Hy Niall. At the beginning of the sixth century the Scots from Dalriada made their settlement in Argyllshire, and ultimately, after strenuous struggles, obtained the crown of a more or less united Scotland (see SCOTLAND—History). About the middle of

the same century Tara ceased to be the residence of the ardrí, many legends being connected with the desertion of this centre. The records tell us only of constant wars, constant successions, and short reigns. The country was in a state of anarchy. One event alone needs to be mentioned, the attempt to rule Dalriada (Argyllshire) as a subject kingdom of the ardrí of I., this attempt, however, was given up. The position of the ardrí was unenviable. He could command no real allegiance save that of his own immediate tribe. The army of I. consisted of the tribes commanded by their own chiefs. The chiefs owed allegiance to the ardrí, but allegiance of such a shadowy type that it counted for nothing. Such was the state of I. when the Vikings began a series of raids which developed into a settlement.

The first invasion of the Norsemen occurred towards the end of the eighth century. The Norwegians were the first to come, and, aided later by the Danes, made settlements on the E. coast. Irish writers distinguish between the natives of the two countries: the earlier who came from Norway, are called *Fionn gall* ('White Foreigners') and '*Lochlann*', the *Dub gall* ('Black Strangers') or '*Danars*' came later from Denmark. The distinction between them is, however, not clearly marked and they are often confused. In popular language the invaders are collectively known as the Danes, while Eng. writers make reference to them as the Norse, or Vikings, or Ostmen. The domination of I. by the invaders for over a century was not altogether a misfortune, since it brought that country into closer contact with the countries of the Continent and with W. civilisation. Many of the Irish tribes fought in the armies of the Danes who invaded England. Foreign trade, especially with Scandinavia, flourished. After the middle of the tenth century there rose to fame in Ireland the great Brian Boru, a Dalcais prince who defeated the Danes and forced them into the position of a subject race. After bitter struggles with the reigning dynasty Brian managed in 1002 to become ardrí himself, and during the twelve remaining years of his life he ruled a peaceful and prosperous I. He strengthened justice, he made good laws, and he built schools. But he had still to face the hostility of the Danes and the jealousy of the Irish chieftains. In 1014 was fought the famous battle of Clontarf, which again broke the power of the Danes, but in which Brian himself was killed. His death was a serious blow to monarchy in I. and led in the century or more following his death to the weakening of the central power and internecine strife. The hist. of I. from the battle of Clontarf to the Anglo-Norman invasion is the record of continual strife, between the O'Briens of Munster, the O'Neills of Ulster, and the O'Connors of Connaught for the ardríship of Ireland. The relations with England during this period were not intimate, but were nevertheless, usually fairly cordial. The question of the Church in I.

was one which perplexed the Eng. primates during the Norman period. Neither were the relations between the Irish Church and Rome intimate, although in the matter of Easter and the tonsure the Irish Church had conformed to the usages of Rome. Dublin was regarded as an Eng. diocese under Canterbury, and from this beginning the Eng. primates had hoped to bring the whole I. into their fold. The synod of Kells of 1152 divided I. finally into dioceses, did much to abolish the anarchic state of Church gov., and made Armagh the seat of the primacy.

National Museum, Dublin

#### THE TISMORE CROZIER

An outstanding example of medieval Irish art believed to date from the twelfth century. The staff is of yew and the crook is of bronze, with bosses of coloured enamel. Tismore was the site of a monastery founded by St. Carthagh in 633.

The Irish Church, was, however, still vigorous enough to produce from its own ranks devoted clerics capable of effecting reforms. Most conspicuous in this work was St. Malachy O'Moynai (d. 1094), abbot of the monastery of Bangor. Having partially restored the famous school he was made bishop of 'Connor' (or Dal Riada) and by much toil revived

religion there. He set before himself the carrying out of two reforms in particular: the first of these was the organisation of definite dioceses. This work of reform and organisation, begun 40 years previously by Gilbert, bishop of the Norse of Limerick, and Celsus, bishop of Armagh, and carried on by Malachy, was completed at the Synod of Kells. A National Church arose, and the unity of the Church in I. was clearly estab. under one recognised head but with full recognition too for the various constituent elements. The other great reform to which Malachy devoted himself was the revival of the monasteries. Most of the early monastic institutions in I. were independent bodies, the Columban monasteries being the sole instance of an affiliated Order. The strict discipline of these rules had been relaxed and Malachy resolved to restore it. The Canons Regular and the Cistercians, who practised the severe discipline estab by the Irish missionaries in Europe, were employed by Malachy to restore the old monastic spirit in I. and for that purpose he brought communities from the Continent and sent Irish students to be trained in European monasteries. The Irish had, between the fourteenth and twelfth centuries, advanced but little so far as their social conditions were concerned. A species of feudalism had grown up, but the tribal system and the Brehon law remained in existence. When Henry II. succeeded to the Eng. throne he had already planned the conquest of I. Pope Adrian IV. had given his sanction to the idea, and had desired the conquest as a means of bringing the Irish Church into closer contact with Rome. In 1166 Dermot Macmurragh, exiled from I. because of his tyranny, and also because of the hatred he had roused by carrying off the wife of the chieftain of Breffni, arrived in Aquitaine and asked for help from Henry II. The king was at that time too much occupied with other affairs to attend to Irish matters himself, but he gave Dermot permission to raise forces from amongst his Lords of the Marches. Dermot applied to Richard de Clare, earl of Pembroke (usually called Strongbow), and by promising him the hand of his daughter and the ultimate possession of his kingdom, induced that earl, whose fortunes were not at their highest level, to help him. Strongbow did not cross over until 1170, but Fitz-Stephen and Fitz-Maurice crossed with a small company of men in 1169, and began the Anglo-Norman conquest of I.

It is impossible to follow here the fortunes of the first adventurers; suffice it to say that by their superior skill and their united efforts they restored Dermot and paved the way for the overlordship of Henry II. which that king estab. when he visited I. in 1172. The kings of I. were forced to acknowledge Henry as their overlord, the country was placed under the administration of a Norman governor, the barons who had fought in I. were granted Irish lands, and the Irish Church was brought by the synod of Cashel into complete union with the Church of Rome. The Irish were, however, allowed to retain

their old Brehon law, and the Anglo-Normans were left to maintain themselves in their dominions as best they could. The hist. of I. for some time after this date is the record of continuous strife between the Norman barons attempting to extend their power and the Irish attempting to retain their customs, laws, and civilisation. The conquered ter. was known as the Pale, and the whole of I. was ruled nominally by a Norman governor. John was made Lord of I. in 1185, but soon made himself hated, as he was later in England. The real rulers of the land were the De Lacys, who had been granted huge ters. by Henry II., and who, by subjugating their land, introduced those great Norman families who have played such an important part in the hist. of I. During John's reign, however, Eng. power increased, as it did also under Richard Strongbow and during the reign of Henry III. The reign of Edward I. saw the power of the colonists still on the increase to such an extent that they were able to help Edward in his wars with Scotland; but although in Connaught and in Ulster the power of the Eng. was still increasing, nevertheless the Celtic tribes were not yet utterly beaten. During the reign of Edward II. Edward Bruce tried to conquer the is. and to drive the Eng. out, but after sev. futile victories he was finally overcome and slain at the battle of Dundalk. The reign of Edward III. witnessed the passing of the Statute of Kilkenny, which forbade the inter-marriage of the Eng. and the Irish; it also saw the creation of the earldoms of Desmond and Ormonde, added to that of Kildare. Richard II. led two expeditions to I., with both of which he did little good; the Celtic reaction was strong and was strengthened by the Anglo-Irish baronage. One of the main results of Richard's second Irish expedition was that it allowed time for the house of Lancaster to usurp his throne. The period of Lancastrian rule was one of extreme misery for I. Henry IV. could do little, Henry V. was too busily occupied elsewhere to turn his attention to I., whilst Henry VI.'s regents did very little indeed. Richard of York was made governor of I. in 1449 for ten years. He ingratiated himself with all parties and became extremely popular. Edward IV.'s reign was remarkable for nothing save its lawlessness and the fact that Tiptoft, earl of Worcester, became governor of the is. and was responsible for much bloodshed. During the reign of Henry VII. was passed the famous Poyning's law, which gave control of the Irish legislature to the Eng. council, and was responsible for much contention at a later date. The earl of Kildare espoused the cause of Lambert Simnel in 1487, but certain of the Irish, and in particular the tn. of Waterford, were strong supporters of the Tudors. Henry VIII. did not turn his attention to I. until fairly late in his reign. By this time the Anglo-Irish families were Irish in almost every respect. They no longer acknowledged any law save that of the tribal system of ant. I. But the king struck with a heavy hand, the power of

the house of Kildare was broken, and the country was slowly rescued from the hands of the feudal lords. Henry himself adopted the title of king of I., and the Irish were gradually brought to look to the power of the crown for the redress of their grievances. The native chieftains were also granted titles from the crown and were encouraged to come to court as often as possible. The reign of Edward VI. saw the beginning of the attempt to introduce Protestantism into I. The attempt was a failure, although it was supported by those in authority. The sincere Catholicism of the people was only too evident, and Mary had no difficulty in restoring the old faith, but the monastic lands which had been seized were not given back, and in fact Protestants from England found in Dublin during Mary's short reign a place of refuge from persecution.

We may revert here to a consideration of the hist. of the progress of the Reformation in I. in the Tudor period. Henry VIII.'s doctrine of his eccles. supremacy received little support in I., where there was no desire for religious innovations. In 1535 Henry appointed a commission to initiate the enforcement in I. of the Reformation. At its head was George Browne, an Eng. Augustinian friar, who had been chosen archbishop of Dublin by the king and consecrated for that office by Cranmer, archbishop of Canterbury, without any authority from the Pope. But the new archbishop secured only the support of the bishop of Meath, and he quarrelled violently with the deputy viceroy, Lord Leonard Grey. In 1536 a parliament, assembled in Dublin, was required to pass 'the Act of the Supreme Head' providing severe penalties for those who obstinately refused to acknowledge the king to be head of the whole church in I. By another Act, 'first fruits' of eccles. offices were to be paid, not to the pope, but to the king. Henry's next step was to undertake the dissolution of the Irish monasteries and convents. There were in I. about 600 religious houses, including seventy convents. By the end of 1535 almost all those in Leinster, most of those in Munster, and some in Connaught had been suppressed. In Ulster and in remote parts of Connaught and Munster, however, monasteries continued to exist till the early seventeenth century. The pretext advanced for the suppression was that they were the abodes of idolatry and superstition, whereas, in fact, the religious houses of I. had performed a number of indispensable social services for the people, including education and hospitals. The dissolution was accompanied, in several cases, by violence and bloodshed and many religious suffered imprisonment and even death for their refusal to adhere to the doctrine of the royal supremacy. In 1539 another commission was set up to find and destroy relics and to transfer images and valuable ornaments, such as golden chalices, to the king's use. Browne then tried to evangelise the more distant parts of his archdiocese, and in the result the Irish privy council asserted that 8 bishops and

2 archbishops came before them in Clonmel to take the required oath. But of bishops of papal creation, only 5 'conformed' and these were deposed for heresy by the Pope. Of the lower clergy few within the Pale took the supremacy oath and scarcely any outside it. Outwardly I. might conform to the reformed doctrine, but at this period it was the practice in the country to enter into engagements without any intention of carrying them out.

When Mary II. Elizabeth, a champion of the Reformation, but one devoid of religious zeal, intended that the State Church of England should exercise sway over I. too. In 1606 she directed the Irish Parliament to pass two important Acts, the Act of Supremacy, declaring her supreme governor, both in eccles. and spiritual and in temporal matters, and denying Papal jurisdiction, and the Act of Uniformity requiring the use of a reformed Prayer Book at public worship. But this religious legislation was far from being strictly enforced anywhere in I. and in a great part of the country it was impossible to enforce it. Even where the authority of the Eng. gov. was effective the queen was careful not to provoke hostility or even rebellion by too great severity. But this moderation was not due either to humanity or to weakness on her part. Throughout her reign she directed her Irish policy to the political subjugation of I. and its reduction to uniformity with England not only in religion, but also in speech and social customs. Resistance to this policy led to persecution of the Catholics. The realisation, at length, in I. that the Reformed doctrines were closely linked with the imposition of foreign rule proved, in deed, to be a cohesive influence among the people, who hitherto, far from revealing that love of country as a whole which to day is styled Nationalism, had fought and died mainly in the interests of clan conflict. But now, under the goad of foreign rule, a broader patriotism grew up through the stimulus of the threat to Catholicism. Elizabeth found, therefore, in I. for her religious policy many zealous adversaries, while her supporters numbered only the few, whose private interests rather than zeal for the policy, induced them to 'conform.' The bishops and priests who refused the Oath of Supremacy were generally deprived of their sees and livings and superseded by Englishmen or Irishmen of more pliant dispositions. But the wretched stipends of the sees and livings were not likely to attract men who could hope for eccles. preferment in their own country. In consequence the churches were neglected and suffered to fall into ruins, and in many places no parochial duty was done. In the parts of the country, however, where the authority of the Eng. gov. was as yet only nominal, conditions were better, especially before the Desmond insurrection had devastated the S. and the O'Neill was ruined the prosperity of Ulster.

With the accession of Queen Elizabeth the State Church was restored in I., but

the most noteworthy events in Irish hist. during this period are the O'Neill and later the Geraldine rebellions. Shane O'Neill had been elected chieftain by his tribe and claimed the earldom of Tyrone, which had passed to a bastard brother, Brian O'Neill. The Eng. supported the claim of Brian, but Shane was able to keep up a continual contest with the crown until finally, in 1567, he was killed.

The crushing of the Shane O'Neill rebellion was followed in I. by a great religious revival. The counter Reformation, which was doing so much to restore Catholicism on the Continent, worked with tremendous rapidity in I., influenced and helped to a very great extent by Jesuit priests. The immediate outcome of this religious revival was the Geraldine rebellions. The second of these led by Earl Desmond, was only put down after four years' continual struggle. The Irish were helped during this period (1579-83) by the Spaniards and the Itals, and were crushed finally with great cruelty. The rebellion had been practically confined to Munster, which was finally subdued by huge confiscations and Eng. settlements; amongst the settlers were the poet Spenser and the adventurer Raleigh. The final rebellion during Queen Elizabeth's reign broke out in 1595 under O'Neill, Earl of Tyrone. Essex, sent to quell it, made terms with its leader and returned home; but Mountjoy, by means of a series of fortresses from which he ravaged and laid waste the land, finally conquered it (1603). Tyrone admitted defeat, and was allowed to keep his lands and title. The wars in I. had of a necessity been barbarous ones, both because the Eng. unjustifiably regarded the Irish as savages and also because I. was struggling for all that England held in greatest hate—Catholicism and the friendship of Spain. The atrocities of the time, equally ferocious on both sides, cannot be palliated, but are perhaps more easily understood. The system of plantations was developed during the reign of James I. The lands of the Earls of Tyrone and Tyrconnel were confiscated, and Ulster was settled chiefly by Presbyterians, although lands were also granted to the City of London. The administration of Strafford is the most important event of the early part of Charles I.'s reign. He promoted industry, law, and order; he restored the country to something approaching prosperity, but his order was the order of repression, his discipline the discipline of the iron hand. His worst and most unjust work was the attempt to 'settle' Connaught, but before he could carry out that work he was recalled to help Charles in England (1640). The great Irish rebellion broke out in 1641, inspired both by hatred of the rule of Strafford and by the fear of what would happen under Puritan rule. Undoubtedly thousands of Protestants perished, although in a number of cases the figures have been grossly exaggerated. The situation was complicated by the outbreak of civil war in England, and the Irish sent some help to the king, who was continually intriguing with them. In 1649 the execution of the

king released the parli. troops for service in I., where the young king, Charles II., had been immediately recognised. The methods of Cromwell and Ireton were thorough, and the Irish were crushed altogether. The garrisons of Wexford and Drogheda were massacred, and every priest that the Puritans found was indiscriminately slaughtered. The Cromwellian settlement followed, and huge tracts of land were confiscated. The only merits of Cromwellian rule were the restoration of order and the prosperity which followed a peace of desolation. The Catholic religion was, however, sternly repressed. The Restoration involved the settling of another great land question. The Cromwellian settlement was to a great extent upset, the original owners were restored, and the Cromwellian settlers given compensation in Connaught. The Roman Catholic religion was also given a certain amount of toleration, and for the greater part of the reign Ormonde ruled I. for the Eng. king. The country was on the whole peaceful, but the trade restrictions imposed were rapidly alienating the Irish people still further, and were the cause of considerable trouble at a later period.

The revolution of 1688 was the immediate sign for the outbreak of hostilities between the Catholics and Protestants of the N. of I. Londonderry and Enniskillen were immediately besieged, and the Protestants found themselves hard set to hold their own. Londonderry remained uncaptured, whilst the besieged in Enniskillen broke out and won a victory at Newtown Butler. The siege of Londonderry is memorable for the valour of its inhabs., who held out for nearly four months, repelling every attack and suffering extreme privation and, at the end, stark famine (having eaten all the horses, cats, dogs, rats, mice, tallow, and starch in the tn.) when some Eng. ships broke through the obstructions of the riv. and so raised the siege and saved the tn. Much of the credit for this historic defence was due to a clergyman named George Walker, who had raised a regiment in the Protestant cause. In 1690 was fought the battle of the Boyne, after which James II. left the country and returned to France. Wm. III. also returned to England, and the Irish rebellion was crushed by John Churchill, Duke of Marlborough, assisted by Ginkell, one of Wm.'s Dutch generals. Cork and Kin-a-le fell. Aghrim was won, and finally Sarsfield, after a magnificent defence, surrendered Limerick, and returned to France with his followers to found the famous Irish brigades. The capitulation of Limerick had, in addition to allowing the Irish freedom to enlist in the service of France, also promised toleration for the Catholics to the degree allowed during the reign of Charles II. But the Penal Code passed by a Protestant parliament did not recognise this latter clause. The Code was a series of vindictive anti-Catholic laws, which denied to the Catholics any rights of citizenship and any ownership of property. The Gov. of I. passed into the hands of a Protestant

oligarchy. The great landowners were never in the country and their representatives treated the Irish peasantry with the utmost cruelty. Parliament was in the hands of the great Protestant families and the Church under the control of absentee and usually irreligious bishops. The Irish people were downtrodden, their trade repressed and their land taken from them. Thousands of them emigrated and the flower of the Irish nation served the enemies of England, since England refused to use their services. Towards the

blessing of the age. The United Irishmen were formed, but William promised that which he could not fulfill—Catholic emancipation—and finally the state of Ireland became anarchic. The United Irishmen were sternly repressed and disarmed. Ulster underwent a brutal persecution at the hands of an armed force but was finally disarmed. In 1796 the French invasion under Hoche had failed at Bantry Bay. In 1798 the Irish rebellion broke out to a great extent it was a national rising. The leaders held out for Catholic emancipation and

*Irish hills*

THE GIANT'S CAUSEWAY, CO. ANTRIM

end of the century, however, Catholic repression was lightened, and some concessions in the matter of ownership of land were allowed them. These reforms were the immediate outcome of the American War of Independence. I had to be better treated or there was the possibility of her also breaking away. The principal result of this war, however, was the granting of an independent parliament. The British troops had previously been withdrawn from Ireland for service in America. Irish invasion seemed imminent. The Irish Protestant and Catholic alike, formed a volunteer force to resist invasion. Then gradually they discovered their own power. Led by Henry Grattan and practically under the threat of rebellion they obtained the repeal of Poyning's law after trade restrictions had been withdrawn (1782).

The next important event was the French Revolution, which Catholic and Protestant alike hailed as the greatest

parliamentary reform, and the peasantry were fighting for separation from Great Britain. The battles of New Ross and Vinegar Hill were the only two engagements of importance and both were defeats for the rebels. The Irish landing was a failure, since it came too late and Pitt saw that only union could end such anarchy. But union was distrusted and disliked. It was only at enormous expense and after much bribery by means of honours that it was brought about. Grattan ever a patriot, spoke strongly against it. In 1800, however, the Act of Union was passed and in 1801 it became law. The Irish were to be represented in parliament by twenty-eight Irish peers and four bishops elected for life by the whole of the Irish peerage. One hundred members were to represent Ireland in the House of Commons. I was to pay a certain amount to the British exchequer, was to be given absolute free trade with Great Britain, and was to keep her judicial and

executive systems. Pitt intended the Act of Union to be accompanied by a measure of Catholic emancipation, but the king (George III.) pleaded his coronation oath and refused to hear of it. Finally, rather than break a pledge, understood if not definitely given, Pitt resigned (1801). Rom. Catholics were unable to sit in the House of Commons until 1829, when the Rom. Catholic Emancipation Act was passed permitting them to do so. O'Connell was the great Irish leader of this time. In 1846 the potato crop failed, and famine made conditions terrible in I. About this time I. also began to feel Amer. competition in the corn market. Great Britain adopted Free Trade, and I., with the loss of protection for her wheat, soon found it impossible to compete with America. Measures were introduced attempting to alleviate the suffering of the smallholders, who, in many cases, were evicted by the impoverished land owners, and thousands of Irishmen emigrated to the U.S.A. and Canada. From 1864 to 1911, I. may be seen to change from a land of tillage to one of pasturage. The political unrest was aggravated during these years by the land question. Gladstone brought forward in Parliament two Home Rule Bills, one in 1886 and the other in 1893, but both were rejected. The work of the Irish leader Parnell (q.v.) in consolidating the Irish Home Rule party deserves notice during this period. Again, sev. years later, the Liberal party under Asquith introduced a Bill for Home Rule for I., and in 1914 this Bill received the Royal Assent. But owing to the Great War the operation of the Act was suspended (see HOME RULE). During the First World War many Irishmen volunteered and fought for Great Britain, and John Redmond, the Irish leader, used all his influence to assist the Brit. cause. But trouble between the two countries was still brewing. In 1916 there was a rising in Dublin, and after the war and the death of John Redmond matters grew worse. Secret societies and societies which were perfectly open in their proceedings strove more and more to separate I. from Great Britain. In 1919 an Irish Republic was set up with its own parliament, the first Dail. In 1920 guerrilla warfare began in I. between I. and Great Britain, and a system of reprisals resulted, which was ended by a truce in 1921. In that year a N. I. Parliament was set up in Ulster and later in the year a treaty between Great Britain and I. was signed. In 1922 the Irish Free State was formerly inaugurated. For subsequent hist., see EIRE; and see also GREAT BRITAIN and IRELAND, NORTHERN.

*Irish Literature.*—I., more than any other country in W. Europe, possesses a vast mass of poetry and saga, existing in MSS., much of which has not yet been catalogued, but this is no doubt only a fragment of the whole of anc. Irish literature. The poet Senchan Torpeist, in the *Book of Leinster*, A.D. 1150, laments that the *Cattle Raid of Cooley* and the *Great Skin Book* had been taken to the E., and in many other of these anc. MSS., are similar

references to books that have disappeared. Prior to the writing of MSS., there existed in I. the bardic schools of poetry and, at a later date, the Christian colleges. We find in the many lives of the saints references to these Christian colleges, but little is known of the bardic schools. It is supposed that they were formed round a chosen bardic poet, who was followed from place to place by his disciples. The earliest extant MSS. written in Old Irish date from the eighth century, and are mostly glosses and explanations of book used in Irish church schools. Other Gaelic works in order of antiquity are the *Book of Armagh*, poems contained in the Milan and the St. Gall codices, and the *Martyrology of Angus the Culdee*. Later, from the twelfth to the sixteenth century, follow the books of the Middle Irish period, which includes the *Book of Leinster* and the *Book of Ulster* containing the *Cattle Raid of Cooley*. The Middle Irish books, however, were compiled from poems and sagas of a much earlier date. As Irish literature developed, it concentrated on the writing of romances, and, unlike other Celtic literature, no drama was produced. Stories of cattle raids, battles, courtships, voyages, visions, destructions of places by sword and tempest are the subjects of epic and romance in prose and poetry, which formed the repertoire of the *ollamh* or chief bard. To learn his craft took the bard from nine to twelve years. The introduction of Christianity had little influence on the early romances, which may be divided into the following mythological cycles: the *Cycle of Tuatha De Danann* and the Pre-Milesians, the *Red Branch Cycle*, and the Cycles of Finn Mac Cumhail, Ossian, and Oscar. These romances date from before the eighth century. Following the Norse invasions of the ninth and tenth centuries, literature and art were blotted out, but in the eleventh and twelfth centuries there was a revival in art and learning. It was during this time that the Middle Irish books were compiled, but, owing to Norman interference, the thirteenth century was comparatively barren. The most important poet of this period was the bard Donogh Mor O'Daly (d. 1211), but there are few poets mentioned who belong to this time, and not many poems are extant. During the fourteenth century poetry again flourished, the most important poets being Tadhg Mor O'Higinn (d. 1315) and John Mor O'Dugan (d. 1372). From this time date the compilations of annals and family records, and the profession of poetry became hereditary, noteworthy families being the O'Dalys and the O'Higinns. Fergal O'Daly and Angus O'Daly, the satirist, Tadhg O'Higinn and Dubhthach, son of Lochadh, are celebrated poets of the fifteenth and sixteenth centuries. With the seventeenth century came a revival of Irish literature under the four masters, Seathrún Keating, Father Francis O'Mulloy, Lughaidh O'Clery, and Duaid. These four men were poets, while Mac Firlis was the greatest prose-writer of that time. A later poet was Teig Mac Dalro, but with

the eighteenth century came the downfall of the *ollamhs*, and their poetry became imbued with melancholy, for they were reduced to poverty and found it impossible even to educate themselves. The sorrows of the *ollamhs* are well expressed in the prolific works of David O'Briadar, who is a typical poet of this period. During the end of the nineteenth and the beginning of the twentieth century there was a revival of the Irish language and its literature, and Gaelic became the official language of Eire. Also many Irish dramatists, writing in Eng., have used the ancient Irish myths.

The Irish contribution to Eng. literature has been peculiarly rich in drama, perhaps the most fertile field. Goldsmith, Congreve and Farquhar, Wilde, Shaw, and O'Casey, in poetry Thomas Moore and Yeats, in philosophy William Rowan Hamilton and A. E. (George Russell) in novel writing, Lover and Joyce and in England, James Joyce. During the past quarter of a century this enrichment of English by writers of Irish extraction has continued. These years have seen the achievement by Eire of independence, a decline in the heroic mood and the rise, of a new middle class of traders and civil servants, and it is against this background, with its inevitable disenchantment, that novelist critics such as Frank O'Connor and Sean O'Faolain have written in the past two decades. While Sean O'Casey, the playwright, has made interesting attempts at a fusion of a raw realism with symbolical significance. Mary Lavin with sev. vols. of short stories including *Tales from Beehive Bridge* (1913, Galt Prize) and a novel, has been the sole reminder from a neutral Ireland that the standard of work in fiction set by Frank O'Connor and Sean O'Faolain has not been lost. Her stories have a singing quality, with prose heightened through local idiom to the musical form familiarised by J. M. Synge. Michael McLaverty's fiction is drawn from his experience of the Roman Catholic people of Belfast and vicinity. His last novel *The Three Brothers* (1918) in its even and lyrical prose, is typical of his exactness of vision. Ely in Mac Mahon of Kerry is a young storyteller whose *Lon Famer and Other Stories* (1918) reveals a talent developed in the traditional *shanachie* manner. Michael O'Boine acutely pictures the lower middle class of Dublin. Among poets there has been something in the nature of a reaction to Yeats, whose greatness has somewhat obscured their individuality. The Gaelic influenced poets (writing in Eng.) include Austin Clarke, Robert Barron Padraic Fallon and Donagh MacDonagh. 9 Irish poets using a more typically 'modern' idiom and more concerned with ideas, are Ewart Milne, Valentin McDermott and Geoffrey Taylor. Ulster poets are John Hewitt and W. R. Rodgers whose concern is with the problems and way of living of a distinctive community in Irish drama, Lord and Lady Longford (of the Abbey Theatre), Teresa Deery, Gerard Healey and Walter Macken are among a small group of playwrights who

have abandoned the peasant-life comedy of Synge for the distraction of contemporary life. Noteworthy, also, is the Gate Theatre, Dublin, founded in 1924. For Irish writers who have written in Eng., see further under ENGLISH LITERATURE. See also GAIIC LANGUAGE AND LITERATURE.

Larratt, *The Course of Irish Verse*, 1918, and H. Shearman, *Anglo-Irish Relations*, 1918.

Ireland, Church in, was founded, according to tradition, by St. Patrick, who has always been regarded as the patron saint of the country, in the fifth century. In the seventh and eighth centuries the Irish Church was one of the most flourishing in Christendom. See IRELAND—History. Despite the outward continuity of the present Church of Ireland with the pre-Reformation Church, it has for centuries been the Church of only a section of the people of whom by far the larger portion remained under papal jurisdiction. The first convocation of the Irish clergy was held in the reign of James I, the Irish articles being drawn up in 1615. These were accepted by the Irish Church in 1834. Their distinctly Calvinistic tone is indicative of the way in which the Church of Ireland has always inclined more in the direction of the advanced reformers than has the Church of England. During the seventeenth century its most important prelates were John Bramhall, Archbishop of Down, and Wm. King, Bishop of Derry. The Act of Union of 1800 linked the Churches of England and Ireland into the

workers in the clothing and textile trades in 1947. Londonderry is an old estab. centre of the shirt-making industry. The only minerals are sandstone, clay, chalk, or other igneous rocks, and granite, the quarrying of which employs some 3000 persons. In 1946 there were some 1663 elementary schools with 135,600 pupils; and 76 preparatory, intermediate, and secondary schools with nearly 20,000 pupils. The Queen's Univ. Belfast, has some 2000 students. The revenue of N. I. in 1945-46 was £51,216,000 and the expenditure was much the same. The total

## FLAX HARVESTING IN NORTHERN IRELAND

The flax is put into the retting dam where it will steep for about ten days

railway mileage is 677, the chief railways being the Great Northern, L. M. and S. (N. Cos. Committee), Belfast and County Down, and Londonderry and Lough Swilly. Air services are in operation between N. I. and the prin. airports of Britain. Although economically N. I. is allied to England, much of the pop. is of the peasant proprietor type common to the whole of Ireland; in 1937 the total pop. was 1,279,745.

According to the census of 1937, the following are the areas and pop. of the towns and co. bors. of N. I. The names of the towns appear in parenthesis:—

Irenseus, Saint (c. 120-202), bishop of Lyons at the end of the second century, said to have been a native of Smyrna, Asia Minor. In early youth he seems to have been connected with Polycarp. He was a priest of the church at Lyons under Pothinus, its bishop, upon whose martyrdom, in 177, in the persecutions of Marcus Aurelius, I. succeeded to the bishopric, which he held for twenty-five years. He spent great labour upon missionary efforts among the pagan Gauls, but he is best known for his attempts to mediate between the bishop of Rome and the Christian churches in Asia Minor in their dispute about the proper day for the celebration of Easter, and for his opposition to the Gnostics and the Valentinians. The account of his martyrdom under Severus is not found before the writings of Gregory of Tours, and is probably a mistake. Of his writings, a few fragments of the *Adversus Haereses*, in the original Gk., and a barbarous Lat. trans. of it are all that are extant. See editions of his works by Erasmus, 1526; A. Stieren, 1818-53; W. W. Harvey, 1857; and in Clark's *Auto-Nicene Library*; and Le P. Salvator Herrera, *St. Irénée de Lyon exégète*, 1920; L. Spikowski, *La Doctrine de l'Église dans St. Irénée*, 1926; S. Lundström, *Studien zur lateinischen Irenaus Übersetzung*, 1913.

Irene : (1) (c. 752-802), Byzantine empress. She was a poor but beautiful and talented orphan, a native of Athens, whom Leo IV., E. Rom. emperor, married in 769. On the death of Leo (780) she ruled over the empire, her son, Constantine VI., being only ten years of age. She restored the orthodox image-worship, for which deed she was canonised by the Gk. Church after her death. When Constantine grew up he tried to free himself of her autocratic sway, and in 790 was proclaimed sole ruler by the soldiers. Two years later the empress conspired against her son, and had his eyes put out. She tried to arrange a marriage between herself and Charlemagne. In 802 she was banished by the patriarians to Lesbos, Nicophorus, her treasurer, being placed on the throne. (2) A Rom. goddess of Peace, according to Hesiod a

daughter of Zeus and Themis. She was worshipped at Rome and at Athens.

**Ireton, Henry** (1811–51), Parliamentarian general, b. at Allenborough, Notts; graduated at Cambridge Univ., 1829, and studied law. Married Cromwell's daughter, Bridget, and acquired great influence in the Parliamentarian party. Took an active part in the Civil War, on the outbreak of which in 1612 he was nominated captain of a troop of horse to be raised at Nottingham, near which tn. his estates were situated. He fought at Edgehill and at Naseby, and was present at the siege of Bristol. He signed the warrant for the execution of Charles I. In 1649 he went to Ireland as Cromwell's deputy, and rendered yeoman service to his party. He died of fever when besieging Limerick.

**Iris**, see **VOGNERA**.

**Iriarte, Tomás de** (1750–91), Sp. poet, b. at Orotava in Tenerife. He began his literary career by the trans. of Fr. plays, publishing his first original comedy, *Uacer que haecomo*, in 1770. In 1771 he became official translator in the foreign office at Madrid, and in 1776 keeper of the records in the War Office. A dull didactic poem, *La Musica* (1780, Eng. trans., 1807), inspired by Haydn, was much admired, but his fame rests mainly on his *Fabulas Literarias* (1782, Eng. trans., 1806), two of which, *The Donkey Flautist* and *The Dancing Bear*, are especially celebrated. See E. Cotarelo y Mori, *Iriarte y su época*, 1897.

**Iridaceae**, natural order of monocotyledonous plants, consisting of nearly 1000 species, which flourish in temperate and tropical lands. They are usually herbaceous plants of such beauty as to justify their cultivation for ornament alone. The *Iris* (q.v.) and *Crocus* (q.v.) are representatives of the predominant northern form of this order, as the *Gladiolus*, *Freesia*, and *Ixia* are of the southern.

**Iridium**, one of the metals of the platinum group. Its symbol is Ir, its atomic number 77, and its atomic weight 193.1. It occurs as an alloy of platinum, and also of osmium in the Urals, Brazil, and elsewhere. It is fusible only with difficulty, extremely insoluble (in the massive form it is not attacked by *aqua regia*), and separable from its allied elements only with difficulty. The best method for its preparation is that devised by St. Claire Deville and Debray. This consists in fusing osmiridium with zinc, distilling off the latter so as to leave a porous mass. This is powdered, mixed with barium nitrate, and ignited. The osmium is converted into barium osmate, and the Ir. into its oxide. On boiling with nitric acid the osmium is volatilised as the tetroxide, while the Ir. is obtained in solution from which the double ammonium chloride can be prepared. This, on ignition, gives Ir. in a spongy form, which, on fusion with lead and subsequent treatment with nitric acid, gives the pure metal. Ir. is used for pointing gold pen-nibs, for electrical sparking contacts, and for making standard measures. Its compounds resemble those of platinum (q.v.).

**Iridosmine**, see **OSMIRIDIUM**.

**Iriga**, tn. of the prov. of Ambos Camarines, Luzon, Philippine Is., on the Ibuli It. The chief products are rice, Indian corn, sugar, pepper, cacao, cotton, tobacco, copra, and hard woods. Pop. 20,000.

**Iris**, in Gk. mythology, was the daughter of Thaumias and Kleotia, and the sister of the Harpies. In the *Iliad* she is mentioned as the messenger of the gods, but the office is given to Hermes in the *Odyssey*. In earlier writers she is mentioned as a virgin goddess with wings of gold, but later writers make her the wife of Zephyrus, and the mother of Eros. She was especially considered the messenger of Hera and Zeus, and is depicted with a herald's wand, and a pitcher in her hand. In Gk. the word 'Iris' denotes 'a rainbow,' of which she is generally considered the personification.

**Iris**, one of the larger of the asteroids, planetoids, or minor planets, a group of small planetary bodies between Mars and Jupiter, first discovered in 1801 and 1802. See **ASTEROIDS**.

**Iris**, chief genus of Iridaceae. 'There are many sections of the I. family, but the family may be divided into two main sections—the species and the tall-bearded varieties. The species are the wild irises, most of them small-flowered, which have been found growing throughout the N. hemisphere—California, Morocco, Transjordan, Persia, China and many other places including Britain. As far as species are concerned there are about 200 different types, some grown from bulbs, some from roots, and others from rhizomes. Seven species are easy to obtain and grow. These are *I. reticulata*, with fragrant and velvety flowers, deep violet in colour; *I. stylosa*, the ideal plant, which blooms all the winter with blue flowers excellent for cutting; Sp. and Dutch irises, both June-flowering types, which grow readily in any normal soil; Siberian irises with attractive flowers in violet, white and blue colours; *Kumpferi* or Jap. I., with broad flat blue purple or white flowers; and *I. chmaeris*, a small, low-growing counterpart of the tall-bearded varieties, useful for rock-garden or border. In the tall-bearded section the only I. known to many gardeners is the purplish-blue variety known as *Germanica*. The well-known species of I. are known popularly by the names of *fleur-de-lis*, *flowers-de-luce* and *flags*. Among the best-known species which are to be found in Britain are the *I. pseudacorus*, the yellow flag, and *I. foetidissima*, the gladwyn or blue I. *I. florentina*, the Florentine I., is a native of S. Europe and the is. of the Mediterranean; its rhizome has an aromatic odour like that of the violet, and is known as orris-root. The Algerian I., which has large blue-purple blooms, is one of the best of all winter flowers and will grow in a poor soil.

**Irish Free State**. The name given to S. Ireland by the Irish Free State (Agreement) Act, 1922, which repealed the Gov. of Ireland Act of 1920 (Home Rule) and created a dominion in Ireland on the Canadian model. Under Mr. de Valera's

Gov. the name was changed to Eire. See further under EIRE.

**Irish Fusiliers (Princess Victoria's), The Royal.** Formerly the 87th and 89th Regiments. The 87th was formed in 1793, and fought under Abercrombie in Egypt in 1801. It gained great fame as the '*Faugh-a-Balloughs*' (Clear the Ways) in the Peninsula, where Sergeant Master-son of the regiment captured the first Fr. Eagle during the campaign. It then took part in the Crimean War, the 1882 Egyptian campaign, and the Burmese War of 1885. The R.I.F. took part in the South African War (1899-1902), and was at the Relief of Ladysmith. During the First World War it raised fourteen battalions, which fought in France, Flanders, Macedonia, Gallipoli, and Palestine. After the war it was reduced to one battalion, and linked with the Royal Inniskilling Fusiliers to form one corps. In the Second World War the regiment was part of the famous Eighth Army and fought in many battles on the It. front. Detachments of the regiment also formed part of the Brit. garrison in Leros.

**Irish Guards.** Formed in 1900 to commemorate the gallantry of Irish regiments during the S. African War, 1899-1902. It was formed from volunteers from other regiments of Foot Guards. During the First World War it raised three battalions which served in France and Flanders, bearing the following honours, among others, on its colours—Mons, Marne, Ypres, Gheluvelt, Loos, Somme, Passchendaele, Cambrai, Bapaume, Hindenburg Line, and Sambre. General the Earl of Cavan is Colonel of the Regiment and King (George VI.) is its Colonel-in-Chief. In the Second World War the I. G. fought in numerous battles in Italy and on the W. Front.

'**Irish Independent**,' founded in 1891 as a penny daily newspaper, the *I. I.* (now pub. at 1d.) has the largest circulation of any daily paper in Eire. It is a strong supporter of the Fianna Fail party, and is active in upholding the revival of the Gaelic language—but evidently without much success—and in promoting the Irish arts and industries. The *I. I.*, together with its satellite papers, the *Evening Herald* and the *Sunday Independent*, takes a great interest in all sporting events.

**Irish Moss,** see CARRAGERN MOSS.

**Irish Nationalist Party,** see NATIONALIST. **Irish Press,** organ of the Fianna Fail (*q.v.*) party in Eire. Founded in 1931, as an Irish National paper, but was subsidised mainly by disaffected Irish Americans. It is the organ of the present (1947) Eire Gov. and has no sympathy with the Brit. Commonwealth.

**Irish Regiment, The Royal.** Formed from certain Independent Companies which were regimented in 1683. It fought at the Boyne and at Limerick under Wm. III. It greatly distinguished itself at the fall of Namur in 1695, where its conduct gained from Wm. III. the grant of one of his own badges, the Lion of Nassau. It fought under Marlborough at Blenheim, etc., and under Abercrombie at Alexandria in 1801. It took part in the Crimea (1853-56), Afghanistan (1879-80),

New Zealand (1881), and Egypt (1882) campaigns, and was at Tel-el-Kehir. It was also in the S. African War of 1899-1902. In the First World War it raised nine battalions, which served in France, Flanders, Macedonia, Gallipoli, and Palestine. As a consequence of the inauguration of the Irish Free State the regiment was disbanded in July 1922.

**Irish Republican Army (I.R.A.),** illegal association of Irish extremists, who stand for a republic of all-Ireland, entirely independent of the Brit. connection. They are the successors of those members of the S. Irish Volunteers who refused to fight for the Allies in 1914 and who formed themselves into the Irish Republican Volunteers, organised the Easter Week rising in 1916, and proclaimed an 'Irish Republic.' More extreme than the Sinn Féiners, they rejected the Anglo-Irish Treaty of 1921, and in 1922 involved their country in a second civil war. They numbered probably about 25,000 in the time of the Fine Gael (Cosgrave) Gov., but dwindled to less than 10,000 in the course of the Fianna Fail (*q.v.*) rule of de Valera. Like the I.R.A., Mr. de Valera, when Prime Minister, aimed at the abolition of the border, but whereas he preserved some kind of external association with Britain, the I.R.A. wanted absolute independence, and to that end they organised a series of bomb explosions in Great Britain—probably in conjunction with Nazi agents—but after the passing of the Prevention of Violence (Temporary Measures) Act, 1939 to expedite legal procedure against the malefactors, considerable numbers of the I.R.A. members were deported to Eire and one or two were hanged for murder. In Eire in Dec. 1940 they raided the Phoenix Park Arsenal and stole large quantities of arms and ammunition, whereupon the Dail passed an emergency act authorising the gov. to intern suspects. Early in his tenure of office de Valera had proscribed all pseudo-military bodies, such as the Blue Shirts, and it might have been supposed that the Act was sufficient for the purpose of rounding up the I.R.A., but in Eire it is difficult to secure a conviction, juries being either sympathetic to the suspect or afraid of the I.R.A. The I.R.A. has no official organisation, only ventures to meet in secret, and is governed by an 'Army Council.'

**Irish Rifles, The Royal (now The Royal Ulster Rifles).** Formerly the 83rd and 86th Regiments, which were linked in 1881. The 83rd was raised in 1793, and gained its first honours under Wellington in the Peninsula. It then saw service at the Cape, in Ceylon, and America. During the Indian Mutiny it served in Central India. The 86th was originally employed as Marines, but in 1799 went to India, where it served with distinction at Bharat-pore (1805). During the Indian Mutiny it served in Central India, and later at the Cape. The R.I.R. went through the S. African War, 1899-1902. During the First World War it raised twenty-one battalions, which served in France, Flanders, Macedonia, Gallipoli, and Palestine. In consequence of the inauguration of the

**Irish Free State** Its title was altered from The Royal Irish Rifles to The Royal Ulster Rifles.

**Irish Sea**, sea which lies between the N. of England and the N. of Ireland, connected with the Atlantic on the N. by the N. Channel, and on the S. by St. George's Channel. The greatest breadth (between Morecambe Bay, Lancashire, and Dundalk Bay, Louth) is 150 m.; the greatest length is about 110 m. Within its boundaries are the Isles of Man, Anglesey, and Holyhead.

**Irish Setter**, see SETTER.

**Irish Terrier**, rather large dog, varying

IRISH TERRIER

in weight from 17 to 25 lb.; with a hard, rough, and wiry coat, without any tendency to curl. Its usual colour is a bright reddish-brown, but varies through different shades of brown. Its head should be long and rather narrow; the ears small, alert-shaped, and lying close to the head; the eyes small and hazel, and the nose black; the fore legs straight and strong with round thick feet; chest narrow with deep brisket, and back straight and strong; the tail, if not cut, should curve. The I. T. is quite a modern breed, dating from about 1870; it is much valued for its affection and pluck, and its enthusiasm for chasing anything and everything.

**'Irish Times'**, constitutional daily paper pub. in Dublin and widely circulated throughout Ireland at the price of 2d. Originally a penny newspaper, it was founded by Major Lawrence Knox as an anti-Horne Rule, anti-Catholic, and loyalist paper of a very pronounced type. In contrast to the Irish Press it stood for the maintenance of Ireland's place in the Brit. Commonwealth of Nations. The paper was purchased in 1873 by Sir John Arnott. The I. T. company also publishes in Dublin an *Evening* and a *Weekly* ed. of the I. T., and the *Irish Field*, a paper devoted to every kind of sport.

**Irish Water Spaniel**, see SPANIEL.

**Irish Wolfhound**, supposed to be the oldest breed of dog in the United Kingdom, but the original breed in reality has died out, and information concerning it is only obtainable by tradition, although sev. attempts have been made to repro-

duce it. The old I. Ws. enjoyed a great reputation for their strength and their courage in attacking wolves. In appearance they seem to have been of two kinds, one resembling a greyhound, and the other a mastiff. Modern I. Ws. are the result of the endeavours of Capt. Graham of Dursley, Gloucestershire, to reproduce the old breed, but there is no positive proof that they do so. They are the result of crossing the Great Dane and deerhound, but a fine specimen exhibited in 1895 was the result of crossing a bitch, of Scottish hounds strain with a dash of Siberian wolf strain, with a Russian wolf-

T. Fall

IRISH WOLFHOUND

hound. The points of this modern breed, as required by the Irish Wolfhound Club standard, are: general appearance not quite so massive as the Great Dane, but more so than the deerhound, the largest hunting dogs in existence, with minimum height of 31 in. and weight of 120 lb. (bitches 28 in. and 90 lb.); head long and narrow, muzzle long and moderately pointed, and ears small, and greyhound-like in carriage; neck long, very strong and muscular, well arched without dewlap; chest very deep and breast wide; back moderately long; loins arched; belly well drawn up; tail long and slightly curved, of moderate thickness and well covered with hair; shoulders muscular and sloping; elbows well under; muscular thighs with second thigh long and strong, and hocks well let down; feet moderately large and round with toes well arched; hair rough and hard on body; any colour that appears in the deerhound but black is rare.

**Iritis**, inflammation of the eye, in particular of that coloured membrane called the iris which lies between the cornea and the lens. I. is usually associated with some constitutional disturbance, such as gout, rheumatism, syphilis, or tuberculosis; it may be secondary to inflammation of the cornea or of the sclerotic or choroid coats. It is sometimes symptomatic of meningitis. The symptoms are pain, especially at night, disturbance or occlusion of vision accompanied by a dread of light and the shedding of copious tears. The physiological changes include

an excess of blood at the beginning of the attack, followed by exudation into the fibrous substance of the iris, possible adhesions to the lens or collections of pus between the lens and the iris. The attack may subside in about six weeks, it may become chronic, or it may take on a recurrent form. Generally, rest for the eye is of prime importance; the eye should be shaded and no occupation requiring its constant use should be permitted; the patient should not, for instance, read at all. Pain may be alleviated by hot fomentations or the administration of cocaine. It has been found that adhesions may be treated with success by the use of electrolytic methods.

Baikal. Fishing in Lake Baikal and trapping for furs are the chief occupations outside agriculture. The climate is severe and earthquakes common in the neighbourhood of Lake Baikal. The inhabitants are mostly Russians, Buriats, and Tunguses. Area 280,429 sq. m. Pop. 521,000. The chief tns. are Irkutsk, Balagansk, Kirensk, and Verkholensk. (2) Cap of the E. Siberian Region, and a univ. tn, lies on the Angara R. and on the Trans-Siberian railway, 40 m. N. of the S. extremity of Lake Baikal and 3722 m. from Leningrad. The tn. was almost destroyed by fire in 1879, and has been rebuilt on a remarkably fine plan. It has many fine buildings, factories, and a gold

Soviet Weekly

## IRKUTSK REGION: LAKE BAIKAL

The railway on the lakeside serves Baikal mica mines

Irkutsk: (1) Region of the R.S.F.S.R. in S.E. Siberia. The country is of a mountainous character, with a general elevation of about 1500 ft., traversed by the loftier chains of the Kitoi and Tunkun in the S., the Sayan Mts. from S. to N.E., and the great plateau of N. Siberia to the N. A great part of the area is given up to agriculture, rye, wheat, barley, oats, and potatoes being cultivated and cattle bred, but the S.E. portion is largely forest land. The most important riv. is the Angara (1000 m.), connecting Lake Baikal and the Yenisei. Coal, gold, iron, salt, fire-clay, and granite are found, but are little worked. There are mica mines by Lake

refinery, and is an important commercial port and the centre of the tea trade. An air service, increasingly employed in the transport of gold and fur, has been estab. between I. and Yakutsk. Riots occurred in I. during 1917, and in July 1918 the tn. was captured by Czechoslovak troops. Pop. (1939) 243,000.

Irham, eccles. par and vil. of Eccles (q.v.) S. Lancashire, England, 7½ m. S.W. of Manchester, at the junction of the Mersey and the Manchester Ship Canal. Pop. 14,000.

Irmin and Irmin Pillars, in Teutonic mythology, god of the old Germanic tribes of the Herminones. The huge wooden

posts called Irmin Pillars were raised in his honour and worshipped by the Saxons during their wars with the christianised Gauls. The chief seat of this worship, the Irminsal (Westphalia), was destroyed by Charlemagne in 772. 'Irmin's (harior) was an ancient name for the Great Bear.

**Irnerius** (sometimes called the 'Lucerna juris'), Italian jurist, b. at Bologna early in the twelfth century. He founded a school at Bologna and at the instance of the Countess Matilda directed his own and his pupils' attention to the *Institutes* and *Code* of Justinian. He appears to have held some office under Henry V. after 1116, and to have died under the Emperor Lothar before 1140. He is generally considered the first of the Glossators, and the author of an epitome of the *Novella* of Justinian called the *Authentica*. See monograph by P. Vico, 1863, and F. C. Savigny, *Geschichte des römischen Rechts im Mittelalter*, vol. iii, 1826, 31.

**Iron, Ralph**, see SCHRIENER OLIVER.

**Iron Age**, third of the three technological ages of man formulated about 1836 by O. J. Thomsen. A Danish curator demonstrated stratigraphically by his student Worsaae in the peat bogs of Denmark, and since generally by all archaeologists.

These ages were not everywhere contemporary, thus the I. A. began in Asia Minor c. 1200 B.C. in central Europe about 900 B.C. in China about 600 B.C. in Britain in the sixth and early fifth centuries B.C. and in the Fiji Is. not until an expedition there in the late nineteenth century. The economical working of iron, particularly for use in agricultural tools and weapons, was a great step forward in civilisation, and it was in fact the chief underlying cause of an urban revolution from which was to arise an organisation of labour and of foreign trade over a large area, and the beginnings of city life and a political consciousness.

The earliest culture of the Early I. A. in central Europe is named after Hallstatt, an exceptionally rich cemetery in Upper Austria which is within forty m. of Noricum, one of the famous iron mines of antiquity. Relics of both bronze and iron were recovered, and stages in the evolution of the sword in both metals provided a relative chronology. But the Hallstatt civilisation as a whole is exceedingly complex, as may be seen from a study of the various hybrid stocks which reach it. Britain in the sixth to fifth centuries B.C. and continental cultures known as Early Iron Age A. The vill sites of All Cannings (Dorset, Wiltshire), Hengistbury Head (Hampshire), and Scarborough, Yorks., have yielded typical pottery, and there are notable camps, or hill-forts, at the Iron Age and Gussbury, Sussex, and Egsbury, Wiltshire.

It may be noted here that the I. A. of Scandinavia is sometimes considered as four main periods — the Celtic I. A. from c. 400 B.C. to the Early Iron I. A. from c. 0 B.C. to A.D. 200, the Late Iron I. A. from A.D. 200 to 400, and the Germanic I. A. c. A.D. 400 to 800. The Viking Period, c. A.D. 800 to 1000 is noted for its iron weapons, and notably for axes and swords inlaid with silver.

Further Celtic immigrants to Britain about the middle of the third century B.C. brought much developed cultures, chiefly from the Marne in N. France, named after a type site at *La Tène* ('the Shallows') on Lake Neuchâtel, Switzerland. The various La Tène cultures grew from trading contacts made between the highly civilised peoples of the Mediterranean and the

IRON HOLLOW CHIT WITH  
HANDLE (Hallstatt)  
(Hallstatt)

Hallstatt farming communities of the Alps. They used it extensively for military and household gear, and the metal smiths were skilled craftsmen as may be seen from such examples of their work in Britain as the Battersea Shield, the Witham Shield, and the Thames Helmet, all in the Brit. Museum. The peoples of the 'Iron Age B' culture, as this is usually called in its wider aspect, were in

the main an aristocracy, but the six chief groups which can be recognised differ much in their agric. domestic and military traditions. Among the important sites and relics in Britain are the *aurus gallicus* forts of Scotland; the charloteers of Yorkshire; the wealthy lake-villa, of Meare and Glastonbury with their fine wood-work and textiles; those of the Atlantic tin-traders and merchants of Cornwall; and the cultures of Wessex have recently been demonstrated in the brilliant excavation of the gigantic hill-fort of Maiden Castle, Dorset. Other remarkable hill-forts with strong defences of this period are Hambury, Devon; and Cadbury and Ham Hill, Somerset.

A third period in the Early I. A. is that dominated by the *Belgic* culture of N. Gaul, which had itself grown by the pressure of the Celts and Germanic peoples of the Lower Rhine on the Marnian culture of La Tène. In Britain the Belgae arrived about 75 B.C. as adventurers, then later as colonists. They were river-side farming folk, and with their new equipment of heavy wheeled ploughs which dealt effectively with loams and clays, they were enabled to follow up the clearance of woodland and to start an agric. revolution. The same ruler, Diviciacus, held sway both in Gaul and Britain at one period; there was a system of inscribed gold coinage; a flourishing export trade in corn, cattle and cattle-products, gold, silver, iron and slaves; and the infiltration of Roman civilisation secured the import of luxuries in return. The cremation cemeteries of *Aylesford* and *Swarling* in Kent with fine wheel-turned pedestal urns and bronzes represent the sepulchral evidence. On the economic side of this final period of the I. A. is the foundation of states to replace tribal groups, and the estab. of urb. caps.—*Verulamium*, (St. Albans), *Callera* (Silchester), and *Camulodunum* (Colchester).

The bibliography is extensive. See, generally, Brit. Museum *Guide to Early Iron Age Antiquities*, 1925. Authoritative works, with references, are T. D. Kendrick and C. F. C. **Iron and Steel.** Iron (Symbol Fe, atomic number 26, atomic weight 55.85) is the fourth most abundant element on the earth. It is only very rarely found in the free state, and then mostly as meteorites which have come from other worlds than ours. Its more usual occurrence is in combination with oxygen as oxides, or with sulphur as sulphides (pyrites). Only the former are true ores of iron, as the latter is infrequently used as a source of extraction of iron owing to the high sulphur content and difficulty of removal. Iron ore, as mined, contains varying quantities of impurities, such as silica, alumina, lime, sulphur, and phosphorus, which have to be removed, as well as the oxygen, before malleable steel or iron is produced. This is almost exclusively done by heat in

the presence of a reducing agent such as coke, charcoal or other carbonaceous material. Terrestrial iron was known early in the prehistory of Mesopotamia and Asia Minor; iron forging was perhaps discovered in Armenia where there are rich ores. The process had spread to N. Europe by 500 B.C. The purposeful repetition gave the first ironmaster of an industry which today produces well over 100,000,000 tons of steel annually. Prehistoric man used iron for tools, weapons, domestic and horse-gear, and particularly for agric. implements such as hoes and sickles.

The primitive processes of working gave a pasty semi-solid malleable metallic product in one operation. The small pieces of iron, weighing only a pound or two at the most, could be hammered into shape with the tools of the early craftsmen. Owing to its extensive distribution throughout the world, iron manu. was widely carried out. Improvement on the crude forging process, though slow, was definite, larger units were built, more powerful blowing machines were introduced, until about A.D. 1300–1400 an unexpected result was achieved. Instead of the partly malleable product, a liquid metal flowed from the furnace, which was found, on setting, to be hard and brittle. This substance we now know as pig iron, and the reason it is so hard and brittle is that it contains about 4 per cent of carbon whereas the prior malleable iron was practically carbon free. The expert ironmaster soon found a way out of the difficulty by a further treatment of the pig iron in a separate furnace and thus there was the beginning of the present-day double process for producing steel or malleable iron. The iron ore which contains about 30 per cent oxygen is heated in a blast furnace with coke to produce pig iron, which contains no oxygen but 4 per cent carbon, the balance being iron. The pig iron is then heated in a steel-making furnace to reduce the carbon to from 0.02 to 1.6 per cent carbon, which is the range of steels from very soft to very hard.

**Sources of Iron.**—Although iron is widely distributed throughout the crust of the earth, the prin. ores from which it is extracted are comparatively few. Among the more important are (i) Magnetite ( $\text{Fe}_3\text{O}_4$ ) containing 72.4 per cent iron; a black ore which, in line with its name, is very magnetic; (ii) Haematite ( $\text{Fe}_2\text{O}_3$ ) containing 70 per cent iron; its colour varies from bluish-grey to red, and one well-known form is the so-called 'kidney ores' of Cumberland; (iii) Limonite ( $2\text{Fe}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ ) containing 59.8 per cent iron, its colour varies from various shades of brown to yellow; and (iv) Siderite ( $\text{FeCO}_3$ ), also known as spathic iron ore, contains 48.3 per cent iron; its colour varies from pale yellow to brown and grey.

Pyrites ( $\text{FeS}_2$ ) is not really a source of iron as it contains too much sulphur to allow a profitable extraction of iron from the raw material. It is a mineral which occurs widely and extensively throughout the earth's crust, but its development as a source of iron is a problem for future generations.

**EVOLUTION OF IRON AND STEEL MANUFACTURE**—In the Middle Ages pig iron was produced in primitive blast furnaces using charcoal as fuel which was burned by an air blast from bellows driven by water wheels. The pig iron was cast into sand beds, allowed to go cold, broken up and then the second process of conversion to malleable metal was carried out in a separate furnace known as a charcoal refinery. Once again the fuel used was charcoal, made by partial burning of wood with a controlled and limited access

for production of wrought iron, but again only giving a semi solid spongy product. The blast furnaces of Darby's day in the late eighteenth century had an output of 10 tons per week, which was considered colossal. Modern blast furnaces which have been developed from it have an output up to 1,000 tons per day.

The major problems of steelmaking may be classified under two headings: (1) heat, (2) refractory material able to resist heat. Iron ore does not react with carbonaceous reducing material until a temp. of over

BLAST FURNACE FOR THE PRODUCTION OF PIG IRON

of air. The product of the refinery was a semi solid spongy mass known as charcoal iron or wrought iron, which was removed from the furnace by tongs and hammered into a solid bloom of malleable metal. Later this bloom was reheated in a charcoal furnace and rolled into billets, bars and other shapes. During the seventeenth century the growing shortage of wood for conversion to charcoal caused the ironmakers to look elsewhere for a possible source of heat. Coal had been known for several centuries beforehand and it seemed a likely substitute. Early experiments were not successful but eventually success was obtained by treating coal so as to convert it to coke in the same way as wood has been converted to charcoal. The charcoal charged to the blast furnaces was replaced by coke by Darby in 1760. The charcoal used in the refinery was also replaced by coke and by long-flaming coal from this developed the Puddling process

when 1,200° C is reached. From this it follows that man could not know iron until he had learned how to make fire which in an open hearth or camp fire reaches a temp. of about 1,000° C. But pure iron does not melt until a temp. of 1,527° C, and it requires about 1,600° C. to get a proper superheat so that the metal can flow during casting. By burning coal and charcoal at room temp. in an open grate with forced draught it is possible to get about 1,100° C, which is still short of the melting point of pure iron and accounts for the production of charcoal iron and coke in the semi-solid pasty condition. The fact that the blast furnace gave liquid metal arose from the absorption of 4 per cent carbon by the pure iron. This metal is not malleable and melts at 1,250° C.

Two methods of producing the high temp. necessary to melt pure iron were evolved at roughly the same period, by Bessemer in 1856, and Siemens in 1866.

The method perfected by Bessemer was the more remarkable as it consisted simply of blowing cold air through molten pig iron. This not only removed the excess 4 per cent of carbon but also other undesirable elements such as silicon and manganese, and at the same time increased the temp. of the metal from some  $1300^{\circ}\text{C}$  to over  $1600^{\circ}\text{C}$ . The method used by Siemens is known as the regenerative principle. When coal or wood at room temp. is burned by air at room temp. in an open fire the maximum temp. reached is about  $1000^{\circ}\text{C}$ . The effect of putting a 'blower' in front of the fire so as to create a good draught and force all the air into close contact with the fuel is well known. By this means temps. up to  $1400^{\circ}\text{C}$  can be obtained but this is still not sufficient to melt pure iron. Instead of using air at room temp. Siemens tried out the idea of preheating the air so that by starting off at a higher temp. he expected to get a higher final temp. in the furnace. His early experiments were unsuccessful until he combined the initial idea with another one—converting coal into a combustible gas by burning it with a limited air supply in a gas producer. He then preheated both this producer gas and the air for combustion to over  $1200^{\circ}\text{C}$  and thus was able to start off work with an initial temp. as high as can be obtained in an open fire. The final temp. reached after combustion was thus in the region of  $1750^{\circ}\text{C}$ . The method of preheating the air and gas is known as the regenerative principle. The hot gases from the furnace pass through two chambers, known as regenerators, in which brickwork is loosely stacked and to which the waste gases give up their excess heat. On reversing the furnace the incoming air and gas pass through these two chambers and increase their temp. to over  $1000^{\circ}\text{C}$ . before being burned in the furnace. On passing out at the far end the waste gases reheat two corresponding chambers at that end. The Siemens Regenerative furnace has proved by far the most successful way of producing steel economically. Electric arc and electric induction furnaces have become widely used for special types of steel. The temps. possible in these two types are well in excess of the melting point of pure iron at  $1527^{\circ}\text{C}$ .

The development of the Integrated Plant for the production of steel represents the most important recent advance. The principle is to have the coke ovens for the production of coke, the blast furnaces for the production of pig iron, the steelmaking plant for the production of steel and the rolling mills for fabricating to shape, all on the same site. This makes for considerable fuel economy, as large quantities of heating gases are evolved from the coke ovens and blast furnaces as a by-product. Further heat is conserved by charging molten pig iron to the steelmaking plant direct from the blast furnaces or, as is more usual after storing in a mixer, and by charging hot steel ingots to the reheating furnaces for rolling.

**Production of Steel from Pig Iron**—Essentially, iron ore is iron plus a con-

siderable quantity of oxygen, steel is iron plus a little carbon (0.04 to 1.5 per cent), so the fundamental action of steel making is to remove much oxygen from ore and replace it with a little carbon. This is done in a preliminary stage of converting coal to coke, a primary stage of converting iron ore to pig iron in blast furnaces, and a secondary step of steel making in Bessemer, Open Hearth, or electric furnaces.

**Production of Coke**—Suitable types of coal are heated in coke ovens out of contact with air, which converts the coal into coke and evolves large quantities of a combustible gas known as 'coke oven gas'. By products such as ammonium sulphate, tar and crude benzol are extracted from the gas which is then passed to the plant for use as a means of heating.

**Production of Pig Iron**—Pig iron is produced in vertical shaft furnaces from ore, limestone and coke being charged at the top and air blown in at the base. An account of the process as carried out in 1531 says: "There are five men who keep the fire to melt the ore having 12 pence per day each. And there are four men at the Bellows whereof three blow at a time and one of them stoude voyde to refresh the others, for they bloweth six or seven hours at every galle that is melting, and thus they make two galle a day each weighing 1 cwt. In 1760, Darby replaced the charcoal which had previously been used as fuel with coke. Outputs by this improvement were increased to 1½ tons per day. In modern blast furnace practice, output of 1000 tons per day are known.

Iron ore as mined is not pure iron and oxygen, it contains varying amounts of silica, lime, alumina, sulphur, phosphorus and other extraneous materials which have to be eliminated. Much of this is done in the production of pig iron in the blast furnace but there is an additional pick up of about 1 per cent carbon. The effect of this is to produce a hard brittle product known as pig iron which is subsequently treated to produce steel cast iron etc.

A modern blast furnace is a circular stack about 100 ft. high and with a maximum diameter of 18 to 26 ft. There is a skip hoist for taking ore, limestone, and coke to the bottom for charging through a bell and one at the top level. Air blast is supplied at the base through tuyeres from a powerful blowing engine and it is preheated in Cowper stoves. The idea of hot blast being first developed by Neilson in 1828. The iron ore, limestone, and coke while descending through the furnace meet the ascending current of hot air which burns the coke, converts the ore to pig iron, and allows the impurities to settle as a liquid slag floating on top of molten pig iron. At regular intervals the slag is tapped off through a slag notch and discarded, while the pig iron is tapped through a separate iron notch and either cast into pig beds or transferred while still molten to a mixer where it is retained until required in the steelworks.

**Iron Castings**—The pig iron as originally produced from the blast furnace is

melted in special air or cupola furnaces, where its carbon content is adjusted to the required amount, and other constituents such as silicon, manganese, sulphur and phosphorus regulated to the desired specification. The cupola furnace is similar in construction to a blast furnace, but is much smaller. It is charged at the top with coke and pig iron. A blast of air forced through tuyeres near the base causes the coke to burn, and develops sufficient heat to melt the iron, which is tapped off through a metal spout into a ladle, from which it is poured into the moulds prepared to the shape of the casting required. Owing to its ease of melting and fluidity when melted, the iron can be formed into intricate shapes in various sizes weighing from a few pounds to upwards of 100 tons. The various types of castings require different compositions of metal according to the use to which they are to be put. For engineering purposes the cast iron must be strong but not too brittle, while for ornamental purposes the main requirement is fluidity in order that the metal may take a sharp impression of the intricate shapes. In other cases it is important that the finished casting should be easily machined. For engine cylinders the iron must have strength, hard wearing surface, and easy casting properties owing to the thin sections required in certain places. For conversion to malleable castings the iron should be low in silicon, giving a white fracture. The castings are malleable by annealing in iron ore. High duty cast irons are produced from specially refined pig iron, and may additionally contain alloying additions such as nickel, chromium, molybdenum, vanadium, etc. Cast iron pipes may be made by centrifugal casting. In making chill castings such as rolls, the surface of the main body is rendered very hard by casting the metal into a cast iron mould instead of the usual moulding sand.

**Production of Wrought Iron.**—Although the amount of wrought iron produced today is comparatively insignificant, yet it was the most important process for converting the hard brittle pig iron to a malleable product until steel came, by the Bessemer and Open Hearth processes became well established just prior to the start of the present century. In making malleable metal from pig iron the essential process is to remove the excess carbon, silicon, manganese, sulphur and phosphorus. This is carried out by oxidation and the conversion of the oxides thus formed into a fluid slag which can be separated from the metallic product. The difference between wrought iron and steel is that the former is produced in a semi-solid pasty condition much intermixed with slag, while the latter is made in a completely liquid form and the separation of slag from it is virtually complete. Wrought iron is made by the puddling process. About 5 cwt. of cold pig iron are charged into the furnace and melted down in a lining which consists primarily of iron oxide. On completion of melting the puddler lowers his damper which

brings the bath up on the boil and much of the slag formed is boiled over the sill plate into a buggy. Later the charge begins to set back, boiling-over ceases, and then 'puddling' commences. This is one of the most onerous jobs carried out close to a furnace at high heat for over half an hr. that has ever fallen to the lot of man. The pasty white hot metal is divided into four by pushing a rod through it, then each of the four pieces is turned and moved about in the furnace until it has reached a suitable state of malleability. The pieces, weighing about 80 to 100 lbs., are removed separately, and compressed by a shingling hammer to remove excess slag and formed into a suitable shape for further reheating and rolling.

**PRODUCTION OF STEEL.**—Steel is made by a variety of processes of which the most important are (1) Crucible, (2) Bessemer, (3) Open Hearth, (4) Electric Furnace. Except in the first case there is a further subdivision into Acid and Basic processes. As the difference between acid and basic is the same in all three processes, it may be briefly dealt with first. In an acid furnace the refractory lining, on which the charge of pig iron and scrap steel is melted, is made of silica brick on top of which is fritted silica sand. In a basic furnace the furnace bottom is lined with magnesite brick on top of which dolomite is rammed. Although the nature of the refractory used for the bottom is the only essential difference, yet it has a very considerable effect in removing impurities. With an acid bottom it is impossible to remove any sulphur or phosphorus; in a basic furnace their removal is possible. Acid steel is still made for special qualities but the present tendency is to change over more and more to the basic process.

**Crucible Steel.**—The Crucible Steel process was invented by Huntsman in 1740. It is still used, more particularly in the Sheffield area, for making high grade steels. As it is purely a melting process, with no refining, it is necessary to charge pure materials. The Crucible furnace is oval in shape and takes two pots side by side, with room around them for coke. When the Crucible is hot enough, a charge of 50 lbs. of blister steel is emptied through a sheet-iron funnel and the cover put on. On melting, the charge is 'killed' with ferro-manganese and aluminium and poured into a mould.

**The Bessemer Process.**—Bessemer took out his early patents in 1856, and within a few years the process was being operated successfully on a commercial scale. In this process, molten pig iron is converted into steel by blowing air through a Bessemer converter. The difficulties to be overcome in the early days arose from the fact that (i) it is necessary to blow vigorously through the molten metal right to its very core; (ii) blowing must only take place when the whole of the metal is in the converter; (iii) it must be possible to stop and restart blowing at will. The converter is pear-shaped, lined with refractory, containing holes in its base through which air is forced at a pressure of about 25 lbs. per sq. in. In operation the converter is

turned down to the horizontal and a charge of molten pig iron poured in, the air blast is then turned on and the converter turned up to the vertical position. The air, in passing through the metal, removes carbon, manganese, silicon and sulphur, and at the same time increases the heat from about  $1250^{\circ}\text{C}$  as charged to  $1600^{\circ}\text{C}$ . During blowing there is a violent evolution of sparks from the mouth of the converter, and the change in composition of the metal can be fixed by the appearance of the flame. When the

the hearth of the furnace and melted down by a hot flame produced by the combustion of preheated air. This preheating is done on what is known as the regenerating principle. The waste gases coming out from one end of the furnace pass through loosely stacked brickwork to which they give up their heat. Every half hour the direction of flow of the gases is reversed and the incoming air and gas are preheated to a high temperature (about  $1250^{\circ}\text{C}$ ). In this way flame temps. of  $1750^{\circ}\text{C}$  are obtained when the

Kukura & Thomas & Co. Ltd.

#### STEEL MAKING FURNACE—SIEMENS OPEN HEARTH PROCESS

melter judges that the metal is correct, the converter is turned down, the blast switched off, and the finished charge poured into a ladle before teeming into moulds. The Bessemer process was not widely used in this country but had a very considerable development on the continent. Within recent years, two large basic Bessemer plants have been erected in this country with satisfactory results.

**The Siemens Martin Open Hearth Process**—The Siemens Open Hearth process was perfected by Sir W. Siemens in 1866, and the first commercial plant for its production was erected at Llandovery Castle, in the following year. The original furnace was about one ton capacity, and had a potential output of about 1000 tons per year. Today, about 100,000,000 tons are made annually by this process. Cold pig iron and scrap steel are charged into

two are combusted in the hearth of the furnace. The steel is thus heated to a temp. of  $1600^{\circ}\text{C}$  which is the maximum generally required for low carbon steels. After clamping, there is a quantity of molten metal covered by a slag containing the impurities. The remaining impurities in the metal are removed by feeding in iron ore and scale or limestone until a suitable composition of the metal is obtained. This is determined by taking samples from the bath and testing them by chemical analysis. When the composition is considered satisfactory, a tap hole is opened at the back of the furnace and the molten metal and slag is allowed to flow out into ladles. The metal is deoxidized to suitable condition by additions of ferro-manganese, ferro-silicon, and/or aluminium from these it is teemed into moulds. The pig iron used varies from

20 to 80 per cent, according to the required composition of the steel, an average figure being about 50 per cent each of pig iron and scrap metal.

**Electric Furnace Steels.**—Electric furnaces may be classified into two types, (1) arc furnaces, and (2) induction furnaces. Of these, the former is much more widely used. In the arc furnace, heat is generated by a spark between the carbon electrodes and the charge of metal. The temp. of the arc itself is well over 3000° C., so that the local heat is very intense. Owing to the high cost of electric current required, the electric arc process is more generally worked with a charge of 100 per cent of scrap steel, in order to cheapen the process. The charge is melted down in a manner similar to that in the Open Hearth process. It is further refined as before by additions of iron ore and limestone. Finally the metal is cast and termed as before. The electric furnace is used in the manuf. of high grade steels, the basic furnace being more widely used as it has considerable advantage in removing sulphur and phosphorus and producing 'killed' steel comparatively free from oxide inclusions. It is improbable that the electric furnace will be able to compete with the Bessemer and Open Hearth processes in the manuf. of steel for constructional purposes and the more common uses, except under special conditions. It will, however, prove a serious rival and will probably finally oust the older processes of steel making in high quality grades.

The electric induction furnace has been further advantageous in replacing the older crucible steel process. As in the crucible furnace there is no refining, and pure metal is charged into the crucible and melted down by a high frequency induction current which generates terrific heat in the metal itself, and causes it to melt rapidly. At the same time the metal is stirred up so as to give very uniform composition.

**Steel Castings.**—These can be made from open hearth furnaces, both acid and basic, from small converters, from crucibles, and from the electric furnace. For general foundry work it is more common to find a small open hearth or 'Tropenas' converter, fed with molten iron from a cupola. It is important to see that the metal is thoroughly killed during the casting operation, otherwise difficulties are likely to arise due to the formation of blow-holes inside the casting. For steel castings the moulds used may be classified either as 'green sand' or 'dry sand,' the former being used for light castings and the latter for heavier castings. 'Green sand' moulds is the general term for those which have not been dried previous to the metal being poured in. 'Dry sand' moulds are made much as above but are faced with moulder's composition and give a clear skin.

**Straight Carbon Steels.**—The properties of steel are considerably altered by varying the carbon content. In general, increasing carbon content from 0.04 per cent to 1.5 per cent gives harder steels with a higher tensile strength but decreasing

ductility and machinability. Some typical ranges and uses are indicated in the following table:—

Carbon	Name	Uses
0.01 to 0.08	Dead mild	Sheets, tinplates, pipes, plates.
0.08 to 0.25	Mild	Structural steels, reinforcing rods.
0.25 to 0.45	Carbon	Rail steels, axles.
0.45 to 0.65	Medium carbon	Holding down bolts.
0.65 to 0.9	High carbon	Drills and other tools.
0.9 to 1.5	Ultra High carbon	Chisels, turning tools, files, razors, etc.

Straight carbon steel can be hardened by quenching in water from a suitable temp. between 750 and 950 °C. according to carbon content. This hardening is accompanied by an embrittling effect which can be minimised by tempering the quenched steel to suitable temp. below 700 °C. The degree of tempering is controlled by the time and temp. at which the tempering operation is carried out.

**Alloy Steels.**—Steel has found a very extensive use in industry and commerce due to the fact that it is possible to produce such a wide range of properties by varying the carbon content and heat treatment. There are certain difficulties with straight carbon steels which have been overcome by the introduction of the so-called 'alloy steels,' i.e. steels containing considerable percentages of alloying elements such as nickel, chromium, etc. The number of such steels on the market today is well into the thousands, but efforts were made during the recent war years to reduce the numbers and so simplify production, and yet retain the valuable properties which such steels have conferred on them by the use of alloying additions.

**Nickel.**—Nickel steels, owing to their strength, are widely used for stressed parts. With carbon around 0.1 per cent and nickel 3.5 per cent, the so-called 'case-hardening steels' find a wide application in heavily-stressed parts requiring a very hard outer surface and a tough core. With a somewhat higher carbon content and similar nickel, the steels have many uses in engineering where both strength and toughness are required. High nickel steels containing 25-40 per cent nickel are used for their resistance to corrosion, special electrical properties, and due to the fact they are practically non-magnetic.

**Chromium.**—Chromium steels are used because they produce greater strength and hardness. Addition of from 0.3-2.5 per cent chromium are typical. Such steels are used for tyres and springs. The addition of 12-20 per cent chromium produces the well-known stainless steels, first developed by Harry Brearley about 1913.

**Chrome-Nickel.**—It is more usual to find both chromium and nickel, as the combination makes for many advantages in hardness and strength combined with ease of heat treatment, to produce suitable properties. In the stainless steel series, the so-called 18/8 (18 per cent chromium, 8 per cent nickel) is widely

used today, as they have the widest range of corrosion-resistant properties. They are also satisfactory as heat-resistant steels. They have a wide use, but perhaps the best known is for table knives, where they have been a boon to the harassed housewife.

**Vanadium**—Vanadium is generally present in alloy steels in relatively small amounts, less than 1 per cent, and more often less than 0.2 per cent, but this has an important effect in increasing the toughness of the steel. It has perhaps its widest use in chrome-vanadium steels, which are used because of their extra strength and toughness. A common analysis is 1 per cent chromium and 0.1 per cent vanadium. It is also added in small amounts to produce a high degree of hardness in tool steels, armour plating, projectiles, rock drills, etc. Vanadium-steel castings are noted for their high elastic properties, strength and toughness.

**Molybdenum**—Molybdenum is present in steels also in quantities under 1 per cent, and in association with the more common alloying elements such as nickel and chromium. It has got a marked effect in increasing the strength both at room and elevated temps. and is an important addition to remove a difficulty known as temper brittleness. There is a fairly wide range of molybdenum steels, each type having its own special application. Molybdenum-iron castings are used where a hard wearing surface is required, while it has also been found advantageous in chilled iron rolls.

**Manganese**—Although manganese is present in all straight carbon steel to an extent of 0.3-1.5 per cent, it is not considered as an alloying addition. The high manganese steels containing about 12 per cent are true alloy steels. They were put on the market by Sir Robert Hadfield in 1882, and have found many uses due to their hardness and high resistance to wear. They are quite commonly used for railway crossing points and for crushing machinery. In wartime they were used for steel helmets. It is a non-magnetic steel.

**Silicon**—High silicon steels containing 0.5 to 3.0 per cent have important electrical properties—a high permeability with low hysteresis and eddy current losses. They are used in electrical transformers. Steels containing from 11 to 20 per cent have a high resistance to corrosion by acids which enables them to be used for containing vessels. A silicon-manganese steel has found extensive uses for general engineering purposes and armour plate.

**Tungsten**—This element is used in high speed tool steels and in magnetic steels. Its effect in high speed tool steel is to retain the cutting edge while allowing the steel to reach a red heat. Ordinary carbon tool steels which may be hard initially are tempered under similar conditions and lose their hardness. Modern high speed tool steels contain 15 to 20 per cent tungsten.

Steels containing from 5 to 6 per cent have good magnetic properties and are used for magnets of generators, magnetos, etc.

**Cobalt**—Cobalt steels containing from 2 to 35 per cent cobalt give a magnet steel superior to the tungsten magnet steels.

**Copper**—About 0.5 per cent copper is said to be beneficial in increasing the corrosion resistance of ordinary mild carbon steels.

**Lead**—About 0.2 per cent lead is in cop with certain steels to improve their machinability. Lead does not alloy with steel and it exists as dispersed globules throughout the metal. A typical steel of this class is known as 'Leadloy'.

**Sulphur**—Although sulphur above 0.08 per cent is generally considered bad in steel making, it has not yet up to 0.3 per cent is added in order to improve machinability.

See R. Jenkins, *The Early History of Steel Making in England 1733 and Iron Making in the West of Dean 1926*. L. S. Ashton, *Iron and Steel in the Industrial Revolution 1921*. R. A. Hadfield, *Iron and Steel: An Outline of Steel and Iron 1930*. J. Derriden, *Iron and Steel Today 1939*. J. B. Fortum and H. B. Mann, *The Story of Iron 1938*.

**Ironbark-tree**, popular name applied to several species of *Eucalyptus* for a very obvious reason. *Ironbark* the red gum tree receives the name most often. It attains a height of 150 to 200 ft. in Australia and is noted for its hard bark, durable wood and the gum which it exudes.

**Ironclads**, originally woolen ships protected by iron plates, were used in 1752 at the siege of Gibraltar. The first used them in the Crimean war and in that time, built four iron plated line of battle ships. In 1860 Britain built the *Warrior*, an iron steam battleship with 4 in plates.

**Iron Cross**, see **ORDERS OF KNIGHTHOOD**.

**Iron Gates**, narrow passage, interrupted by rapids and rocky shoals, in the course of the Danube below Orsova (Rumania). In 1896 the Hungarian Gov. at a cost of £400,000 succeeded in rendering the channel navigable by blasting and canalising. A pilotage service is maintained here by the Danube Commission.

**Iron Mask**, The Man in the mysterious figure of great romantic interest in 17th hist. He was a political prisoner in the reign of Louis XIV., who when travelling from one prison to another, always wore a mask. He finally died in the Bastille in 1703. The mystery of his identity still remains an historical problem.

Klenné du Juncu (d. 1706) Lieutenant of the Bastille, recorded in his official journals that on Sept. 15, 1698, Saint Mars the new governor, arrived at the prison from the Île St. Marguerite, bringing with him in a litter a prisoner whom he had formerly held in custody at Pignerol. This prisoner always wore a black velvet mask, and his name was never told. He died on Nov. 19, 1703, and was buried in the par. cemetery of Saint Paul, his name being registered as 'M. de Marchidol'. The name actually recorded in the register was 'Marchidol'.

Stories spread about the prisoner even during his lifetime, and in 1745 and 1746

it was asserted in *Mémoires Secrets pour servir à l'histoire de Perce* that he was the duke of Vermandois, the illegitimate son of Louis XIV. and Mlle. de la Vallière, and was imprisoned for life for having assaulted the grand dauphin. Public interest was further aroused by Mouhy's romance, *L'Homme au masque de fer*, and by the writings of Voltaire on the subject. Voltaire, under the head 'Ana' in *Questions sur l'encyclopédie*, asserted that the 'Mask' was a bastard older brother of Louis XIV. and the son of Anne of Austria and Cardinal Mazarin. Abbé Soullavie, in *Mémoires de Marechal Richelieu*, made out a case for a twin brother of Louis XIV., but this theory is historically untrue, though it appealed to Grimm, Zschokke, Fournier, and others.

A much more feasible conjecture is that the 'Mask' was Count Mattioli, a minister of the duke of Mantua (b. 1640). He negotiated with Louis for the surrender of Casale, but the Fr. king, discovering that his dealings were treacherous, had him kidnapped (1679) and conveyed to Pignerol. But there was no secrecy about Mattioli's imprisonment, and it appears more than probably that Mattioli died at Pignerol in 1694.

The mysterious prisoner has also been identified with Eustache Danger, imprisoned at Pignerol in July 1669. Andrew Lang, in *The Valet's Tragedy* (1903), identified this Danger with one Martin, the valet of Roux de Marsilly, a Huguenot intriguer in England. Barnes (*The Man of the Mask*, 1908) found Lang's theory untenable, and suggested that Danger was really James de la Cloche, the natural son of Charles II. Lang proved subsequently that James de la Cloche was identical with 'Prince' James Stuardo, who died in Aug. 1669 at Naples.

As well as the works already mentioned, see a letter by Heiss to the *Journal Encyclopédique*, 1770; L. Dufers, *Intercepted Correspondence*, 1789; Roux-Fazillac, *Recherches historiques sur l'homme au masque de fer*, 1801; J. Delort, *Histoire de l'homme au masque de fer*, 1825, and *Histoire de la détention des philosophes*, 1829 (which contains the correspondence between saint-Mars and Louvois); M. Topin, *L'homme au masque de fer*, 1870; T. Jung, *Le verité sur le masque de fer*, 1873 and Barnes, *The Man of the Mask*, 1908.

**Iron Lung**, see under AEROTHERAPEUTICS.

**Iron Mountain**, cap. of Dickinson co., Michigan, U.S.A., 16 m. N.W. of Escanaba. Has extensive iron mines which produce large quantities of first-class ore. Lumber mills and Ford motor works. Pop. 11,000.

**Ironside**, Sir William Edmund, first Baron, Brit. soldier b. 1880. Was in the Brit. secret service in Ger. S.W. Africa during the Herero campaign, receiving the Ger. service medal for his good offices. He was appointed to command the Brit. Expeditionary force sent out to Archangel during the latter part of the First World War. His conduct of the operations against the Bolshevik forces concentrated

along the Dwina showed generalship of a high order. Commanded the Ismid Force, 1920; N. Persian Force, 1921; Commander, Meerut Dist., India, 1928-31; Colonel Commandant, Royal Artillery, since 1932; Governor and Commander-in-Chief, Gibraltar, 1938-39; Inspector-General of Overseas Forces, 1939; Chief of the Imperial General Staff, 1939-40; Commander-in-Chief, Home Forces, 1940; Field Marshal, 1940. He wrote *Tannenberg: The First Thirty Days in East Prussia*, (1925).

**Ironsides**, nickname given to a man, particularly a soldier, who displayed great bravery. Edmund II., king of England, appears to have been the first in English history to receive the name. It was applied to Cromwell, and later to his cavalry, those 'God-fearing men,' whom he trained to iron discipline. They were the chief means of the parl. victories in the field.

**Ironton**, co. seat of Lawrence co., Ohio, U.S.A., on the Ohio R., 140 m. S.E. of Cincinnati. It occupies a central position in a productive mineral dist., abounding in iron ore and bituminous coal. Pop. 15,800.

**Ironville**, eccles. par. of Derbyshire and Nottinghamshire, England, 3 m. S.E. of Alfreton. Pop. 3000.

**Ironwood**, name given to the wood of many different trees on account of its hardness and durability, and is applied to various plants in different countries. A good timber-tree of India is *Mesua ferrea*, the Nagas or L., and is a species of Gutierrez. *Sideroxylon incarnae*, a Sapotaceous plant, is the Cape L.

**Ironwood**, banking city of Gogebie co., Michigan, U.S.A., 6 m. S.W. of Bessemer. It has become noted by reason of the valuable deposits of magnetic iron ore and hematite which abound in the vicinity. It is surrounded by lakes and streams, where there is good hunting and fishing. Pop. 13,300.

**Iron Work**. Iron, like bronze has been used for casting, but the purest use of iron in decorative art is to be found in wrought iron. Since early days iron has been used for weapons of war, but, owing to the effect of rust on iron, little early iron work is left to us. Iron appears to have been used by the Egyptians as early as 1500 B.C., and on a large scale in Babylon after 600 B.C. for such things as bolts and hinges. The Assyrians used iron to a great deal for the framework of fortifications and the coverings of buildings, although with them iron was considered a precious metal and was probably scarce. The Hebrews used iron considerably, and the Phoenicians made vessels of iron with which they traded. Pliny mentions Grecian iron statues, while Plutarch writes of a polished iron helmet which shone blue like silver. We know from writings that the Greeks fully appreciated the beauty of iron and knew about the casting, forging, welding, embossing, tempering, polishing, and inlaying of iron. They used iron for such things as chariots, agric. implements, and in shipbuilding, whilst in Sparta coins and jewellery were often made of iron.

The Romans continued with I. W., using the metal for armour, window-bars and grilles. Barbaric races used iron before they were conquered by the Romans, and continued to use it with greater success than their conquerors. Up to the fourteenth century I. W. was the work of a smith, and he made and decorated such things as grilles, door decorations, and hinges. During the fourteenth century, a change came over I. W. The smith began to work the iron when cold, using file and saw, chisel and vice, whilst sheet iron also was cut and hammered into patterns. Thus came into being the armourer and locksmith, who used heat for working the iron only in the preliminary stages, and who were capable of carving a statuette out of a solid lump of iron. This change over I. W. came from the E., and designs often more suited to wood and stone were carried out in iron. The Fr. iron-workers produced after this time the best I. W., their work being both beautiful in design and delicate in finish. During the centuries that followed iron was used for such things as locks, door handles, screens, firebricks, knockers, grilles, gates, and railings; and the designs used in the work included scrolls, rosettes, leaves, flower-patterns (particularly the passion-flower), and heraldic devices. See C. Ffoulkes, *Decorative Ironwork*, 1913; J. S. Gardner, *Ironwork*, 1927-30; J. A. R. Stevenson, *Din of a Smithy*, 1932.

**Irony** (Fr. *ironic*, Lat. *ironica*, Gk. *eiporeia*, dissimulation), a form of ridicule in which statements, apparently accepted, are held up to scorn, saying one thing and meaning another. A familiar example may be found in Pilate's question to the Jews, 'Shall I crucify your King?' (John xix. 14). Socrates used this mode of speech and raised it to a philosophical fine art. Among Eng. writers Swift holds the palm for abundant and apt examples of I.

**Iroquois**, name given by the Fr. to one of the great confederations of the N. Amer. Indians. The league was originally composed of five tribes, the Mohawks, Oneidas, Onondagoes, Cayugas, and Cayugas, called the 'Five Nations', and probably dating from the sixteenth century. In 1713 the Tuscaroras were admitted to the league, which was henceforth known as the 'Six Nations.' The I. were undoubtedly the strongest confederation of Indians in N. America, and numbered, at that time, about 11,600, of whom 2150 were picked warriors. Their original home seems to have been round the upper reaches of the R. St. Lawrence, from which they moved south-westwards round the shores of Lakes Ontario, Huron, and Erie and occupied the greater part of Upper Canada, the whole of New York State, and a large part of Pennsylvania, Ohio, and Michigan, while a section of them moved S. through Virginia and Tennessee to the Carolinas. The league was strong enough, not only to hold its own against such hostile tribes as the Hurons and Eries, but to extend its dominion over the Mohicans, the Nanticokes, Shawnees, Mississaugas, and other Algonquin tribes. In the border warfare

with the Fr., the I. always sided with the Eng., while their bitter enemies, the Algonquins, fought for the Fr.; they also fought for the Eng. in the Amer. War of Independence. The Iroquoian stock, including Iroquois, Wampanoag, Cherokee, and Kiowa number 52,100 in the U.S.A. There are reservations in Canada, New York, Oklahoma, and Wisconsin. They have made considerable social progress, adopting the customs of Eng. civilisation and becoming, for the most part, Protestants, and attending the Eng. schools.

See W. Halo, *The Iroquois Book of Rites*, 1883; J. C. Pilling, *Bibliographies of Eskimauan, Siouan, Iroquoian Languages*, 1888 (Washington); J. N. Hewitt, *Iroquois Cosmology*, 1924; A. Pound, *Johnson of the Mohawks (1715-71)*, 1930; F. W. Seymour, *Lords of the Valley*, 1930, and C. Wissler, *The American Indian*, 1933.

**Iroquois Language**, see under NORTH AMERICAN NATIVE LANGUAGES.

**Irradiation**. When white objects or objects of a very bright colour are seen on a dark ground they appear larger than they really are. This phenomenon is called I. Thus a white square on a black ground seems larger than an exactly equal black square on a white ground. The phenomenon differs very much in different people and even in the same person on different days.

**Irrational Numbers**, see IRRATIONALS.

**Irrawaddy**, see IRRAWADDI.

**Irrédents**, It. patriotic and political society which was particularly active immediately after 1878, when it had for its avowed object the liberation from foreign rule of all parts outside the boundaries of Italy, in which, it was claimed (sometimes wrongly), the It. tongue is spoken universally, i.e. S. Tyrol (Trentino), Görz, Istria, Trieste, Tessino, Nice, Corsica, Malta. It became of little importance after the Fr. occupation of Tunis in 1881, when Italy formed the Triple Alliance with Germany and Austria.

**Irotragabilis**, Doctor, see ALEXANDER OF HALEB.

**Irrigation**, see also DRY FARMING.

**Irrigation** (Lat. *in* and *rigare*, to water) is the artificial application of water to land, as contrasted with watering by manual labour. I. is of great antiquity, as is shown by many I. works in India, Egypt, and China. (See also under IRRIGATION). No trace of scientific I. is found in the sculptures and paintings of ant. Egypt, but in works of as early a date as 2000 B.C. the practice of baling up water is represented. Among the simpler forms of water-raising machinery the following may be mentioned: a pole with a bucket at one end of a crossbeam and a counterpoise at the other (known in India as a 'denkli', or 'pneottah', in Egypt as a 'shaduf') largely used in the Nile dist.; rude waterwheel, consisting of earthen pots on an endless chain which runs round the wheel, is termed a 'sukya' in Egypt, and a 'harak' in N. India. By means of this a pair of oxen can raise water as far as 18 ft., and keep from 5 to 12 ac. irrigated. The 'churras' of India is a large

leather bag, suspended from a rope which passes over a pulley and is raised by a pair of bullocks which go up and down a slope equal in length to the depth of the well. I, which is effected by means of canals naturally depends on the discharge of the riv. in connection. When the riv. varies very much in vol., being very low in the dry season and flooded in the wet, a complete control of the water is necessary for the engineers, and the canal is therefore very costly. Such is the system on the Cuttack Canal, in connection with the Mahanadi R. The canals of Lombardy, on the other hand, are much less costly, as there is no great variation in the rivs on which they depend, the Ticino and Adda, owing to the restraining influence of Lakes Maggiore and Como. The canal

electric power. Today the U. S. A. ranks third in the irrigation countries of the world. India has about 55 million ac.; China about 50 millions, and the U. S. A. over 20 millions. In Egypt I. works have been carried out on a very large scale, the delta formed by joining Cairo, Rosetta, and Damietta is intersected by many channels, and much benefit has resulted. Lower Egypt has been irrigated by a dam constructed at Assut in 1902, which, however, failed in very dry seasons. The difficulty was partly met by raising the height of the barrage so as to hold back the waters, but as further areas came into cultivation it became necessary to construct a feeding lake. This was accomplished by constructing the Aswan Dam at a cost of 4,000,000 and thus creating a

from "In This Land" by H. G. Pott

#### IRRIGATION IN JAPAN

Beyond the tea pickers can be seen the small field from which the barley crop has been harvested and which are flooded for the re-germination of the rice shoots.

system of N. India contains works of hydraulic engineering unsurpassed in any country. In the S. of India I. is always required for the rice and sugar cane crops, though maize and millet can be grown without any such aid. Generally speaking, the other districts of India can manage without I. in good years. When most of the rain-watered lands of the U. S. A. had been taken up by settlers, the problem of the so-called arid lands came into prominence. There were vast areas in the Middle and Far W. states and in some parts of the S. states, deficient in water. Companies were formed solely for irrigation purposes, and to fix services to intending settlers, and under the Reclamation Act of 1902 the U. S. Gov. set aside a sum from the sale of public lands to finance great irrigation projects. Water rights were then sold to the settlers. In many places enormous dams have been built, and these, in turn, have proved valuable, because of hydro-

electric of 1000 million tons of water. The masonry dam at Alicante in the Monegre R. dates from 1779, and is said to have a capacity of 130,000,000 cubic ft. of water. In Italy, Spain, and in the S. of France I. is extensively carried on. The newly constructed Hume Reservoir at the junction of the Murray and Mitta Mitta rivers, stores 11 million cubic ft. of water which runs on a catchment area of 6000 sq. m. of mountainous country on the border of Victoria and N. S. W. (see MURRAY RIVER). Experience has shown that for successful I. a thorough system of drainage in conjunction therewith is a necessity. This principle was overlooked at first in modern works, and the complete saturation of some districts in consequence had a prejudicial effect on their fertility. Generally speaking the water used in I. not only supplies the moisture so necessary for vegetation, but fertilizes the soil by furnishing such mineral constituents

as salts of potash and soda, sulphates of lime, soluble silica, etc. In proportion as the water is rich in these, the effect on the soils is similar to that produced by a dressing of bone-manure. Sewage water is unquestionably even more valuable for irrigating purposes than ordinary water, owing to the large amount of putrefied animal and vegetable matter contained therein. The drainage of many trns. is thus turned to a profitable use at the present time. Various systems of I. are used to suit the special requirements of the case, one of the following being generally used in England: (1) Bedwork I.; this is the most effective system, but is also the most costly. (2) Catchwork I., in which the same water is used many times. (3) Subterraneous I., in which the water is drawn up through the soil to the surface. This is applicable only to level surfaces. (4) Warming I., in which the water is allowed to stand on the land until it has deposited the mud, etc., contained in it. The proper management of water-meadows requires great care and skill. There must be neither too much nor too little water; the flow must be regulated with exactitude, etc.

*Irrigation problems of the British Empire.*—It was estimated by F. S. Harris (*Soil Alkali*, New York, 1920) that in 1920, about 100,000,000 ac., or 7 per cent of the total area of the earth's surface under cultivation, was farmed by I. Since that year thousands of additional acres have been added, and it is thought that the area of land under I. will continue to increase. This is probable because nearly one-third of the earth's surface receives only 10 in. of rain or less annually, and over another third the rainfall is between 10 and 20 in. Over most of this latter area little if any additional water is needed, except for intensive crops, although special methods of cultivation, aimed at moisture conservation and known as 'dry farming' have to be adopted. But on land receiving less than 10 in. I. is generally essential if any kind of profitable crop production is to be undertaken. The geographical distribution of regions of deficient rainfall compiles a considerable proportion of the Brit. Empire and its mandated ters. (particularly N. Tanganyika). The main areas concerned are parts of Canada W. of the 100th meridian; N.W. India up to the Ganges; most of Australia; Palestine; considerable portions of S. Africa; N. Tanganyika; and the Sudan. Within these areas the supply of I. water is necessary for arable farming. The successful development of a stretch of land for I. farming and the maintenance of the fertility of the soil involves a constant attention to economic, engineering, and scientific factors. The engineering problems connected with the construction of dams, main and branch supply canals, drainage ditches, and pumping stations, like the economic factors, are specific to each dist. and are executed in accordance with fixed principles. The scientific factors comprise the questions of the composition of the water available for I. and the chemical composition and physical

properties of the soil. They apply not only to the development of new areas, but also to the maintenance of the fertility of existing I. areas. The scientific factors relate to the concentration of soluble salts (sulphates, chlorides, nitrates and carbonates of sodium, potassium, and magnesium, and chloride and nitrate of sodium) in arid conditions; the effects of soluble salts on soil fertility and on the physical state of the soil; and the tolerance of vegetation to alkali conditions. The complete cycle of soil changes which are traceable may proceed rapidly or be so slow that a noticeable change occurs only over a considerable period of years; but sooner or later the danger of deterioration confronts every irrigated area. Thus the famous irrigation of the Nile Valley, where fertility has been maintained for centuries, now appears to be showing the first signs of deterioration owing to a change in cultural methods. In the old or basin system of I., after the winter crop of wheat or *berseem*, the land remained fallow from May to Aug. Economic factors, in particular the extension of the area under cotton and maize, have necessitated perennial I., the necessary water for these summer crops being held by the Aswan dam and delivered as required. Under this system the frequency of the *sheraqui* or summer fallow period is much diminished, with the result that difficulties in cultivation and decrease in yield of the more sensitive crops are beginning to creep in. A. Howard and G. L. O. Howard have summarised the principles underlying water saving for the wheat crop in India as follows: (i.) I. water must be spread over the largest possible area; (ii.) it must interfere as little as possible with the natural aeration of the soil; (iii.) heavy waterings reduce the proportion of grain to total crop and increase the growth period; (iv.) a limited water supply encourages deep root development; and (v.) the soil moisture must be conserved as far as possible by a surface mulch of dry soil. The problems of I. in the Brit. Empire are being faced in different ways in different parts; but it is evident that I. is not simply a matter of providing a water supply; it necessitates constant vigilance by soil experts, otherwise deterioration sets in. See B. A. Kren, *Memorandum on Irrigation Practice and Problems* (Empire Marketing Board pamphlet), 1927.

See Sir C. C. Scott-Moncrieff, *Irrigation in Southern Europe*, 1868; W. Willcocks, *Egyptian Irrigation*, 1899; R. Buckley, *Irrigation Works in India*, 1905; Sir Hanbury Brown, *Irrigation: its Principles and Practice*, 1907; F. E. Kanhack, *Irrigation Engineering*, 1921; E. Hawks, *Wonders of Engineering*, 1929; O. Israelson, *Irrigation Principles and Practice*, 1932; E. Hill, *Water into Gold*, 1937.

**Irritability in Plants, or Sensitiveness**, is the manner in which they respond to the action of external forces such as (1) gravity, (2) light, (3) mechanical contact or pressure, (4) moisture, etc. Response to gravity is known as geotropism, and to light, heliotropism; and members are

positively or negatively geotropic or heliotropic according as they grow towards or away from the force. Thus roots are negatively heliotropic and positively geotropic, and shoots are just the reverse. Instances of irritability to contact are the leaves of the sensitive plant sundew, the stamen of *Berberis*, and the lobes of the stigma of the musk, which close together when touched. Response to presence of moisture is shown by growing roots, which are said to be positively hydrotropic.

**Irritant Poisons, see under POISONS.**

**Irsina**, tn. of Italy, formerly known as Montepeloso, 24 m. N.E. of Potenza in the prov. of Basilicata. Pop. 7600.

**Irthingborough**, par. and vil. in Northamptonshire, England, on the R. Nen, and 2 m. N.W. of Higham Ferrers. It has large ironstone quarries, and manufs. of boots and shoes. Pop. 5000.

**Irtysh**, or **Irtys**, riv. of Siberia and a trib. of the Ob or Obi. It rises in the Altai Mts. of China, flows N.W. through Lake Zaisan, and joins the Ob 180 m. N. of Tobolsk. It is navigable during about eight months in the year for some 2000 m. Length 2500 m.

**Iruks**, tribe, numbering in all about 86,000, dwelling in the Nilgiri hills, Arcot, the forests of S. India, and other places in the vicinity.

**Irun**, tn. in the N.E. of Spain, in the prov. of Guipuzcoa, on the l. b. of the Bidasoa. It was a garrison tn. and the most important custom-house in Spain; but suffered tragically in the civil war being almost wholly destroyed, in 1936, in the struggle for San Sebastian. There are hot mineral springs, iron mines, and potteries. Pop. 12,000.

**Iruña, see PAMPLONA.**

**Irvine**: (1) Par., royal burgh, and seaport of Ayrshire, Scotland, situated on the R. Irvine. Its prosperity has increased since the improvement of the harbour in 1873. It has an academy, a tn. hall, a statue to Burns, and is the bp. of James Montgomery, the poet, and John Galt, the novelist. Elizabeth Buchan founded here her religious sect, the Buchanites, in 1779. I. exports iron, coal, and chemicals. Ship-building is carried on, and there are engineering works, steam saw-mills, tanneries, iron and brass foundries. Pop. 12,000. (2) Riv. in Ayrshire, Scotland, which rises on the borders of Lanarkshire, flows W., dividing the dists. of Cunningham and Kyle, and empties itself into the firth of Clyde. Length, 30 m.

**Irving, Edward (1792-1834)**, Scottish divine, b. at Annan, Dumfriesshire. Having been educated at Edinburgh Univ., he became a master at Haddington (1810) and at Kirkcaldy (1812). He here taught Jane Welsh (afterwards Mrs. Carlyle), and fell in love with her, but he was already engaged to a Miss Martin, whose family prevented him from breaking off the engagement. In 1815 he obtained a licence to preach from the Church of Scotland, and four years later became an assistant to Dr. Chalmers, then in Glasgow. In 1822 I. became the minister of Cross Street Chapel, Hatton Garden, London, and his sermons became extraordinarily

popular. In 1823 he pub. *For the Oracles of God and For Judgment to Come*, in which he declared his belief in the second personal advent of Jesus Christ. His popularity waned as his views developed. His belief in Christ's oneness with men in the attributes of humanity was misinterpreted, and he was accused of imputing sinfulness to Christ. In 1830 he was tried before the London Presbytery, and two years later was deposed from the ministry. In conjunction with Henry Drummond he estab. the 'Holy Catholic Apostolic Church,' the adherents to which came to be known as 'Irvingites.' He and his followers made a particular study of the Apocalypse, and recognised orders of apostles, prophets, evangelists, and angels. I. became 'chief pastor' of this new sect's first church in Newman Street, but died shortly afterwards in Glasgow. His complete works were pub. in 5 vols. by Gavin Carlyle (1864-65). See Carlyle's *Reminiscences*, 1881; and biographies by W. Wilks, 1854; and Mrs. Oliphant, 1862.

**Irving, Sir Henry (1838-1905)**, Eng. actor, whose original name was John Henry Brodribb, was the son of a Somersetshire tradesman, who afterwards settled in London. The boy's tastes always inclined to the stage, and, while he was a city clerk, he took lessons in elocution, fencing, and dancing, and devoted such leisure as he had to reading and studying plays and frequenting the theatres. At the age of eighteen he threw up his job and secured an engagement in a stock company at Sunderland and, later, another at Edinburgh. He remained in the provs., learning his art, until 1866, when he made his London debut at the St. James's Theatre as Doricourt in *The Belle's Stratagem*. At the same theatre, in the following Dec., he played Petruccio to the Katherine of Ellen Terry. He was now firmly estab. as a London actor, but he did not achieve any marked success until 1870, when his performance of Digby Grant in *The Two Roses* made him popular. His Alfred Jingle in *Pickwick* added to his laurels, but he first became famous when he played in *The Belts* at the Lyceum (Nov. 25, 1871). In 1874 he played Hamlet for two hundred nights, and with this performance, around which a controversy arose as to his rendering, he rose to the head of his profession. Four years later he became manager of the Lyceum, and, with Ellen Terry as his leading lady, made it the first theatre in the country. His prin. successes were Hamlet, Shylock, Benedick, Malvolio, Dr. Primrose (in *Olivia*), Landry (in *The Dead Heart*), King Lear, Becket (in Tennyson's play), and Corporal Brewster (in *A Story of Waterloo*). I. was not a good man of business; his production expenses were heavy, his generosity unbounded, and when in 1898 his store of scenery was burnt down, he had to part with the leasehold of the Lyceum, though he continued to act there until 1902. In the following year he played in *Dante* at Drury Lane, then went for the eighth time to America, made a tour in England, and in April 1905 revived *Becket* at Drury Lane, where he was

enthusiastically received. He went on tour again, but his health was broken, and after a performance of *beckat* at Bradford on Oct. 13 he collapsed and died a few hours later. He was buried in Westminster Abbey. I was the greatest figure in the theatrical world of his day. He had many mannerisms but against these he had dignity and a great conception of tragedy. I's conception of the art of the theatre differed fundamentally from that of G. B. Shaw who was then a prominent dramatic critic, and for details of this rather controversial matter one should consult both Gordon Craig's *Henry Irving* and Shaw's *Letters to Ellen Terry* (1931). His dominant quality was magnetism, not that of all-mastering eloquence, for his voice was neither dominant nor strong but rather of passionate yet quiet intensity. He had strongly marked physical handicaps. His troubles with speech were not confined to the weakness of his voice, for there was also the strange pronunciation which he adopted in moments of excitement, as "God" for "God" and interpolated grunts and groans, all of which lent them clues to his feelings. But these disabilities he overcame in the end by patient effort and towards the latter part of his life he was a model of pronunciation. But he could never endow himself with a fine voice or great physical strength; hence, while his Hamlet and Richard III and Iago and Shylock were perfect, his Macbeth and Lear—though both splendid—tired him out, and his Othello was almost a failure. I had a loyal and generous side to his nature and as a man was the embodiment of courtesy and distinction. He was a great man as well as a great actor and it was often said of him that he would have risen to eminence if he had followed any other profession. But it is impossible to imagine him in any other, for all his thoughts all his deeds, all his very being were concerned with his acting and his theatre. I was the first actor to be offered a knighthood and after having declined it twelve years earlier (in 1855) he accepted the honour. He married the daughter of Surgeon General Daniel O'Connell in 1834 but they separated five years later. Lady I (who died in 1933) was the mother of Henry Brodribb I (q.v.) and Frances I (q.v.). There are six lives in living those by Bram Stoker, 1906; A. F. Leitch, 1908; and Gordon Craig, 1930. See also Henry Irving in *Art of Acting*, talk by Philip C. Muns (cat. in *The Listener*, Oct. 21, 1931).

**Irving, Henry Brodribb** (1870-1919) Youngest son of Sir Henry I. Born at Putney, London (older son of Sir Henry I (q.v.)). Educated at Marlborough and New College, Oxford. He was called to the bar in 1891, but had previously acted in the Garrick Theatre (cost of *School*, Sept. 1891). He joined Ellen Terry's company and met Dorothea Bard whom he married in 1896. He repeated many of his father's parts, but added a reputation in comedy—e.g. *Crichton* the butler in *Barnes' Admirable Crichton*, 1902. Acted in America, 1906; Australasia, 1911. For the last six years

of his life lessee of Savoy Theatre. His hobby was criminology. He wrote *Life of Judge Jeffreys* (1898), *Lost of Itamar* (1900), *Criminals* (1918), *Last Studies in Criminology* (1921). See A. Briction, *H. B. and Laurence Irving*, 1922.

**Irving, Laurence Sydney Brodribb** (1871-1911) Young actor, younger son of Sir Henry I. Educated at Marlborough and in Paris. He was taken to Russia by his mother and spent three years there. His first appearance on the stage was at Dundee in 1891 under Benson. Wrote *Peter the Great* for his father, 1898. His best impersonation was Lord Skulch in *Lupin* by Melchior Lengyl. I and his wife (Mabel Hackney) were drowned in the sinking of the steamer *Empress of Ireland* in the St. Lawrence R. on May 29, 1911.

**Irving, Washington** (178-1899) American author born in New York of a father who claimed Scottish descent and of a

WASHINGTON IRVING

Scottish mother. He was given an inferior education after which for his health's sake he visited Europe before settling down in the city of his birth. After some essays in the monthly periodical *Salmagundi* he published in 1801 a *History of New York*, by Diedrich Knickerbocker, in admirable burlesque. In 1811 he came to England where he remained for many years, and he soon became dependent on his pen for a livelihood. His *Sketch Book* appeared in 1820, and was well received on both sides of the Atlantic, his *Town and Country* and *Westminster Abbey* being singled out for especial praise; this was followed by *Bracebridge Hall* (1822), and *Life of a Traveller* (1824). As the result of a sojourn in Spain he wrote *The Life of Columbus* (1828), *The Conquest of Granada* (1829), *The Alhambra* (1832), and other works, which were very popular. I returned to New York in 1832, where he was enthusiastically wel-

comed. His later books include biographies of Goldsmith, Mahomet, and Washington, and *Recollections of Abbotsford and Neustead Abbey*. He had the gift of style in no small degree, and in all his work there is charm, but he is seen at his best in his shorter efforts. His fame rests mainly on the *Sketch-Book*. The best ed. of his works is the 'Geoffrey Crayon' in 26 vols. (New York, 1880). See lives by his nephew, P. M. Irving, 1862-64; G. S. Hollman, 1925; see also S. T. Williams (ed.), *Washington Irving and the Storrows*, 1933; Van Wyck Brooks, *The World of Washington Irving*, 1946.

**Irvingites**, see IRVING, EDWARD, and CATHOLIC APOSTOLIC CHURCH.

**Irvington**, tn. of Essex co., New Jersey, U.S.A., 3 m. S.W. of Newark. It manufs. tools, ropes, steel, wall-papers, etc., and has smelting-works. Pop. 55,300.

**Irwell**, riv. of Lancashire, England, rising 2 m. S. of Burnley, and flowing, in a tortuous course of 40 m., through Bacup, Rawtenstall, Bury, and Manchester, to the Mersey at Irlam. The Manchester Ship Canal is now included in the lower part of its course. Length, 40 m.

**Irwin, Edward Frederick Lindley Wood**, first Baron, see IRVING, VISCOUNT.

**Irzykowski, Karol**, (b. 1873), Polish writer and literary critic, b. at Blaszakowa. In his *Pulubia and Dreams of Maria Dumin*, which appeared in 1904, he showed himself a precursor of Proust and Breud. His earlier and precocious books were followed by *Poems and Dreams* (1907), *Devil Knows Where* (1922), and various essays and studies. In later years he devoted himself to literary criticism.

Is, see Iffr.

**Isaac**, only son of Abraham and Sarah, b. in their old age (Gen. xvii. 17). For the story of his being offered as a sacrifice and the miraculous intervention of Jehovah see Gen. xviii. When forty years old he married his cousin Rebecca, who bore him twin sons, Esau and Jacob. He seems to have lived a peaceful, uneventful, nomadic life, and to have died in Hebron at the age of one hundred and eighty. See ABRAHAM. See also G. Rawlinson, *Isaac and Jacob* (Men of the Bible series), 1890.

**Isaac I.** (Comnenus), emperor of Constantinople (1057-59), the first of the house of Comneni. He had served in the army, and on the deposition of Michael VI. was declared emperor by the soldiers. He repaid the finances, forced the clergy to contribute to the state revenue, and repelled the attacks of the Hungarians in the N. In 1059, being overcome with a serious illness, he abdicated and retired to the monastery of Studion, where he died in 1061. His *Scholastika* and other works on Homer are extant.

**Isaac II.** (Angelus), emperor of Constantinople (1185-95 and 1203-04), succeeded Andronicus I. In 1197 his brother Alexius seized the throne by force and I. was blinded and imprisoned. Eight years later he was restored to the throne, but was too weak, mentally and physically, to rule, and died in 1204, shortly after Mourzouphes, his general, usurped the throne.

**Isaacs, George Alfred** (b. 1883), Brit. politician and trade union official, b. in London. Former member of the council, and mayor of Southwark. Elected Lab. member of Parliament for the Gravesend div. of Kent 1923-24 and for Southwark (N.) in 1929-31 and since 1939. Parl. private secretary to the Lord Privy Seal in the second Labour gov. (1929) who had special charge of the unemployment problem. Also parl. private secretary to the secretary of state for dominion affairs (1930) and, on the advent of the first national gov., acted in a similar capacity to the leader of the Labour opposition. Member of the executive of the Trades Union Congress, 1934; parl. private secretary to the first lord of the Admiralty, 1942-45; P.C. 1945. Member of the Royal Commission on Workmen's Compensation, whose recommendations resulted in the passing of the National Insurance (Industrial Injuries) Act, 1946. Secretary of the National Society of Operative Printers and Assistants (*Natsopa*); past president of the Printing and Kindred Trades Federation; chairman of the Trades Union Congress General Council, 1945; president of the World Trade Union Conference, London, 1945. Minister of Labour and National Service since 1945. Editor of *Natsopa Journal*. Pub. *The Story of the Newspaper Printing Press*, 1931.

**Isaacs, Sir Isaac Alfred** (1855-1935), Australian lawyer and statesman, b. and educated at Melbourne. Admitted to the Victorian Bar, 1880. Q.C. 1889. Member of Legislative Assembly, Victoria, 1892. Solicitor-General of Victoria, 1893, and Attorney-General, 1894; entered Commonwealth Parliament, 1901. Was a member of Convention which framed Commonwealth Constitution. Attorney-General, Commonwealth of Australia, 1905. High Court judge, 1906. Knighted, 1928. Chief Justice, Australian Commonwealth, 1930-31. Governor-General of Australia, 1931-36, he being the first Australian to be so appointed.

**Isaacs, Jorge** (1837-95), Colombian poet and novelist; b. at Cali; son of an Eng. Jew turned Christian and planter and married to a Sp. woman. Attended school at Bogotá; at sixteen went to London to complete his education. In 1864, his first vol. of poems was enthusiastically received. In 1867 he pub. *Maria*, an 'idyllic romance,' somewhat autobiographical. Filled a diplomatic post in Chile. Was a member of Congress, and director of public instruction at Ibagué—where he died.

**Isaacs, Sir Rufus Daniel**, see READING, MARQUESS OF.

**Isabela**: (1) N.E. coast prov. of Luzon, Philippines, area 5394 sq. m. It is mountainous and covered with forests. Coffee, sugar-cane, rice, maize, and tobacco are cultivated, and cattle-raising is carried on. Pop. 76,000. The cap., Ilagan, is 150 m. N.N.E. of Manila. (2) Trading centre in Pueblo, Negros Occidental prov., Philippines, 37 m. S. of Bacolod. Pop. 13,000. (3) Vll. and port on the N. coast of the republic of Haiti, W. Indies, and 36 m.

W N W of Santiago Founded by Columbus (1493), the first European settlement in the New World. (1) 1493 on the NW coast of Puerto Rico W Indies, 10 m NE of Aguadilla in the prov of that name Pop 23,065

**Isabella** (1292-1358) daughter of Philip IV of France, and wife of Edward II of England, whom she married in 1308. She sided with the barons against Edward and the Despençers, and in 1326, having been sent over to France to settle a dispute between her husband and her brother, the 11 king, she collected forces and, being joined by Roger Mortimer her lover and other barons, attacked and defeated the king who was probably put to a cruel death. She and Mortimer ruled supreme for a time, but in 1330 Edward III had Mortimer executed and imprisoned his mother in Castle Rising for the rest of her life.

**Isabella** (1491-1504) Queen of Castile and Leon (1474) wife of Ferdinand V of Aragon. In 1474 she married Ferdinand and became the crown of Castile and Aragon. Ten years later they occupied the throne of all Spain. Her father and mother were both descendants of John of Gaunt of England. She sympathized with Columbus's ambition. See I. L. Plunkett *Isabella of Castile and the Making of the Spanish Nation* (1911) and life by A. S. Wuthrich, 1936.

**Isabella II.** (1830-00) *b* in Madrid was the eldest daughter of Ferdinand VII. She was proclaimed Queen of Spain at the age of three in the death of her father, who had refused the Cortes to repeal the Salic law. Her title was disputed by Ferdinand Don Carlos, and her reign was one continual succession of quarrels and intrigues. In 1846 she married her cousin Prince Francisco de Assis de Bourbon (1822-1907) from whom she separated in 1870. In 1868 she had been forced into exile and abdicated two years later in favour of her son Alfonso XII. See *P. de Fugère, L'Espagne de la Restauration à l'Espagne*, (2nd ed.) 1911.

**Isabey, Jean Baptiste** 176-18 ) Fr  
portr at painter b at N y He studied  
under Dumond and David and was em-  
ployed at Versailles where he painted the  
portraits of most of the celebrities of his  
time He painted many of the revolu-  
tionaries including Barre and Saint-  
Just and was patronized in turn by  
Napoleon and Josephine in the Bour-  
bon sovereigns Apart from portraits, his  
best known works are *Isabey's Boat*  
1796 and *Review of Honor by the First*  
Con ul See list by M L Ligny, 1899

Isaeus, Attic orator, son of Diagoras, b. at Chalcis in Euboea. He lived between 420 and 400 B.C., and was the fifth of the ten Attic orators. He was a pupil of Isocrates, and wrote judicial orations for other people and founded a school of rhetoric at Athens in which Demosthenes is supposed to have been his pupil. Eleven only of his speeches are extant. They throw an important light on Attic law. See Sir R. C. Jebb *Attic Oratory from Antiphon to Isaeus*, 1893. Sir T. W. Higginson, *Isaeus*, 1901.

**Isaiah, son of Amoz** was the greatest and most important of the early Jewish prophets. He was of high social rank, and an inhabitant of Jerusalem. We learn from ch. viii 3 that he was married and the father of a family. The heading of

the book which bears his name (I) tells us that he prophesied from the year of King Uzziiah's death (740 B.C.) through the reigns of Jotham, Ahaz, and Hezekiah, and a late tradition (cf. Heb. vi. 37) tells us that in the days of Manasseh he suffered death by being sawn asunder, but no mention of such a fate is to be found in the Book of Kings. The account of the vision by which the prophet was called to his work is given in ch. iv. The book which bears his name has during the last century been the subject of much discussion. Aben Ezra was the first to call attention to the fact that the book was capable of subdiv. and later critics have criticised on the work of subdiv. most vigorously. The chief break comes after ch. xxxix (chapters I to lxxi contain many passages that seem conclusively to prove them to be post-exilic. The people no addressed is these who have already suffered the punishment of their sins and who are in exile. Further in the discussion on the rightness of Uziah's who reign more than a century after the death of I is added to a sign that Uziah will fulfil his promises in the near future. This latter section is itself generally divided into two parts, viz. I-iv and lv-lxxi known perfectly as Deuter. Isaiah and Lito Isaiah of which the second is the earlier in date. The question of the subdiv. of the earlier part of the work is more difficult and complicated. If we sum up certain portions such as xii-lvi, xlvii, xxxv, xxxix etc. are shown to be post-exilic by the fact that they presuppose the conditions of later times. It would be impossible here to speak of the more elaborate subdiv. such as those of Cheyne (*The Isaiah* etc.) but most scholars are agreed in making a fourfold div. of the prophetic actually attributed to I. These divs. correspond to four invasions of Palestine. The first is that of Tiglath-Pileser, prophesied in ch. vi to the beginning of x and possibly also in certain later parts. The second that of Sennacherib, and Sennacherib ch. xxxiv, contains the first promise of the coming prince whom later ages have identified with the Messiah. There is much doubt as to the extent of the third invasion, that of Sargon whether or no it included Judah. Driver, Robertson Smith, and others hold that it did not and assign to this period xx-xxi 10; Cheyne, Sayce, and others hold the opposite view, and give chs. x-31 and xlii to the last invasion, that of Sennacherib, belong most of the chapters from xx-xxxi. See G. H. A. Smith *Prophecy of the Old Testament*, S. J. Driver, *Isaiah*, 1888. G. A. Smith (commentary in *The Expositor for a Bible*, G. W. Wad, *The Book of the Prophet Isaiah* (Westminster Commentaries), 1911 and works by C. I. A. Dillmann, E. Dichtelheim, I. K. Chyrene, etc.

**Isala**, see **ISSERL**.

**Isandlwana**, or **Isandula**, isolated kopje in Zululand, 60 m. W.S.W. of Ulundi, S. Africa. Here, during the Zulul War, Col. Durnford's column was surprised, on Jan. 22, 1879, by 20,000 Zulus under Cetewayo, and annihilated. Col. Durnford and Pulleine being killed.

**Iear**, riv. of Bavaria, rising in the Tyrol, close Alps and flowing N. and N.E., pasting Munich. It enters the Danube opposite Deggendorf. Length 180 m.

**Isaure**, **Clemence**, see **CLEMENCE ISAURE**.

**Isauria**, anct. dist. in Asia Minor, bounded by Pisidia, Lycaonia, and Cilicia. In Rom. times, the inhab. were a barbarous race and daring sea-robbers. They were overcome by P. Servilius in 78 B.C., but soon rebelled and were a constant source of trouble. The rebel Trebelianus, in the third century A.D. assumed the title of emperor, but was overpowered and executed. The Isauri are said to have been effectually subjugated in the reign of Justinian in the sixth century. I. has had the honour of producing two emperors, Zeno (A.D. 474-491) and Leo III. (718-741). See W. M. Ramsay, *Historical Geography of Asia Minor*, 1904.

**Ischalis**, see **ISCHIA**.

**Ischia** (anct. *Ænarca*), very fertile and picturesque is. in the Bay of Naples, Italy. In the centre is an extinct volcano, from which the surface gradually slopes all around towards the sea. Corn, fruit, and wine are grown; straw plaiting and fishing are carried on. The is. was disturbed by earthquake shock in 171 B.C., 92 B.C., A.D. 1302 and 1883. The chief tns. are I., the cap. and Casamicciola, visited for its hot springs. I. was sacked by the pirate Barbarossa in 1541 and captured by the duke of Guise in 1547. It was occupied by Nelson at one time, and Murat took refuge here in 1815. It was originally colonised by the Greeks, who called it *Pitheusa*. Pop. (is.) 29,500; (tn.) 9200. See A. Rittmann, *Geologie der Insel Ischia*, 1930.

**Ischl**, or **Bad Ischl**, magnificently situated inland watering-place of Upper Austria, 30 m. E.S.E. of Salzburg. Chiefly known for its medicinal baths and as the summer residence of the former Austrian Imperial family. An important industry here in salt. Pop. 10,300.

**Iseo**, **Lago d'**, picturesque lake of Italy, 15 m. long and about 2½ m. broad, at the foot of the Alps, between Bergamo and Brescia. It is traversed by the R. Oglio.

**Iseran**, pass in the Alps (9085 ft.), connecting the valleys of the Arc and the Isère. The neighbouring peak, Mt. Grand Paradis, was for years confused with Mt. Iseran, owing to the fact that the Montagnards call not a peak but a series of pastures a *mont* and that the pastures here were called Mt. Iseran.

**Isère**: (1) dept. in the S.E. of France, between the Rhone and Savoy, formed out of the anct. prov. of Dauphiné. The S. portion is very mountainous, the highest point being the Alguille du Midi (13,075 ft.), which rises on the S.E. frontier. The N. and W. of the dept. is formed of plateaux broken by hills and valleys. The R.

Rhone surrounds it on every side but the S., while its trib., the I., flows through it. The dept. is divided into three arrons., Grenoble, La Tour du Pin, and Vienne. The cap. is Grenoble. Silver, lead, coal, and iron are mined; slate, stone, and marble quarried; and gloves, silk, paper, and cement manufactured. Green Chartreuse was manufactured in the monastery 11 m. N. of Grenoble. Area 3179 sq. m. Pop. 573,000. (2) Riv. rising in the Alps, and, winding W. and S.W. for 180 m. (100 m. of which are navigable) through the depts. of Savoye, I., and Drôme, joins the Rhone a few m. above Valence.

**Iserlohn**, tn. of Westphalia, Prussia, 36 m. by rail S.E. of Dortmund. It has manufs. of cutlery, bronze, and other metal articles, furniture, and chems. Pop. 31,000.

**Isernia** (*Æsernia*), tn. in the prov. of Campobasso, Italy, situated in the Apennines, 50 m. N.E. of Naples. It is notable for its Rom. antiquities and near the tn., and especially for a long subterranean aqueduct, which still supplies the industries and fountains of I. with water. There is, too, an anct. Rom. bridge outside the tn. Nearly is a chapel to SS. Cosmas and Damian. I. is identical with the anct. Samniti tn. *Æsernia*, which was conquered and colonised by the Romans c. 260 B.C., and the massive polygonal walls which form the basis of the existing walls in nearly their entire circuit are attributed to the Samnites. An earthquake in 1800 overthrew the cathedral besides doing other damage. In 1799 the tn. was stormed by the Fr. and in 1860 it was sacked in a Bourbonist revolt. I. is the seat of a bishopric. It has manufs. of woollens, pottery, and tiles. In the Second World War some damage was sustained by the churches of S. Maria della Benedettina and S. Maria della Monache, but the Rom. bridges were, for the most part, spared and the tn. suffered comparatively little. The Gers., however, stole the entire coin collection. Pop. 15,000.

**Istahan**, see **ISPAHAN**.

**Isherwood**, **Christopher**, Eng. novelist, b. at Disley, Cheshire, 1904. His father, who was killed at Ypres in 1915, was an Army officer and I.'s early years were spent in various garrison tns. He was educated at Repton School and Corpus Christi College, Cambridge. After temporary employment as a private secretary and tutor, he went in 1929 to Berlin where he stayed until Hitler came to power in 1933. From schooldays he had formed a close friendship with W. H. Auden (q.v.) with whom he collaborated in three plays notable for their expressionist technique—*The Dog beneath the Skin* (1935), *Ascent of F.6* (1937), and *On the Frontier* (1938). In 1938 he went with Auden to China for the purpose of writing a book about conditions there. The result of this further collaboration was *Journey to a War* (1939). His first novel, *All the Conspirators* was pub. in 1928, followed by *The Memorial* (1932), his next novel *Mr. Norris Changes Trains*

(1935) showed a considerable advance and established his reputation as a writer with a capacity for realistic and humorous perceptions and a clear prose style. In Jan 1919 he went to the U.S.A. with the intention of becoming a permanent resident. His interest in metaphysical studies allied him with the Vedanta Society in Los Angeles, and he has collaborated in a translation of the Bhagavad Gita. Living in California he has also worked as a script writer for films. His autobiographical work, *Lions and Shadows*, was published in 1935.

**Ishu, Kikuduro, Viscount** (1866-1945), Japanese diplomat. Studied law at Tokyo. Was in the consular service and afterwards he became Vice-minister of foreign affairs 1908. Ambassador, 1912 till mid minister of foreign affairs, 1913-16. Viscount and member of House of Peers, 1916. Ambassador to U.S.A., 1917-19, and to France from 1920. Acting president of Council of League of Nations 1921. Delegate to Naval Disarmament Conference, Geneva. Killed, together with his wife, at their home in Tokyo in an American bomber attack, May 25, 1941.

**Ishum** (1) In the Onk Re-ion of the R S F S R, 120 m S S L of Loholsk on the Ishum R. It lies in an alluvial field in Dec. and the tallow-milling works spinning and weaving mills. Pop. about 7000. (2) Riv. of Siberia flowing in Kholmok Kizak S S R and flowing through fertile districts at a distance of 300 m. It joins the Irtys R. of Fobolsk. Its total length is 600 m.

**Ishmael**, son of Abraham by Hagar the Egyptian handmaid of his wife Sarah. On account of Sarah's jealousy at the age of fifteen years with his mother expelled from his father's house and driven into the wilderness, when a guardian angel preserved their lives and directed them to water (Gen. xxi 1-21). The boy grew up into a famous hunter, married an Egyptian woman and became the ancestor of a great nation. Mohammed claimed descent from him. Mohammed asserts that he is buried with his mother in the Kaaba at Mecca. (cf. Genesis xvi 12).

**Ishpeming**, city of Marquette Co., Michigan, U.S.A. Has large iron mines. Gold and marble are also found in the neighbourhood. Pop. 9400.

**Ishwar Chandra, Ishwar**  
**Isidore of Seville**, Isidorus Hispanensis (c. 606-666) Bishop of Seville and Spanish cardinal. He was educated in a monastery and became distinguished in his controversies with the Arians. In 699 he was elected bishop of Seville and became famous for his powers of administration and his learning in science, history, and theology. He was present at the councils of Toledo (700) and Seville (701), and it was his influence that altered the organisation of the church in Spain. He wrote an encyclopaedia from his own knowledge. It included law, science, history, and theology and helped to keep alive some knowledge of learning through the Dark Ages. Among his works are *Origines seu etymologiarum libri*, and a list of the

Goths and Vandals. See C. Dziedowski, *Isidorus und Hildefons als Literaturhistoriker*, 1898, and A. Schmickel, *Die positive Philosophie in ihrer geschichtlichen Entwicklung II Isidorus von Sevilla*, 1911.

**Isidorian Decretals, or False Decretals**, spurious amplification of the canonical collection in use in the Church of Spain in the eighth century. The author assumed the name of Isidore taking in addition the name of Mercurator. The collection is divided into three parts. The first contains seventy letters (forged) attributed to various popes. The second contains a collection of councils and the forged Donation of Constantine. The third a series of decretals from the Nicæan council. The object of the forged was to reform the canon law and to increase the authority of bishops against civil rulers. They were very skillfully composed, and were the cause of violent controversy.

**Isinglass**, variety of gelatin obtained from the dried swimming bladders of different fishes. It is used principally for culinary purposes and for clarifying beer and wine, and also for making cement and plaster. It is manufactured chiefly in Russia, Canada, Brazil, and the Indies.

**Isis**, (1) Egyptian deity, the goddess of fecundity, identified in Greek mythology with Ceres. She was the wife of Osiris and the mother of Horus and daughter of Nut or the Sky. Her story is one of great beauty and tragedy and is briefly as follows. Osiris, king of Egypt, was the victim of a conspiracy led by his brother Set, the god of evil. Osiris was entangled in a chest which was thrown into the Nile, carried away, and finally thrown up on the sea shore. Isis, after long search, found the chest, married over it, and him. It went to urge him to avenge his father. Meanwhile Set, in anger upon the chest, cut the body of Osiris into fourteen pieces and hid them dispersed over the land. Isis then revived herself by travelling from place to place, building a temple over each fragment of her husband's body as she found it. Osiris became lord of the other world and appeared to his son Horus and taught him the use of arms. Horus defeated Set and took him prisoner, but, being enraged because his mother gave Set his freedom, he cut off her head. Photh replaced it in the form of the head of a cow. The outstretched wings of Isis are frequently found in Egyptian decoration; she is often represented with the face of a woman and the horns of a cow, sometimes with the lotus on her head, and at other times hooded—the latter representing incidents in her career.

**Isis**, name applied by Oxonians to

ISIS

the upper part of the R. Thames, England. This name was used as early as 1607, for Camden mentions it. The popular belief that the name Thames is derived from the composition of Thame and Isis is incorrect.

**Iskander Beg**, see **ISKANDERBEG**.

**Iskanderun**, another name for **ALEXANDRETTA** (q.v.).

**Iskelib**, tn. of Asiatic Turkey, situated in the vilayet of Ankara, 100 m. N.E. of Ankara. Has an old castle, and there are salt-springs S. of the tn. Pop. about 15,000.

**Isle de Pasqua**, see **EASTER ISLAND**.

**Isle y Roja**, José Francisco de (1703-81), Sp. salarist, Jesuit priest, and a famous preacher, b. at Villa Vidanes, Leon. Lamphooned the ignorance of the Sp. priesthood in a novel entitled *Historia del famoso predicador Fray Gerundio de Campuzos*. The book was prohibited (1760) in consequence of the storm of protests raised by the victims, but he pub. a second part in 1770 unknown to his superiors. He also completed, shortly before his death, the trans. of *Gil Blas* into Sp. In 1850 his *Obras Escogidas* came out as vol. xv. of the *Biblioteca de Autores Españoles*. With the other Jesuits he was expelled from Spain in 1767, and went to Bologna, where he lived until his death. See B. Gaudeau, *Les Prêcheurs barbesques en Espagne au XVIII<sup>e</sup> Siècle*, 1891.

**Islam** (Arab *Islam* = 'surrender to God'), virtually the Mohammedan faith (see **MOHAMMEDANISM**). The term is used in a broader sense to refer to the general features—philosophical, religious, artistic and social—of Mohammedan culture, e.g. in Nietzsche's *Antichrist*, Renan's lecture *Islamism and Science* (pub. Eng. trans., 1896), etc. 'Moslem', 'Muslim', or 'Mussulman' (derived from Arabic *salam*, meaning 'to submit'; cf. *salaam*), as a substantive, means a Mohammedan and, as an adjective, 'of or pertaining to the Mohammedans'; and all Mohammedan communities of the world of Islam are Muslim or Moslem communities. The salient feature of I. is the remarkable homogeneous unity of the Moslems, a unity which is founded on their faith and on the language in which the Koran was written. The essential world of I. embraces Egypt, the Anglo-Egyptian Sudan, Saudi Arabia, Iraq, Syria, Palestine, Transjordan, Aden, Libya, Algeria, Tunisia, Morocco and Zanzibar— all Arab countries; and the non-Arab countries, Persia, Afghanistan, India (which has 75 million Muslims) and Malaysia. These countries do not exhaust all the existing Muslim pop.; they represent, however, most of the independent Muslim lands and the most important Muslim communities. There are also numerous Muslim communities in various European countries, e.g. there are estimated to be 25 million Moslems in Soviet Russia, in Yugoslavia (1½ million), in Albania (about 800,000); and, among non-European Muslim communities, are large elements in Liberia, China (over 20 million), and Madagascar (700,000), etc. Turkey is not included, for, by the Law of April 10, 1928, of the

modern Constitution, Turkey officially no longer regards herself as an Islamic state, Islamic teaching being forbidden in schools, while even instruction in Arabic is not tolerated. The religious orders in Turkey have been closed and religious exercises outside the mosques prohibited; though individual Turks are no doubt still loyal to the teachings of Mohammed and the mosques in fact still attract large congregations. Probably so remarkable a unity as characterises the Moslem faith would never have been achieved if the influence of I. had been restricted to the religious aspects of Muslim life. But unlike Christianity and other monotheistic faiths, I. supplies a political and social standard as well as a religious code. It provides standards for legal, social, and political conduct, and regulates the life of a Moslem throughout the entire complex of his economic and personal activities. Hence I. overrides the racial, national, or social distinctions in Muslim communities and in fact everything that savours of caste or class distinction is anathema to true I. The political consequences of this Muslim unity in the world's affairs, or, in other words, the existence of a homogeneous Muslim Empire began to lessen with the decline of the Caliphate. The Ottoman Empire did indeed provide a temporary if artificial and materialistic basis of unity, but it was only after the beginning of the present century that the idea of Muslim unity began once more to exercise an increasing influence upon international affairs. Today the Muslim peoples of Egypt, Iraq, and Persia are a political force in modern affairs. Though the world of I. has, to a considerable extent, felt the impact of W. ideas, it is still governed essentially by religion. The extreme asceticism of the Wahabi kingdom of Ibn Saud is an eloquent proof of this truth. Nothing, too, has been a stronger bulwark against Nazi influence in the Muslim world than the faith of I. Even in Persia, where, during the late Shah's reign, religious practices were not encouraged, the Constitution of 1925 maintained a limited religious-Islamic character and with the abdication of Shah Reza Pahlavi in 1911 religious restrictions were relaxed. Many of the Muslim peoples dispersed throughout the world have become assimilated to the political and cultural life of their country of adoption. This is especially true of the Arab immigrants in America; but, as indicated above, there remain more than a dozen Muslim, or partly Muslim, countries whose chief inspiration comes from I. and Islamic traditions. But it cannot be denied that generally speaking, occidental influence has been dangerous for I. W. methods, customs, and theories have been accepted for which there was no favouring historical and cultural background. Recognition of the superiority of W. science and methods induced many Arabs to break with Islamic tradition. This has involved a secularisation of native life in the Near Eastern countries; but the relaxing of hereditary ties with I. in such

advanced countries as Egypt and Syria has also been ascribed to the antagonism of Arab youth to the narrow-mindedness of the *ulama* (doctors of sacred law), whose interpretation of I. was retrogressive and opposed to all scientific advance. Yet this estrangement from I. is often only slight and many of the most advanced Arab thinkers of today realise that, without I., the future offers only poor prospects to those peoples whose spirit and intellectual life depend fundamentally on the Muslim faith. In the last two decades political nationalism has been the dominant factor in the political life of the specifically Arab countries. But even this nationalism has been and still is coloured by I., and indeed Arab nationalism, the ultimate objective of which is pan-Arabism (*q.r.*), could never be divorced entirely from I. Pan-Islamism, however, remains a mere dream, as remote from probability as a jihad waged in all the Islamic countries of the Near and Middle E. Prominent Islamic writers and thinkers, like the Persian Murtahid, Sheikh Al-Zinjanj, Dr. Taha Hussein, one-time Dean of the Faculty of Letters in Cairo Univ., and Dr. Yahya al-Dardiri all tend to see in a return to the Koran the chief remedy for Arab ill and their 'moral anarchy.'

Antonius, *The Arab Awakening*, 1939; A. J. Arberry and R. H. Landau (ed.), *Islam Today*, 1943; H. St. J. Philby, *A Pilgrim in Arabia*, 1943.

**Islamabad**, tn. in Kashmir, India, on the R. Jhelum, the original cap. of Kashmir, but now of secondary importance. It possesses an old summer palace, a beautiful mosque, and a shrine. Close to it are the sulphur springs of Anant Nag, falling into a reservoir full of sacred fish. Chintz, cotton, and woollen goods are manufactured, and the famous Kashmir shawls. Pop. 10,000.

**Island** (Old Eng. *íeg*, *ísh*, and *land*), piece of land surrounded by water, but exclusive of continents (see **CONTINENT**). Greenland, less than one-fourth the size of Australia, is possibly an ice-bound archipelago. New Guinea, with an area of 303,000 sq. m., Borneo (284,000 sq. m.), Madagascar (227,000 sq. m.), and Sumatra (182,000 sq. m.) are the next largest Is.; Great Britain comes sixth on the list, with an area of 83,700 sq. m. Is. may be divided

into two classes, continental and oceanic. The former are the result of the submergence of a coastal range, or may have been formed by the sea cutting through the neck of a peninsula, or the eating back of an inlet until a piece of land is cut off. In all cases, except Madagascar, these Is. are connected with the mainland by a continental shelf, and their flora and fauna are similar to those of the adjacent continent; for example, the Is. of the W. coast of Scotland bear this relation to Great Britain, which itself bears the same relation to the continent of Europe. They may be classed according to their structure, if they be solitary, as Iceland; in chains, like Japan; or in archipelagoes, as in the Aegean. New Zealand, in structure is usually associated with areas of continental dimensions, and, for that reason, it is often regarded as an I. of the continental type. It is, indeed, a miniature continent and too isolated to be spoken of as adjacent to Australia or to any other continental mass. Oceanic Is. rise abruptly from great depths, and show no geological continuity with the mainland. They are due to various causes, and may be either 'volcanic,' due to the gradual rising above the waves of submerged mountain peaks, or to a violent volcanic upheaval of the ocean-bed; or 'coral Is.' due to the gradual agglomeration by the action of the water, or the active building of the corals themselves, or the skeletons of marine organisms (see **CORAL**). Numerous submarine Is. have been discovered which only require volcanic action or the deposition of sediment to rise above the surface of the ocean. See also **GEOGRAPHICAL DISTRIBUTION**.

**Islands**, Bay of, bay on the W. coast of Newfoundland, in the Gulf of St. Lawrence, forming an estuary at the mouth of the Humber R. It is famous for its beautiful scenery, and is within easy reach of good fishing and hunting.

**Island Scots**, body of Highlanders, descendants of Somerset,thane of Argyll and lord of the Isles, who settled in Ireland, establishing themselves in the mts. of Ulster, plundering the surrounding country. The earl of Sussex made an attempt to subdue these MacDonalds (MacDonnells), but failed. They were finally defeated by their former ally, Shane O'Neill, who took their leader, Sorley Boy MacDonnell, prisoner. The Eng. restored the MacDonnells, and Shane O'Neill was slain by one of the Highlanders in a brawl (1567).

**Islandshire**, part of Northumberland, England. It was at one time part of the co. of Durham; it includes the Farne Is. and some dists near Berwick-on-Tweed.

**Isias** do Barlovento, see **WINDWARD ISLANDS**.

**Isia** de Pinas, see **ISLE OF PINES**.

**Isias** de Sotavento, see **LERWARD ISLANDS**.

**Islay**, is. of the Inner Hebrides, Argyllshire, Scotland, 13 m. W. of Kintyre, separated from Jura by the sound of I. Area 150,100 ac., or 235 sq. m. The lochs of Gruinart and Iudal penetrate so deeply

that the portion is almost separated and known as the Rhunn ofIslay. The highest summit is Ben Bheigair (1609 ft.). Fishing is very good in the streams and lakes; dairy-farming and whisky distilling are the chief industries. The chief tn. is Bowmore. I. was once the chief seat of the 'Lords of the Isles,' but the Campbells finally gained the is. (1616). Pop. 6500.

**Islebius, Magister,** *see* AGRICOLA, JOHANN.

**Isle Adam, L',** tn. of the dept. of Seine et Oise, France. The sixteenth century church of St. Martin suffered considerable damage in the Second World War. Pop. 1200.

**Isle de Bourbon,** *see* RÉUNION.

**Isle de Richelieu,** *see* JAN MAYEN ISLAND.

**Isleham,** vil. of Cambridgeshire, England, 10 m. S.E. of Ely. Chippenham Fen, 3 m. S.E. of the railway station, is a natural reserve of Fenland of particular interest because of the insect, plant, and bird life which it contains.

**Isle Jourdain,** tn. in the dept. of Gers, France, on the Save, 18 m. W. of Toulouse. It has great horse and cattle fairs and considerable trade in wine, produce and wine. It is an old tn., and contains an anct. church with a tower dating from the tenth century. Pop. 1100.

**Isle of Dogs,** *see* DOGS.

**Isle of Ely,** name given to the N. portion of Cambridgeshire, on account of its having been at one time isolated by marshes, being included in the region of the Fens; it has been drained and is now fertile land. Famous as the scene of the final stand of Hereward the Wake. It returns one member to Parliament.

**Isle of France,** *see* MACRITICH.

**Isle of Man,** *see* MAN, ISLE OF.

**Isle of Pines,** (1) I. of S.W. Cuba, 80 m. off Batabano, with an area of 1180 sq. m.; it has some minerals and quarries; but the islanders are chiefly engaged in rearing cattle, and cultivating grape fruit and winter vegetables. Pop. 10,000. (2) Also an is. dependency of New Caledonia, 30 m. to the S.E. with an area of 58 sq. m. and a pop. of about 600.

**Isle of Thanet,** *see* THANET, ISLE OF.

**Isle of Wight,** *see* WIGHT, ISLE OF.

**Isles, Lord of the,** Scottish title claimed by the descendants of Somerled (d. 1161), thane of Argyll. Somerled was a descendant of Colla Uais of Ireland. He succeeded in driving the Norsemen from Argyll and the W. Isles, establishing himself as an independent prince; his lands included Kintyre and the Isle of Man. His descendants maintained themselves in the same manner. In 1111 the Donald of the Isles, who had become very powerful by his fleet and large army, claimed the earldom of Ross through his wife, including the Isle of Skye. The earl of Mar, with an army of Lowlanders, marched against him, and Donald was defeated with great loss at the battle of Harlaw in Aberdeen. The earldom then reverted to the crown (1121), but was restored by James I. to the heiress, mother of Alexander Macdonald, third lord of the Isles

and thus eleventh earl of Ross. John Macdonald, fourth lord, committed treason, and was deprived of his earldom (1469). In 1502 Donald Dhu, grand-son of John, was proclaimed king of the Isles, and led a revolt against James IV. He was defeated and fled to Ireland. Since 1469 the title of 'Lord of the Isles' has belonged to the Prince of Wales. The title 'Lady of the Isles' is sometimes applied to the wife of Baron Macdonald, descendant of a half-brother of John of the Isles. It is, however, a matter of keen controversy. The house of Somerled survives in two branches, that of Baron Macdonald of the Isles and the Macdonnells, earls of Antrim in Ireland.

**Isles of the Blessed, or Fortunate Isles,** mythical group of is., on the edge of the W. Ocean, peopled by the blessed mortals who were 'never to die.' Sev. nations seem to have believed in this myth. Tradition places the Amenet (pleasant place of the dead) of the early Egyptians somewhere in the W. Ocean; the Babylonians believed in an isle of the blessed encircled by four rivers. The Gk. belief expressed by Homer appears to connect them with the Elysian Fields. Plato describes in his *Timæus* how Solon was told by Egyptian priests of a country larger than Asia Minor, which was overwhelmed by the sea. This was known as 'Atlantis,' and the surviving is. were termed the Fortunate Isles. A very early tradition suggests than an unrecorded voyage to the Canary Isles and Madina may have gained these places this mythical name. The Celtic Avalon of King Arthur and St. Brendan's Is. were presented as blest with summer all the year round, and 'therefore fortunate.' There are also legends of Lyonesse off Cornwall and many others.

**Isle-sur-la-Sorgue L',** tn. in the Vancluse dept. of France, 12 m. E. of Avignon, picturesquely situated on the Sorgue, a trib. of the Rhone. The inhabs. are chiefly engaged in the textile industry. Pop. 6500.

**Isleworth, tn. and dist. in Middlesex, England.** Situated in the fertile valley of the Thames, it is full of flourishing mkt. gardens and nurseries. It also contains Swan House, a former seat of the duke of Northumberland. The only manuf. of importance is soap. Forms with Heston a bor. constituency, pop. 47,000.

**Islington, Sir John Poynder Dickson-Poynder, first Baron (1866-1936),** Eng. politician and administrator, son of Rear-Adm. J. B. D.-P. Succeeded his uncle, 1881, as sixth baronet of an old Wiltshire family of Hartham Park, Corsham. He sat as Unionist member for the Chippenham div. of Wiltshire, 1892-1910, but took an independent line as a strong free-trader. In 1910 he was appointed governor of New Zealand. Chairman of the Indian Public Service Commission, 1912-14. Chairman, National Savings Committee, 1920-26.

**Islington, metropolitan bor. of the co. of London, England.** It includes Holloway, Highbury, Kingsland, Barnsbury, and Canonbury, all retaining the names of anct. manors, the latter belonging as early as

the thirteenth century to the priory of St Bartholomew, Smithfield the name still given to the great metropolitan cattle market. The two prisons of Pentonville (1842) and Holloway (1850) are included in the dist. also the Agric Hall (1862). Other buildings are the Great Central Hospital, the N Polytechnic the London Fever Hospital and the London School of Divinity St John's Hall Highbury. The bor is divided into three parls divs each returning one member. Pop 220 100.

**Islip**, tn of U S A, Suffolk co New York on Long Island and Great South Bay a favourite summer resort. It is 11 m N of Brooklyn and the head quarter of sev sporting clubs. Hatching and fruit canning industries. Pop 3 400.

**Ismail**, or **Ismailia** (1) Tn and dist of Bessarabia in the Moldavian S S R on the N arm of the Danube 120 m S W of Odessa. The tn is the seat of an active export trade being especially noted for its fruit. It was at one time Turkish fortrez but was taken by the Russian general Suurov in 1790 and finally ceded to Russia in 1878. It became Rumanian in 1918 and Russian in 1940. Taken by the Gers in 1941 in the course of their invasion of Russia and retaken by the Russians in 1944. Pop (tn) 26 600 (dist) 221 200. (2) In of Egypt on the Suez Canal and connected by rail with Suez and Cairo. Has fine public squares and gardens. Pop 16,000.

**Ismailis** Mohammedan sect who belonged to the Shiites. They therefore believed that the imamate was vested in the descendants of Mohammed alone and so of Ali, the prophet's son in law and chosen minister. Their name was derived from Ismail ibn Ja'far, whom they deemed the seventh and last of the Imams. The sect would long ago have died out had not a certain Abdallah ibn Maimun arisen (c A D 870) a Persian sceptic and juggler who traded on the Ismailites' Messianic belief in a 'Hidden Imam' or 'Mahdi'. The converts of Abdallah learnt to despise all positive religious and outward observances, and to regard the doctrines of resurrection and hell etc. as mere myths or allegories. In 891 a Babylonian peasant named in Karmat allied himself with the Ismailis and founded the brotherhood of the karmathians who were the cause of ceaseless bloodshed and rebellions during the two centuries following. The Fatimite dynasty of Califs and Mahdis sprang from Obeidallah Grand Master of the Ismailites. This man was descended from Ali Allah and claimed to be a son from the stock of Ismail the prophet's daughter.

**Ismail Pasha** (1830-95) Khedive of Egypt will be chiefly remembered in history as the man who by his senseless expenditures opened an easy avenue to European intervention in Egyptian affairs. Yet he discovered in his backward people the worth of a good education and of many Western ideas. In 1863 he became viceroy, having successfully crushed a formidable revolt in the Sudan. In 1867 he persuaded the Turkish sultan to recognise

him as Khedive and four years later became virtually independent. During his reign he enriched many an unscrupulous financier for he built palaces and theatres founded a sugar industry, reorganised the customs etc. all with foreign credit. By 1874 the year of the annexation of Darfur he had piled up a national debt of over £100 000 000 and when he sold his Suez Canal shares to Great Britain (1875) he practically finished the work of his financial rescue. The final result of foreign interference was the abdication of I in 1879 in favour of his son Ismail. The remainder of his life was spent in exile. See Califes **Ismail** the Imperial Khedive 1933 G. Doubl *Il Re Sultano dell'Egitto* 1934

ISMAEL IASHA

**Ismay, Lionel Hastings**, first Baron (b 1884) Brit soldier commissioned in 1907. He served on the Indian frontier and in the First World War in Southland, where he was twice mentioned in despatches. He was at the Staff College Quetta, 1922, and at the Army Headquarters India in 1924. He was military secretary to Lord Wellington Victoria of India, 1931-33, and secretary to the Committee of Imperial Defence 1938. He was deputy secretary to the War Cabinet from 1939 and Chief of Staff to the Minister of Defence from 1940.

**Ismay, Thomas Henry** (1837-99), English owner of a Cumberland. He started a shipbuilding business of his own at Liverpool, after serving a short term of apprenticeship and engaged particularly in the Australian trade. In 1867 he entered into partnership with Wm Imrie, and formed the Oceania Steamship Company. Later he became chairman of the White Star Line, and a director of many other industrial enterprises.

**Ismene**, daughter of Oedipus and Jocasta. She wished to share the punishment of Antigone, her sister, for giving burial to Polyneus.

**Ismet Pasha**, see **İNÖNCÜ**.

**Ismid**, or **Isnikmid** (auct. Nicomedia), tn. in Asiatic Turkey, situated at the head of the gulf of the same name. It is connected by rail with Halidar Pasha, Angora, Konia, and Smyrna, and contains a fine sixteenth century mosque. It is the seat of a Gk. metropolitau, and an Armenian archbishop, and was formerly the auct. seat of the kings of Bithynia, but it now retains little of its former dignity. Its port, Dariche, is about 3½ m. distant, and here the Anatolian Railway Company have built docks and a quay. Pop. about 18,100.

**Isnik**, see **NİĞİKA**.

**Isobar**, line drawn on a chart joining places of equal atmospheric pressure. The chart may represent the earth's surface or a surface at a constant height above the earth.

**Isochronism**, that property possessed by an oscillating system, e.g. a pendulum, which oscillates in equal times, however great the vibrations may be. This can only be possessed when it moves in a cycloidal arc. Because of their practical l., musical instruments such as tuning forks, organ pipes, and stretched strings give notes whose pitch is independent of the intensity. *See* SOUND; ELASTICITY.

**Isoclinial Strata**, those which dip in the same direction on both sides of the axis of curvature. They were doubtless preceded by ordinary symmetrical folding, after which the vertical axis became tilted and gave a sigmoidal fold; in many cases continued strain has caused the middle limb to be elongated and fractured.

**Isoclinic**, and **Isogonic**. When a magnet is suspended freely from its centre of gravity, and allowed to come to rest, it is found that it takes up a definite position at a given locality. The vertical plane passing through the axis of the magnet is called the magnetic meridian. The angle, between the plane of the geographical meridian and the magnetic meridian is called the declination. This varies at different points on the earth's surface. **Isogonic** lines are lines connecting those places on the earth's surface at which the declination is the same. The angle made by the axis of the freely suspended magnet with the horizontal is called the inclination or dip. At the two magnetic poles the dip is 90°; at the magnetic equator its value is zero. It has intermediate values at places between the poles and the equator. **Isoclinic** lines are lines connecting those places on the earth's surface at which the inclination is the same.

**Isocrates** (436-338 B.C.), celebrated Attic orator, b. at Athens, where he was taught in the schools of Gorgias, Prodicus, and Socrates. He was prevented by his timidity from ever speaking in public, but wrote orations for others. He started a school of rhetoric at Chios, but subsequently moved to Athens, where he had 100 pupils. He was a personal friend of Philip of Macedonia, and this friendship for a time kept off war. When the Athenians were defeated at Cheronæa in 338, I. was so overcome with grief that he put an end to his life. Twenty-one of his orations and nine letters have come down to us. The

eds. of his extant writings are by Baizer and Sauppe, 1856; Benseler and Blass, 1878 and 1913-27; and Mathieu-Lémond, 1928 ff. *See* Sir R. C. Jebb, *Attic Orators*, 1893; G. Schmitz-Kahlmann, *Das Beispiel der Geschichte im politischen Denken des Isokrates*, 1939.

**Isocyanides**, **Isontitriles**, **Carbamines**, or **Carbylamines**, class of carbon compounds, isomeric with the cyanides, but containing the group -NC, in which the alkyl group is united to carbon through a nitrogen atom. They are extremely poisonous, have a disgusting odour, and on hydrolysis with a mineral acid yield formic acid and an amine. They cannot be hydrolysed by alkalis, and are of interest as possessing a bivalent carbon atom, the normal valency of carbon being 4. I. are made by heating a primary amine (e.g. aniline) with chloroform and alcoholic potash. *See* NITRILES.

**Isodimorphous Substances**. Two substances are said to be isodimorphous when they each crystallise in two distinct forms (i.e. are dimorphous) and in each of their dimorphous forms are isomorphous. For example, arsenic and antimony trioxides each crystallise in two distinct forms which occur naturally in minerals, but each form of the arsenic compound is isomorphous with the corresponding form of the antimony compound. Thus, As<sub>2</sub>O<sub>3</sub> in arsenolite (cubic), in claudelite (orthorhombic); Sb<sub>2</sub>O<sub>3</sub> in senarmontite (cubic), in valentinite (orthorhombic). A. and S. are isomorphous, so also are C. and V. Again, calcium carbonite is dimorphous, crystallising as calcite and aragonite. Lead carbonate (i. the mineral cerussite) is isomorphous with aragonite, but no form is known which is similar to calcite. Crystals of calcite often contain, however, carbonate of lead (plumbocalcite), which shows that this latter may also crystallise in the same form as calcite, although as yet it has not been discovered as a distinct mineral. Calcium and lead carbonates may therefore be said to be isodimorphous.

**Isoteles**, single genus contained in the order Isotelaceæ, which flourishes in temperate and tropical lands and consists of fifty aquatic or semi-aquatic plants. Sev. of the species are known as quillworts on account of their grass-like appearance, and *I. lacustris* is known in Britain as Merlin's grass. The genus resembles *Selaginella* in its characteristics.

**Isola**, tn. in the Free Ter. of Trieste, 9 m. S.W. of Trieste on the S.E. shore of the gulf. It is noted for the famous I. wine. Pop. about 10,000.

**Isola Bella** and **Isola Madre**, two celebrated is. of the Borromean Is., Lake Maggiore, N. Italy. I. M. is the larger and has long terraces and an old palace.

**Isola del Liri**, com. of Italy, prov. of Caserta, situated on an is. formed by the R. Liri, and 5 m. S.W. of Sora. It has machinery works and paper and woollen mills.

**Isolationism**, see UNITED STATES OF AMERICA, History.

**Isomerism**, term introduced by Berzelius to denote the phenomenon of the existence of two or more different substances whose molecules consist of the

same number of the same atoms. Thus there are two compounds, viz. ethyl alcohol and dimethyl ether, which both have molecules consisting of 2 carbon atoms, 6 hydrogen atoms and 1 oxygen atom. The existence of isomers is explained by the different ways in which the atoms are arranged in the molecules. Thus ethyl alcohol is  $\text{CH}_3 \cdot \text{CH}_2 \cdot \text{OH}$ , while dimethyl ether is  $\text{CH}_3 \cdot \text{O} \cdot \text{CH}_3$ . The first case observed was that of ammonium cyanate and urea (Wöhler, 1828), both of which have the formula  $\text{CON}_2\text{H}_4$ ; the former compound, however, is of the structure  $\text{NH}_4 \cdot \text{O} \cdot \text{C} \equiv \text{N}$ , while the structure of urea is  $\text{O} = \text{C}(\text{NH}_2)_2$ . **Stereoisomerism** is I. which cannot be explained on the usual plane formulae, but necessitates consideration of all three dimensions of the molecule. It is frequently accompanied by optical activity, i.e. stereoisomers often exert a rotatory effect upon the plane of polarisation of polarised light. **Dynamic isomerism** or **tautomerism** is the name given to the reversible chemical transformation of one isomer into another. Dynamic isomers usually exist as an equilibrium mixture of the two isomeric forms; thus ordinary ethyl acetoacetate is a mixture of a compound

with the isomeric substance

**Isomorphism** (Gk. *isos*, equal; *морфн*, form). Two substances are said to be truly isomorphous when their crystalline forms and chemical compositions are similar. Mitscherlich discovered that the phosphates and arsenates of sodium crystallise in the same form, and from this and other observations he formulated, in 1821, his 'law of I.' which states that substances of similar chemical composition exhibit the same crystalline form. Since, however, a large number of similarly constituted substances are now known which crystallise in distinct forms, the statement requires modification. Among truly isomorphous substances may be mentioned the following: the alums, zinc sulphate,  $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$ ; and magnesium sulphate,  $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ ; ammonium chloride,  $\text{NH}_4\text{Cl}$  (in which the group  $\text{NH}_4$  behaves as a metallic radicle); and potassium chloride,  $\text{KCl}$ , etc. The converse of Mitscherlich's law by no means holds. Thus we find the diamond, C; magnetite,  $\text{Fe}_3\text{O}_4$ ; and the alums, which exhibit no chemical analogy, crystallising in octahedra. These substances are not truly isomorphous, but are said to be isogonous. The power to form 'mixed crystals' or 'overgrowths' is generally accepted as a criterion of I. Thus, magnesium and zinc sulphates crystallise together in all proportions in the same form as a crystal of either constituent, and if a crystal of chrome alum be immersed in a solution of common alum, the new layer of the latter will be deposited regularly on the old crystal of the former. The law of I. is the most important generalisation in the science of crystallography, and has proved of much use in settling the atomic weights of sev. elements.

**Isonitriles**, *see* under **NITRILES**.

**Isonzo** It. riv. which has its source at Monte Terglou in the Julian Alps and drains into the gulf of Trieste in the Adriatic. It is about 75 m. in length, is deep and rapid, and waters a rich alluvial plain in Friuli, including all Gradisca and Gorizia. In its upper course it unites with the Natisone. Its tribs., more mt. torrents, are the Idria, Torre, and Vipacco. At the tn. of Gorizia it is about 110 ft. above sea-level. It was the scene of the defeat of the barbarian king Odoacer by Theodoric in A.D. 493. In the First World War, being in what was then Austrian ter., it was early the objective of the Its., whose armies reached it in 1915, their aim being mainly directed to the achievement of their traditional irredentist dreams. But this was all they were destined to accomplish for some time, for in 1916 the Austrians weakened the It. hold on the I. valley by a determined advance in the Trentino. The Its., however, aided by Brusilov's drive on the E. Front (*see* BRUSILOV, ALEXEI ALEXIEVICH; RUSSIAN FRONT (FIRST WORLD WAR)) launched a strong counter-offensive along the riv. and, on Aug. 4, the first day of the move against Gorizia, carried the heights on the W. bank overlooking the tn., storming the summit of Monte San Michele and, after sev. more days' fighting, capturing all the heights W. of the riv. together with Gorizia. They were now appreciably nearer their goal of emancipating Trieste; but thereafter Cadorna, under whom these successes had been won, suffered his historic defeat at Caporetto (*see* CADORNA; CAPORETTO). No further fighting of decisive importance took place on the I., the issue being decided on the Piave.

**Iso-poda**, name of an order of Malacostracan crustaceans, characterised by a broad, flattened body, with no carapace, and by lamellar legs, whose inner rami serve as branchia, situated on the abdomen. They have many features in common with the Amphipoda, as, for instance, the sessile eyes and the firm, calcareous covering of the body, but the abdomen of I. is usually much shortened and the heart is situated posteriorly. Some of the larger species inhabit the bed of the sea, others are inhabitants of fresh waters, and many are parasitic on the bodies of fishes and crustaceans. I. are divided into two sections; under I. Genuina are grouped Oniscoidea, woodlice, the only terrestrial forms, Asellota, Phreatoicoidea, Valsifera, Flabellifera, and Epicaridea.

**Isoprene** or **Methyl-butadiene** ( $\text{CH}_3 \cdot \text{C}(\text{Me}) \cdot \text{CH} \cdot \text{CH}_2$ ), liquid which boils at 36–37° C. It is a member of the olefine series of hydrocarbons, and can be obtained by the distribution of caoutchouc or synthetically from isoamyl alcohol (which is present in fusel oil). I. has attracted much attention because it may readily be converted into substances resembling rubber, but synthetic rubber as hitherto made is generally inferior to, and more expensive than, the natural product.

**Isopyre**, greyish or black mineral, consisting of silicates of lime, iron, and alumina. It has a vitreous lustre like obsidian.

**Isoquinoline**, see **LEUCOL**.

**Isotelus**, name of a genus of trilobites found in the calcareous strata of the U.S.A.

**Isothermal Lines** (from *ἴσος*, equal, and *θερμός*, heat), also called **isotherm**, connect places on a map where the temp. on the earth's surface is the same at any given time at the sea-level. Isothermal charts afford a ready means of studying relative temperatures and may be drawn to indicate the average monthly, seasonal, or ann. temps. They show how temp. is affected by land and sea.

**Isotopes**. The word isotope was introduced by Soddy to embrace those instances where two or more individuals of different atomic weight occupied the same position in the Periodic Table. I. have identical atomic numbers (excess of protons over electrons in the nucleus—see **ATOM**), whilst the number and distribution of electrons outside each nucleus are the same. For practical purposes, their chemical and physical properties agree.

covery of I. of very general occurrence. The elementary gas to be examined is subjected to an electrical discharge (see **DISCHARGE TUBES**) under high vacuum, whereby some rays carrying positive charge result. These rays are allowed to pass through a slit in the cathode to an observation chamber beyond. The diaphragm *D* selects rays which have been deflected by the electrical field imposed by the oppositely charged plate *P'P'*, and they are then brought to a focus on the photographic plate *N* by the operation of a magnetic field introduced by the electro-magnet *M* (see Fig. below). A mass spectrum depending on mass alone is obtained at *N*. Each isotope gives a record of its presence, and its atomic mass can be found. Thus, chlorine contains two I. of atomic masses 35 and 37 mixed in such a ratio that the average atomic weight is 35.46. Tin has eleven I. The atomic masses of all I. examined are whole numbers (within one part in 1000) except

POSITIVE RAY SPECTROSCOPE

Though in the case of the isotopes of hydrogen, viz. hydrogen itself (atomic weight 1), deuterium (atomic weight 2), and tritium (atomic weight 3), the chemical and possibly physiological properties are noticeably different.

Ordinary lead (atomic weight 207.2; atomic number 82) is isotopic with radium G (atomic weight 206.05), a disintegration product of uranium; with radium D (atomic weight 210), a product of the disintegration of radium; and with thorium D (atomic weight 208). Richards obtained the value 206.08 for the atomic weight of lead associated with the mineral clevite, whilst Hönigschmid reported 207.9 for lead from thorite deposits. During radioactive changes (see **RADIO-ACTIVITY**) the effect of an element losing a  $\beta$  particle (an electron of negligible mass) is to shift it one place to the right in the Periodic Table, whilst the loss of an  $\alpha$  particle (identical with the helium nucleus of four protons and two electrons) shifts the element two places to the left. Thus if an element loses two  $\beta$  particles and one  $\alpha$  particle, a new element is formed occupying the same position in the Periodic Table (an isotope). Again, an atom of uranium (atomic weight 238) can lose eight  $\alpha$  particles and six  $\beta$  particles giving an element of atomic weight  $238 - 4 \times 8 = 206$ .

**The Positive Ray Spectroscopy** (Aston, 1919) has been invaluable for the dis-

covery of I. of very general occurrence. The elementary gas to be examined is subjected to an electrical discharge (see **DISCHARGE TUBES**) under high vacuum, whereby some rays carrying positive charge result. These rays are allowed to pass through a slit in the cathode to an observation chamber beyond. The diaphragm *D* selects rays which have been deflected by the electrical field imposed by the oppositely charged plate *P'P'*, and they are then brought to a focus on the photographic plate *N* by the operation of a magnetic field introduced by the electro-magnet *M* (see Fig. below). A mass spectrum depending on mass alone is obtained at *N*. Each isotope gives a record of its presence, and its atomic mass can be found. Thus, chlorine contains two I. of atomic masses 35 and 37 mixed in such a ratio that the average atomic weight is 35.46. Tin has eleven I. The atomic masses of all I. examined are whole numbers (within one part in 1000) except

**Separation of Isotopes**.—Chemical methods in general are unsuitable, but other methods such as distillation, evaporation, diffusion, effusion, and centrifugation have been more successful, in particular cases—e.g. uranium 238 and uranium 235—separation has been effected on a comparatively large scale.

Most elements have isotopic forms, and some (e.g. xenon, tin, and cadmium) have six.

**Isotropy** (*ἴσος*, like, *τροπή*, character), condition of having uniform characters throughout. The term is especially applied, in physics, in connection with substances or media in which elastic stresses are propagated uniformly in all directions. Such substances are termed **isotropic**, and the possession of the quality supposes that the molecular structure of the medium is homogeneous throughout its substance. Non-homogeneous media, on the other hand, are known as **anisotropic** or **heterotropic**. In crystallography, I. is a property possessed by certain crystals of the cubic system which have only one index of refraction for rays of the same wave-length. They have, therefore, no action on polarised light. I., in embryology, is applied by Pünger to that

condition where there are no predetermined axes

**Isoutriles, see** ISOCTYANDIA

**Isfahan**, or **Istahan**, tn and prov. of Iran (Persia). The prov. is bounded on the N by Kashan and Ilq, on the E by Yazd on the S by Fars and westward by the Bakhtiari dist and Aharistan. Its pop is over 500,000. Wheat, rice, cotton, opium, and tobacco are produced in plenty. The tn, once the cap of Persia, lies on the Zayandeh R., which is spanned by fine bridges connecting the city with its Armenian suburb Julia, the surrounding plain is covered with fertile gardens and orchards. The Chihil Sutun, or Hall of Forty Pillars, Hasht Behesht, the palace of Shah Abbas I and the Masjid-i Shah, or Royal Mosque are splendid remains of the days of its glory before the Afghans demolished it in 1722. Traders gather in crowds along the busy bazaar, but whole streets are now in utter desolation. Pop about 100,000.

**Ispirescu, Petre** (1830-87) Rumanian writer b at Bucharest the son of a barber. Acquired a printing estab and printed the records of the Rumanian Academy. In 1862, he began to write popular tales, and left as his literary legacy many books of folk tales and the reputation of being the best in his line in his native land.

**Israel** (God fights) name given to the patriarch Jacob on the occasion of the famous incident related in Gen. xxxii and the name also came to be given to the tribes of the Hebs. collectively and as a nation. In later days it will be seen the name was restricted to the N kingdom of I proper, while the S kingdom was known as Judah (see the following article). It is proposed in this article to deal with the hist. of the Hebs. from the time of the Patriarchs to the fall of the temple. (For their hist. since that date see Jews.) The accounts which the Hebs. themselves in later days gave of their origin are contained in the early books of the Bible, and these are largely based upon genuine tradition. But, as will be seen from the articles on the separate books, they underwent much editing in the course of years, always with a view to securing their greater conformity to a scheme and to increasing their didactic character. Moreover, they show a general tendency to imagine later conditions as present in primitive times. The ancestors of the Israelites were certain of the pastoral tribes having their abode in the wild tracts to the S and E of Palestine, of N Semitic (and probably of Aram.) stock. Their nearest kinsmen were Edom, Ammon, and Moab. About 2000 B.C. they migrated under their tribal chief, Abraham, from Haran in Mesopotamia into the land of Canaan. Here the tribes continued to lead a pastoral life and ultimately, in the time of Jacob, a famine in the land of Canaan led to a fresh migration into Egypt. In the Biblical narrative the whole twelve tribes are mentioned as taking part in this migration, but it is important to notice that the movement is

especially associated with the name of Joseph, that is to say, the ancestor of the chief of the N tribes which formed I proper. Here they obtained leave from Pharaoh to dwell in the land of Goshen, where their continued adherence to their own customs and pastoral life led them to be accounted barbarians by the cultured Egyptians. In Egypt they were subjected to repressive measures, induced by a fear lest they should ally themselves with Egypt's foes. Then there arose the figure of Moses, the great founder of both the religion and the law of I. Moses was the son in law of a priest of Midian, and at Horeb / Sinai, the mt. of God he heard the call of Yahweh (Jehovah), his father's God to deliver I from the bondage of Egypt. He had much difficulty in rousing the enthusiasm of those he was sent to save, but ultimately the work was accomplished by means of the miracle wrought by Yahweh on behalf of his people. Moses led the Israelites to Mount Sinai, and here a covenant was solemnly made with Yahweh and the new religion of I was inaugurated based upon a conception of the Deity more spiritual than any which had yet been conceived. From Sinai they passed to the work of conquering Canaan for which they had set out. An attempt made at Kadesh on the S frontier was unsuccessful and they returned to the wilderness for a time which according to the Biblical narrative made the whole period forty years. During this time Moses died and it was under Joshua that the entry into Palestine was finally made. Details of this are given in the Book of Joshua.

The Israelites now settled down to an agr. and commercial life entering in many cases into treaties of friendship with their Canaanite neighbours. This weakened the bonds of union between the various tribes and might well have led to the ultimate fusion of the races. This was prevented by the rise from time to time of the *shofetim*, or Judges, who roused the dynamism of the tribes. Fifteen such hebs. are named in the Book of Judges. After Joshua comes a long period of falling away marked by the occasional rise of a deliverer. Among the rest of the Judges the most famous are Deborah, the prophetess, and Barak, Gideon, Jephtah, Samson and the prophet Samuel. During this period I does not come at all into contact with the great kingdoms of the East, and their conflicts were rather with their own kinsmen, the Moabites, Ammonites and also the Philistines. The Philistines were among the most powerful opponents of I, and it was while suffering under defeat from this race that the Jews cited for a king, not only that by this centralisation of authority more highway might be made against the invaders, but also that they might be like all the other nations. Samuel the prophet, who was at that time their leader, reluctantly consented to accede to their desires and chose as their king Saul, the son of Kish.

*From the foundation of the Monarchy (c. 1020 B.C.) to the exile—Saul soon*

proved his fitness for the new position which had been given to him by brilliant successes first by the raising of the siege of Jabesh Gilead, after which he was solemnly proclaimed king at Hebron, and then by a decisive victory over the Philistines at Micmash. Here the victory was due chiefly to the bravery of Saul's son Jonathan and six hundred Benjamites, who accompanied Saul who was a member of their tribe. Saul was himself a great warrior, and his next campaign was against the Amalekites, who had long been troubling Judah. He was, however, given to fits of madness, and to quiet him in these, David, the son of Jesse the Bethlehemite, a cunning player on the harp, was brought in to play to him. His presence, however, had a bad effect on Saul, and this was increased by David's rapid rise in popularity. His courage and success in war had led Saul to make him his armour bearer, and his intimate friendship with Jonathan, the king's son, rendered his position such as to cause Saul's jealousy. Moreover, he was the king's son-in-law. Hence Saul decided to slay David, who in consequence became an outlaw, ultimately having his centre of operations at Ziklag. He resolutely refused to enter into operations with I and events were so shaping themselves that it was possible for him to return in power on Saul's death. This occurred at Mount Gilboa, and David, on hearing of it, immediately went up to Hebron with his followers, and was anointed king of Judah. Meanwhile Abner Saul's leading general, had taken Saul's son Ishbosheth to Mahanaim and there had him crowned as king of I. War in consequence broke out between I and Judah, in which the S. kingdom was steadily victorious. On the death of Abner and Ishbosheth, the crown of I was offered to David, who immediately took up the work of uniting the two dynasties. He transferred his cap to Jebus (Jerusalem), the great hill fortress of the Jebusites, whose position had hitherto constituted them a barrier between N. and S., and thence he brought the ark. But the Philistines, though they had acquiesced in David's sovereignty of Judah, could not acquiesce in this extension of his power, and war resulted. In a succession of violent conflicts David secured the freedom of his kingdom and pushed it boundaries in the N. to Dan, S. to Beersheba, and W. to the Philistian frontier. The I. boundary was continually changing. David's great work, however, was in the consolidation of the kingdom, and his internal administration. To him the idea of the national sanctuary at Jerusalem soon to become the Temple owed its inception. His high poetic and religious faculty is attested by his psalms and by those of the school named from him. The crown passed from David to his son, Solomon, whose name is associated by tradition with power, wisdom, and wealth.

Now for the first time, I took a prominent place among the great nations of the E., though it is probable that it was in some degree subject to Pharaoh, whose

daughter Solomon had espoused. Commercial treaties were entered into with such neighbouring monarchs as Hiram of Tyre, in union with whom ships were sent as far as Tarshish (Spain) and Ophir (S. Arabia?). Solomon now led the life of the ordinary F. despot. His court was more splendid than any other of which we read in the hist. of I., but such magnificence could be sustained only by a heavy taxation. Matters reached a crisis on the death of Solomon (930 B.C.). A denutation headed by Jeroboam, which came to Solomon's son Rehoboam, to ask relief from the burdens which his father had laid upon the country. There were two courses open to him: acquiescence in his people's demands, or an attempt to intimidate them. He chose the latter, and the immediate result was a revolt of the tribes of Israel under Jeroboam, the son of Nebat. Judah and Benjamin alone were left to Rehoboam, while I., for the name is henceforth reserved to the N. kingdom, made Jeroboam its king.

At this point it will be well to make a short digression, and to consider the main points in the religious condition of the Hebrs. The anc. Hebrs. had no conception of Yahweh (Jehovah, *q. v.*) as the God of the whole earth. He was regarded rather as the God of their own particular nation, though not as the only God who might be worshipped. This latter consideration explains the frequency of the falling away of the Jews from Jehovah, which would be inexplicable on the hypothesis that they recognised Him as the one God. But the Israelitish conception of the Deity advanced rapidly, and as a result their moral ideal was far higher than that of the surrounding nations. The advance continued during the period of the Judges, though as we have seen, relapses into foreign cults were frequent. In this period the functions of the prophets, such as Deborah, was to bring back the people to the conception of Yahweh as the God of their nation, to prevent in fact, the religion of Yahweh being entirely overcome by heathen cults. The institution of the monarchy heralded a great change. David brought his royal sanctuary at Jerusalem to pre-eminence, and the next reign saw the erection of the Temple. Its purpose was that here, at certain ann. festivals, the whole people might gather for a national feast. Though later tradition attributes to Moses as its customary the institution of a priestly succession in the line of Aaron, the institution of the hierarchy, in point of fact, post-exilic sacrifices were offered by the head of the nation, clan, or family, or by a prophet. When Jeroboam instituted a new kingdom, therefore, one of his first acts was to prevent the Israelites from going up to keep the ann. festival at the Temple. He did this by instituting or reviving sanctuaries at Bethel (and Dan?), where he set up golden calves as symbols of Yahweh, and instituted a new priesthood. His sin, it would seem, lay not in neglecting the service of the Temple, but in the retrograde step towards idolatry shown by the erection of the golden

calves. The great period of the prophets was the eighth century B.C., to which belong many of the greatest of the Messianic prophecies, such as those in Amos ix. 11, Hosea iii. 5, and those in the earlier half of Isaiah. The high spiritual feeling of the age is also well shown in the Book of Deuteronomy, from which Our Lord quoted the two commandments on which hang all the Law and the Prophets. The idea of Yahweh as the judge and ruler of the whole world was now generally accepted, and a still greater development is seen in the emphasis laid upon the moral responsibility of the individual by such a prophet as Jeremiah.

To return now to the political development. During the two centuries that elapsed between the death of Solomon and the conquest of I. by Shalmanezzer, king of Assyria, nineteen kings reigned in the kingdom. These nineteen kings may be regarded as covering four periods. The first period (930-890 B.C.) is occupied in attempts to establish a dynasty and in wars with Judah. It ended in civil strife, from which ultimately emerges the new dynasty of Omri, which gives us the second period from 890-843. Its kings, after Omri himself, were Ahab, Ahaziah, and Jehoram. The reverses which Omri suffered at the hands of the Syrians were made up for by Ahab. This king was a great statesman, though the injury his idolatry did to I. is well shown in the Biblical narrative. He formed an alliance with Jehoshaphat, king of Judah, the alliance being cemented by the marriage of Jehoshaphat's son, Jehoram, to Athaliah, daughter of Ahab. The two nations then took united action against the Syrians, with whom, after the defeat of Benhadad II., a treaty was formed. Ahab died in battle at Ramoth Gilead, and in the reign of Jehoram an attempt was made in union with Ahaziah, king of Judah, to retake this town. Now occurred the rebellion of Jehu ben Nimshi, in which Jehoram and Ahaziah both perished. Jehu founded his dynasty (which forms the third period, 843-740) in a sea of blood. Down to the time of Jehu, the sovereignty of Judah had remained in the possession of the house of David (six kings), but on the death of Ahaziah an attempt was made by Athaliah to exterminate this dynasty. Joash, however, escaped, and after six years was proclaimed king by Jehoiada, the chief priest. Athaliah was slain and the Davidic dynasty restored. A fresh attack now came from Hazael, king of Syria, who was bought off by Joash. There now succeeded for Judah a time of comparative prosperity and quiet. Matters changed with the accession of Tiglath-Pileser III. to the throne of Assyria in 745 B.C. At this time a general confederacy of Syrian states against Assyria was being promoted, but Ahaz, king of Judah, refused to join it. He rolled instead, in opposition to the prophet Isaiah, upon friendship with Assyria. Hence the Syrians and Israelites opened a campaign against him, in which they then were joined by the Edomites. Tiglath-Pileser entered N. Israel in support of Ahaz, and

deported into Assyria the leading inhab. of Galilee and the dist. around. He also extinguished the Syrian monarchy, and set up Hoshea as vassal king in I. For some years Hoshea remained submissive, but he was then persuaded to revolt by So, king of Egypt. Hence Shalmanezzer IV. marched against him, and for three years besieged him in Samaria. The city was eventually taken by Sargon (722 B.C.), and the chief inhabitants of I. to the number of 27,290 were taken into Mesopotamia and Media. They were replaced by Assyrian colonists, and these, intermixing with the inhab. of the country, formed the mixed race known as Samaritans. The kingdom of Judah had, after all, survived its more powerful neighbour. Here Ahaz was still king, but he was succeeded a few years later by his son, Hezekiah, who attempted a reform in the religion of the country, which had been much debased under the preceding kings. He inaugurated a campaign against local sanctuaries and strove to restrict worship to the Temple. In this he was assisted by Isaiah. Judah was still subject to Assyria, and Hezekiah's friendship with Egypt brought him into danger of punishment from Sennacherib. An Assyrian army was, indeed, approaching Jerusalem when it was arrested by a plague. Egypt was, moreover, prepared to support Hezekiah, and so Sennacherib retired. On the death of Hezekiah the succeeding princes encouraged the heathen cults in their worst forms, but another and greater reform came on the accession of Josiah (621 B.C.), connected especially with the finding of the book of the law (see DEUTERONOMY) by Hilkiah the priest. Meanwhile the Assyrian empire was breaking up, and Judah came into collision with Pharaoh Necho II., who was desirous of pushing the interests of Egypt. In conflict with him Josiah fell at Megiddo (608), while Jehoahaz, his younger son and heir to the throne, was carried into Egypt while Necho set Josiah's eldest son, Jehoiakim, on the throne of Judah. In 605 Egypt became subject to Babylon, and Judah became subject to Nebuchadnezzar II. before 600 B.C. In 598 an attempt to regain his independence was made by Jehoiakim, and Jerusalem was besieged. Jehoiakim, the boy-king who had succeeded his father, was taken prisoner, and in the following year (597), from which Ezekiel reckons the years of the captivity, the greatest and noblest of the Jews were deported to Babylon, while Zedekiah was appointed king over those that remained. In 586 a fresh revolt led to the sack of Jerusalem by Nebuchadnezzar and fresh deportations. There was still no peace, however, for Gedaliah, the Babylonian governor left in charge, was assassinated but the remnants of the Jews fled into Egypt, taking with them the prophet Jeremiah.

*From the Exile to the Revolt of the Maccabees.*—The exile was a distinctly providential step in the development of the Jewish religion. Now, indeed, the true idea of the Messiah first clearly appears in such writers as Deutero-Isaiah, generally allotted to this period. The synagogue

was now instituted and the general conception of the after-life was developed under Persian influences (see HELL). But although those Jews whose minds were fixed chiefly on commerce found themselves better off in Babylon than in their own country, the idea of absence from the Temple was intolerable to the religious. Hence it was not long before attempts were made to secure a return to Jerusalem. Nothing more is known of the hist. of the return from exile until the reign of Artaxerxes Longimanus (162-125), when a band of some six thousand exiles, under the leadership of Ezra the scribe, arrived in Jerusalem. In 116 the city of Jerusalem was re-fortified, and the Temple worship re-instituted. To this period belongs the final split between the Jews and the Samaritans, made by the establishment by the latter of a rival sanctuary on Mt. Gerizim. Palestine was affected by Alexander the Great's march through the E., and, on the defeat of the Persians at Issus in 333, it became subject to Gr. rulers. A large number of Jews were deported to form part of the pop. of Alexandria. On the subdivision of the kingdom on Alexander's death, Palestine fell to the lot of the Ptolemies, for whom still larger numbers of Jews passed into N. Africa. The lot of Palestine was, on the whole, fortunate until the reign of Ptolemy Philopater, when the Jews were much oppressed. After the defeat of the Egyptians, Antiochus III. incorporated Palestine with the dominions of the Seleucidie (197). A deliberate attempt was made under the next sovereign, Antiochus Epiphanes, to stamp out the Jewish religion. Its peculiar rites, such as circumcision and the observances of the Sabbath, were strictly forbidden, while the Temple was dedicated to Zeus, and sacrifices offered there. Thousands suffered death rather than give way to such coercion, but ultimately a deliverer arose, who inaugurated one of the greatest and most heroic periods in Jewish hist.

*From the Maccabees to the Destruction of the Temple.*—Hitherto the resistance of the Jews had been mainly passive. Active resistance came from the family of Mattathias, an aged priest of the vil. of Modein. He slew a Jew who was offering sacrifice to heathen deities, and slew also the Syrian officer who was supervising. Then, taking with him his five sons, he fled eastward, and gathered round him in the wilderness a great company who would with him take aggressive measures, fighting if need be, even upon the Sabbath itself. The act was a desperate one, and a measure of success was rendered possible only by the internecine struggle for the throne which distracted the Syrians themselves. Mattathias, who was an old man when he commenced the revolt, soon died, handing on the leadership to his son Judas, surnamed *Maccabeus*, 'the hammerer,' from which his whole family has received the name of 'the Maccabees.' Judas was a great warrior and a fervent believer in his cause. He defeated Apollonius, a prominent Syrian general, and finally, Lysias, the viceroy himself, at Beth-zur. Being now master of the country around the cap.

Judas decided to make Jerusalem the centre of his operations, and hence the Temple was fortified and re-dedicated. After being besieged in the Temple by the Syrians, in 162 B.C., permission was granted them to exercise their religion freely. But the Maccabees resolved to continue the struggle for political freedom. The secular struggle was to be less successful than the religious. It began well, with the defeat and death of Nicanor near Beth-horon, but this was almost immediately followed by an overwhelming victory for the Syrians at Elasa, in which Judas himself was slain. The leadership of the party, which was now scattered far and wide, fell to Jonathan, the brother of Judas who was able by skilful diplomacy to secure peace on favourable terms, ultimately being himself made high-priest in 153. In 143 Jonathan was slain in the quarrels for the throne of the Seleucidie, and Simon, his brother, became leader of the Maccabean party. He fortunately espoused the cause of Demetrius II., from whom he secured a recognition of Palestine's independence (142). So famous a year was this that it was considered the beginning of a new Jewish era, and from it dates were counted and coins were dated. Simon, who was made high-priest in 141, was a wise and prudent ruler, and under him the country enjoyed comparative quiet, and in the one important conflict, that with Antiochus Sidetes, Simon was victorious. But there was still much scheming and party strife. Ptolemy, Simon's son-in-law, was striving to secure the supremacy and as a step to this Simon was assassinated. But the crime gained Ptolemy nothing, for the power fell into the hands of Simon's ambitious third son, John Hyrcanus, who assumed the high-priesthood in 131 B.C., and with it the sovereignty. The reign of John Hyrcanus was outwardly most prosperous, though at the beginning he was hard pressed by Antiochus. Later in his reign (131-104) he extended the Jewish dominions considerably in all directions. The Samaritans were reduced and the 'Temple' on Mt. Gerizim was destroyed. He further subdued the Galileans and Idumeans. During his reign, however, there is visible the rise into political prominence of the Pharisees and Sadducees. John was led to throw in his lot with the latter of these on account of that opposition of the Pharisees to his family which was to continue throughout the period of the Hasmonean dynasty. On his death, his son, Aristobulus I., succeeded to the throne by the murder of his brother, and reigned but one year, during which he reduced the Itureans. He was followed by Alexander Jannaeus, a warrior prince who almost entirely neglected his sacerdotal position, his chief aim being the extension of his ters. He met his death (76 B.C.) in a campaign against the Arabians.

After him, the high priesthood fell to Hyrcanus, Alexander's oldest son, but all power remained in the hands of his mother Alexandra, who accorded a much greater share in public affairs to the Pharisees. But Hyrcanus's younger brother, the

energetic Aristobulus II., angry at his exclusion from a share in the gov., raised an army and deposed Hyrcanus. Then, as the supporter of Hyrcanus, there arose Antipater the Idumean. This man induced Hyrcanus to place himself under the protection of Arcas, king of the Nabataeans, by whose aid Aristobulus was defeated. The Romans now took a hand in the struggle, and Pompey, in 65 B.C., sent his legate, Scourus, to settle matters, which he did in favour of Aristobulus. This decision was reversed two years later by Pompey himself. Hyrcanus was made high-priest, but the gov. of Judaea was attached to the Roman prov. of Syria. In 57 an attempt was made to set Alexander, the eldest son of Aristobulus, on the throne. Alexander was taken prisoner by Gabinius, governor of Syria, and in order to break up what unity remained among the Jews the land was divided into five administrative dists. Aristobulus, who had been taken by Pompey to Rome, now escaped and raised a second ineffectual revolt in 56, and this was followed in 55 by a last attempt under Alexander, which was put down by Gabinius. On the death of Pompey, however, Hyrcanus made his submission to Caesar. Antipater the Idumean then secured for himself the post of procurator of Judaea (17 B.C.), while to Hyrcanus was left only the high-priesthood. Thus ended the Hasmonean dynasty. Antipater also succeeded in making his eldest son, Phasael, governor of Jerusalem, and his other son, Herod, governor of Galilee. But the patriotic Jews viewed with horror this estab. of an Idumean dynasty, and set up Aristobulus's last remaining son, Antigonus, as his rival. Antipater was poisoned and Phasael committed suicide in prison, but Herod invoked the aid of the Romans, and in 37 secured Jerusalem. Antigonus was put to death in the same year. Herod carried on the difficult task of ruling Judaea by the aid of the Romans, and with the utmost cruelty. On his death the kingdom was divided into tetrarchies, ruled respectively by his sons Antipas, Philip, and Archelaus, the last-named ruling Judaea and Samaria. His rule, however, was so cruel and despotic that in the year A.D. 6 Augustus deprived him of his power and sent him into exile. His tetrarchy was then attached to the province of Syria. Henceforward, except for the brief period from A.D. 11 to 13, Judaea was under Roman procurators. During these few years it was ruled by Herod Agrippa, whose favour with Claudius secured to him all the territories over which his grandfather had ruled. On his death there was a period of dreadful anarchy and internecine strife between the inhabs. of Palestine, which was increased rather than lessened by the actions of the procurators, many of whom were in league with the worst elements of the pop. From the chaos there rose a fanatical party known as Zealots or Sicarii (Assassins). These rose in revolt in the year 70, and a bloody struggle ensued, terminated only by that bloodiest of all scenes, the destruction of Jerusalem by Titus (A.D. 70). See also HEBREWS.

**Israel**, a secular Zionist State in Palestine, the precise boundaries of which remain to be settled. (For the hist. of the anc. Heb. nation, see preceding article.) The state is the ultimate development of the institution, after the First World War, of a national home for the Jews in Palestine through the mandate granted by the Allied and Associated Powers to Great Britain. The General Assembly of the United Nations in Nov. 1947 approved the partition of Palestine into Jewish and Arab independent states by a majority vote, and a United Nations Commission was entrusted with the duty of partitioning the country (see further under PALESTINE). The state of I. came into existence on May 16, 1948, on the day following the termination of the Brit. mandate, in confirmation of the proclamation by the Jewish National Council at Tel Aviv of a new Jewish state with the Council as its provisional gov. President Truman's recognition of the state followed soon afterwards, and before long his lead was followed by more than thirty other members of the United Nations. On May 11 the State of I. was admitted as the fifty-ninth member of the United Nations by a plenary session of the General Assembly which by 37 votes to 12, with nine abstentions, endorsed the favourable recommendations of the Security Council.

The United Nations' partition scheme divided Palestine into no fewer than eight segments; but the achievement of the precise application of this scheme was still baffling the power of the United Nations in 1949. Meanwhile by force of arms the Jews had infiltrated everywhere excepting the Jerusalem-Tulkarm-Jenin triangle and the areas held by them included all Galilee and, in the S., almost all the Negeb. They had also secured Haifa as a reinforcement base; Jaffa had become a Jewish tn.; so also Nazareth and Beersheba; while the E. Negeb was occupied by Jewish forces down to the gulf of Akaba. Moreover, though the United Nations' scheme of partition (which I. had accepted) included the new Jewish Jerusalem in a special International Zone, Dr. Chaim Weizmann, the first Israeli president, declared that it was inconceivable that the city should be placed under 'foreign' rule. Furthermore Jewish

propaganda was already envisaging Jewish settlement eastwards into Trans-Jordan. The net result to the Arabs of the Jewish military successes was that the number of their refugees reached the appalling total of 600,000 including the pop. of Jaffa, Acre, and Nazareth, who fled in panic after details became public of the massacre by Irgun Zwi Leumi and the Stern Gang of the inhab. of Deir Yasin, an Arab vil. near Jerusalem, and the number was further augmented by the forcible eviction of the Arab inhab. of Arab vills. by victorious Jewish troops in order to make room for Zionist immigrants.

Within the Jewish-held areas of Palestine the Israeli gov. put into force the plans which the Jewish Agency had worked out in readiness for the termination of the Brit. mandate and by early 1949 the Tel Aviv Gov. had an organised administration. Jewish courts were functioning; there were Jewish depts. for war, finance, foreign affairs, posts, telegraphs and telephones, railways, public works, education, police, immigration, and antiquities; there were two wireless stations—Kol Israel and Kol Hierushalayim (the Voice of Israel and Jerusalem); the full H. press appeared, as well as the Eng. *Palestine Post* in Jerusalem and an Arabic daily newspaper *El Yom* (the Day) was printed and ed. by Jews in Jaffa. The State of I. took over three para-military unofficial organisations: el Haganah, a large well-equipped force; the Irgun Zwi Leumi, a smaller body organised on commando lines; and the Stern Gang, a gangster formation specially trained for murder (it was finally proscribed by the Israeli authorities). In addition, since the mandate ended a large number of men specially trained in Hungary and elsewhere in E. Europe were brought to Palestine and absorbed into the Jewish army. The total Jewish fighting strength was unknown but was estimated at 100,000 men and women. They were much better equipped and armed than the Arabs and much of their material came from Czechoslovakia. It may be noted here the difficult questions of nationality may arise in W. countries which have accepted the Balfour Declaration (q.v.) and have recognised or will recognise the State of Israel. But no Middle E. country ever accepted the Balfour Declaration and none had recognised the Israeli State before late in 1949. Hence the status of the Jewish communities in the various Arab countries remains to be settled. In Iraq there are 73,000 Jews; in Egypt, 63,000; in Syria, 30,000; and in Libya 30,000. Now that there is Israeli nationality, these Middle E. Jews have become foreigners; the decision whether they will be naturalised or asked to leave rests with the Arab Govs.

I. is a pioneer country, but differs from other pioneer countries in the fact that the cap. required for the absorption of the new immigrants into its economic life has been supplied not from foreign loans, but from the immigrants' own assets and from the donations of world Jewry. Thus I. has hardly any foreign indebtedness and

has a credit balance of cap. The rate of economic progress in I. will doubtless continue to be determined by immigration and cap. importation, and everything seems to indicate that after the return to normal political conditions Jewish private cap. will be invested in I. on a large scale. Jewish industry in I. was a creation of the immigration from Central Europe which began about 1933 and made great advances during the Second World War. Thus the diamond industry began during the war and great quantities of cut stones were exported to the United States. The chief articles of industrial export, besides polished diamonds, are Dead Sea chemicals, petroleum products, artificial teeth, and soap. The export industry of citrus concentrates is steadily growing. Olives, mostly cultivated in the hill areas, form the next most important crop. Vegetables are grown extensively, and also grapes and figs. Of great importance to the development of Jewish industry are the labours of the Weizmann Research Institute carried on under the direction of Dr. Chaim Weizmann and Dr. David Bergmann. Much development has been achieved by the Jews in Palestine. The modern vills. in the desert, the drained marshes and reclaimed dunes, the schools, hospitals, factories, and social services are all evidence of their practical activities. The Jews in Palestine have remained untouched by the native mode of life; they have not learnt from the Arabs how to build houses that are cool, spacious, and cheap—this conservatism being the result of the immigrants having come from the Diaspora, from the ghettos and suburbs and displaced persons' (q.v.) camps of the world and having brought with them scraps of alien civilisation picked up in transit. Life in I.'s cap. has an amorphous quality that gives the impression of being the huge Jewish suburb of a non-existent city.

The Socialist parties in I., with their materialist and anti-clerical doctrine, occupy all political and economic key positions. Yet life in I. is (1949) nevertheless under the sway of clericalism as in no other country of the world—a paradox in view of the fact that the orthodox religious element represents only about 13 per cent of the pop. I. has a univ. on Mount Scopus in Jerusalem, but no medical faculty there mainly because dissecting bodies is against Mosiac law. The dominant political party is the Labour party (*Mapai*), which commands about one-third of the total votes and can rule only by coalition—either with the United Workers' party on the extreme Left or with the Revisionists and other Right wing groups, and it is said that if it wishes to rule independently of the extreme Right and Left it must make concessions to the clergy. The paradox here in present day I. is that of a Socialist country under clerical sway, which may be explained by the gap in its hist. and the fact that its heroes are still the Prophets and its only classic the Bible. But while this state of things may last for some years the young native generation,

which is already playing a dominant part in the Israeli army, has no memory of ghettos, is developing a native folklore and national tradition of its own, and may well carry out a bloodless secular div. between Church and State.

A common language of the immigrants of recent decades was a practical necessity, and the choice of Heb. followed naturally. The movement to revive Heb. began in

a continuation of W. thought, art, and values, or on a vincer of Levantinism.

The Knesset, the name for the Israeli constituent and legislative assembly, met for the first time on March 8, 1949, in its permanent home in Tel Aviv. Immigration and development figured largely in the gov.'s programme, it being proposed to launch at once a four-year development and absorption plan to double the pop. in

Odhams Press Ltd.

#### ISRAEL: YOUNG JEWS MARCH TO WORK ON A NEW SETTLEMENT

The Hebrew inscription on the makeshift ceremonial arch reads (translated): 'Be this village a nest of securities (safety) to us, to our sons (children), and to all the refugees of (the people of) Israel'

Palestine in the 1880's; by the end of the First World War it became, with Arabic and Eng., the official language of the country. Biblical Heb. is the language of the gov. and parliament, of schools and courts, of press and radio. But it is not a dead language, and was not so even before Zionism (though that movement gave it a new vitality) having been a *lingua franca* for Jewish scholars all over the world. Its future in I. is assured. (See also *HEBREW: The rebirth of the Hebrew tongue through Zionism.*) At present the whole educational system is based on developing out of its anct. roots a specifically Heb. culture rather than on

that period by mass immigration. But concern for I.'s economic condition came upon the heels of this optimistic proposal. Through unlimited immigration that condition was rapidly becoming more dangerous than were the advancing Arab armies in the previous year and this concern at length crystallised into the sombre realisation that I. could not depend indefinitely on the generosity of world Jewry or foreign loans, and that only by her own efforts would I. survive as a sovereign State. In the year ending about April 25, 1949, more than 210,000 Jews entered the country and over 100,000 of these arrived in the four months of 1949. Although

more than 150,000 had been housed 53,000 were then (April 26) still in reception camps and suffering from great overcrowding, while thousands of immigrants who had houses were without work. In these circumstances the gov. announced plans for an austerity plan based on the Brit. model, including a rationing system with a dietetic standard, control of imports and home production, fixing of maximum prices for essential articles and heavy surcharges on unessential goods and restriction of luxuries to export needs.

It was realised that a vital factor in the development of I. was the Negeb, the desert wilderness in S. Palestine reaching to the Sinai and the Suez Canal. The basis of the 1919 four-year plan was the irrigation of this area to provide home-steads for the flood of immigrants. Political considerations complicate the situation, apart from the possibility of oil-discoveries. Its proximity to the Suez Canal must make the area a matter of concern for Britain, and in some quarters communal settlements are confused with communism, and regarded as a danger in view of the condition of the Arab States. Large-scale development, moreover, requires the water of the Jordan, and this in its turn depends upon a firm understanding between I. and Transjordan.

It is clear that I. will continue to regard itself as a member of the W. nations. The attitude of Britain, and the activities of the Arab Legion, in a large measure destroyed the pro-British feeling which was once latent, but the U.S.A. has undertaken the rôle of protector. Dollars from America formed (in 1919) a vital part of I.'s economy, this causing a move to the right in internal politics.

The behaviour of the I. Gov. towards its Arab minority of about 120,000 has been characterised by moderation and a desire to weld them into the community. Freedom of the press and religion was established, and Arab workers grouped into trade unions affiliated to the central Trade Union Council (Histadruth). Education and the vote were secured for women: Arabic as well as Hebrew is compulsory in State schools.

The estimated Jewish pop. of Palestine at the end of 1916 was 608,000. Jews formed the whole pop. of Tel Aviv (183,200) also of Petah-Tiqva (18,000) and Rehovot (10,200), and there were 71,000 Jews in Haifa and 31,000 in Jaffa.

See Musa Alami, *The Lesson of Palestine* (Beirut) 1919.

**Israelis, Josef** (1821-1911), Dutch painter, was of Jewish parentage. For two years he worked in Paris under Picot, and soon afterwards he settled down at The Hague, where he made his home for life. It was during a convalescence passed in the fishing-in. of Zandvoort that the poignancy of the poor's suffering and the tragedy of life were first vividly revealed to him; henceforth his pictures 'were painted with gloom and suffering,' and became the most sensitive and artistic expression of his well of intense compassion for the distressed and weary of mankind. I. has truly been called the Dutch Millet,

although he emphasised the shadow rather than the light. Among his masterpieces are: 'The Zandvoort Fisherman,' 'Village Poor,' 'Shipwrecked,' 'Cradle,' 'When We grow Old,' 'The Widower,' 'The Bric-à-brac Seller,' and 'Between the Fields and the Seashore.' I. is one of the first of modern painters. Pub.: *Spain, a painter's account of a journey in that country*, trans. by Alexander Teixeira de Mattos.

**Israfil, or Israfeel**, angel of music, who, according to the Mohammedan belief, will sound the last trump from the Temple rock at Jerusalem, calling men to judgment.

**Issik-kul, or Issikul** (*Kirghiz*, warm water) (1) lake in Russian Central Asia, in the I. Region of the Kirghiz S.S.R., is 5000 ft. above sea-level, and covers an area of 2300 sq. m. It is fed by many streams, but the surface is becoming smaller. The water is salt, and contains a large quantity of fish. On the S. shore stands the tn. of Przhewalsk (Karakul).

**Issoire, tn.** in France, in the dept. of Puy-de-Dôme, near the confluence of the Conze and Allier. It was captured by the Protestants and destroyed by the Catholics during the religious wars of 1574-77. It has manufs. of cotton goods and machinery. There is an interesting Romanesque Church of St. Paul. Pop. 6100.

**Issoudun, tn.** in the dept. of Indre, France, on the Théols, 17 m. N.E. of Chateauroux, is the cap. of an arron. It has copper foundries, manufs. of parchment, cloths, and agric. implements, and quarries of lithographic stone. Pop. 12,600.

**Issue:** (1) In law, off-spring or lineal descendants of any degree. In Eng. law the term is peculiarly appropriate to the descent (see INHERITANCE) or grant (*q.v.*) of real property, whether by deed or will. Before the Wills Act, 1837, a devise (*i.e.* grant by will) 'to A and his heirs, but if A die without issue, then to B and his heirs,' was construed to mean that A's estate (*q.v.*) should descend to A's issue in tail (see ENTAIL), *i.e.* as long as I. remained, when the gift went over to B and his heirs. But the Wills Act expressly enacts that the word 'die without issue' should be construed to mean die without I. living at the death (*i.e.* of A in the above example) and not an indefinite failure of I. The Settled Land Act, 1882, made a further change, the effect of which is that as to testators dying after 1882, any child of A who has attained twenty-one is free to retain or sell the land at his pleasure.

(2) In the language of pleading means some definite proposition of law or fact asserted by one party and denied or contested and avoided (see CONFESSION AND AVOIDANCE) by the other; conclusively settling forth the points on which both parties desire the verdict of a jury or the judgment of a court. To 'join issue' means in effect to deny or traverse a proposition in the other party's pleading, upon which joinder no further pleading is necessary. Where the parties are agreed as to the questions of fact to be decided between

them, they may, before judgment by mutual consent, obtain an order from a master to go to trial upon such questions without formal pleadings, the question being stated in what is technically termed an issue. The meaning of *I* in Scots pleadings is not dissimilar.

**Issus** (modern *Aïssa*), in Cilicia, near where that proud adorns Syria. Here Alexander the Great inflicted a crushing defeat on a huge host (500,000) of Persians under Darius their king. Vast treasure and the royal family fell into the conqueror's hands.

**Issy**, in the dept. of the Seine. France, 3 m. S.W. of Paris, forms part of the S.W. defences of Paris. It contains a school, Saint Sulpice, formerly the residence of Margaret of Valois. It manufactures silk and waxcloth and has distilleries and chemical works. Pop. 20,087.

**Istakhr**, ancient city of Persia, which was an extension of Persepolis, destroyed by Alexander the Great in 330 B.C.

**Istanbul** (formerly Constantinople), ancient *Κωνσταντινούπολις*, the city of (Constantine), until Oct. 13, 1923 cap. of Turkey, when it was superseded by Ankara (Ankara). The city stands on a hilly promontory of triangular shape having the Sea of Marmora and the Bosphorus on the S and E, and on the N the Golden Horn, an arm of the Bosphorus. It is thus surrounded by water on all sides but the W, where a strong wall shuts the city off from the mainland. Like Rome, *I* is a city built on seven hills, six of them being separated portions of one long ridge. As in the case of all great cities, *I* has spread far beyond its original bounds, and may be said to include two originally quite separate from itself. The name *I* is generally reserved for the part built on the promontory above described, and the suburbs are considered separately. These are: to the N. of the Golden Horn, Galata and Pera with *Lepliane*, to the E. of the Bosphorus in *Via Scutari* and *Hadikof*. Galata, of which the chief ornament is a lighthouse, is a great shipping mercantile, and banking centre, and was not united to *I* until 1153. Pera is the European residential quarter. *Lepliane* is of was important for the union founded from which it derives its name. *Scutari* (770) is an important commercial and industrial centre. The city of *I* is excellently situated, more advantageously perhaps than any European city but Naples. From the outside its appearance is most picturesque and imposing. At the taking of *I* most of the churches were destroyed and mosques were erected in the most prominent situation. Cupolas and minarets, with graceful curves and soaring spires combine with lofty cypresses to give the city an air of unique grace and to invest it with the mysterious glamour of the oriental world. Within, however, the appearance is not so pleasing. The streets form a labyrinth of dirty crooked and ill paved alleys, while most of the houses are low and are built of wood or rough stone. During the last seventy years the aspect of things has become much more European. The streets, under

W influence, have been widened and improved lighting at night is common, and a European style of building has been introduced. Cabs and electric trains are to be seen in most parts, while the old camel service has entirely disappeared. The dress of the people has changed in the same direction. The streets are generally dull in appearance, almost all animation being concentrated in the bazaars.

Almost all the important architectural and antiquarian monuments of *I* are to be found in the city proper. First and foremost among these comes the church of St. Sophia (*Αγία Σοφία*, Holy Wisdom),

W. I. Mansell

# ST SOPHIA, ISTANBUL

erected by Constantine, and rebuilt with additional magnificence by Theodosius (412) and Justinian (538-68). Though necessary repairs have been executed, it is the church of Justinian that we now have. The exterior appearance of the church is disappointing, but inside it is the most magnificent creation of Byzantine art. The architects were Anthemius (471) and Isidorus of Miletus. The great oval dome is 260 ft. long by 107 ft. wide, the central square being bounded by four large piers (each 2½ ft. square). These are surmounted by semi-circular arches, and support a dome 107 ft. in diameter. E. and W. are other great semi-circular spaces each crowned with a dome. The ornament is extravagant in its beauty. Moulds of various hues are arranged to form intricate patterns and mosaics appear here and there uniting the marbles. After the capture of the city by the Turks, St. Sophia was turned into a mosque, and its Christian ornaments removed or covered up. Some twenty churches shared the same fate. Of these that of St. Sergius and Bacchus may be named as an interesting early Byzantine monument. From St. Sophia many other mosques were imitated, and it may be said to inaugurate a fresh type of architecture for those buildings. The greatest of the imitations

is the mosque of Solymian the Magnificent, of which the effect has been said to be more imposing than that of the original. Of the two hundred or more mosques scattered throughout the city those of Achmet, Hajazet, and Mohammed II. may be mentioned. An important monument of the anct. city is furnished by the remains of the Hippodrome, the centre of the Rom. life of the tn. Here are to be found the obelisk of Thothmes III., brought from On in the reign of Theodosius, and the triple serpents column, once in the Temple of Delphi and brought to I. by Constantine. In 1153 the conquering Sultan threw his mace at the three talisman serpents in the Hippodrome, which were supposed to protect I. against serpents, and broke the lower jaw of one, but refrained from doing further damage when he learned that the city would probably be devastated by an invasion of serpents if its protectors were destroyed. The pub. reports upon the excavations in and near the Hippodrome are making Byzantine I. more real to us. The chief Mohammedan antiquity is the Old Seraglio, occupying the whole S.E. corner of the city. It originally formed the private domain of the sultan, and from the name of its chief entrance, Babi Humayun, the 'Sublime Porte,' has come the official name by which the Turkish gov. used to be recognised. It has three spacious courts, and around them are arranged the anct. buildings, one the church of St. Irene, and one the old treasury, still containing vestments and arms of tremendous value. The question of education has received much attention during the last half century, and much progress has been made, though the teaching establs. are very largely of foreign institution and management. Amer. and Fr. colleges led the way in modern education, though one of the large Gk. schools dates from the Middle Ages. Both Gks. and Armenians now have excellent educational facilities. The Turkish Gov. has also made great improvements, and in 1867 a school for higher education was instituted by Sultan Abdul-Hamid. This work was carried further in 1909, when a univ., granting degrees in theology, arts, science, etc., was also opened. The univ. of I. was completely reorganised in 1933. From the beginning there have been schools connected with the mosques, where elementary subjects and theology were taught. It is in the bazars that the oriental spirit is strongest. These are arranged in rows, well-furnished with most kinds of wares, but without any particular architectural features. The city is well fortified, the main line of fortification having been constructed since the Russian war in 1878. It is now easily accessible by rail, and there is good communication with the rest of the continent. It is connected with the central European railway system *via* Belgrade and Sofia. Exports are chiefly cereals, carpets, silk, wool, hides, and all kinds of refuse and waste material, such as horns, hoofs, skins, bones, old iron, etc. Sev. hundreds of tons of the sweetmeat known as 'Turkish delight'

are also sent yearly to the rest of Europe and America. The manu. of I. have all taken their rise during comparatively recent times, and only that of cloth-making has made any headway. During the years 1899 and 1900, handsome new quays were built on both sides of the Golden Horn, thus making an excellent harbour. Ships of the largest class find safe anchorage here, and there are fine graving and dry-docks. It was the centre of the Mohammedan faith throughout the world, being the seat of the Caliph until the office was abolished on March 2, 1924. The climate of the city is generally healthy, but it is very damp, and liable to great and sudden changes of temp. The city was originally very unhealthy through inefficient sanitation, but this is now improved somewhat. There are electric trams in I. and its suburbs, and in Izmir. The pop. is varied, presenting a most remarkable mixture of races, nationalities, faiths, languages, and costumes. Each div. forms to some extent a separate community, and the city divides itself into quarters according to these. On Nov. 1, 1922, the office of Sultan of Turkey was abolished, and on Nov. 4 the administration of I. passed into the hands of the Nationalist Gov. at Angora. On Nov. 17 the Sultan left I. 470 years after the first conquering Sultan had entered it. On Oct. 29, 1923, Kemal Pasha was elected first President of the Turkish Republic. I. had endured numerous air attacks during the First World War, and had been occupied by Great Britain, France, and Italy for five years; it was evacuated by them on Oct. 1923. A little later it was crowded by 30,000 destitute Turkish and 65,000 Russian refugees. According to the census of 1927, the pop. was 673,029, of which Stamboul contained 261,504, Pera 286,970 and Scutari 124,555. Pop. (1945) 845,000. I. is governed by a prefect assisted by a nominated council of twenty-four. It has now ceased to be the commercial centre of the Near East and the citadel of Islam and the capital of E. Christianity. I. has often been devastated by fire from the year 100 onward. In 176 the public library, which is said to have contained 120,000 vols., was destroyed. In 1696, 10,000 houses were burnt in consequence of the illuminations for the birth of the Sultan's son. In 1911 sev. thousand houses were burnt, and many more in 1912, 1916, 1917, 1919, 1921, and 1922. But now there is a fire-fighting organisation. In 330 I. was erected by Constantine the Great on the site of the anct. Byzantium, which dated from the seventh century B.C. For seven centuries it remained as the cap. of the Rom. Empire in the E. As 'New Rome' it was early important, and on the partition of the empire in 395, it became the seat of the E. emperors. Even before this time the new city had had to withstand assault, for in A.D. 378, after the defeat of Valens, the Goths had attacked it. Henceforth it was to do so on many occasions. Twice, in 616 and 620, it sustained onslaughts from the Persians, and twice again, in 668-75 and 717,

the Arabs furiously but unsuccessfully attacked it. In 1203, and again in 1204, it was taken by the Crusaders whose conduct on that occasion is one of their chief disgraces. From 1396-1401 it was unsuccessfully besieged by the Turks under Sultan Bajazet. Sult. in Murad II attacked it once again in 1422 and it held out with the greatest difficulty. The end was near, and in 1453 after a long and heroic defence against great odds, the city of Constantinople fell. See BARKAN WAT and TURKEY. See G. J. Grelot *A Late Voyage to Constantinople* (trans. by Philips, 1653), C. du I Du Cange, *Constantinople des Christiana* (new ed 1825) and *His. de Constantinople sous les empereurs français*, 1826. W. #### Istankeu, s (COS)

Isthmian Games, were held at Corinth and were called after the Isthmus. They were originally a festival commemorating Melicert who after being hauled into the sea was hanged into a deity. Their celebration dates back to 1326 B.C. but for some years they lapsed and when Theseus re-instituted them he did so in honour of Poseidon. Later they were held every five years and became sacred that they were not omitted even when Mummius had razed the proud city to the ground (146 B.C.). Huge crowds gathered from the islands and Asia Minor as well as Greece proper to witness contests of every description, and the most coveted prize was a pine leaf garland or a parsley wreath.

Isthmus (Gk *isthmus*, neck) term used in geography to describe a narrow neck of land joining two larger parts otherwise separated by water. Thus the I. of Suez links together Asia and Africa at the head of the Red Sea, that of Panama connects N. and S. America, and that of Corinth the Peloponnese with N. Greece.

Istap, town in which was formerly European Turkey now included in Serbia. Yugo-slavs on the Balkans. The inhabitants chiefly Serbians, number about 20,000, and are engaged in agriculture.

Istres, town in the dept of Bouches-du-Rhône France on the W. shore of Étang de Berre 19.25 m. N.W. of Marseille. It has important salt and soda works. Pop. 7000.

#### Istria, Dora d', see GRIKIA, HIRINA

Istria, comprises a peninsula in the N.E. corner of the Adriatic Sea between the gulf of Trieste and the gulf of Venice, and the is. of Krk (Veglia), Cherso (Lussino) and others. Total area of 1904 sq. m. The coast is very rocky and broken by many bays. Two thirds of the pop. are Slavs, and the rest Itals. The chief industries are

fishing, salt retrieving, and shipbuilding. Olive oil and wine are manufactured, fruits are cultivated, wheat, maize, etc. and oats grown, and cattle bred in large numbers. The local diet meets at Pore (Istria) (12,355) but larger towns are

Yugoslavia

#### CHRIS OF ISTRIA

Publ. (1) and Castagno (Konstanz) (1511) and (2) (1511) Indian author and so called. At the time of the dominion of Austria in 1511, between the two World Wars was part of Italy and since 1914 has been part of Yugoslavia. Pop. 403,000.

Iswari, Ishwar) Chandra (Vidyasagar) (1811-1861) Indian author and so called. At the time of the dominion of Austria in 1511, between the two World Wars was part of Italy and since 1914 has been part of Yugoslavia. Pop. 403,000.

Isyllus, Gk poet who occurs in an inscription in the temple of Asclepius in Epidaurus. Probably lived at the time of the Gk invasion of Sparta after Chalcidians.

Itacolumite, town in Brazil at the mouth of the Mucuna a tributary of the Amazon has a thriving exporting trade in the products of the district: corn, spices, dried fish, and india rubber, etc.

Itacolumite, or Flexible Sandstone, vel low sandstone of a porous nature found in Brazil. In the form of thin slabs, it is slightly flexible, a bar of it when supported at its ends, sags visibly but returns to the straight when laid flat. This is supposed to be due to the sand grains

which form the rock not being firmly cemented together. In England, beds of flexible sandstone are found associated with the magnesian limestone of Durham. Brazilian I. occasionally contains crystals of diamond.

**Itagaki, Taisuke, Count (1837-1919),** Jap. statesman, was prominent in the progressive movement which led to the overthrow of a feudalism long since antiquated. At Tosa he opened a school (the 'Rishisha') where he taught his advanced and enlightened political views. The party of patriots, 'Aikoku Kō-tō,' acknowledged him as their leader, and he directed the policy of the 'Jigūto,' whose watchwords were 'liberty' and 'reform,' 1881-1900.

**Itajahy, riv. in Brazil,** flows through Santa Catherina, and enters the Atlantic Ocean at Itajahy, a small port for the Ger. colony of Blumenau.

**Italian Art,** in the dawn of Christian art in the fourth century a common style was sought in architecture, sculpture and painting, so as to give a common expression to the new religious ideas. The hist. of the development of Gothic architecture in Italy establishes very clearly the gradual transition from Roman ideas to Romanesque and Byzantine and ultimately to Gothic. Earlier Gothic architecture in Italy never achieved the striking effects it achieved in other European countries, owing to the constant influence of classical traditions and, in lesser degree, to the influence of Gk., Arab, and Moorish work. The earliest buildings used for Christian worship in Italy were not more adapted for such worship than for pagan rites. The form of architecture used was the Rom. art of the times, and to a large extent Rom. buildings, and particularly basilicas, were converted from the time of Constantine into Christian churches and anc. monuments were despoiled to provide the material for the Christian basilicas, mausoleums, and baptisteries, and even for the Arch of Constantine. The church of San Vitale, Ravenna, affords clear evidence of the way in which the constructional arrangements of pagan Rome were copied and utilised by the Christians. At the end of the sixth century and during the seventh, decoration in Rome assumes the Byzantine style even in colouring, e.g. in the basilica of the Apostles or in the mosaic of S. Vitale, Ravenna. In the Carolingian period of the ninth century the conflict between indigenous and foreign influences is interrupted by an attempt to return to the classical antique; but it is impossible to estimate the cultural movement of the Carolingian epoch towards the antique because no example of the sculpture of the period is extant. But revived Byzantine art continued to spread westward and Byzantine ivory carving and sacred icons and goldsmiths' work supplied models for all Europe from the tenth to the twelfth centuries,—a wealth of splendour which is extant in St. Mark's at Venice.

In what is called the second golden age, from the ninth to the eleventh centuries, Italy was enriched with Byzantine struc-

tures. Some of the best still contribute to the beauty of Venice and Sicily. The Gk. orient had its influence on painting up to the close of the thirteenth century, though not on architecture or sculpture; for since the eleventh century a new art had appeared, known as Romanesque, though some think it should more appropriately be called It. for one of its strongest characteristics was a harking back to old classical Rom. memories in the decora-

THE FIVE DOMES OF ST. MARK'S, VENICE

tion of cathedrals. Modern art, says Adolfo Venturi, had its beginnings in the Romanesque cathedral with its subordination of most elements to light effects, its doorways adorned with rare magnificence. Romanesque art in sculpture may be exemplified in the statuary of Autelami at Parma and Milan. In Tuscany, a whole line of architects in marble seem to have inherited a classical conception of design and to have maintained its integrity throughout the century, e.g. in the Baptistery at Florence and the cathedral of Pistoia. In the early thirteenth century Gothic designs were beginning to appear in Italy. This is shown in the construction in 1216 of the classic porch of San Lorenzo and in 1210 that of Civita Castellana. Yet at the same time the Cosmati still adhered to the horizontal in preference to the vertical and to the rounded arch, and it is from the Cosmati that the Umbrian architects trace their artistic descent. Cosmatesque art matures in the thirteenth century and finds a master in Tuscany. Arnolfo di Cambio, who exalts the It. tradition and influences the art of Giotto and through him all It. painting (Venturi).

Until the great revival of plastic art took place in the mid-thirteenth century, the sculpture of Italy was decidedly inferior to that of more N. countries and much of it was actually the work of N.

sculptors. Unlike the sculpture of the Pisani and later artists, the early figures are purely secondary to the architecture they are intended to decorate and they are the work of men who were primarily architects. But after the end of the thirteenth century the reverse was more often the case—as is exemplified by the sculptured decorations at the W. end of Orvieto cathedral. During the thirteenth century Rome and the central parts of Italy produced very few sculptors of ability, almost the only notable men being the Cosmati already mentioned. But during the fourteenth century Florence and neighbouring cities were the chief centres of It. sculpture and in the succeeding century Florence had become the æsthetic cap. of the world, having attained a pitch of artistic wealth and perfection rivalled only by that of anc. Athens, and indeed there is some similarity between Florentine plastic art of this period and that of fourth or fifth century Athens.

Niccolo d'Apulia's statuary is reminiscent of the mighty constructions of anc. Etruria and Rome and marks a break-away from Romanesque art. It heralds the reform in sculpture continued by Giovanni Pisano, in whose hands the representation of the human figure attains a completeness which It. painting could not acquire till a century later. In Niccolo's baptistery at Pisa sculpture is subordinated to architectural framework, but in the pulpit at Siena, made by him in collaboration with Giovanni Pisano, the sculptural effect is richer and more varied. In the fountain at Perugia, the finest flower of Giovanni's brilliant imagination, the influence of Niccolo has all but vanished and 'grave tranquillity has yielded to excited rhythm' and these qualities are to be found in the followers of Giovanni Pisano—Giotto, Andrea Pisano, Orcagna, who was famed as a goldsmith and painter as well as a sculptor, and Nino Pisano—sculptors of the thirteenth and fourteenth centuries. Another of the most inspired creations of Giovanni Pisano is the 'Massacre of the Innocents' in one of the reliefs of the Baptistery of Pisa. Well has it been said that this 'impassioned contemporary of Dante never created a greater or more dramatic work of art than these convulsed groups of mothers and children.' Andrea Pisano, originally an obscure goldsmith, became famous for his bronze bas-reliefs in the Florentine Baptistery. In it he shows a mastery of the representation of movement and a regard for the unity and inter-relationship of the varied scenes of a story which introduce a fundamental reform in composition in which he was forestalled only by Giotto in his paintings. The later half of the *trecento* also exhibits a nascent tendency towards reality, a tendency exemplified amongst the Veronese sculptors and particularly in the Venetians, Jacobello and Pier Paolo delle Masogno.

Great names in painting in the *trecento* are those of Pietro Cavallino, Giotto, and Cimabue, the last-named, as Dante records, being the first famous name in

Florentine art. Cavallini was the herald of the *stil nuovo* in It. painting and it was he who inspired Giotto. He was a master of the 'Roman School' and the greatest exponent of the classical style at the end of the thirteenth century. Some of his finest work is to be seen in the mosaics of Santa Maria in Trastevere, Rome, notably in the panel of the 'Birth of the Virgin' and in his frescoes in the convent of Santa Cecilia, Rome. Giotto, who with Duccio di Buoninsegna was a pioneer in liberating the arts from the rigid medieval tradition, reveals the profound tranquillity, the dignity of the spirit of this first renaissance of poetry and painting. His figures, far from imitating the silhouettes of contemporary sculpture, recall the massive simplicity of primitive monuments and their simplicity is enhanced by a corresponding simplicity of scenic background. His greatest paintings were destroyed, but in the Scrovegni chapel his frescoes reveal his power of capturing life, his sense of human character, and his keen dramatic instinct. Cimabue the Florentine continues the Romanesque tradition as may be seen in his work in the Uffizi gallery, Florence, and the frescoes at Assisi. Other names of the fourteenth century are those of Simone Martini, an artist with a rare sense of beauty of line, of colour, of graceful movement, and of human expression, Lippo Memmi and Ambrogio and Pietro Lorenzetti of the 'Sienese School,' a 'sort of æsthetic Lotus-land of painters.'

*Quattrocento* or fifteenth century It. architecture is glorified by the genius of Brunelleschi, the inventor of architectural perspective. The exteriors of his buildings preserve medieval castle features but the internal decoration is inspired by classical art. The church of Santa Croce in Florence and the cathedral there exhibit his work at its best. His follower Leon Battista Alberti, nevertheless gives the exterior a significance of style of its own. In Brunelleschi's art there is a light Florentine elegance in the airy arcades and friezes of cherubim; in that of Alberti is shown a predilection for the massive, a love of the romantic. Of the *quattrocento* was Francesco di Giorgio Martini who built the palace of Gubbio. The Lombard Gothic style of architecture of the fifteenth century is illustrated by the 'Ca' d'oro' Palace at Venice and the Doge's Palace. The Arco Foscari in the latter is the work of the sculptor Antonio Rizzo. Amadeo, in Milan, renounced the Gothic style, yet carried its flowery decoration into the Renaissance, as is shown in the facade of the Colleoni chapel at Bergamo. The lofty spirit pervading the work of the Urbino artist, Donato Bramante, is exemplified in the church of San Satiro, Milan and in the Trivulzio chapel, San Nazaro, in the same city.

The Gothic style characterises the work of many It. artists at the beginning of the fifteenth century. Among them may be mentioned Gentile da Fabriano whose most celebrated work is the 'Adoration of the Magi' in the Uffizi gallery. He was not a great artist, but he inherited much of the Siena School's feeling for beauty of

person, of line, and of colour, enhanced by a lively fancy which filled his compositions with jewels and flowers, rich brocades and gentle laughing faces so representative of the court art of his time. Antonio Pisano (Pisanello) is, however, the greatest painter of this artistic movement, but he displays a child-like pleasure in the minute presentation of natural objects. Other painters of this century were Fra Angelico, Masaccio, Paolo Uccello, Andrea del Castagno, Piero della Francesca, Melozzo da Forlì, Luca Signorelli, Antonio Pollaiuolo, Andrea Verrocchio, Filippo Lippi, Domenico Ghirlandajo, Giovanni di Paolo, Pinturicchio, Perugino, Botticelli, Mantegna, Cosimo Tura—a pioneer of the Ferrarese School—C. Crivelli, Francesco del Cossa—also of the Ferrarese School—Borgognone, Bramantino, Ercole de' Roberti, Antonello da Messina, Cima da Conegliano, Giovanni Bellini, Gentile Bellini, and Carpaccio. These are the masters of those great artists who were to invest the succeeding century with the full splendour of its art: thus Leonardo da Vinci derives descent from Verrocchio who perfected the art of shading figures and endowing them with spiritual refinement; Raphael derives from Perugino and Piero della Francesca; Michelangelo from Botticelli and Signorelli, both, especially the latter, remarkable for energy and vigour in their treatment of the human figure and their reaction from impassiveness; Correggio (Allegri) from Mantegna, the founder of humanistic painting in N. Italy, and Costa; (Gorgione) and Titian from Giovanni Bellini, whose faces are imbued with the clear light of innate goodness and calm. Fra Angelico's supreme quality is that of colour, and no other painter of the time employed tones of such purity. He has been described as 'the chief prophet in Italy of the beauty of holiness.' His designs are always exquisite and sometimes, as in the Florentine frescoes, 'The Transfiguration,' and 'The Marys at the Sepulchre,' they attain extraordinary grandeur. Masaccio, who died prematurely, assimilated scientific principles with the same natural ease with which he mastered the general construction and appearance of the human figure. In his fresco 'The Tribute Money' there is a mt. range which, in Ruskin's judgment, was the first piece of real mt. drawing in ant. art. Uccello was a great craftsman but he combined science with art to such an extent that it seemed to Vasari the art was overbalanced. Grandeur characterises the few surviving works of Andrea del Castagno as may be seen in the small 'Crucifixion' in the Brit. National Gallery. Of the Florentines of the fifteenth century Fra Filippo Lippi is noted for his gift of colour in the grand manner. Portraiture assumes a more prominent place with Ghirlandajo, a pupil of Baldovinetti, Perugino, like Pinturicchio, has an eye for undulating airy distances which seem to add an importance to his figures which they might not otherwise possess as is exemplified by his 'Virgin with S. Bernard.' Piero della Francesca, a Florentine by choice, is the link between the

old and new generations. His sense of spacious design was unrivalled by his contemporaries and make him a greater pioneer of landscape than Perugino. As a portrait painter he has no contemporary superior. In 'Baptism' and 'Nativity' the National Gallery has two of his best panel paintings. Signorelli was one of the most original masters of his time, whose energy found its outlet in the robust treatment of the nude, which he handled with a solid power only surpassed by Michelangelo himself. Antonio Pollaiuolo made a close study of artistic anatomy, as may be seen in the 'Martyrdom of S. Sebastian' in London. His 'Apollo and Daphne,' also in the National Gallery, proves him an admirable artist. Verrocchio's name survives chiefly as a sculptor, though he was also a musician and goldsmith as well as painter, but we are never certain how far paintings ascribed to him are wholly his work and not sometimes the work of his great pupil Leonardo da Vinci. Botticelli, the great artist of linear design is world famous for the languorous poetic beauty of his feminine types, but beneath this beauty lies a vigorous artistic energy. In all his best work he uses line with a sense of rhythmical quality which makes it seem a 'living thing' (Holmes). Leonardo da Vinci also had this quality but is inclined to confuse it with scientific considerations, whereas Botticelli uses rhythm for the sheer delight of creating them. His celebrated allegories 'Primavera' and 'The Birth of Venus' exhibit these qualities in their highest degree. Mantegna seeks the glamour of ant. Rome in statues and relief and most of his paintings have been described 'as a kind of coloured sculpture in the flat.' Typical examples are 'Triumph of Scipio' and 'Samson and Delilah' in the National Gallery. Material splendours are apparent in the work of Carlo Crivelli, many of whose paintings are in the National Gallery. Giovanni Bellini shows a wonderful and tender sympathy between man and nature, allied, however, to great artistic power. Within the range of his devotional studies he shows so remarkable a variety of design, sense of form, and gifts as a colourist that his example dominated Venice for a quarter of a century (Holmes) and his translucent colour effects are the peculiar glory of the Venetian school. In Carpaccio of the same school the Venetian delight in pageantry found its most complete expression.

Pisa's dominance in sculpture ended with the fourteenth century and as we have seen passed to Florence. The moment of transition from Gothic to Renaissance art can be studied in the work of Lorenzo Ghiberti, who vanquished Brunelleschi in the competition in 1402 for the decoration of the second door of the Florentine Baptistery. Jacopo della Quercia of Siena, a near contemporary of Ghiberti, is a bolder innovator in his love for strong relief and vigour of subject. The last traces of the Gothic tradition of sculpture are abolished by Donatello who for half a century imposes his own art on

Italy as a national art. His equestrian statue of the *Cattacchita* at Padua is one of the noblest in the world and only rivalled by the statue of *Colonna* at Venice by Verrocchio and Leopardi. In his relief he creates almost impressionistic effects of Bacchic movement. He has no rival in representing the ebb and flow of a crowd. Other sculptors of this century include Luca della Robbia, a maker of statuettes in Lucany. Desiderio da Settignano with a faculty for carving graceful aristocratic figures. Francesco di Giorgio Martini who was architect, painter and sculptor and three Florentine artists, Bernardo Antonio del Pollaiuolo and Andrea Verrocchio (already mentioned as painters) who almost outdo Donatello in attacking the problem of vital movement, the passion of the Florentine Renaissance.

In the sixteenth century, Rome became the artistic cap of Italy. Painters, sculptors and architects flocked there, and on their departure spread the new gospel throughout Italy and a national artistic style developed in the name of Rome. Architects as students of Roman classicism endowed their buildings with an imposing monumental aspect and a rhythm of regular proportions. The leader of this school of artistic thought was Donato Bramante, the architect of the Belvedere at Rome and of the staircase of the Vatican, but the unity of the monumental and the harmonious is the work of Michelangelo and of Giuliano and Antonio Sangallo. Great examples of Michelangelo's work in architecture are to be seen in the Sagrestia Nuova of San Lorenzo at Florence and in the magnificent dome of St. Peter's in Rome. Other architects of this period are Jacopo Tatti (Sansovino), Andrea Palladio of Venice and Vignola, the architect of the Palazzo Iarnese. In sixteenth century sculpture Michelangelo dominates the field. He raised the sculpture of the modern world to its zenith of glory, yet at the same time he sowed the seeds of a rapidly approaching decline for his imitators—such as Baccio Bandinelli, Giacomo della Porta, Ammanati and others copied and exaggerated his faults without the saving grace of a scintilla of his genius. The *Lapiths and Centaurs* and two figures of *Slaves* in the Louvre may be mentioned as examples of Michelangelo's power of dynamic expression through the nude human figure. Subtlety and refinement inform his splendid *Little group of figures* in St. Peter's. As a sculptor Benvenuto Cellini strives after size, but with him as with Sansovino and Alessandro Vittoria the art of Michelangelo is reduced to a sobriety that yet is not devoid of grace. The tomb of Giovanni Galeazzo Visconti, completed 1560, is a sumptuous example of the style of the Renaissance grown flabby from excess of richness and through abandonment of the simple purity of fifteenth century art. The sixteenth century indeed was one of transition to the state of degradation, yet it produced many sculptors of high ability, such as Giovanni da Bologna,

whose bronze statue of 'Mercury' in the *Uffizi* is a triumph of movement, while another of his works is the great fountain at Bologna.

In Northern Italy in the fourteenth to sixteenth centuries terra cotta was adapted to the most elaborate architectural purposes. Thus the W. facade of the cathedral at Monza, the cathedral of Crema, and S. Maria della Grazie in Milan are striking examples of the splendid effect obtainable by terra cotta work. But the most important application of terra cotta in medieval Italy was to statuary—reliefs, busts and groups of life-sized figures of the fifteenth and sixteenth centuries. Some of the Florentine terra cotta sculpture of the fifteenth century is the most beautiful plastic work known in any medium, particularly that by Jacopo della Quercia and Donatello. The portrait busts in terra cotta are perfect models of Ionic sculpture. Groups in realistic style in the sixteenth century were produced by Caradosso (Ambrogio Loppa) for S. Vitore at Milan and by Guido Mazzoni for churches in Modena.

LEONARDO'S 'GIOCONDA'

The sixteenth century in Italian painting was rendered glorious by a constellation of supreme artists whose names are headed by those of Leonardo da Vinci, Michelangelo, and Raphael, and include Titian, Giorgione, Allegri (Correggio), Veronese (Carrari), Sebastiano del Piombo, Jacopo Tintoretto, Gambattista Moroni and Caravaggio. It is true enough to say of Leonardo that 'his influence was so extraordinary that it is difficult to treat of any painter of his time

without mentioning his name.' His interpretation of chiaroscuro and his solution of the problems of form and movement proclaim the scientific visionary looking into the heart of nature. Yet the dominion of sixteenth century art properly belongs to Michelangelo, the artist of the prologue of the hist. of man in the Sistine Chapel, rather than to Leonardo. The masterly power of his art can be comprehended only by long study, the study of all that the progressive Florentine artists had been striving to achieve since the time of Masaccio but was attained only by Michelangelo. Like the great Gk. artists before him he seized on the nude as the best medium for revealing the highest aesthetic perfection; but, while Titian and Correggio sought this perfection in the sensuous, Michelangelo sought it triumphantly in physical force. Power and intellect are the qualities that mark his art, a profound knowledge of nature and careful study of the living model, yet no servile copying even of nature, for he often violates rules of proportion and, in other ways, rejects the lessons of science if that is necessary for the expression of his idea. For he was, perhaps, the greatest of idealists; his figures 'live by virtue of the life he infused into them and remain the grandest creations of Italian art' (Bryan). Raphael embodies the highest aspirations and finest culture of the Renaissance. He made a study of the frescoes of Masaccio and the reliefs of Donatello and of Michelangelo's sculpture and the work of Mantegna, and, next to Michelangelo, he was the most representative artist of his age. His frescoes in the Vatican are remarkable for a solemn grandeur of composition, wonderful portraiture, and great depth and richness of colour. Harmonious rhythm is, for Raphael, beauty itself as it is for Alberti. His tranquil art reflects the cultivated urbane society in which he moved and he had his triumphs, triumphs so real that even Michelangelo felt uneasiness at his growing fame and, it is said, availed himself of the powers of Sebastiano 'del Piombo' as a colourist for his own designs for a Pietà group at Viterbo in order to outlive him. Titian, who was a pupil of Giorgione, reaches the heights of sensuous beauty and as a colourist is unrivalled; but spiritual beauty is often wanting; he was a realist and, as Ruskin says, no ascetic. He tried like the Gk. artists to express the *joie de vivre* of human kind, and no painter was ever more brilliantly successful in the effort. His women's portraits have a rare charm and as a portrait painter he is admitted to be of the front rank. One of his most famous portraits is 'Homme au Gant' (in the Louvre). In this craft he undoubtedly influenced Velasquez. Classical myths and romantic idylls were the stuff of Giorgione's genius. Famous among the last named are 'Sacred and Profane Love' in the Borgese Gallery, 'The Three Ages of Man' in the Bridgewater Gallery, and 'Noli me Tangere' in London. He delights in pictorial visions without any concrete subject. Landscape, with Giorgione, be-

comes the main subject of the picture and figures belong to the landscape, not the landscape to the figures (Bryan). In his later works he approaches nearer the classical (Gk. than does any other master of the Renaissance, while yet revealing a note of yearning that was alien to the Gk. conception. His celebrated Bacchanal 'Bacchus and Ariadne,' in the National Gallery, is one of the supreme masterpieces of all time. Callari (Veronese), as may be seen from his famous 'Marriage at Cana' in the Louvre, delights in the gorgeous in style and conception. Pomp and splendour of earthly pageantry, the vainglory of humankind, are manifestly the most obvious features of his typical banqueting scenes. Tintoretto's fame, apart from his power of portraiture, rests upon his vast imaginative compositions, with the character of which Ruskin has familiarized us. His Christ before Pilate is both massive and dramatic. Caravaggio led the reaction from the Eclectics—a naturalistic reaction from conventionalism and academic idealism analogous to the revolt in France under Manet and Courbet. Typical of Caravaggio's style are 'The Death of the Virgin' in the Louvre and the 'Flight into Egypt' in the Doria Gallery, Rome. His new movement, says Sir Charles Holmes, was of such importance to the arts that its effects have endured to our own day. Notable painters of the Ferrarese school were Francesco Bianchi (Giovanni di Niccolò Luteri), Dosso and Battista Dosso, and Benvenuto Tisi (called Garofolo). Garofalo was strongly influenced by Raphael and by Dosso Dosso. His religious compositions, if monotonous and wearisome, are of high technical quality and his classical myths are somewhat too conventional, but his 'Mars and Venus' (Dresden Gallery) has charm.

Post-Renaissance baroque It. architecture and sculpture of the seventeenth century are dominated by the innovator, Lorenzo Bernini. 'The Fountain of the Four Rivers' in Rome and the monument of Urban VIII. are examples of his sculpture. His daring innovation—in the churches, his sumptuous palaces and monuments of marble, bronze, and gold, lent the Eternal City a new-found magnificence. An equally bold innovator of this century was Borromini who first introduced contorted spirals and hollow mouldings. In his lavish use of arabesques and colours he is as far removed from the classical tradition as is Bernini with his love of light effects on gold and coloured marbles. Valvasori's splendid Doria Palace is an illustration of the new rococo style. Other architects and sculptors of the time are Pietro de Cortona, Maderno, and Rainaldi.

Seventeenth century Bolognese painting finds its chief representatives in the Caracci—who founded the School of the Eclectics at Bologna—Barbieri (called Guercino), Guido Reni, and Sassoferrato; but the leading school of the century was at Naples, as illustrated by Giovanni Caracciolo, Mattia Preti, Salvator Rosa, the painter of classical landscape, Luca

Giordano, and Cavallino. Bernardo Strozzi is amongst the best portrait painters of the time. Gian Battista Tiepolo in the eighteenth century is noted for his transparent atmospheric effects. In conception he derives from his contemporary Piazzetta his power of invention and decoration as revealed in the frescoes of Antony and Cleopatra in the Palazzo Labri, Venice. Also of the eighteenth century is Canaletto (Antonio Canal) the painter of the Venetian canals and *campi*. Nineteenth century Italian architecture, sculpture and painting had their leading exponent in Antonio Canova, one of whose masterpieces is the Gangaulli sepulchre. In some sense Canova gave renewed life to the art of sculpture restoring it to that standard from which it had deteriorated when the instinct for classical beauty and austerity of titanic invention and will-nish superhuman energy as embodied in the superlative genius of Michelangelo had yielded to the exuberant mannerisms of the seventeenth and eighteenth centuries. Other names of the century are those of Sabatelli, Domenico Morelli, and Giovanni Segantini, artists of the impressionist school.

Early in the twentieth century Italian artists made a noteworthy contribution to the Futurist movement. Its foremost adherent, Umberto Boccioni (d. 1916) expounded its creed in his *Linea e vite Futuriste*, but he sought to go beyond Futurism and to record not only a set of visual facts from a new angle but also their deepest emotional experience. He came nearest to achieving this ambition in a remarkable series of three paintings—

Leave-taking, Those going away, and Those who remain behind. The Meta-physical school was short-lived. Its aims were set forth by Carrà in *Pittura Metafisica* and its principal exponents were Modigliani and De Chirico. Douglas Cooper has detected the cause of their failure in their inability to break entirely with naturalism and thus the wondrous quality of their poetic visions from its natural form. They were caught in a ready-made fabric.

The next outstanding figure is Giorgio Morandi (b. 1890). Though at first influenced by the Metaphysical painters, he has remained aloof from all movements. He is conservative without being reactionary, a fine technician who works however lacks movement and employs subdued colouring to express his predominant sadness. The dominant personality in painting today is Renato Guttuso (b. 1912) a Sicilian. He like his companions of the Roman school is concerned not with philosophical theories but with human experience in his own day. Guttuso's fierce realism is best seen in four works painted in 1948. 'The Mechanic', 'The Washerwoman', 'The Seamstresses', and 'The Water Melon Stall'. In sculpture the three most interesting figures are Manzù, who (a cardinal was recently bought for the Pitti Gallery) the Scillian Pietro Comaresa, and Marino Marini, who has been described as 'probably the best young sculptor in Europe

today'. All three belong to the Realist school.

*Damage to Italian art in the Second World War*—The most serious losses in Italy's art of Bologna were Bonaventura Cathedral, Santa Chiara and the university at Naples, the Campo Santo of Pisa, the banks of the Arno at Florence, the Tempio Malatestiano (see MALATESTA) at Rimini and the Benedictine monastery of Monte Cassino. On the credit side could be placed the immunity of Rome, save for the church of San Lorenzo and the great Tuscan and Umbrian cities, and also Livorno and Lido. Public exhibitions organised under Anglo-American auspices of paintings and other works of art in Florence, San Marino and elsewhere afforded evidence of the care taken by their custodians to safeguard them while the tide of war swept over. But the red hot rake of the battle line (Micheleuzzi) moved more slowly but more tenaciously might have occurred. But the determination and gallantry of the Allied armies fighting against the grain of a most difficult country and the zeal of the officers of the sub-commission for Monuments, Fine Arts and Archives working in their wake, made it possible to save the greater part of Italy's unique artistic wealth. An attack was the chief cause of damage in Italy of Bologna (greatly taken by the Eighth Army (71) and R.A.I. headquarters) to limit destruction otherwise the tragic reckoning would have been heavier still. But Padua, Vicenza, Verona, Mantua and Bolzano all suffered while Genoa endured the additional affliction of bombardment from the sea. One of the most grievous architectural losses was that of two of the finest historical bridges in Italy—the Ponte Scaligero built in 1331 and the Ponte della Pietra, culist of surviving Roman bridges, both at Verona. These were blown up in spite of assurances to the contrary on April 2, 1945, by the Germans. Sixteen of the twenty churches on the list of protected monuments in Verona as well as most of the fine palaces were destroyed. At Vicenza the cathedral was virtually destroyed. At Padua the destruction of the Franciscan church involved the greatest individual disaster to Italian art. *Official Report by the British Committee on the Preservation and Custody of Works of Art in Enemy Hands* (1946)—The list of the whole series of frescoes by Mantegna at Mantua, the Gothic church of S. Francesco was almost completely destroyed. The old town of Bolzano suffered great harm not only to its individual monuments but to its general character and atmosphere. At Genoa 11 churches, 13 oratories, 13 cloisters, 129 palaces and villas and 3 theatres—all of artist importance—were more or less damaged. The most serious loss being the magnificent interiors of the medieval palaces. At Bologna and Turin the damage was less than might have been feared, and at Milan though there was widespread damage, this seldom amounted to complete destruction and Leonardo da Vinci's fresco of 'The Last Supper'

survived in spite of the fact that the roof of the refectory and the wall opposite the painting were destroyed. *See also under the names of cities and towns.*

*See further under ARCHITECTURE, PAINTING, and SCULPTURE and under the names of individual artists.*

**Italian East Africa.** The name given by Italy in 1936, after her conquest of Abyssinia, to the territories it occupied in E. Africa. They then comprised the former colonies of Eritrea (q.v.) and It. Somaliland (see SOMALILAND), and were divided into five provs.: Eritrea, Amhara, Galla, Harar and Somalia, the cap., Addis Ababa, being a separate dist. not included in any prov. The total area was 660,000 sq. m., and the pop. was estimated at 7,000,000. The whole of this colonial empire was lost in the second World War in 1940-41.

**Italian East Africa, Campaign in (1940-41).** The conquest of It. E. Africa—Eritrea, It. Somaliland, and Abyssinia, besides the recapture of Brit. Somaliland—was one of the most remarkable campaigns in the annals of African warfare. The lessons of mechanised warfare had been taken to heart, great distances over difficult mountainous country were covered with spectacular ease, the co-operation of the R.A.F. was effective to a degree, while the co-ordination of all the forces, operating from a dozen different directions, pointed to a highly creditable staff organisation. Imperial forces comprising S. Africans, S. Rhodesians, Sudanese troops, the King's African Rifles, and The Royal W. African Frontier Force together with Abyssinian patriot forces, all took part and, in the denouement, following the conquest of Eritrea, some three forces were all advancing at great speed on Addis Ababa where the It. had hoped to hold out long enough for the rains to save them. Not for long, not the least important function of the Brit. forces was themselves to play a similar rôle and to hold in check large It. armies, while Gen. Wavell's forces were advancing on Cyrenaica (see BATTLE OF THE WESTERN DESERT). This accomplished, all the forces were set in motion some advancing from the Sudan into N. Abyssinia and into Eritrea, others northward from Kenya and into S. Abyssinia, others across Ogaden and to Harar, while yet others penetrated W. and S.W. Abyssinia. But at first, following the

fall of France, the Brit. forces, for lack of resources, human and material, were unable to do more than hold frontier posts, yielding them only after stubborn resistance; while Brit. Somaliland had to be evacuated and it even seemed to many somewhat doubtful whether the Brit. would ever be able to counter the main It. thrust against Alexandria and the Suez, the fall of which would have multiplied the difficulties of a campaign in E. Africa beyond conjecture.

The It. began operations by bombing Berbera, cap. of Brit. Somaliland, and by attacking Brit. Moyale just inside the Kenya border, and, crossing the Abyssinian-Sudanese frontier, occupied more Brit. frontier posts. Early in July, S. African and S. Rhodesian airmen bombed It. aerodromes at Dire Dawa an important town on the railway from Addis Ababa to Djibuti in Fr. Somaliland, (which colony was now under the orders of the Vichy Gov. of unoccupied France and in no sense an ally of Britain), and Massawa, the chief port of Eritrea. On Aug. 5 the It. invaded Brit. Somaliland from Abyssinia moving on Odweina, Hargeisa, and Zeila. The colony was defended only by mobile motorised units of the Somaliland Camel Corps. Zeila was occupied without opposition. Hargeisa was taken by a force including tanks, artillery, and aircraft. The Brit. delaying force fell back. Zeila, under the original plan was to have been defended by the Fr. but, owing to their collapse, it was not advisable to send Brit. forces to take their place as they would have been isolated from the main garrison in Brit. Somaliland, small as this was. On Aug. 11 the It. made a general attack on positions covering Jugargan Pass. The Brit. staff decided that it was impracticable to defend Brit. Somaliland and more advantageous to make the enemy use up his supplies in what was, strategically, a wasteful enterprise—a policy which later proved justified. The It. were using two divs., complete with artillery and armoured fighting vehicles, originally intended to oppose the Fr. forces in Fr. Somaliland. At this stage all the Brit. could do was to bomb It. positions at Juba, Maraca, and Dessie in Eritrea and Abyssinia, as well as harass the It. advance in Brit. Somaliland. But the Brit. forces, although unreinforced, continued to resist with great determination all the way to Berbera. Eventually, however, the Brit. troops were evacuated from the colony all the guns, excepting two lost in the campaign, being unbarbed and the stores destroyed. The original disposition had been based on the scheme of Anglo-Fr. collaboration under which the Brit. forces at Djibuti were to hold the right flank, the pivot of the whole position. The only sound course in the circumstances was to fight rearguard actions with the small force available and to inflict the maximum losses on the enemy until evacuation became inevitable.

On Aug. 19 R.A.F. bombers raided Addis Ababa for the first time. S. African and S. Rhodesian squadrons also raided Mogadishu, cap. of It. Somaliland,

and railway buildings in Kassala in the Anglo-Egyptian Sudan—which was in enemy occupation. Extensive raids were carried out a few days later by Brit. and S. African bombers on aerodromes at Neghelli, Jellib, Kismayu, and Mogadishu—notably on that of the last-named town. All through the campaigns against the Ites, whether in Cyrenaica or in E. Africa, the Brit. command adopted the sound course of bombing the enemy's planes on the ground or fighting them out of the skies so that, ultimately, when the Brit. turn came to advance, the Ites were hampered for lack of aircraft and of undamaged aerodromes and, indeed, the process of destruction of machines continued right through the campaign. Brit. losses in planes and pilots being relatively slight.

There was now a lull in operations. Numerically the enemy was in a formidably superior position. But he met stout Brit. resistance, and where by sheer weight of numbers and metal he forced a way through, it was only to encounter a dogged opponent, who contested literally every foot of ground. In the conditions in which the Brit. forces were placed by reason of the collapse of France a greater military nation than the It. would have captured Aden and Egypt. Their failure to make any substantial progress anywhere in Africa while faced by forces negligible in numbers gave their opponents encouragement in a time of gloom.

Over two months later Mr. Anthony Eden, war minister, toured the Middle E., while Gen. Smuts toured E. Africa, to inspect the Brit. defences. This was the preliminary to the turning of the tide, which began with the capture of Gallabat, on the Abyssinian-Sudanese border, which important position had been taken by the enemy in June. This capture was made by Brit. and Indian troops, with tanks and artillery, and with the co-operation of the R.A.F., the enemy being taken by surprise. The R.A.F. also attacked the key positions of Agordat and Keren in Eritrea and bombed Assab, a port in Eritrea. The enemy now began to appreciate his danger, fighting grew fiercer, and in the next four days Gallabat changed hands sev. times. Asmara, cap. of Eritrea, (Gura, and Massawa, Eritrea's chief port, were bombed, while Brit. artillery fire forced the enemy to evacuate Metemma, 2 m. from Gallabat (Nov. 24). At the same time Asosa and Gondar in Abyssinia were raided by the R.A.F. who gave the Ites no respite anywhere. At this period (Nov. 1940-Jan. 1941) the focus of interest was the battle of the W. Desert. Wavell's spectacular advance to Benghazi being facilitated by the fact that Gen. Cunningham's operations in It. E. Africa prevented the duke of Aosta, commander-in-chief in It. E. Africa, from rendering Graziani any help.

On Jan. 13 Haile Selassie (q.r.), who was now in Khartoum, announced that he would soon cross the Abyssinian frontier and lead an Abyssinian army against the Ites. The revolt, fomented by the Brit. in that country, was now making great headway. The Imperial standard had been

raised at Gollam by Ras Mengasha and the war drums were rallying the Abyssinian patriots. Haile Selassie said that, like Marshal Badoglio (q.r.), he would enter Addis Ababa on a white horse, tear down the figure of a wolf erected by the Ites in the square, and reinstate the white marble statue of the Lion of Judah (the original of which had been taken to Rome). Ras Kassa, one of the leading Abyssinian generals in the Abyssinian-It. war, arrived in Khartoum on Jan. 21 to join his emperor.

By now Brit. troops were successfully advancing into Eritrea, while Indian troops were marching over the Sudan frontier. A contingent of regular troops of a newly-formed Abyssinian army went into action on the 22nd in the Sudanese-Eritrean war zone, the command being given by Haile Selassie to a young Australian artillery lieutenant. Haile Selassie had actually crossed the frontier a week earlier, hoisting the flag of Ethiopia on his native soil in the presence of Brit. and Abyssinian troops and accompanied by the Crown Prince and the duke of Harar and Ras Kassa. Keri and Aicota, together with 600 It. prisoners and two guns, fell to the Brit. forces on Jan. 29. From Kenya patrols had crossed the frontier at numerous points without meeting with the enemy. In Eritrea the Brit. attack was now concentrated on the Agordat-Barentu area. The distances and physical obstacles of this difficult region were overcome by strong concentrations of Imperial troops through the labours of the Cape Mechanical Transport companies. By the end of the month operations were developing on all African fronts—the Sudan-Abyssinian frontier, Kenya-Abyssinian frontier, Eritrea, and It. Somaliland—while revolt was spreading in Abyssinia. Agordat fell on Feb. 1—giving the Brit. a junction of considerable strategic importance on the Red Sea railway. Brit. and Indian troops, with R.A.F. support, stormed the position, capturing a dozen tanks, and driving the enemy towards Barentu and Keren—a stronghold surrounded by natural rocky fastnesses of great height. Other It. forces, harassed by Abyssinian patriots, withdrew from the Eritrean-Abyssinian frontier, abandoning their mechanical transport, and soon they were in full retreat towards Gondar closely followed by mobile forces. Throughout Feb. the enemy in Abyssinia, Eritrea, and It. Somaliland was always in retreat save at Keren—a stronghold on which every device of military engineering skill had been lavished. Here the enemy had sought to make a stand after being driven out of Barentu (Feb. 3) leaving hundreds of killed and wounded with many guns and other equipment which were of great use for arming the Abyssinian patriots.

The Imperial troops now laid siege to Keren. It was to prove the most costly operation of the whole campaign, but by Feb. 7 over 3500 prisoners had been taken, and wherever the enemy gave ground war material littered his track. There were now in simultaneous operation some five movements: the penetration of

It. Somaliland by S. African troops; an advance in S. Abyssinia by S. Africans; an advance through the N. part of Abyssinia, a patriot advance from the W. into Abyssinia and in S.W. Abyssinia; and the attack by mixed troops on Keren. The important port of Kismayu (It. Somaliland) fell to the S. Africans on Feb. 15. The attack was carried out in co-operation with the Royal Navy and the S. African air force. Five days later the troops were across the Juba R., while other troops from that dominion took Mega in S. Abyssinia, an It. air base some 6500 ft. above sea-level and the head

announcement that occupied territory, formerly ruled, claimed, or occupied by the It. gov. in Ethiopia and Somaliland were placed under the military jurisdiction of Gen. Alan Cunningham, general-officer-commanding, E. Africa. Dagga Bur, 600 m. N. of Mogadishu, fell to the victorious imperial troops on March 10, Harar being their next objective. It. losses since the opening of the Somaliland offensive had now reached 30,000 prisoners, while practically the whole of It. Somaliland, a great part of Eritrea, and enormous supplies of war material had fallen to the Brit. forces.

#### ABYSSINIA: THE OMO RIVER GORGE

A British officer studies Italian defensive positions seven miles away

of an important motor-road to Addis Ababa. Later in the month the Imperial forces made a remarkably rapid advance in It. Somaliland. They took Mogadishu, the cap., on the 25th after a march more rapid even than that of the army of the Nile in Cyrenaica. This gave them the centre of a good road system and so demoralised the enemy that over 9000 of them surrendered. On the Kenya-Abyssinia border Abyssinian irregulars drove the It. from their last footholds in the Brit. colony by taking both Brit. and It. Moyale, positions which had proved almost as stubborn as that of Keren. On the first day of March an important pass covering the approach to Keren was captured by an Anglo-Fr. force advancing from the N., the Fr. troops being Senegalese who had trekked across the continent to Port Sudan to help the cause of Free Frenchmen. Burye, an important It. fort, fell to the patriots on March 4, and the same day was noteworthy from the

Penetration into Abyssinia was now in progress on twelve fronts, including a thrust on Gondar in the N., a drive by patriot forces towards Debra Markos, the next goal after Burye; a Brit. advance on Harar from It. Somaliland; a thrust from the Sudan to Afodu; and other penetrations in the Blue Nile region of S.W. Abyssinia. But time was nonetheless an essential factor in the general plans of the Brit. authorities. The longer Keren held out the greater the possibility of the rains saving the It. On March 16, however, Brit., Indian, and Sudanese forces, strongly supported by the R.A.F., made a most determined attack on precipitous positions covering Keren and stormed three important heights 3000 ft. high, under cover of well-directed gun fire and bombing. Reverting to the earlier days of March, the position was that the Brit. All-Africa column (Gold Coast and S. African Forces) and Brit. and Patriot Ethiopian forces were all

converging on Addis Ababa. For the first fourteen days of the month the All Africa column averaged over 40 m a day across rising uplands on Abyssinia's E threshold. Other forces around Lake Tana were then nearer Addis Ababa but the formidable barrier of the deeply canyoned Blue Nile retarded their progress. The Imperial Army from Fritrea was fighting at the immensely strong position of Keren, the biggest battle of the campaign. A trail of abandoned ammunition and material along the modern tarmac road marked the headlong flight of its soldiers. The All Africa column was chasing two disorganised enemy divisions which were desperately trying to find a way back across the desolate Ogaden landscape. By mid March the strategic position of Jijiga 30 m E. of Harar, lay ahead of the All Africa column. The question was whether the Its would make a stand there or in the hills round Harar. But air reconnaissance found Jijiga almost deserted whence it was inferred that Harar with its high mud wall pierced by five gates would prove the key to the whole campaign. Yet it was doubtful whether the Its could spare as many as 10 000 troops for its defence—the number believed to be concentrated in the vicinity. Already their crack grenadier units had been sent to Keren and at all costs they must hold that position and the Blue Nile crossings. They had also to keep garrisons everywhere to ward off patriots while finally they had already lost over 30 000 prisoners, a serious depletion of the 500 000 men Italy was supposed to have under arms in E. Africa.

Meanwhile, on March 18 Berbera was retaken as the result of a combined sea land, and air operation. Imperial forces soon the whole of Brit. Somaliland was recaptured, the Italian operation having thus lasted some seven months. Indications were, however, that the Its never effectively occupied the colony, failing to organise even a semblance of administration. Berbera was actually taken with little fighting, a tribute to the skill and daring of the operation which was effected by two landing parties, one mainly of Indian troops the other of Arab and Somali volunteers. The significance of the rapid advance to Daggabur (600 m N of Mogadishu), towards Jijiga and Harar, was that in this neighbourhood existed one of the chief passes into the great mountainous plateau known as the Abyssinian Highlands. The Its hoped to retire to this natural fortress and hold the limited number of practicable inlets in the expectation that the coming rains would restrict British operations to comparatively small columns. The series of operations in E. Africa was, in its way, as brilliant as the campaign of the W. Desert. If the army of the duke of Aosta was less formidable than that of Marshal Graziani the natural difficulties of the terrain were greater. If the pace was slower, except for the rapid advance northward from the Webbi Shibli in the direction of Jijiga and Harar, the size of the tasks which

formed the objective was far greater. The manner of the development of the campaign was in itself remarkable. Apart from minor operations, it began with an outstanding success in the N., between Kassala in the Sudan and Igordat, in Eritrea. Then at Keren as we have seen the Its found an extremely strong position where for weeks on end they offered a vigorous resistance and contrived to hold up the British advance on Asmara and Massawa. The Brit then initiated a gigantic turning movement from the N., which made rapid progress at first, but for long could not dislodge the enemy at Keren.

By March 27, however, the road to Asmara was open to the victorious troops of the Imperial Army of the Sudan. The final attack was delivered after fourteen days of fierce fighting, an attack which battered down the last remnant of enemy resistance and carried the Brit troops triumphantly into the town. Guns, cars, and great piles of rifles and equipment encumbered the roadside. The It garrison numbering 10 000 including Savoy Grenadiers, Carbiniers, and Alpini, with nearly 200 guns fought from prepared positions of great strength on peaks 4000 ft above the Eritrean plateau. They poured a withering fire on the Brit troops toiling up the steep slopes in a temp. of well over 100°. But nothing could deter the advance, not even reckless counterattacks by the Its, who realised that the fall of Keren meant the loss of Eritrea, the one really loyal It colony, the one outlet to the sea from the fastnesses of doomed Abyssinia. In Keren gorge where 1 m from the town the Its blazed 200 yds out of the road to thwart the Brit advance, the Brit soldiers fought hand to hand with machine gun crews which had been covering this obstacle. Harar fell at the same time and with this double success, the Brit obtained possession of three quarters of Eritrea and practically sealed the fate of the It force left in what remained of Mussolini's E. African empire. The last phase of the campaign now opened with the general crumbing of the force left to the duke of Aosta, viceroy of Abyssinia, Brit planes actually taking off It women and children to places of safety.

At the beginning of April more than half Abyssinia was in Brit hands. From Asmara Gen. Platt's troops were climbing down into 5000 ft high to capture Mekele while another column was reaching up the road to Adowa, the occupation of which was calculated to have a strong moral effect on both the Its and the Ethiopian patriots. In the central part of the front Gen. Cunningham's troops were marching from Harar and Dire Dawa along the two roads that converge at Mekele 150 m from Addis Ababa. Flying ahead 5 African pilots were destroying the railway and road at Welenchilli and Adama 40 and 60 m respectively, from the cap. In the S., the It garrison at Soroppe, near Lake Rudolf, was surrounded by African troops and surrendered. The sole port now left securely in the hands of the Its was Assab, for already Massawa

was threatened, and the navy were closely watching it. The only considerable tns. held by the enemy in the interior were Dessie, Gondar, and Addis Ababa. Gondar was all but cut off by Abyssinian patriots, who were pressing on round Lake Tana and the sources of the Blue Nile. Dessie was filling with retreating soldiers from Eritrea, who, while streaming through the Green Valley were subjected to a major bombing attack by the S. African squadrons who raked the roads in the valley from end to end. Revolt was now sweeping the country behind the It. lines. Ironically, along the Addis Ababa railway, Brit. imperial troops were hurrying to protect the Its. against their own native conscripts. Abyssinian deserters were sniping the Its. from the surrounding scrub everywhere except at Dessie and Addis Ababa, where It. white troops still outnumbered them.

The historic battlefield of Adowa now fell into Brit. hands and then the holy city of Axum, and on April 9 Massawa capitulated. In the whole country there were now left only more or less disorganised bodies of troops, groping their way towards Dessie, Gondar, and Jimma. Merce fighting in the Kombolcha Pass, 14 m. S. of Dessie, was the prelude to the Brit. capture of this mt. stronghold in the last days of April. But there was still a strong force of the enemy under the duke of Aosta, at Amba Alagi, another mt. stronghold. Here the Its. held out for nearly three weeks. By May 14 the enemy had been driven back by the S. Africans to the peak of Mt. Alagi, where they had tunnelled galleries into the cliff faces and cut gun emplacements out of the rock. Machine-guns and artillery fired from the narrow mouths of caverns where they were immune from anything except by direct hit. But there was one weakness in this well-nigh impenetrable stronghold. The long-prepared defences were intended to meet an attack from the N., and the S. Africans were piercing the vulnerable S. side. The siege of Amba Alagi reached its crimmest stage on May 14 when a terrible artillery bombardment almost wiped out the It. forces. Deserters at night stole their own lorries to escape. The Transvaalers blasted the Its. out of their dug-outs. Few escaped to carry back the tale of terror to the duke of Aosta's cavern—the very cavern in which Haile Selassie had sheltered five years previously from his It. conquerors. Some ten days later the duke of Aosta formally surrendered, together with some 19,000 prisoners. Thereafter there remained only small pockets of hopeless resistance. In only four months a well-equipped force of 135,000 Its. and 200,000 native troops, of which 170,000 were infantry, with a considerable air force and 212 aerodromes, under an able commander, had been smashed and scattered. Of this great host the Brit. forces under Gen. Cunningham had captured about 190,000; 125,000 had deserted leaving nothing remaining in military formation, apart from one or two small bodies, numbering altogether 6000, who were soon to be rounded up. The

hollowness of the It. claim that their opposition had contained in Abyssinia large numbers of Brit. troops who were urgently required elsewhere is shown by the fact that the Brit. forces at the beginning, when Italy took up arms, numbered fewer than 25,000 men, of whom only 5000 were white. At no time did the Brit. forces on all the fronts in E. Africa, even after the arrival of reinforcements from India and W. Africa, approach the strength of the combined It. metropolitan and native armies. And again, whereas the It. garrison had begun with hundreds of heavy guns, the Brit. forces had no more than 68 field guns. Yet in four months the Imperial forces under Gen. Cunningham had conquered three countries and reconquered a fourth, totalling some 700,000 sq. m., captured 120,000 prisoners, 800 heavy guns, and 150 tanks, as well as thousands of motor vehicles, thousands of machine guns, and millions of rounds of ammunition. Most preconceived ideas of colonial warfare were abandoned. In this remarkable campaign sheer speed broke the Its. The Brit. concentrated superior fire-power in a few unexpected places. Gen. Cunningham's victory was the story of battles which began among the swamps of the Juba R. that cuts off Kenya from It. Somaliland. He forced a passage over the stream at two points, cut through the It. lines, and his two columns converged on one another till they met behind the enemy and formed a triangle at the apex. In one increasing wave the Brit. forces swept up the coast through Kismayu, Brava, and Mogadishu, then wheeled left across the desert with lines of communications lengthening to 1500 m. Great tracts of unconquered ter. lay on either side, but still the Brit. forces pushed ahead, lorries, guns, hospital and staff cars roaring up the road to the all-important position of Juba. It was untechnical and unprecedented, but the Fascist forces, bewildered at the loss of morale, which spread rapidly through their ranks at length surrendered their chief stronghold, Keren, and that was really the beginning of the end. It is not a little strange that, at the beginning, between June and Sept. 1940, the Its. did not follow up their only success in capturing Kassala and Gallabat by a mechanised push on Atbara, the vital transport centre of the Sudan, and Khartoum. Such a move might well have brought the whole country under their yoke in a few days. In Kenya, too, they were advancing from Moyale to Buna, and in the Sudan, in Oct., they launched a drive into the S. of the country which, if better supported, ought to have reached the great Sennar Dam. The secret of the Brit. avoidance of disaster at this critical juncture, was that while machine-guns were being mounted on the walls of Khartoum, and tanks traps laid before them, the Brit. generals, by a policy of aggressive patrols and then rapid movement of their small forces, caused the enemy to believe that they were opposed by numbers tenfold as great as they really were.

It. resistance did not end entirely with the surrender of the duke of Aosta. The disorganised garrisons of scattered strongholds, particularly at Jimma, Debri Tabor, and Gondar in N. Abyssinia, protected by the seasonal tropic rains, held out for some weeks the last remnants of Mussolini's great army of Abyssinia. During this period, Ethiopian patriot troops took an effective part in operations which resulted in the capture by those forces alone of some 10,000 prisoners. The It. commander of the garrison at Debri Tabor, 60 m. E. of Lake Tana, surrendered early in July (1941), not long after the fall of Jimma, and with his surrender, the sole important remaining garrison was that at Gondar, a strong natural position almost comparable with Keren. In the 'Battle of the Lakes', the operations which virtually ended with the capture of Jimma on June 20, and resulted in the elimination of It. resistance from a vast area S.W. of Addis Ababa, the Brit. forces took over 30,000 prisoners and more than 100 guns. See also ITALO-ABYSSINIAN WAR, 1935-36. *Abyssinian Campaigns: Official Story of the Conquest of Italian East Africa (H.M.S.O.)* 1943; Christine Sandford, *Ethiopia under Haile Selassie*, 1946.

**Italian Front, First World War Campaign on.** Italy declared war on Austria-Hungary on May 23, 1915, and a general mobilisation was ordered for the next day but war was not declared against Germany until Aug. 23, 1915. On May 25 It. forces penetrated Austrian ter. in S. Tyrol and the N.E. corner of Venetia and along the Isonzo (q.v.). Gradisca was occupied within a few days and the crossing of the Isonzo promptly followed. On the W. flank progress was being made in the Trentino. Austrian posts on the Alps were taken by the Its. in rapid succession. At the end of May the frontier was crossed at Lake Garda at Riva (N. end of the lake). During the first week of June there was a stiffening of the whole line, and fighting became more serious. On July 20, the Its. gained a victory in an all-day fight on the Lower Isonzo. This developed into a series of conflicts on the Carso (q.v.). In Oct. the W. flank was improved by securing Mt. Nodda which gave the Its. command of the Ledro valley. During the winter of 1915-16 the Austrians were preparing a counter-offensive in the Trentino under the command of Archduke Charles, with Field-Marshal von Hotzendorff as his Chief of Staff. The attack was launched on May 14 and by May 19 the Its. were in retreat on the whole Trentino front and the Austrians reached It. soil. In ten days they had captured 21,000 prisoners and 250 guns. Asiago (q.v.) fell to the Austrians on May 29, and although their flanks were held, their centre continued to advance. The Its. counter-attacked, and by June 26 had recovered a good deal of ground. Gen. Cadorna (q.v.) the It. commander-in-chief, launched an offensive in the Isonzo on Aug. 6, 1916, and captured the bridgehead at Gorizia, with 10,000 prisoners. Further progress westward continued throughout the month. On Sept. 10, the Its. advanced

their right flank on the Carso and throughout Oct. and Nov. continued to press the Austrians back on their N.E. flank. In May 1917 a great offensive on the Isonzo was launched, progress being made chiefly N. of Gorizia, and with the help of Brit. guns a serious threat was made to the Austrians on the Julian front. Brit. monitors also fired on the rear of the Austrians from the gulf of Trieste. In June the Its. made some progress in the Trentino. On Aug. 19 they resumed the Isonzo offensive mainly across the Carso, and by the end of the month the high ground S.E. of Udine was in their hands. About this time, Ger. troops, under the command of Gen. Otto von Bulow, were being transferred to the Isonzo front, and attacked the Its. on Oct. 24, 1917. The Its. were thrust back at Caporetto (q.v.), and the rout continued until the Gers. captured Udine on Oct. 29. This exposed the Its. on the Carso to the danger of envelopment, and a hasty withdrawal was made to the Tagliamento: but here the Gers. forced a passage and the situation became critical. At this time five divs. of Brit. troops under Gen. Plumer arrived on the It. front. In Nov. 1917 Cadorna was succeeded by Gen. Diaz. The Its. defeated all attempts of the enemy to pierce the Piave front, so they turned their attention to the mt. sector further N. Here they gained some points, but the presence of Brit. and Fr. troops prevented any serious loss. In May 1918 Lord Cavan succeeded Gen. Plumer in command of the Brit. troops. On June 15, 1918, the Austrians launched their final assault. They attacked on a ninety-m. front with forty divs. from Asiago to the sea. The Piave was crossed at Montello, and Venice also was threatened, but the sector held by the Brit. stood firm against all attacks. Before the end of the month the Its. counter-attacked with the result that the Austrians were soon in full retreat. On Oct. 26 a great offensive was launched against the Austrians which turned the retreat into a rout and ultimate surrender. See L. Villari, *War on the Italian Front, 1932*; G. L. McEntee, *Italy's part in winning the World War, 1934*.

**Italian Front, Second World War Campaigns on.** For the events leading up to this campaign, see AFRICA, NORTH, SECOND WORLD WAR CAMPAIGNS IN.

*Fall of Pantelleria, Lampedusa, and other small Italian islands.*—Pantelleria, which, after 1937, was strongly fortified as a naval and air base, surrendered to allied forces on June 11, 1943, and was occupied by allied forces very shortly after the white flag was seen from the air flying from a hill top. This surrender was the first instance where a strongly defended enemy bastion has been conquered from the air. The air attack began thirteen days previously and by June 11 had swelled to a terrifying climax. Bombers, fighter-bombers, and fighters were sent against this one target. Flying Fortresses in greater numbers than ever previously used by the N.W. African Air Forces, made repeated sorties throughout the offensive, which lasted from dawn to dusk. Twice

the allied commander gave the garrison (numbering 10,000) a chance to end the destruction, and twice the garrison rejected the offer. The air bombardment was supported by naval bombardment and towards the end of the attack strong forces of cruisers and destroyers were firing salvoes at frequent intervals. Early in the offensive the airfield was wrecked. Every ship in the harbour was put out of commission. By dusk of June 10 the 1st batteries, well-concealed and in heavy gun emplacements, were silenced and the 1st's doom sealed. In addition to the garrison there were 6000 civilians on the 1st, but, happily, they suffered hardly any casualties, for the 1st consists of volcanic rock which is full of galleries and air-raid shelters. Lampedusa and the still smaller 1st of Linosa, both in the Pelagie group just over 100 m. S.W. of Sicily, held out but a very short time after the surrender of Pantelleria. Lampedusa was subdued after a naval bombardment followed by a heavy air attack and Linosa surrendered without a fight.

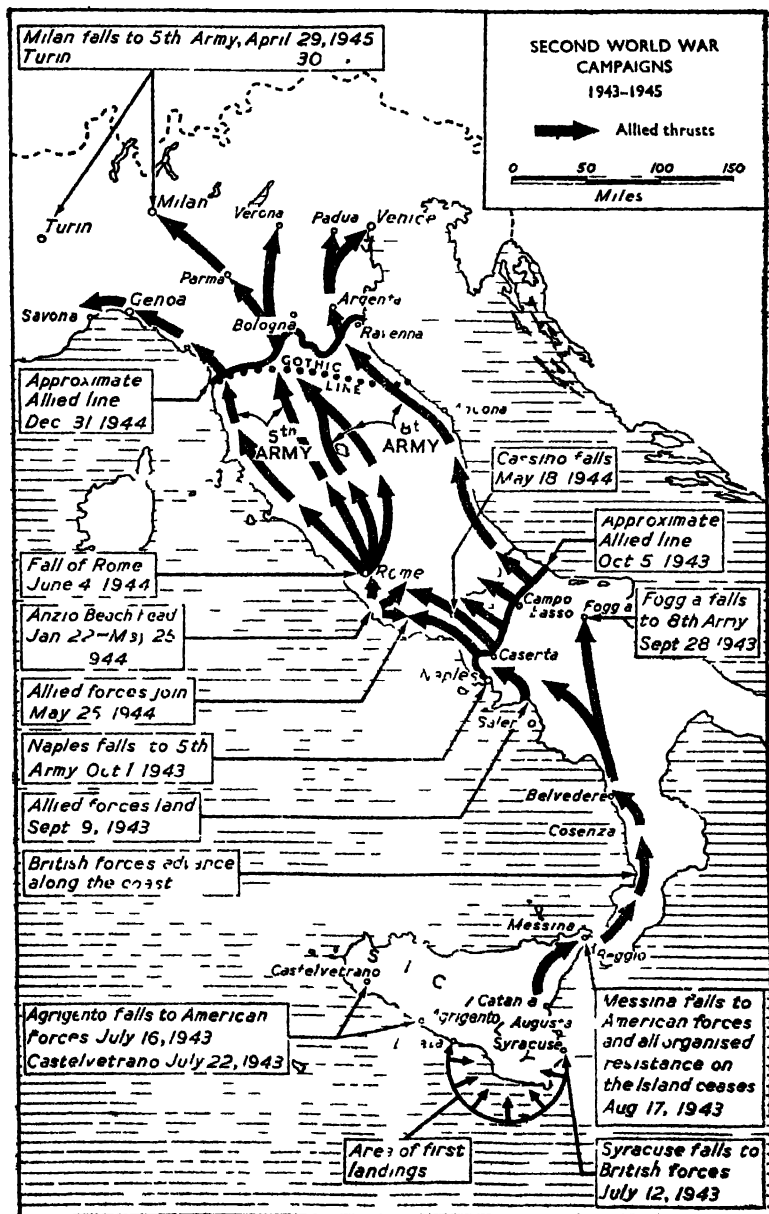

*The Battle of Sicily (July–August, 1943)*—Anglo-Amer forces under Gen. Alexander as deputy commander-in-chief, with Gen. Montgomery as commander-in-chief of the Brit. forces, in an armada of nearly 3000 vessels, invaded Sicily early in July, 1943. The first stage of the invasion started on July 10, soon after the occupation of Pantelleria and Lampedusa, when the allied air forces crippled the Axis air-bases in Sicily. This was so effective that the second stage, the establishment of bridgeheads in the 1st, was easily accomplished and the landings, preceded and accompanied by terrific air assaults and broadsides of warships commanded by Adm.-of-the-Fleet Sir Andrew Cunningham, on a 100-m. wide stretch of the coast from S. of Catania to Gela, met with only negligible resistance. The core of the invasion consisted of the seasoned troops of the Brit. Eighth Army, the Amer. Seventh Army and Canadian forces (First Canadian Infantry Div. and the First Canadian Army Tank Brigade). In the initial operations a large part was played by the troop-carrier command of the N.W. African Air Force and by paratroops, Amer. and Brit. Allied air forces acted throughout in close co-ordination with the sea and ground forces. 'Lightning' aircraft left a trail of ravaged lorries, armoured cars, and railway trains, and, in the vicinity of the ports, of small ships. Heavy day bombing attacks were made on Gerbini, Trapani, Milo, and Sciacca. Brit. raids by 'Wellingtons' were made at night on Syracuse and Catania. The Amers. took all the beaches assigned to them within three hours of their first landing. The strongest opposition was met in the Cape Passero area by Brit. and Canadian forces. The landings generally were less costly in casualties than had been expected and many hospital ships were held in reserve because they were not wanted. The next task was to secure the possession of the harbours and centres of communication on the coast and close behind it. By July 12 Gen. Montgomery,

with the Canadians on his left flank, seized the road and railway S.W. to Pozzallo in the extreme S. of the 1st, together with the port of Syracuse. In the other zone of operations—the bay of Gela—the Amers., under Gen. Patton, seized Gela, Licata, and other places along the Syracuse-Pozzallo road. Seven enemy counter-attacks, the strongest in the direction of Gela, were made with tanks and infantry and all were repulsed, 2000 prisoners being taken. Ragusa, Floridia, and Augusta fell on July 13 and two thrusts were now made from Syracuse and Augusta, northwards towards Catania and S.-westwards to the Palazzolo heights which dominate the plain of Catania. Most resistance came from two Ger. panzer divs., one facing the Brit. in the E. and the other the Amers. in the S. The allies soon penetrated in some sectors to a depth of 20 m. from the coast. By July 14 the Brit. Eighth Army was within 15 m. of Catania, but resistance was now obviously stiffening. In the W. the Amers. captured the important airfields of Comiso and Ponte Olivo. By this time over 12,000 prisoners had been taken, of whom 8000 were taken by the Amer. army. Though the Allied advance was speedy it was recognised by the commanders that, until the Catania plain and the Gerbini airfields were in their hands, resistance would be protracted, particularly in the mountainous regions of the N.E. and around Etna. Considerable gains, however, were made on July 15–16, the Eighth Army advancing sev. m. beyond Augusta, and its spearheads striking into advance units of a powerful Ger. force. Heavy losses were inflicted on the Axis forces in the W. sector, where the Amers. advanced sev. m. across difficult country. Simultaneously with these operations, the heaviest combined air assault theretofore launched from N. Africa was made on Naples (July 17) by more than 500 aircraft mostly from the N.W. Amer. Air Force, part of the Neapolitan naval arsenal being destroyed. Agrigento fell to the Amers. on July 16, a day of confused battle, with guns firing steadily from almond orchards and olive groves all round the city; but its ten towers were unscathed. At the same time Porto Empedocle, named after the Sicilian philosopher, also fell. The following day (Caltanissetta), on the railway linking Agrigento and S.W. Sicily with Catania and Messina, was taken by Gen. Patton's troops, 20 m. to the E., the Canadians took Piazza Armerina and both Amers. and Canadians were now advancing on Enna, the most important junction in the 1st. The Eighth Army, which had the hardest task in the campaign, was now some 3 m. from Catania. On July 19 Rome was raided for the first time, when Amer. bombers attacked marshalling yards and railways—a raid which was to have immediate and profound effects on the political situation in Italy. On July 21 Linosa fell and Amer. and Canadian forces were now threatening to turn the whole enemy line. With the Amer. Seventh Army were Moroccan Goums, who distinguished themselves as

mt infantry just as they did in the coastal mts of N. Tunisia. With the Eighth Army's estab on July 19 of a bridgehead S. of Catania the Axis forces now began a general though orderly retreat towards Messina. In the area S. of Catania about 6 m. in width and 1 m. in depth, the Germans had frequent counter attacks despite mounting casualties. Among their troops were remnants of the revived Hermann Goering Panzer Grenadier Div but their numbers were dwindling. Casualties to Brit forces were far lower than had been anticipated. The Allied advance in the W. half of the is. continued with great rapidity. Castelletto with its important airfield, originally built for patrolling the Sicilian channel fell on July 22. Marsala was then abandoned by the Axis troops. The threat to Palermo was accentuated Allied troops being now only 25 m. away, while other troops of the Seventh Army were nearing the bay of Termini on the N. coast. Palermo fell to the Seventh Army on July 23, the enemy being completely surprised by a rapid thrust by advanced troops of highly mobile forces. By this time the Seventh Army had taken 27,000 prisoners, 250 guns and 10,000,000 rounds of ammunition besides destroying 84 tanks. The success of the Sicilian campaign coupled with the bombing of Rome, now had its political repercussions in Italy. For Mussolini resigned and the king of Italy assumed supreme command of the It. armed forces with Marshal Badoglio as the new prime minister. By the end of July the number of prisoners was 75,000, three fourths of this total being taken by the Amers and it was now clear that the battle of Sicily had entered its culminating phase—the struggle for Catania and Messina. The general offensive for these positions began to develop in Aug. following a week of intensive preparation during which large reinforcements of men and guns had been moved up to the front. The Brit 78th Div captured Centuripe after some very bitter street fighting. The 1st (Highland) Div. advanced on their right. To the left the Canadians captured Rexaluto where the opposition was especially fierce. Further N. the Seventh Army captured Trapani (Aug. 2), Cerami and Caltanissetta. On the coast road the advance continued in the face of extensive enemy demolition. But the fate of Catania had been sealed at Centuripe, nearly 20 m. away, for the commanding heights here gave the allies control over the road from Catania round the W. of Etna in the same way that the Navy had given control of the sea round the E. of I. Iona. In such predicament the enemy had no alternative but to fight in the city to the last or to escape under cover of darkness. He chose the latter. One strong reason for retirement was that greater threats to the mainland of Italy were now impending. Brit forces entered Catania early on the morning of Aug. 5, the city being taken without a shot being fired. Following on the capture of the tn. of Bronte the immediate objective of the Allied forces was Randazzo on the N.W. side of Etna and the key to the whole

Axis defence. The Amers, having landed parties at two points on the N. coast so as to command coast roads to Randazzo, while the Brit took Acireale, the respective Allied armies were now fast converging on Randazzo. German resistance had now however become more tenacious than ever. The enemy tactics relied above all on demolitions and minefields protected with well-sited machine guns, their hope being to evacuate the bulk of their armies under cover of rearguard actions to the It. mainland. The rugged terrain was well adapted to these tactics. Randazzo however, eventually fell (Aug. 13) to the steadily concerted Allied pressure. The enemy had already been driven from most points N. of Randazzo, and (Mazze and Riposto) on the E. coast had been occupied. The Axis line in Sicily now collapsed and their forces were in full retreat. Messina fell on Aug. 17 to the Amers who made contact there with the Brit. Eighth Army later on the same day. All organized resistance in Sicily had now ceased. The Sicilian campaign had thus ended after thirty-eight days and the Allied forces stood 34 m. from the It. mainland. Owing to the proximity of the mainland the Germans were able to run the gauntlet of air bombardment in the straits and to bring a large part of their troops away. Generally, their retreat never became a rout. The conquest of Sicily finally sealed the mastery of the narrow seas to the S., where previously only Malta held out in lonely loyalty and the possibilities opened up were now almost unlimited. The total Axis casualties were 165,000. Of the 10,000 to 15,000 Germans on the is. at least 10,000 were lost. Many of these were killed between Aug. 5-17 when the Allied air forces destroyed or damaged some 400 vessels trying to cross the straits. Over 100 main guns and 260 tanks were destroyed or captured, while well over 100 aircraft were brought down or captured. The Allies lost 103 tanks and 251 guns, and comparatively few aircraft. The total allied casualties were about 25,000—about 14,000 Brit and 11,000 Amers.

**Allied Invasion of Italy.**—Prior to the actual landing on It. soil, Brit and Amer warships shelled roads, power stations, railways and other objectives particularly in Calabria. Reggio, where were important airfields, was also heavily raided from the air. Stromboli and the Lipari is. surrendered to Amer naval forces at the same time. Some days later the Allies directed a great air offensive against the It. railway system to sever its S. arteries. Foggia, Salerno and Benevento were among the most severely attacked places. The Brit. Eighth Army landed near Reggio di Calabria and advanced, without encountering much opposition, on Palmi. Then Allied air forces, operating in great strength made a prolonged attack on the Naples area, the main effort being against airfields. All these formidable attacks, coupled with invasion, quickly had political repercussions, for on Sept. 8, Gen. Eisenhower announced that the It.

Gov. had surrendered its forces unconditionally and an armistice was granted. Hostilities between the Allies and the forces under Marshal Badoglio (g. r.) therefore ceased and all Its. who co-operated in ejecting the Gers. from Italy were promised Allied support. The Fifth Army under the Amer. Gen. Clark, including a Brit. corps, landed near Naples at 4 a.m. on Sept. 9, the Brit. and Amer. warships covering their disembarkation. Soon three Allied forces were advancing inland from each corner of a great triangle to seize the whole of the foot of Italy. The Fifth Army was meeting intense Ger. opposition on the Salerno beaches in a struggle which was developing into a great battle for Naples. Part of Montgomery's Eighth Army was advancing northwards in Calabria. Other elements of the Eighth Army, having taken Brindisi and Taranto, were following retreating Ger. forces to the N. of those tns. The most desperate fighting occurred for the Salerno bridgeheads, the tn itself having quickly fallen. The Gers. hoped to hurl back the invaders into the sea and, holding the high ground overlooking the Allied positions, were able to subject the Allies to a devastating fire from well-sited guns. But the bridgeheads from Salerno to Agropoli held firm, while over more reinforcements in men and material poured into the beaches and also into more southerly ports, covered by naval and air forces. The enemy had the advantage in the air, for whereas the Allied fighter planes of the N.W. African Air Force had to fly from a great distance, the Ger. fighters could operate from near bases. Allied air forces, however, flew over 800 sorties on Sept. 13 to support the infantry and gunners who were fighting on the open crescent of the plain of Salerno without cover of vegetation or terrain against an enemy skilled in the defensive use of hills dominating almost every point of the bridgeheads. The fighting there now grew more intense than ever, and, to harass the Ger. reinforcements, the N.W. African Air Force on Sept. 14 made the most concentrated offensive until now of the whole Mediterranean war. Meanwhile the Eighth Army, having seized Bari, Canosa, and Belvedere, were making forced, if unopposed, marches to link up with the Fifth, from which they were now separated by 70 m. Throwing a powerful mobile force across the Apulian plain, they then captured the important air base of Foggia (Sept. 28), considerable casualties being inflicted on the Gers. In the advance, extensive demolitions had been carried out by the enemy at Foggia and, the Apulian aqueduct having been destroyed, the tn. was without water. At the same time Castellanovo was taken by the Fifth Army, whose tank spearheads were thrusting across the plain towards shattered Naples, while other forces were pressing on through difficult mountainous country N. of Salerno. The frenzy of Ger. demolitions in Naples and on the road to the city indicated that the Ger. commander, Kesselring, had no intention of defending it. It took the Fifth Army six days to pierce the

Ger. defensive ring in the wild mts. separating Naples Plain from the gulf of Salerno. Among the crags and along the valleys were fought some of the bitterest engagements of the war. Ger. rearguards had to be bayoneted, bombed and blasted from their strongpoints. Brit. troops played a great part in fighting a way through. Shortly afterwards the naval base at Castellammare 14 in. across the bay from Naples fell, and the whole Sorrento Peninsula was in Allied hands. Naples fell on Oct. 1 to Gen. Clark's army. Bombing and Ger. demolitions had left deep scars on the city. Most of the public buildings, factories, wharves, ware houses, and installations of military value had been destroyed, mainly by fire. Shops were empty, roads closed, and streets mined and demolished. As the Allies had long foreseen, the Gers. had evacuated the city in order to take up a very strong defensive position on the Volturno R., and on the line of that riv. bitter fighting lasted for some time. Meanwhile against growing resistance the Eighth Army pushed W. from Termoli on the Adriatic coast. The Fifth and Eighth Armies were now in contact with each other and the Allied line ran from Naples through Caserta, Campobasso, and S. Martino to Termoli. By capturing the tn. of Capua early in Oct. the Fifth Army at length won a bridgehead on the Volturno R. But though they advanced to the entire W. course of the riv. in a single day, progress in the difficult country of the Apennines was slow. Towards the end of the month there was a general advance on the whole of the Allied line except at its extremities. It was evident that the line from Vasto on the Adriatic to Mondragone on the Tyrrhenian sea, by way of Isernia and Venafro, would be strenuously defended by the enemy, for it represented the strongest position that could be held S. of Rome and all roads now led to the cap.

Isernia, a pivotal point in the Ger. defence and centre of their lateral communications, was captured by the Eighth Army on Nov. 4. The Gers. were also driven off Monte Massico in the S., the Allied armies making a substantial advance along the whole line from the Tyrrhenian coast to the knot of the Montagna di Matese in the centre of the Ger. line. Almost simultaneously the Eighth Army struck across the Fregio R. on the section of the front near the Adriatic coast, but there were strong prepared Ger. defences across the riv. 5 m. behind and much bitter fighting lay immediately ahead. Vasto, on the coast, was taken on Nov. 7 without a fight. Though unimportant as a harbour, it gave command of most of the road running S.W. to Castiglione. Meanwhile the Amer. Fifth Army had advanced past Venafro in the centre and, on the extreme left, their patrols crossed the Garigliano riv. (Casalbordino fell to the Eighth the next day but only after heavy fighting which, however, brought Montgomery's forces to the banks of the Sangro. Desperate Ger. counter attacks to drive the Amer. troops N. of Venafro into the Volturno valley failed. The capture of

Castiglione on Nov. 10 gave to the Eighth Army control of the whole road from Vasto to this important supply point in the Apennines. The flying of the swastika over the vil. of Castelforte, on the N. side of the now swollen Garigliano seemed more than anything a gesture of defiance; but it symbolised the Ger. command's long obvious determination to stand and fight along the magnificent defensive positions on which it had now been thrown back. This defensive line is not a single line nor yet even a series of lines; rather is it a mass of easily-defended hills or mts. 36 m. in depth. The Fifth Army was now only on the approaches of these positions. Savage counter attacks were launched to meet virtually every Allied improvement of position. It was evident to the Allied Command that, in view of the enemy's defensive strength, even local attacks and breaches might require long planning for what seemed to be disproportionate effort.

The Gers. were, in fact, well placed in Italy. They now had ten divs. on the central front facing the Fifth and Eighth Armies along the Garigliano-Sangro line, stretching across the narrowest part of Italy. Its centre, the central massif of the Apennines, is the highest and wildest country in the whole range. The Ger. hope was that, even if Montgomery broke the Sangro line and threatened Rome from the N.E., they could at least hold him for a time in the mts. between the two fronts. Altogether the Gers. now had at this time (Nov. 19) nearly fifty divs. in Italy and the Balkans, an increase of from 10 to 15 divs. in the past month and obvious evidence of their realisation of the Allied threat to the whole S. and S.E. of Europe.

On Nov. 29 Gen. Montgomery, after a period of heavy rain and bogged conditions, began a new offensive across the Sangro, his attack being preceded by a demolishing air and artillery bombardment. Allied mastery of the air was so complete that in its initial attack the Eighth Army succeeded in gaining positions along the outer edge of the Gers.' winter defence line. Brit., Indian, and New Zealand troops made determined attacks, the enemy resisting with successive counter attacks supported with tanks including flame-throwing tanks. The sternest fighting was around the vil. of Mozzagrona and Santa Maria, which are 4 m. from the sea, and also in the Archi area where a second bridgehead was established. On Dec. 1 the Eighth Army made a general advance along its whole right flank and shattered the most important part of the Gers.' winter line in Italy. Lanciano, Castel di Frontano, and Casoli, on the lateral road from the Adriatic to the centre of Italy had now fallen to Montgomery, whose advance was aided by the Tactical Air Force's devastating assault on Ger. positions and transport and their close support of the attacking troops. The Gers. were now falling back in the Sangro sector, but the pursuit was hampered by the bad weather. Large quantities of guns and equipment were

abandoned by the enemy, who had suffered severe casualties and was now rushing up reinforcements from N. Italy. In the ensuing days, in the W., Gen. Clark's Amer. and Brit. Forces, in a desperate struggle in rainy weather and across country which remains flooded and waterlogged long after the rains cease, slowly but surely drove the enemy from his strongly fortified positions on and around Monte Maggiore and Monte Camino. But the Gers. fought grimly to defend their vital defences along the road to Rome. Hills, valleys, and ravines were defended with all the devices of mines and entanglements calculated to delay advancing troops, while deep in the mt. slopes gun emplacements were hewn out of the rock to a depth of 8 ft. or more. Transport was so difficult and troops in such inaccessible places that supplies had to be dropped to them from the air. In the E. the Eighth Army, despite a deluge of rain, crossed the Moro R., Canadian troops securing positions N. of it, including Ortona.

Thereafter, for five weeks, there were no marked changes in the respective positions of the opposed forces. But on Jan. 18, Brit. troops of the Fifth Army eventually crossed the Garigliano in the Tyrrhenian coastal strip in face of fierce yet ineffective Ger. resistance. On the next day very hard fighting developed particularly round Minturno, Castelforte, and Subiaco. Hard also was the struggle on the high ground covering the Appian Way where it runs by the sea towards Formia and Gaeta. The destruction of bridges and the sowing of innumerable landmines hampered progress. In the attack on a 7-m. front from Minturno and Castelforte cruisers and destroyers of the Royal Navy bombarded shore positions in the gulf of Gaeta. Initially successful sea-borne landings were made on Jan. 22 by Fifth Army troops S. of Rome near Nettuno and Anzio only 32 m. from Rome, the troops advancing well inland before meeting any resistance. The Gers., far from expecting such a move, had sent strong reinforcements, including their best motorised Panzer Grenadier divs. from the Rome area, S. to the Fifth Army front, where by then they were believed to have 100,000 men. The new Brit. landings were covered at sea by naval forces—Brit., Amer., Gk., Dutch, and Fr. under the command of Adm. Lowry of the U.S. Navy, Adm. Troubridge of the Royal Navy commanding the forces which landed the Brit. troops. The simultaneous Allied air offensive was directed against the ring of airfields round Rome and then on rail and road communications radiating northwards from the cap. These attacks by Flying Fortresses, Liberators, and R.A.F. Wellingtons ranged along every railway artery in the triangle formed by Rome, Pisa, and Florence. Other targets were Civita Vecchia, the nearest port N. of Rome, and a villa near Frascati (15 m. S. of Rome) which was known to be the carefully-concealed headquarters of Oberkommando Sudwest, the U.S. 12th Air Force scoring twenty-six

hits on the villa. Along the Garigliano valley advancing Brit forces repulsed heavy Ger counterattacks between Castel forte and Minturno (Jan 22). Even by the 25th no effective resistance to the landings had been met and still more troops and supplies poured into Nettuno. But to the S the Gers launched still more violent counter attacks against the 15th Army's main front in the Garigliano and Rapido R's area, most of these onslaughts being hurled back with heavy loss to the

found time to concentrate a powerful army in the Alban hills overlooking the beach-head, bringing substantial reinforcements from great distances. An Allied advance across the Apennine Way met with stiff resistance and on Feb 3 the Gers opened their first major attack on the beach head. This was sustained with varying intensity for more than a week and although it was eventually fought to a halt, it had succeeded in establishing a firm investment of the Allied positions. ANZIO MEN OF THE 2ND INFANTRY BRIGADE LEAVING LANDING CRAFT, JANUARY 22 1944

enemy particularly around Minturno. There were also violent struggles for the commanding position of Monte Croce N of the important and hotly contested town of Cassino. By Jan 29 the Amer forces had crossed the Rapido.

After the Anzio Nettuno landing had been successfully made, it seemed that sea power despite the loss of two cruisers and two landing craft, had intervened with decisive effect to turn the flank of the Ger position on the Cassino front and cut the lines of communication to Rome. When, therefore, in the first few days hardly any opposition was met, it seemed possible that the Ger. commander, Kesselring, must begin a general withdrawal. Gen. Alexander, however, found it necessary first to consolidate his position on shore but, before he could do so, the Gers. had

the initiative passed for a brief space to the Allies when Brit troops advanced near Cassino but four days later Kesselring resumed the assault with a furious attack on a narrow front along the Anzio Albano road. Deep penetrations were made in the Allies position, but after some days of exceptionally bitter fighting this second Ger attack also commenced to falter. The heavy guns of the Allied fleet intervened with powerful support and as the tide of assault began to turn, the bombers of the 15th Army concentrated their weight against the flapping Ger attack and by Feb 22 it was evident that this attack too had spent its strength. In the ensuing week of bad weather Kesselring regrouped his divisions and prepared to deliver his third attack. This was shorter than either of the first two

but it exceeded both in intensity. It was delivered early on the 29th, Kesselring's tactics on this occasion being to concentrate a great weight of attack upon a very narrow front, while trying to contain the Allied forces holding other sections of the perimeter by subsidiary or local operations. The main blow was delivered with three divs. against a sector of no more than a thousand yards on the Carroccio side of Cisterna, the aim apparently being to strike at the hinge between the Brit. and Amer. forces. It fell, however, directly on the Third Amer. Infantry Div., which included some of the most seasoned troops the United States had in the Mediterranean area. The Amers. were forced to yield some ground before the impact of so tremendous a weight of men and armour, but their counter-attack was soon launched and by the next day they had regained all the ground won by the Gers. Meanwhile the line as a whole had held at the other points attacked so that by March 1 the Gers. were everywhere back at their starting-points, having inflicted heavy casualties, but having themselves suffered much more severe losses.

*General Alexander's Attack on the 'Gustav' and 'Hitler' Lines—Capture of Rome.*—On the night of May 11-12 Gen. Alexander launched a new offensive on the grand scale. This offensive was really the opening of the general assault on Hitler's fortress of Europe, it being the Allies' intention to invade France within a month and Stalin's to attack along the entire E. front almost at the same time, so as to embarrass the Ger. High Command with simultaneous offensives in the W., S., and E. Alexander's offensive was delivered after an intricate regrouping of armies, the main weight of the Eighth having been brought across to the W. side while the reconstituted Royal It. Army (Corpo Italiano di Liberazione) took over the Adriatic sector. Having crossed the Rs. Rapido and Garigliano, where these formed part of the Ger. 'Gustav' Line, the Allied forces were soon assaulting the whole line with irresistible force. In their victorious advance they were given tremendous air support. Heavy bombers, too, made a huge gap in the Aviano viaduct, thus stopping the movement of supplies through the Brenner Pass. Fr. forces—mainly Goums and other colonial troops accustomed to mountainous country—made a spectacular advance on Ansonia and the vicinity. Moving with incredible speed across many miles of difficult mt. terrain they captured Monte Majò, opened a dangerous breach in the Gustav Line, and disorganised the whole system of defences in this part of the enemy's line. The Fr. were helped by a corresponding Amer. advance to the S. Meanwhile Brit. forces were advancing through the mouth of the Liri valley and threatening the Via Cassilina and the Cassino position, while Polish troops had secured dominating positions N.W. of the Abbey (Monte Cassino). San Giorgio was carried by storm. Meanwhile the Amers. were pushing ever further along the Applan Way and the W. coast. At the same time,

with the capture of Pignatario by Indian troops of the Eighth Army, a substantial bridgehead was estab. on the N. bank of the Liri and the Ger. grip on Cassino, the Via Cassilina and the Abbey was relaxing. Cassino tn. eventually fell on May 18 to Brit. troops and the Abbey was captured by the Poles. (For an account of the protracted struggle for Cassino, Feb.-May, 1944, see *CASSINO, BATTLE OF*). With the fall of these famous positions the Gustav-Line S. of the Apennines had ceased to exist, and the victorious allies were everywhere advancing on the outposts of the 'Adolf Hitler' Line—the name of these rearward positions being some indication of their importance in the eyes of the Ger. Command. Farther S. the Fr. captured Esperia and the Amers., who had seized Formia, were now overrunning the Gaeta peninsula. So far some two fifths of the Ger. Tenth Army, which was holding the main front, had been almost destroyed. The Aquino-Pontecorvo position was now the lynchpin of Kesselring's defences, for it was the centre of vital road communications, which, if lost, would mean that the Allies might turn the whole N. part of the Hitler Line. Hence Ger. resistance now stiffened considerably and there were counter-attacks against both the Brit. and the Fr. tact. local reserves were thrown in an effort to save the situation, which, however, still further deteriorated with the loss of more high ground N.W. of Pico.

A new and dramatic turn was now given to the campaign by the sudden launching of a strong offensive by the Anglo-Amer. forces of the more or less dormant Anzio beachhead. This was in fact the second phase of Gen. Alexander's general offensive. The struggle now grew most intense: Fr., Polish, and Brit. troops were wrestling successfully with the dense and intricate Ger. defences of the Liri Valley centred on Pontecorvo and facing repeated and desperate counter-attacks, while the Amers., meeting with slighter resistance, were overrunning the trackless mass of the Volscian mts. to the S. Near Borgo Grappa, on the coastal highway between Terracina and Anzio, the beachhead forces at length linked up with the main Fifth Army front, so that a single Allied front now stretched right across Italy, separated from Rome by only 25 m. The whole of the Applan Way was now in the hands of the Allies. Allied tanks, supported by infantry, soon wiped out the last Ger. resistance in the centre of the heavily damaged tn. of Cisterna, and Brit. troops broke through the defences about the railway station on May 25. All that day a house-to-house battle was fought among the crumbled ruins of the tn. On the same day that Cisterna fell Pontecorvo was taken by Canadian armoured cars. That memorable day saw the whole original Ger. defence line shattered. Allied tanks were now massing with other strong concentrations in the coastal plain for a powerful thrust from the Applan Way to Highway Six (Via Cassilina), Kesselring's supply route. All through this day tanks and infantry

poured through the gap in the Hitler Line near Pontecorvo, forcing the enemy to evacuate the tn. and to swing back their line pivoting on the Aquino defences so that it now ran insecurely E. and W. on the S. side of Highway Six. The Ger. hold on the Via Cassilina was now so precarious that the withdrawal of their divs. from the Liri Valley was made due northwards instead of in the direction of Rome. Kesselring's forces were virtually split in two, one body retiring into the Apennines, the other into the Alban Hills, which latter constituted the last naturally defensible positions protecting the cap. from the S. Over 10,000 prisoners had now fallen to Gen. Alexander. Yet the Gers. continued to make a stout, if ill-organised, resistance. Kesselring, in the endeavour to retain Rome, staked everything on the defence of the strongholds of Velletri and Valmontone, the two bastions of the Alban Hills. The last battle for Rome now began. Fierce fighting raged in the Alban foothills, with desperate counter attacks by the Hermann Goering Div., which now re-appeared and temporarily checked the Amers. S. of Campo Leone the Brit. forces made a substantial advance. N.W. of Cassino New Zealanders were pressing onward to the important stronghold of Avezzano, through which ran Kesselring's vital escape route. Velletri was surrounded by June 2 after the Amers. had taken Monte Artemisio. Velletri and Valmontone fell to the Fifth Army that day and the fall of Rome was imminent. This outstanding and significant success in the Alban Hills was achieved after only a week of bitter struggle in which Ger. resistance grew more intense each day, the vineyards of Velletri being packed with Ger. snipers. Velletri suffered tragically in the encounter, and viewed from the Applan Way, which skirts the tn. on the W. side, it seemed as if not a single house had escaped damage.

The Fifth Army entered Rome on June 4, after some heavy fighting in the outskirts. The Gers. did little damage to the city, partly because their retreat was too precipitate and partly because Kesselring accepted proposals by the Vatican to declare Rome an open city. The main objective of Gen. Alexander was, however, not the occupation of Rome; it was the destruction of the Ger. armies. Leading elements of the Fifth Army passed through Rome on June 5 and crossed the Tiber. The wreckage of Ger. vehicles littered the road for 80 m. N. of Rome. Hundreds of heavy bombers joined the fighter-bombers in continuous attacks on the retreating enemy. Eighth Army infantry and tanks advanced along the whole line of attack. The total of prisoners had now risen to 26,000. Civita Vecchia, the naval base 40 m. N.W. of Rome, fell on June 7, Viterbo and Tarrquinia on the 9th. Further and further the Gers. were being forced back E. of the Tiber. The advance on the right was slower but the terrain was much more mountainous; but by the capture of Avezzano the Eighth Army gained control of the central Apennine sector while

on the coast Indian troops entered Pescara, the sluice gates of which had been destroyed by Allied bombers some weeks previously. Kesselring's line was now moving back across the whole width of Italy, swiftly in the W., slowly and steadily in the centre, and rapidly on the Adriatic.

After troops of the Seventh Indian Div. had crossed the Pescara and the tn. of Pescara had fallen resistance on the Adriatic coastal sector grew less stiff; there was, however, greater resistance in the W. especially at Grosseto and in the centre around Terni. By now Ger. strength in Italy had been halved by Gen. Alexander's offensive. But Kesselring still had the equivalent of twelve and a half divs. left to fight, three of them fresh including the Fourth Parachute Div. About 70,000 men or the remains of eight and a half divs. were now (June 23) deployed on a line across Italy which ran through Chieti, S. of Lake Trasimeno, N. of Perugia and to the Adriatic about 30 m. S. of Ancona. Heavy rains had given the Gers. a respite and enabled them to recover equilibrium. Eighth Army forces on each side of Perugia were engaged in very heavy fighting and it was apparent that the Gers. had no intention of withdrawing from their strong positions between Lakes Trasimeno and Chiusi without an attack in force.

A Fr. force landed on Elba on June 18 and, with the support of allied aircraft and ships, soon occupied a large part of the is., which was important to the Gers. as a submarine base. The chief obstacles to the landings was in the Golfo di Campo on the S. coast from powerful batteries on the Capo d'Enfola. They were strongly sited on granite heights but were put out of action by bombing attacks. By noon on the next day resistance ceased with the capture of Portoferraio, the remainder of the garrison, numbering nearly 2000 Gers. being captured.

*The Allied Advance to the 'Gothic Line.'*—The advance of the Allies to the so-called 'Gothic Line' involved sharp fighting in difficult mt. country, but by early July the Eighth Army had broken through the Ger. defences to the W. of Lake Trasimeno and in the direction of Arezzo, 20 m. N. of the lake. The Gothic line ran from Pisa on the Tyrrhenian coast to Rimini on the Adriatic; it had been powerfully fortified for a year past because it was the penultimate line of natural defence before the valley of the Po and, if the Allies broke it, Kesselring's only remaining substantial line was the curve of the Apennines E.S.E. of Genoa. The Fr. corps now took Siena, an ancient city which was an important point on the W. approach, by the Via Cassia, to the Gothic line. A fortnight later Polish troops took Ancona and the Amers. entered Leghorn where the port installations were found to have been destroyed. The capture of Ancona was a swift exploit helped by Polish tanks, and over 2000 prisoners were taken. The enemy, however, maintained a very stubborn defence along the high ground facing the Eighth Army in front of Florence, the outskirts of which great city the

Eighth reached soon after the capture of Arezzo. By the end of the first week of Aug. Brit. troops held that part of Florence which lies S. of the Arno, but great care was taken in their use of heavy weapons to avoid damaging historic buildings, and this retarded progress. The Gers., however, soon abandoned their loudly-proclaimed pretence of keeping Florence an open tin, and already all the bridges across the riv. except the Pontevecchio were wrecked by the Fourth Parachute Div. At the end of Aug., however, the Gers. had been forced back into the Gothic line and Polish troops were in Pesaro on the Adriatic and engaged in bitter fighting against the Ger. First Parachute Div. Eighth Army infantry and tanks had now crossed the R. Foglia and were strongly attacking the Gothic line. The campaign entered a new and significant phase in the opening days of Sept. with the Gothic line broken along a 20 m. front in the Adriatic sector, a general advance of the Eighth Army's front, the capture of Pisa, and an advance by the Fifth Army across the Arno. The breaching of the Gothic line by the troops of the Eighth Army was an outstandingly decisive victory for allied arms, in which Brit., Canadian, Polish, It., and Indian troops had all taken part since the attack was launched on Aug. 26, for the 20 m. stretch of that line from Pesaro inland was the most trusted Ger. defence work outside Germany itself and was intended to form one of the main buttresses of Hitler's fortress of Europe.

*The capture of Rimini—The Gothic Line overcome.*—Rimini, E. pivot of Kesselring's position, fell to the Eighth Army on Sept. 22 after one of the stiffest battles that Army had had to fight in the course of its long advance from Egypt. The battle of the Gothic Line and of the Apennines ended when First Gk. Mt. Brigade and Canadian tanks captured the deserted and auct. city of Ravenna, while the Brit. and Empire forces further inland were driving over the last foothills of the Apennines to reach the Marecchia R., which runs from Arezzo to Rimini, and thereby to render the city untenable. In front of the Allies now lay the Lombardy Plain, with the Po valley stretching out beyond. The Eighth Army were now within striking distance of the Via Emilia, historic road along the Po valley to Bologna and Piacenza. In these operations two Ger. divs. had lost most of their effective strength, while losses far heavier than those they had suffered at Cassino had been inflicted on the First and Fourth Parachute and four other divs., including the crack Twenty-Sixth Panzer Div.

Ten days relentless attack against the Gothic Line defences in the central sector had left those defences a shattered mass of rubble and battered fortifications. The Gothic Line could have been the most formidable artificial defensive system the Brit. had so far encountered. But its defects were that it was overlooked from the S. and lacked depth. Moreover, many individual works were badly sited and their construction incomplete or

shoddy, perhaps the deliberate sabotage of It. contractors. The fiercest struggle in the battle for the Gothic Line was for the high ground which commanded the Rimini gap: while the fighting for Gemmano, Croce, Sansovino, and Coriano proved to be some of the bloodiest in the hist. of the Brit. Army. Ger. reinforcements to the extent of five divs. were rushed up in the hope of saving the Gothic Line. Gemmano changed hands ten times. Then Gen. Leese, commanding the Eighth Army, pushed the Canadian corps into the gap between the sea and hills without waiting for the hills to be cleared. The experiment succeeded. While the Canadians drove on to capture San Fortunato ridge overlooking Rimini and the Marecchia valley, the sorely-tried Brit. Home line regiments, in a magnificent riposte, carried Croce and Monte Colombo. The Ger. abandoned most of their prepared positions and retired to the N. slopes of the Apennines, where they were well served by the numerous roads of the Po valley, leaving the Allies to maintain forward communication through the rough trails over the mts. The Ger. left flank was covered by a great depth of defensible riv. lines.

*Ravenna and Faenza captured by Allies*—*Savio, Senio, and Santerno rivers crossed.* After this series of successes there followed a long lull, broken a month later when the Eighth Army advanced between the Via Emilia and the coast, driving the Gers. back to the Savio R. Six weeks later Ravenna was entered by the Eighth, the city being outflanked by a Canadian unit, Princess Louise's Dragoon Guards, in a brilliant encircling movement which forced the Gers. to withdraw to avoid being trapped. Then twelve days later, on Dec. 17, after highly effective operations in which Gen. Freyberg's New Zealanders played the chief part, the Eighth Army captured Faenza and carried the allied line nearer Bologna. But the lull was resumed and four months elapsed before the Allies struck again in Italy, though in the meantime they rendered valuable service in holding down twenty-five well-equipped Ger. divs. at a time when the Allies were carrying out their great attacks on the W. and E. Fronts. From the Allied viewpoint the main difficulty in Italy lay in the nature of the country. The Fifth and Eighth Armies had advanced northwards over mts., across rivs., and through defiles in terrain peculiarly adapted for defence, and they had never at any time had a sufficient superiority in numbers and equipment to enable them to achieve a decisive success. For, as the demands of other fronts grew, the It. theatre of war had to take a subordinate place and for about four months, owing to wintry conditions, it had been quiescent. The co-ordinated attack on Germany from the S. may be said to have begun on April 10, 1945, with the opening of the allied offensive on the It. Front to compass the destruction of the Ger. Army of the Po and drive it away from the industrial area of N. Italy, and eventually to

link up with the Allies in Yugoslavia and Austria.

The Senio R. was crossed on a wide front in the vicinity of Lugo, N. of the Rimini Bologna highway. A day later troops of the Eighth Army, now under Lt Gen McCreery, were across the R. Santerno in strength and at once encountered strong resistance. Other troops landed from Lake Comacchio in the rear of the enemy positions.

*The final Allied offensive launched—Fall of Bologna and Modena—Po crossed.*

Castel san Pietro, on the Via Emilia, was strongly defended but Brit troops entered the town on April 17 and pushed on N.W. towards Bologna, bypassing Argenta. Next day the Argenta gap providing the sole practicable route for mobile forces W. of Lake Comacchio, was brought under Brit control with the capture of Argenta on the evening of April 18 and the advance of the Brit. troops towards Bocca Leonc and Ferrara. From Locatone to Lake Comacchio the Gers had their last and toughest defence line, a continuation

A CANADIAN SKI TRAIN IN THE ITALIAN MOUNTAINS

—The Allied offensive was soon extended to the Fifth Army under Gen Mark Clark N. of Bologna. His attack like that of the Eighth Army, was preceded by air blows on a formidable scale by both strategic and tactical air forces. The offensive was led by the Tenth Amer Mt Div which was fresh and well equipped for its arduous task of overcoming this rugged Apennine sector. The Eighth had now crossed the Sillaro R. which runs parallel with the Santerno bridgeheads being won on both sides of the Ravenna Bologna road. The Gers brought up reinforcements and there was heavy fighting at Bastia, a key position on the Ravenna Ferrara road. They made desperate efforts to hold the vital Argenta gap but the Brit forces pressed on and established another bridgehead across the Sillaro. Huge allied bombing raids were made on a score of targets S. of Bologna in support of both the Fifth and Eighth armies.

of the vain gloriously named 'Gonzghis Khan' line along the R. Idice designed to cover the approaches to the Po. But already the Eighth Army had shown superb skill in crossing rivers held by some of the best troops in the Wehrmacht in formidable natural positions strengthened during the winter months with all the ingenuity and thoroughness of the Ger. High Command. Following a week of heavy fighting through mountainous country S.W. of Bologna Amer troops entered the Po Valley W. of Bologna on April 20 cutting the Via Emilia between Bologna and Modena. Bologna fell to S. Africans of the Fifth and Poles of the Eighth Armies on April 21, Amer forces advancing 20 m. beyond in pursuit of disorganised Ger formations. Bologna was the first great objective of the Allied spring offensive. Thus the Allies now stood inside the gateway to the Po plain. With Fifth Army troops closing on Modena and those of the Eighth

closer to Ferrara the full power of the Mediterranean Allied Tactical Air Force was turned on the Gers, penetrating across the Po valley, with devastating effect, and on April 21 the Allied armies reached the Po. A ceaseless attack was maintained throughout the night against enemy columns on the roads and against ferry and pontoon crossings of the Po from Mantua eastward to the Adriatic. Allied air forces sustained the attack through the following day. Bridges across the Adige S. L. of Verona and at Idria were bombed and trucks and locomotives destroyed. Next day there were important developments. Allied troops stormed across the Po less than twenty-four hours after they had reached the river (April 24). At the same time three great cities of N. Italy fell to them. Spina, important naval base on the gulf of Genoa, Modena, a big communication centre 23 m. N.W. of Bologna, and Ferrara, another communication point 3 m. S. of the Po. Already over 40,000 prisoners had been taken by the two armies.

**Americans capture Verona and Genoa.**—With the Amers well across the Po the Gers became thoroughly disorganized and their resistance collapsed. The road from Bologna to Verona passed through a flourishing countryside almost unscathed by war. The almost complete absence of blown bridges across the Po and of shell-riven buildings showed how precipitate had been the Ger retreat. Bridging the Po by pontoons was a laborious task, owing to the steepness of the bank and the delay involved in dragging heavy pontoons across the Apennines. Verona fell on April 26 to the Amers, who then crossed the Adige near the city. It was in a pitiable state, one third of its buildings being destroyed or damaged by allied bombing, and more wrecked when the Gers blew up all seven bridges over the Adige before the Amers reached it. Genoa was occupied by Amer Nisei troops on April 27. It partisans having previously seized control of a large part of the city and facilitated the entry of the troops. The patriots in fact now controlled much of N. Italy. Amer armour advancing along the Via Emilia from Parma captured Piacenza midway between Parma and Milan.

**Milan entered—Mussolini executed by Italian partisans.**—At Lecco, in the hills above Como, Mussolini was arrested on the same day by customs guards while he was trying to escape into Switzerland. Next day the ex-Duce and twelve members of his Fascist cabinet were executed by It. partisans, who carried their bodies to Milan for public display just before the Fifth Army entered the city (April 29). The bodies of the executed fascists were exposed in a square where fifteen partisans had been shot a year previously.

**London troops in Venice.**—14th Army across the Adige near Padua.—Troops of the 56th (London) Div entered Venice on the evening of April 29. The Allied advance now swept rapidly across the N. of Italy liberating Bergamo, Brescia, Vicenza and Padua, while, as mentioned above,

the Amers entered Milan. In this swift movement the Fifth and Eighth Armies drove through the enemy's strong defensive Adige line forcing the Gers back to the S. side of the Brenta. A whole Ger. infantry div surrendered to the Brazilian expeditionary force. Negotiations were now in progress for the surrender of the Ligurian army commanded by Marshal Graziani, who was now a prisoner in allied hands. Eighth Army forces near Idria crossed the Adige in face of great difficulties, the crossing being a major engineering feat on account of the fast flowing and swollen current of the river and the destruction of all bridges.

**German armies disorganised—Lurin entered.**—By the end of April the liberation of all Italy was nearing completion. The Ger armies were so broken and disorganised that they had virtually ceased to exist as military forces. This destruction had all been accomplished in an offensive lasting only twenty days for the Eighth and fifteen days for most of the Fifth Army. Twenty-five Ger divs, some of which had been torn to pieces and were no longer able to resist the Allies. Thousands of vehicles, tremendous quantities of arms and equipment and over 120,000 prisoners had been captured. The military power of Germany in Italy had practically ceased even though scattered fighting might continue as remnants of the retreating enemy were mopped up.

Lurin was entered by Amer in entry on April 30 having been captured a short while previously by It. partisans. On the other side of N. Italy Treviso was taken by the 5th S. African armoured div. New Zealand troops crossed the Piave and the 6th C. column which was advancing on Idria from the S.E. after the city had been captured was intercepted and broken up with the loss of many prisoners. Troops of the 10th Amer mt. div crossed the Adige in assault boats and captured Mussolini's villa at Garzanti. Other Amers seized crossings over the Tizno and advanced across the Brenta. Marshal Tito's Yugoslav troops broke into Trieste and were fighting in the area of Trieste. Troops of the 2nd New Zealand Div, after crossing the R. Isonzo, reached Montebelluna and made contact with forces of Marshal Tito's Yugoslav Army (May 1). The Sixth Brit. Armoured Div entered Trieste on the same day. Other Eighth Army troops passed through Vittorio Veneto, scene of a great Allied victory in the first World War and reached Belluno. The Fifth Army continued to advance along the gulf of Genoa and occupied Savona.

**Italian partisans in control of northern industrial region.**—The efforts of It. partisan forces, which, in Lurin and Milan, did not wait to be liberated but struck timely and powerful blows against the Nazi and fascist forces, greatly contributed to the enemy's defeat and disorganisation. The liberation of Milan by the combined efforts of the Committee of National Liberation and partisans represented the culminating effort of the resistance move-

ment, which during the previous year had been organised to a high degree of efficiency; and what happened in Milan and Turin happened also in Genoa and in nearly all the big cities of Lombardy and Piedmont. The result was that the greater part of the industrial equipment of N. Italy—factories, foundries, power stations, and hydro-electric plants—were preserved intact in so far as it was undamaged by allied bombing. In the case of Milan abortive negotiations had been in progress for two months between the Committee of Liberation and the Ger. and Fascist authorities, with the object of ensuring that the Gers. should not wreck factories when they withdrew. Hence, when the Fifth Army crossed the Po, the Committee decided that the time had come to put into action plans prepared for a general insurrection, with the object of seizing control before any harm could be done. The Gers. had no fighting troops in Milan at this time, and the Fascist militia of 100,000 men were unreliable and soon yielded to the partisans. Sporadic fighting continued for a short time but soon the committee of liberation was in control and had taken over the administration of the city.

These events were the prelude to the total collapse of Ger. and Fascist resistance in Italy and their unconditional surrender to Field Marshal Alexander.

*Unconditional surrender of German and Fascist Armies.*—Long negotiations preceded the unconditional surrender of the Ger. and Fascist forces in Italy. They actually began as early as Feb. and most of what took place was without the knowledge of either Hitler or Himmler. The allied offensive, which began on April 9, was not affected by these negotiations, but doubtless in its turn it expedited the decision finally taken by the Gers. to surrender. On March 19 there was a conference near Locarno in Switzerland between two representatives of Sir Harold Alexander's staff and Gen. Karl Wolff, senior J.S. officer of the Ger. forces in N. Italy, at which the Allied officers told the Ger. general that Field-Marshal Alexander was interested only in getting authorised Ger. representatives to Caserta to accept unconditional surrender. Eventually, on April 27, Wolff and two Ger. plenipotentiaries arrived in Switzerland and were brought by allied aircraft to Caserta next day. On the morning of April 29 the Gers. were told that either they must surrender unconditionally or the negotiations, which had been begun the previous day, would end without further delay. The Gers. then accepted the Allied terms for the surrender of their entire forces under Col. Gen. von Vietinghoff-Scheel's command to Field-Marshal Alexander, Allied Supreme Commander, Mediterranean. The instrument of surrender was signed in Caserta Palace, near Naples on April 29, the terms to be effective from noon, May 2. The ter. of the Ger. 'South-West Command' included all N. Italy to the Isonzo R. in the N.E. and the Austrian provs. of Vorarlberg, Tirol, and Salzburg, and portions

of Carinthia and Styria. The enemy's total forces surrendered numbered over 900,000, the combatant troops of which included the remnants of twenty-two Ger. and six It. Fascist divs. The terms involved the unconditional surrender by the Ger. commander of all forces under his command or control on land, sea, or in the air and the immediate immobilisation and disarmament of enemy forces. It was also provided that the instrument would be superseded by any general instrument of surrender imposed by the United Nations and applicable to Germany and the Ger. armed forces as a whole. The surrender of so much ter., which allowed the Allies to advance without opposition to within 10 m. of Berchtesgaden, hopelessly compromised the so-called 'southern-doubt' founded on Bavaria, to which the Gers. on the W. and E. Fronts intended to fall back after their forces had been split in two by the junction of the W. Allies and the Russians on the Elbe (see also WESTERN FRONT IN THE SECOND WORLD WAR). The total number of Ger. prisoners taken by the Allies on the It. front before the end of hostilities was 230,000.

The New Zealand Div. occupied Trieste on May 2, Gen. Freyberg accepting the surrender of the Ger. garrison. New Zealand forces also occupied Gorizia. The presence of Tito's and other Yugoslav troops in part of Trieste and elsewhere within Italy's E. borders was, however, provocative of awkward territorial and political questions. Troops of the Eighth Army on May 7 crossed the It. frontier into Austria at a point N. of Udine. This movement of the Eighth Army was now linked up along almost its entire course from N. to S. with the line of the Russians' movement to the W. By the creation of this line a boundary was set up which marked the limit of Brit and Russian operations. This line ran from Liezen, half way between Klagenfurt and Linz, through Judenburg, Koflach, 15 m. W. of Graz, and thence due S. to the Yugoslav frontier. See G. Carr, *Today—Italy the Target*, 1943; W. B. Kennedy-Shaw, *Long Range Desert Group*, 1943; C. Buckley *Road to Rome*, 1945; A. Moorehead, *Elbows*, 1945; H.M.S.O., *The Report by the Supreme Allied Commander, Mediterranean, to the Combined Chiefs of Staff on the Italian Campaign*, 1948.

Italic Dialects, see LATIN LANGUAGE.

Italics, letters of It. origin, said to have been an imitation of the hand-writing of Petrarch. They were introduced by Aldus Manutius of Venice in the sixteenth century for the purpose of printing his projected small ed. of the classics. The cutting was entrusted to Francesco de Bologna. The caps were square Rom. letters, but the small letters, sloping to the right, were designed to imitate hand-writing, even containing a large number of tied letters. Although i. are not joined to each other in modern printing, the ligatures or connecting lines at the beginning and end of each letter are a prominent feature. They were introduced into

England in 1524, and are used to distinguish words, sentences, or sometimes such portions as introductions and prefaces which do not properly belong to the work. They are generally used for unassimilated foreign words occurring in Eng. text, for quotations, and for words requiring special emphasis.

**Italo-Abyssinian War (1935-36).** This conflict arose out of what was known as the Wal-Wal incident. A dispute between Ethiopians and Its. over the ownership of scattered wells in a sandy desert had led to fighting between It. and Abyssinian forces on Dec. 5, 1934 - but, in its wider implications it was, or became, the focus of the international relations of the greater part of the world and, indeed, it would not be untrue to say that it was the virtual beginning of the Second World War in 1939.

It. claims to spheres of influence in Abyssinia, first made towards the close of the previous century, were nullified by Gen. Baratieri's signal defeat at Adowa (Adua) in 1896 at the hands of the Amharans, which resulted in a treaty signed at Addis Ababa recognising Abyssinian independence. This disaster always rankled in It., and one of Mussolini's motives in going to war was that of revenge as well as to outshine the glory and complete the work of the Risorgimento. An Anglo-It. accord of 1891 had recognised the It. zone of influence over almost all modern Abyssinia, but this and later agreements and treaties were superseded by still later agreements, and the whole position was governed by a tripartite treaty between Great Britain, France, and Italy (1906), the terms of which were largely determined by the Italo-Ethiopian Treaty of 1896 (see ABYSSINIA). But despite this settlement, It. foreign ministers had always schemed for the recovery of It. influence, and these aspirations naturally grew more marked after the conquest of Tripolitania and Libya, thus holding out the hope of a vast It. empire in N. Africa. Abyssinia, however, confirmed her independence by being admitted, with the strong support of Italy, a member of the League of Nations, whereby it became the duty of the League to assist the Ethiopian Gov. so that it might develop the country's economic resources and improve the social welfare of its people. In 1935, however, Mussolini charged the Ethiopian Gov. with failing to fulfil its special obligations as a League member, particularly in respect of arms traffic and slavery, and, indeed, he made no secret of his intention to invade the country. The League endeavoured to stay his hand by setting up a committee to consider how to promote assistance for Abyssinia so as to secure administrative reform and economic development. The It. Memorandum of Sept. 22, 1935, in reply, called attention to the internal conditions of Ethiopia, and demonstrated the existence of an essential distinction between the countries of the east. Amharic stock and the outlying recently-conquered areas, averring that the Ethiopian rulers had so exploited these areas for their slave trade that they

presented an urgent case for It. intervention and that, in any case, the authority of the Negus (Emperor) did not extend to such areas. The Committee then proposed certain territorial adjustments in Abyssinia in favour of Italy in the vicinity of the Somaliland coast, Britain offering Zeilah (a port in Brit. Somaliland) to Abyssinia by way of compensation. But the It. Gov. rejected these overtures and contended that Abyssinia was incapable of respecting international agreements of any kind. It was now too late to stop the It. invasion, but the League, faced with the necessity of implementing the much-advertised Covenant (see COVENANT OF THE LEAGUE OF NATIONS) now proposed to put economic sanctions into operation against Italy as an aggressor State, and restrictions on trade with Italy were enforced six weeks after the invasion began. This naturally only served hopelessly to embitter Anglo-It. and Anglo-Fr. relations with out producing the desired result, and the next diplomatic move was the morally still worse Laval-Hoare plan for 'exchange' of ter., which, in reality, was a one-sided transaction whereby Abyssinia was being called upon to make the sacrifices and Italy invited to do the taking, and which contained an equally one-sided proposal for a 'zone of economic expansion and settlement.' The League rejected the plan, and the question which now came before it was that of oil sanctions, a drastic step which Mussolini said Italy would regard as an unfriendly act. The situation seemed the more grave from the very fact that the Brit. fleet in the Mediterranean and the forces in Egypt had been greatly augmented, while the Fr. Gov. had agreed, in the event of an It. attack on the Brit. fleet, to co-operate in resistance; but in fact Britain was not in a position to enter on a major war. 'Collective action' was on its trial, but no prominent member of the League was anxious to make the first move, especially as the U.S. gov. declined to take any part in the move. Moreover tension in Europe generally increased by reason of Hitler's denunciation of the Locarno treaties (q.v.), a factor which, it was feared would have repercussions on the Abyssinian war, Italy being a guarantor under those treaties. Peace feelers were now thrown out by the League, to which Italy returned an evasive reply, while Marshal Badoglio intensified his efforts to crush the Abyssinia forces before effective negotiations could thwart Italy's victory. The negotiations, however, were not continued and soon afterwards hostilities ceased with the fall of Addis Ababa in May, 1936.

**Military Operations.**—The It. invasion was launched on Oct. 3, 1935. Mussolini's war aim being to unite the hitherto isolated It. possessions, Somalia and Eritrea, by conquering all or part of the intervening and independent kingdom of Abyssinia. Hence he delivered his attack simultaneously on two fronts, though the only obvious objective, apart from the psychological import of capturing Adowa, was the railway. Abyssinia's sole route for

Gen. de Bono began three operations simultaneously: an assault on Adowa, which was taken within a few days; an advance southward through Tigré; and an advance from Musa Ali near the Danakil Desert; while Graziani advanced through the Ogaden to menace the Harar plateau and the railway from the S. But the Musa Ali operation dwindled away and Graziani's advance came to a standstill early in 1936. After four months he was little further advanced than when he started. Had the Abyssinians at once exhausted themselves in massed attacks the It. advance at this stage would no doubt have been much more rapid. Bands of Abyssinians from the Tembien mts. and Amhara carried out unexpected successful attacks, these regions not being included in the It. plan of campaign. Early rains, too, helped the Abyssinians; and the earlier air raids failed to impair the morale of the people. Moreover, It. hopes of detaching from Haile Selassie (*q.v.*) not only the recalcitrant Tigrean Races, but also the grievously-oppressed non-Amharan subject peoples, such as the Danakil, Somalis and Gallas, proved ill-founded for the most part, though the Wallo Gallas turned against their Amharan overlords and their disaffection had some influence on the war in the N. zone at its most critical stage.

Throughout the campaign the It. generals took pains to keep down to a minimum the casualties in the ranks of the It. troops, as much as possible of the fighting being left to the airmen, tanks, and armoured cars. If infantry had to be used, the hand-to-hand bayonet fighting was imposed mainly on African natives—Eritrean conscripts and Somali or Libyan mercenaries. The total death-roll was It. troops of African race, 1593; It. workmen, 153; It. troops of It. race, 2313 of which number at least 1000 died of accidents or sickness. The Abyssinians could mobilise a million men; but the Imperial Guard, trained by European officers, only numbered 30,000 of the total, and even these had but only the most elementary training in W. methods of warfare. The rest of the forces were feudal levies raised by local chiefs, lacking training in modern weapons. It is believed that they had no more than 100,000 modern rifles, about 400 machine-guns, and no artillery. When the advance began Graziani had only two divs. at his disposal, the great majority of the It. forces, for political reasons, being concentrated in Eritrea mainly with the view of wiping out the ignominy of Adowa in 1896.

*The Campaign in the North.*—At 5 a.m. on Oct. 3, 1935, the first detachments of the It. forces in Eritrea crossed the March and advanced on Adowa, while their planes raided that tn. and Addi Grati, the latter being occupied next day. A little resistance was met between Addi Grati and Adowa, but on the morning of the 6th, when the It. entered Adowa, they found that the forces of Ras Seyum, Commander in the Tigré, had retreated during the night. The capture of the tn. was, however, celebrated with great rejoicings

throughout Italy. The absence of effective opposition from Ras Seyum lent plausibility to the It. propagandist version that their invasion was in the nature of a peaceful occupation of a countryside, whose people were eagerly awaiting liberation. During the halt after Adowa It. proclamations were issued announcing, *inter alia*, the abolition of slavery and the suspension of customs tolls. As a result defections of inhabs. during the first few weeks were on an extensive scale. The most notable desertion was that of Dejazmach Haile Selassie Gugsa, governor of the E. Tigré and son-in-law to Haile Selassie, the Emperor, who is said to have bitterly resented the appointment of Ras Seyum to the command in the Tigré, and de Bono rewarded him with the appointment of Ras of the Tigré.

On Oct. 15 a deputation of priests handed to de Bono the keys of Axum, the holy city of Abyssinia, which, according to tradition, still held the Ark of the Covenant, brought from Jerusalem by the Queen of Sheba. When the next general move forward began on Nov. 3 towards Mikale, 35 m. distant, neither Ras Seyum nor Ras Kassa of Amhara offered any opposition; but it took the It. five days to cover the journey, heavy rains complicating their transport problems. There now ensued another prolonged pause for road construction and consolidation of ground occupied. But this tardy mode of campaigning did not please the It. gov. or Italy and de Bono was superseded as High Commissioner and Commander-in-chief by Marshal Badoglio, Chief of the It. General Staff, and the most distinguished It. soldier of the time. Time was of the essence of the campaign, for the League had just then decided to impose economic sanctions on Italy as an aggressor, and de Bono's Fabian tactics were unsuited to the altered conditions. Badoglio soon showed that the invasion was the reverse of a peaceful colonial enterprise, and he made no effort to conciliate the inhabs. of the occupied zones, an attitude wh. 2, as later events proved, heralded the adoption in March of the next year of the policy of nightfulness. On Dec. 4, the It. occupied Abbi Addi, cap. of the Tembien, a dist. of rugged heights, cliffs and ravines which the It. never really succeeded in 'combining' or 'mopping up.' Elsewhere on this front the It. forces consisted of little more than scattered outposts.

By Dec. the Abyssinian forces had been strengthened by the arrival of Ras Mulhgeta, War Minister and an Adowa veteran, with detachments of the Imperial Guard. The first really serious engagement of the war on the N. front began on Dec. 15 on the It. right, where Abyssinian detachments from the forces of Ras Idris, governor of Gojjam, had crossed the Takazze riv. in an attempt to turn the It. flank. The It. were driven back 15 m. and the Abyssinians, pressing hard upon this sector, regained most of S. Shire by the end of the year. They also succeeded in reoccupying Abbi Addi at a heavy loss and gained control of the Adowa-Mikale road, thus leaving their foe in a dangerous

salient at Makalle, with the prospect of the May rains precluding any further advance. But Badoglio had made good use of the pause in constructing roads and in re-organising his forces. When he took the initiative again he proved the equal of his foe in mobility and much his superior in strategy and in armaments. In the second week of Feb. 1936 he advanced with a speed which surpassed all expectations and which he maintained till the end of the mobility of his forces not being affected to any extent by rain. Six battles, indeed, were fought and won in a campaign largely through the skill of the Italian engineers and labour corps. Early in the previous month Mulugeta occupied Amba Aradam a mt. 12 m S of Makalle thereby blocking the way to Amba Alagi and supporting Ras Kassa and Ras Seyum in the Tembien. Then followed a five-day battle in the Tembien (Jan. 19-23). There were repeated attacks and counter-attacks by both sides particularly at the Warieu Pass, N of Abbi Addi, which was held by It. Blackshirts.

The Abyssinians now overconfident were massing their forces in order to contest any further It. advance tactics which were certain to play into the hands of their enemy, for while their forces remained scattered the It. use of artillery and air bombardment was much restricted. The battle of Amba Aradam (Feb. 11-13), fought in most intricate country was a disastrous defeat for Mulugeta who did not foresee that Badoglio would attack on both flanks and so surround him. By Feb. 15 Ras Mulugeta and the remnant of his army were fighting their way through and in full retreat southward, while It. planes bombed them relentlessly. Their total losses were said to be about 20,000 men in this one battle. There seems but little doubt that Mulugeta's decision to hold Amba Aradam was the turning point in the fortunes of Abyssinia for while the It. advance could have been checked, it is evident that the defeat of the Imperial Guard accelerated the Abyssinians' disintegration and shattered their morale. The First It. Army Corps then began a cautious advance on Amba Alagi, a strong natural position which was held in considerable force, but owing to the treachery of the suborned Gallas and other tribesmen the flanks of the loyal Abyssinian tribesmen forces were left exposed and the position fell on Feb. 28. Meanwhile the Third Corps moved westwards and secured control of the main line of communication from Dessye to the Tembien. The forces of Ras Kassa and Ras Seyum numbering 30,000 men were now thus almost encircled from the S by the Third Corps, from the N.E. by the Kiritrean Corps, which had been guarding communications from Makalle, and from the N.W. by both the Second Corps based on Axum and the Fourth Corps of new reinforcements. The Abyssinians were driven out of their fortified posts after fierce fighting and heavily bombed as they retreated to the fords of the Takazze, Ras Kassa and Ras Seyum, with the remnant

of their forces—a great many deserted to resume their agr. pursuits—made their way southward and, later, joined up with the Emperor's forces near Lake Ashangi. The Second and Fourth It. Corps now converged on Ras Imru in S. Shire, using a good deal of poison gas. The Abyssinians fled across the Takazze with heavy losses. The way was now open to Badoglio for an advance towards Lake Tana and by mid-March the It. had crossed the Takazze, 'combed' the Semien massif, and entered Walkait across the Setit R. At the same time an It. column of 5,000 men left Asmara in 100 motor vehicles to make a dash on Gondar. They reached their goal over 300 m of difficult terrain in two weeks, but encountered no resistance. On April 12 the It. flag was hoisted on the N. shore of Lake Tana and in Gallabat. The First and Third Corps were also rapidly advancing S. towards Lake Ashangi, while the Third Corps was moving from Abbi Addi towards Sokota, an important junction. The main Abyssinian army, under Haile Selassie himself, was posted near Kworam S. of Lake Ashangi. The Emperor had left Dessye and come N. in the hope of rallying his forces. But the morale of the Abyssinians was crumbling against the terrible weapon of mustard gas, dropped in containers or sprayed from aeroplanes over soldiers and civilians indiscriminately and over the undergrowth in which they sought shelter. Yet they were still capable of a last desperate stand against the It. advance on Lake Ashangi and on Sokota towards the end of March. Anticipating Badoglio's pincer movement the Emperor moved northward for Kworam with 21,000 men and attacked the First It. Corps at Mal Gai above the lake (Mar. 31). The Abyssinians displayed great gallantry but as has been seen, pitched battles were hopeless against modern European forces. The fighting continued till April 4, the Abyssinians holding their ground against gun and air bombardment with forlorn tenacity, finally fleeing in disorder to Dessye, bombed by aircraft along the road. Some of the Emperor's own secretaries and closest collaborators were in the pay of the It. and was borne out by the accuracy with which the It. were able to forecast the Emperor's moves and send bombing planes wherever he went in an attempt to kill him. The persistence with which they attempted to get rid of the Emperor and the eventual results of his departure from the scene justify the view that the whole Ethiopian structure depended on him personally and would collapse if he were killed or removed. Dessye, occupied on April 15, now became Badoglio's headquarters. During the month Addis Ababa was often visited by It. planes. No bombs were dropped, but the machine gunning of the aerodrome and the tales of defeat brought by stragglers from the battlefields deepened the gloom of the inhab., though they still seem to have entertained hopes of assistance from the League of Nations. When that hope

vanished, a proclamation was issued calling on all males to report for military service. On April 30 the Emperor returned to his cap together with Ras Kassa and other generals, just after the Its. had succeeded in piercing the S. defences. The failure of the Emperor's appeal for recruits on May 1, coupled with attacks on his life by his subjects turned brigand, broke his will to further resistance. He had already arranged for the Empress and his family to leave the country, and at the last moment he decided to accompany them. One of his last orders was that his palace should be thrown open in order that the people of the city might take its contents. The result was a vulgar orgy (May 2-4) of looting, rioting, and burning, which involved more than five hundred deaths, including some foreigners. It was not until Marshal Badoglio made his triumphal entry into the city on May 15 that order was restored.

*The Campaign in the southern zone.*—The chief objective of the army on the S. front was the occupation of Harar but Graziani was hampered by the smallness of his forces and his long lines of communication based on Mogadishu and Bandar Qasbi. The main body of the Ethiopian army in the S. was concentrated round Harar and Jijiga under Dejazmach Nasibu. Dolo, near the Kenyan frontier, was occupied at once in order to hold Ras Desta in check. By the end of Oct. the whole of the region between the Wehi Shebeli and the Fafan, S. of Gorahel, was in It. possession. The fall of Gorahel (Nov. 7) was due largely to air raids, and this had a decidedly adverse effect on Abyssinian morale. But on Nov. 11, the Abyssinians won a considerable action at Anile, 30 m. S. of the important Abyssinian post of Dargu Bur, ambushing a number of It. tanks. This defeat, coupled with the rains, led to an It. withdrawal all along the line, while Ras Desta, hitherto inactive, began an advance on Dolo so as to divert It. attention from their drive northwards. In mid-Dec. the main body of his troops were located by aeroplanes 150 m. N.W. of Dolo. An air attack took place near Negelli and Dargu Bur was bombed every day. The ensuing pause enabled Graziani to organise the local tribes. Ras Desta who had made a leisurely descent from the highlands on Graziani's rear, delayed over-long in country where his enemy could make the best use of his modern armament and transport. But despite gallant rearguard actions, the attacking Somalis, Askaris, and It. national troops proved too much for them and they were finally routed by It. tanks in the rear and then subjected to aerial bombardment in their headlong retreat into the Sidamo foothills. Mechanised It. detachments arrived in Negelli, 210 m. from their starting-point, on Jan. 20. This victory and the occupation of Negelli, besides removing the threat to his flank and to his communications, allowed Graziani to advance northwards as soon as weather and other conditions permitted. Moreover, the advance was a valuable political set-

off to de Bono's delays in the N. campaign; and though it was not strategically of much importance, it fully served its political purpose. Graziani now spent his time in consolidating his hold over the country between Dolo and Negelli. When, at the end of the month, the It. advance was resumed, the Abyssinians had greatly strengthened their defences before Jijiga and Harar with deep entrenchments, redoubts and machine-gun posts, which system of defences became known to the Its. as the Abyssinian 'Hindenburg Line.' Both these lns. were heavily bombed from the air with incendiary and explosive bombs, though Harar had been proclaimed an open tn. The Its. now advanced up the valleys of the Wehi Shebeli and the Fafan, and by April 27 they were in possession of the Abyssinian 'Hindenburg Line.' There was, however, fierce fighting near Sasa Baneh, both sides suffering heavy losses and Graziani had to call a halt, owing to the exhaustion of his men. The Abyssinian position, however, threatened as it was in the rear with a possible attack by the It. army in the N. was hopeless in any case, and still more so if they delayed too long in the 'Line.' On April 29 Sasa Baneh and Bulale were captured by Graziani after desperate fighting, the occupation of these two places marking the final collapse of the Abyssinians in the S. The further progress of the It. troops was checked by heavy rains, but by May 8, they reached Harar and by their arrival saved the city from the looting and burning that had marked the abandonment of Addis Ababa.

Later, Haile Selassie went to Djibuti and sailed for Palestine. Soon afterwards the It. gov. announced that Italy had annexed all Abyssinia and made Victor Emmanuel its Emperor. Five years later, following the brilliant Brit. campaign in It. E. Africa, Haile Selassie re-entered Addis Ababa as Emperor. See further under ITALIAN EAST AFRICA CAMPAIGN IN (1940-41) and WORLD WAR, SECOND.

Cremona, *Italy's Foreign and Colonial Policy, 1914-1937*, 1938; Christine Sandford, *Ethiopia under Haile Selassie*, 1946.

Italy, republic in the S. of Europe, comprising the peninsula which extends southwards from the Alps into the Mediterranean Sea, together with the is. of Sicily, Sardinia, Elba, and various small is. The Alps form a semicircular barrier which separate it from the continent of Europe, from France on the N.W., Switzerland on the N., and Austria on the N.E. Its boundary on the W. is that portion of the Mediterranean known as the Tyrrhenian Sea, while its E. shores are washed by the Adriatic. Its greatest length, measuring in a straight line from N.W. to S.E., is

710 m., its breadth ranges from 354 to 20 m., having an average breadth of about 90 m. The total area of I. was estimated (1945) at 310,000 sq. km or 119,660 sq. m. of which 100,480 q. m. are accounted for by the mainland, exclusive of Sicily (9935 sq. m.) and Sardinia (9299 sq. m.). N.I. is cut off from the rest of the peninsula by the Apennines, which branch off from the Maritime Alps E. of Nico, and run in a S.E. direction from the gulf of Genoa to the Adriatic Sea. The range then turns more to the S. near Urbino, and extends as far as Capo Spartivento in the 'toe' of the peninsula, thus forming the backbone of Central and S. I. It is convenient to consider the peninsula under these three divs.: N., Central, and S. N. I. embraces the provs. of Liguria (Riviera of Genoa), Piedmont, Lombardy, Emilia, and Venetia, including the Trentino. Lying between the Alps and the upper Apennines is the wide plain which forms the basin of the Po. This is shut in all round from Mentone to the gulf of Trieste by the towering Alpine wall, called from W. to E. the Maritime, Cottian, Graian, Pennine, Helvetian, Rhaetic, and Carnic Alps. The highest point is the Gran Paradiso (13,652 ft.), a peak of the Graian Alps. The loftiest summits of the Alps are not included in I. ter. To the S. of the Alps, in the N. of Lombardy and Venetia, lie the beautiful lt. lakes, Lago di Garda, Maggiore, Como, Lugano, and Orto. The fertile plain of Lombardy, as already mentioned, is watered by the Po, which rises near Monte Viso, and is enriched on its way to the Adriatic by numerous tribs. and int. torrents. The prov. of Venetia, to the N. and E. of the Po, is traversed by the Adige, Brenta, Piave, and Tagliamento. Along the coast of the Adriatic, N. and S. of the Po delta, there exist large tracts of salt water, known as lagoons, brackish and marshy dist. They are separated from the sea by narrow banks of sand in which are inlets, so that the lagoons serve as harbours. The chief of these is that on which Venice is situated. It extends over nearly 10 m. from Torcello in the N., Chioggia and Brondolo in the S. The S.W. coast-line of N. I. is formed by a narrow strip of land, closed in by the steep abrupt rocks of the Apennines, and known as the It. Riviera.

**Geography.**—The geography of Central and S. I. is mainly determined by the Apennine range, which, sloping across the head of the peninsula as well as down its length, extends for about 750 m. The culminating point of the border range between N. and Central I. is the Monte Cimone (7110 ft.). The Apennines in Central I. are broken up into many short ranges, particularly in Tuscany. The chief peaks are Monte Catria (5590 ft.), Monte della Sibilla (7663 ft.), Monte Vettore (8128 ft.), and Pizzo di Sevo (7945 ft.), while the culminating peak of the whole range is Monte Corno (9577 ft.) in the Gran Sasso d'Italia. Central I., according to the general div., comprises the five provs. of Tuscany, Rome, Umbria, Marche, and Abruzzi. The first named is watered by the Arno,

Cocina, and Ombrone, all rising in the Etruscan Apennines and flowing into the Tyrrhenian Sea. But the most important riv. of Central I. is the Tiber, the riv. of Rome, which is navigable for 90 m. The chief lakos of this region are the Lago di Celano and Lago Trasimeno, while the Lago di Bolsena, Lago di Vico, and Lago di Bracciano occupy the craters of extinct volcanoes. The volcanic tract extends from the Monte Amiata (5690 ft.) in Tuscany to Vesuvius (nearly 4000 ft.), a detached and active volcano in Campania. On the W. the Apennines slope down to the Pontine marshes, S. of Rome which is connected with the Terra di Lavoro, the plain of Campania, and on the E. to the broad Apulian plains. The provs. of S. I. are Campania, Apulia, Basilicata, and Calabria. The main ridge of the Apennines is continued due S. by the Monte della Maddalena, culminating in the Monte Pollino (over 7000 ft.). The low hills N. of the Gulf of Taranto, between the 'heel' and the 'toe' of I., are of Pliocene formation, while the Calabrian Hills are a broken limestone range where the height rises to 6000 ft. in La Sila, a densely wooded granite mt., the highest peak being Aspromonte (6420 ft.). The rivs of S. I. are not of great importance. The Gariellano flows in a westerly direction into the gulf of Gaeta, about 15 m. from the mouth of the Volturno. The Sele is a short river flowing into the gulf of Salerno. The chief rivs. which flow into the gulf of Taranto are the Agri, Vulture, and Bradano. The rivs. of the E. coast are numerous, and are all short and rapid, the principal, S. of the Po, being the Foglia, Metauro, Fiume, Cilent, Tronto, Sangro, Tefano, Biferno, Fortore, Cervaro, and Ofanto. The coast-line along the Adriatic is practically unbroken but for the promontory of Gargano. The is. of I.—Sicily, Sardinia, Elba, the group of Lipari Is. N. of Sicily, Giglio, Capri, etc.—are dealt with in separate articles. The harbours of the Adriatic are Venice (pop. 303,200), Ancona (90,000), Brindisi (42,000), Barietta (46,000), and Bari (197,100); the large harbours belong to cities of the W. shore, Genoa (pop. 619,300), Spezia (111,700), Leghorn (124,700), Civita Vecchia (23,100), Naples (944,000)—and in the S. is the fine harbour of Taranto (180,800). The cap. of I. is Rome (pop. 1,573,900), and its prin. inland tns. are Turin (702,000), Milan (1,270,000), Verona (162,900), Mantua (712,900), Parma (122,500), Modena (112,700), Bologna (279,200), Florence (331,300), Pisa (67,000), Lucca (79,100), Siena (47,815), Perugia (137,500) and Potenza (16,000).

**Climate.**—The climate of I. is in general hot, but is tempered by the long coast-line, while on the uplands it is cool and pleasant. There are great differences in temp. and atmosphere between N. and S. I. The plain drained by the R. Po has the most extreme cold, while the It. Riviera enjoys a warm, sunny climate all the year round. The Adriatic coast is exposed to biting N.E. winds, but Tuscany and Rome, and the greater portion of the

W. half of the peninsula, enjoy a mild winter and have a very hot summer. The rainfall during the summer months is slight but there are heavy rains in late autumn. A large portion of I suffers from malaria, the chief areas so affected including the marshes of Grosseto and Orbetello the Rom (ampagna, the Pontine marshes, and the dist. between the gulf of Manfredonia, and the gulf of Taranto. Efforts have been and continue to be made by the gov. to mitigate the evil by improving the drainage and by combining agricultural improvements with hygienic advantages.

*Cultivation, Flora, etc.*—In the N plains of I no plants and trees thrive

is declining. Rice is grown extensively in the Po valley, and oats, barley, and rye are also valuable crops. The cultivation of grass and green forage is extensive, and in some dists. as many as nine crops have been reaped from the same field in one year. The vineyards occupy about 11,000,000 ac. or one third of the total cultivated area. Over a thousand million gals. (45,000,000 hectolitres) are produced yearly. The chief It. wines for export are the Sicilian Marsala, the Piedmontese Vermouth, and the Chianti produced in Tuscany. The numbers of live stock are increasing and the large produce of milk in the country gives rise to a large

THE DOME OF ST. PIERRE AND (RIGHT) CHURCH SAINT ANTOINE (POPE OF HADRIAN)

which cannot endure the frosts of winter. Along the Riviera of Genoa the climate is extremely favourable for the growth of olives, oranges, lemons, date palms, and citron trees which are also found in great profusion in the S. The mulberry is grown extensively in Tuscany and elsewhere, and there are many vineyards on the lower slopes of the Apennines. The sugar cane, cotton plant, prickly pear, pomegranate, all flourish in the warmer regions. In the forests and on the mt. sides are found the chestnut, cypress, laurel, myrtle, oleander, arbutus, and evergreen oak. Agriculture is the chief industry of the country, about 70 per cent. of the total area of I being under cultivation. The principal crop is wheat, nearly 12,500,000 ac. being under cultivation. The average yield per ac. is less than half a ton, but in the wheat dists. of Emilia and Romagna and in the reclaimed lands at the mouth of the Po, as much as two tons per ac. have been harvested. Next in importance is the cultivation of maize (average ann. yield 3,670,000 tons), but the consumption of maize as human food

is declining. The best known varieties of It. cheese are Gorgonzola, Casu Marzu, and Parmesan. A great variety of fruit is grown—oranges, lemons, figs, peaches, apricots, and prickly pear. Almonds are cultivated in the S. and in Sicily and Sardinia, and hazel nuts, pistachios, walnuts, and chestnuts are among other products. The mulberry tree, cultivated on account of its leaves which serve as food for silkworms. The breeding of silkworms is of importance in the N. provinces of Lombardy, Piedmont, and Venetia, where silk is manufactured in the large towns.

*Industry and Commerce.*—Other important industries are the manufacture of thread, cotton, wool, chemicals, jute, glass, and ceramic wares. Machinery of all kinds is manufactured at Terni, Savona, Naples, and elsewhere. The textile trades and motor car industry made rapid progress after the First World War. The manufacture of tobacco and salt is a gov. monopoly. I. has also tanneries, breweries, paper-mills, straw-hat factories, engineering workshops, chemical works, etc. The chief minerals found are

sulphur, zinc, mercury, coal, iron, and lead. The production of coal is unimportant, and its use is largely replaced by water-power and electric-power generated from water. The growth of industry is due to the latter. Under the Fascist régime the commercial and industrial policy was directed towards the development of irrigation and drainage, land reclamation, application of agricultural research, reafforestation, building of houses and roads, anti-malarial campaigns, etc. In the fishing industry only the sardine and tunny fishing is of importance. The chief imports are foodstuffs, coal, iron, hides, rubber, and silk-cocons. The chief exports are fruit (dried and fresh), wine, olive oil, hair, straw hats, worked coal, raw silk, cotton tissues, and silk tissues.

**Communications.**—The construction of railways dates from 1839, when a line was opened from Naples to Portici (5 m.). Now there are two main lines running the entire length of I. along both sides of the Apennines and connected with the lines of the N. plain, together with numerous minor lines, the total length, including the lines in Sardinia and Sicily, being (1939) 11,500 m. The main lines (11,000 m.) are under State control. The electrification of railways has been carried out in recent years, and by the beginning of the Second World War over 3000 m. of public and private line were electrified, excluding the electric tramway system, which covers nearly 3000 m. Before the war there were some 2000 electric locomotives and 2500 steam locomotives. By the end of the war this number was reduced to 400 and 800 respectively with a corresponding decrease in the number of serviceable coaches and wagons. The total mileage of roads is (1940) 127,000 m., of which 13,500 m. are State roads. Telegraph lines cover some 42,000 m., and there are 10,000 telegraph offices with 11,000 post offices. The prin. canals are in the valley of the Po, connecting Milan to the Po, Adda, and Ticino. The delta of the Po is so much obstructed with sand that navigation from the sea to the riv. is carried on by means of the three canals, Canale Bianco, Po di Primaro, and Po di Volano. The mercantile marine included (1939) 2300 sailing vessels of 100,000 metric tons, 1060 steamships of 1,600,000 metric tons, and 300 motor ships of 380,000 metric tons. The total tonnage of the mercantile fleet was over 3,000,000 metric tons in 1939. By the end of the Second World War this was reduced to 500,000 metric tons, chiefly fishing vessels; in 1916 the tonnage of sea going vessels (123) was 691,700.

**Population.**—At the first general census (1871), taken after the unification of the kingdom, the pop. was 26,801,154. In 1881 it had increased to 28,450,628, and in 1901 to 32,965,504. In 1910 the pop. was estimated at 34,947,865, and in 1921 at 38,716,433. Under the Fascist régime strenuous efforts were made by the gov. to keep up the birthrate and celibacy was penalized. In the 1931 census the total had risen to 41,176,671; in the 1936

census to 42,993,602; and was estimated in 1947 to be 45,646,000 (excluding Venezia in Giulia and Zara), an increase of 2,652,000 over the 1936 total. According to this census the population was distributed among the regions as follows:—Lombardy, 6,298,000; Veneto, 4,654,000; Sicily, 4,356,000; Campania, 4,175,000; Piedmont, 3,580,000; Emilia, 3,488,000; Tuscany, 3,099,000; Latium (including Rome), 3,159,000; Apulia, 3,027,000; Calabria, 2,006,000; Abruzzi e Molise, 1,687,000; Liguria, 1,506,000; Marches, 1,352,000; Sardinia, 1,196,000; Venezia Giulia e Zara, 977,257; Umbria, 780,000; Venezia Tridentina, 689,000; Lucania, 543,262. For the pop. of tns. see above under *Geography*.

**Government.**—Formerly a constitutional monarchy I. was declared a republic as a result of the referendum held on June 2, 1946. The Constituent Assembly consisted of 556 deputies, elected by popular suffrage at the General Election also held on June 2, 1946, and was then the sole legislative body. The Senate which existed under the monarchy was abolished. The Constituent Assembly which came into existence for a period of one year, later extended to eighteen months, then assumed the task of framing a republican constitution.

The new constitution was passed by the Assembly by 453 votes to 62 on Dec. 22, 1947 and came into force on Jan. 1, 1948. The first Article describes I. as 'a democratic republic founded on work' and emphasises the constitutional sovereignty of the people. Parliament consists of the Chamber of Deputies and the Senate. The Chamber is elected for five years by universal and direct suffrage, on the basis of one deputy for every 80,000 inhabs. Deputies must be at least twenty-five years of age. The Senate is elected on a regional basis, each region having at least six senators, one for each 200,000 inhabs. (the Valle d'Aosta has one senator only). The President of the Republic, who is himself a senator by right and for life, can nominate six senators for life from eminent men in the social, scientific, artistic and literary spheres. The President is elected in a joint session of the two houses, to which are added three delegates from each Regional Council (one from the Valle d'Aosta). A two-thirds majority is required for election, but after three indefinite scrutines, an absolute majority is sufficient. The President must be at least fifty years of age and his term is seven years. The President of the Senate acts as his deputy. The President is empowered to dissolve the chambers of Parliament, except during the last six months of his term of office. The defeat of a gov. bill does not involve the resignation of the gov., which can be compelled to resign only on a motivated motion of censure. For administrative purposes I. is divided into nineteen Regions, each Region being sub-divided into *provs.* and *coms.* The organs of the Regions are the Regional Council, the Junta (executive), and the President of the Junta. A gov. commissioner super-

vises and co-ordinates the regional administration. Sicily, Sardinia, Trentino-Alto Adige, Friuli-Venezia Giulia and Valle d'Aosta have been granted special statutes of autonomy. A Constitutional Court, consisting of fifteen judges—five each being appointed by the president, Parliament in joint session and the Supreme Law Court—has rights similar to those of the Supreme Court of the U.S.A. It is empowered to decide on the constitutionality of laws and decrees, define the powers of the State and Regions, adjudicate on conflicts between the State and Regions or on inter-Regional conflicts, and try the president of the republic and the ministers.

The reorganisation of the Fascist party is forbidden. Members and descendants of the House of Savoy are excluded from all public offices, have no right to vote or to be elected, and are forbidden to enter It. ter.; and their estates are forfeited to the State. Titles of nobility are no longer recognised, but those existing prior to Oct. 28, 1922 (the date of the Fascist 'march on Rome') are incorporated as part of the name.

**Defence.**—Under the Fascist régime military service was compulsory and universal for men between the ages of 21 and 35. The army was divided between the Metropolitan Army with a normal peace time establishment of 260,000, and the Colonial troops. At the beginning of the Second World War a million and a half men were mobilised including 132 battalions of the Black Shirt Militia, normally part of the Voluntary Militia for the National Security (M.V.S.N.). The *Carabinieri*, or military police, numbered over 50,000 in 1939. The navy with a personnel of 4000 officers and 75,000 men consisted, in 1939, of 6 battleships, 20 cruisers, 52 destroyers, 65 torpedo boats, and 90 submarines. The battleships of the *Littorio* class had a standard displacement of 35,000 tons and carried 9 fifteen-in., 12 six-in., and 12 three-point-five-in. guns. The air force, including army co-operation units and the naval air arm, mustered 2000 first-line aircraft in 1939 with 400 reserves.

Under the provisions of the Peace Treaty (1947), the army is limited to 250,000 men, to include the *Carabinieri* with a strength not exceeding 75,000. The 35,000 ton battleship *Italia* (formerly *Littorio*), and the *Fulvia Veneto*, the 23,000 ton battleship *Giulio Cesare*, 7 cruisers, 7 destroyers and other vessels were surrendered to the Allies. Eight submarines were also surrendered, and the remainder destroyed. The post-war navy consists under the Peace Treaty of two 23,000 ton battleships, 5 cruisers of not more than 7000 tons, 4 destroyers, 15 torpedo boats, 20 corvettes and minesweepers. The total strength is limited to 25,000 officers and men. The air force including the naval air arm is limited to 200 fighter planes and 150 planes of other types, with a maximum personnel of 25,000. Bombers are forbidden under the Peace Treaty.

**Finance.**—Under the Fascist régime the taxation system and the levying of

taxes were simplified. To maintain family ties and encourage capital, death duties were abolished while, for many transitory taxes, more permanent sources of revenue were substituted. Among sources of revenue other than taxation and excise and customs are state monopolies, state railways, and stamp duties. I. entered the Second World War with an internal debt of 200,000 million lire and a deficit of over 12,000 million lire, of which 5700 million were in the ordinary budget and 6500 million in extraordinary accounts, i.e., military exigencies and the development of the empire. At the end of the war the internal debt stood at 850,000 million lire. For the fiscal year 1946-47 the deficit was 610,000 million lire, and for the following year revenue was estimated at 520,000 million lire and expenditure at 872,000 million, involving a deficit of 312,000 million.

**Education.**—Education, controlled by the State, is under a minister, assisted by a council. Primary education is free and compulsory, and the state also maintains, partly or wholly, secondary, technical schools, and the universities. Education was the primary concern of the Fascist gov., and the education theories of Prof. Gentile were put into practice. Under his system, educational programmes were laid down, but the teachers were free to arrive at the results therein determined by their own methods. There was, however, no departure from Fascist principles, which were further inculcated through the youth organisations, the *Ballila* for boys from the ages of five to fifteen and the *Avanguardisti* from fifteen to eighteen. The subservience of education to the Fascist state was completed by the so-called School Charter (*Carta della Scuola*) of 1939, education of women was discouraged and co-education forbidden. With the overthrow of Mussolini education was freed and enabled to return to its liberal tradition. The reorganisation of education was one of the most difficult problems in I. in 1945. Owing to some extent to the outbreak of war the School Charter had never really been operative, and school life had subsequently become thoroughly disorganised, partly on account of a lack of teachers, and partly owing to the destruction of numerous school buildings in the war. With the restoration of peace it was found possible only to allot one school-house to two schools, so that each pupil had only half a day's education from the state. Often the political party organisations provided lessons and, with the co-operation of U.N.I.R.A. (q.v.), a meal during the hrs. left free. This linking of politics with social relief was a dangerous inheritance from fascism but it was essential to seek relief where it could be found. Among reforms most discussed in I. today are the extension of elementary education, the development of a scholarship system, and the end of the choice between classical and scientific *licei*. Professor Marchesi, a strong anti-fascist, is the leading advocate of a uniform classical secondary-school education. I. is fortunate in its univ. life. There are

over twenty univs, most of them supported by the state. Many are of very ancient foundation. The univs of Bologna, Genoa, Macerata, Naples, Padua, and Perugia date from the thirteenth century, and those of Ferrara, Pavia, Pisa, Rome, and Siena from the fourteenth. When the end of the war brought the students back to the univs these became more overcrowded than ever before. Thus, in the academic year 1915-16 there were nearly 32,000 students at Naples, nearly 30,000 at Rome, 20,000 at Milan, 12,000 in Turin, 11,000 at Bologna and 10,000 at Bari.

*Religion* — The Rom. Catholic Church is re-organised as the State Church, but toleration is granted to all creeds. Over 97 per cent of the pop. is Rom. Catholic. By the Act of 1871 the rank of the pope as a sovereign prince is recognised, the Vatican and Lateran palaces and the papal villa at Castel Gandolfo having the privilege of extraterritoriality. This cleavage between Church and State had hindered the unification of I., and under the monarchy the 'Rom. Question' was a source of political difficulty. But on Feb. 11, 1929, Mussolini signed a treaty, a concordat, and a financial convention with Cardinal Gasparri, the papal secretary of state for Pope Pius XI. The law of Papal Guarantees was abolished, and the pope recognised the It. Kingdom under the Savoy dynasty, Rome being the capital. The sovereignty of the Papacy over the Vatican was maintained, and St. Peter's and the Vatican palaces became neutral and inviolable, forming the Vatican City. (q.v.) In the summer of 1931 another rupture occurred between Church and State over the nature of the Azione Cattolica, but an agreement was arrived at on Sept. 2. The pope also has jurisdiction over the Lateran, the Palazzo della Cancelleria, the residence of the Cardinal Vicar, and the Papal Villa. By the concordat, the right to appoint Italian bishops remained with the Holy See, but newly appointed bishops were to take the oath of allegiance to the king. By the financial convention, I. paid the Holy See 750,000,000 lire together with 5 per cent bonds to the nominal value of 1,000,000 lire.

In the newly formed republic, the position of the papacy was not defined until the passing of the constitution of Dec. 22, 1947, though before that date a strong body of Catholic opinion was in favour of renewing the concordat in the new constitution. In the result the treaty of Feb. 1929 was confirmed by article 7 of the constitution, laying down that the Catholic Apostolic Rom. religion is the only religion of the state. Other creeds are permitted, provided always they do not profess principles, or follow rites contrary to public order or moral behaviour. The profession of such creeds is free, and discussion on religious matters is freely admitted. In practice, however, protestants labour under many disabilities. The appointment of archbishops and bishops is made by the Holy See, but before proceeding to such appointments the Holy

See submits to the gov. the name of the proposed appointee in order to obtain an assurance that the gov. will not raise objections of a political nature. (Catholic religious teaching is given in elementary and intermediate schools. Marriages may be solemnised before a Catholic clergyman in accordance with the rules of canon law, or before a clergyman of any other religion admitted by the state. Marriages can also be concluded before a registrar.) Religious statistics of the 1931 census show Rom. Catholics, 11,011,000; Protestants, 83,600; Jews, 74,300; atheists or of no religion, 17,000.

*History* — The name of I. was, until 49 B.C., confined to the narrow S. extremity or toe of the peninsula, the district lying between the gulfs of Squillace and Euphemis. During the republic the word was applied to the whole country S. of the Apennines, and ultimately was used to include the whole of the peninsula. The early hist. of I. is inseparable from that of Rome, which is dealt with in a separate article. Under the wise administration of Augustus I. was for the first time dealt with as a whole, and its unification thus gradually took place. Rom. rule of the peninsula continued up to A.D. 476, when Odoacer, leader of the Herulian mercenaries, deposed the young Romulus, last Augustus of the W. empire, and placed the kingdom under the rule of Zeno, the Byzantine emperor. Odoacer, who had been pronounced 'patrician' by the emperor and 'king' by his soldiers, ruled in I. until he himself was conquered and deposed in 493 by Theodoric, King of the Ostrogoths. Theodoric was a wise and just ruler and chose his ministers from among the Rom. pop. At his death (c. 526) Theodoric and Narces sent by Justinian, invaded and reconquered the country. In 568 the Lombards, who had been employed by Narces as mercenaries, swept down upon I. from the N. under the leadership of their king Alboin. Pavia was captured after a three weeks' siege, and made the capital of the new kingdom. The Lombards spread S., and formed the two duchies of Spoleto and Benevento, but lacked the strength to occupy Rome, Ravenna, Venice, the Is. of Sicily, Sardinia, and Corsica, and the important sea towns. Their rule was very oppressive until Gregory the Great (590-604) converted them to orthodoxy and established Rome as the rallying point of the whole nation. In 756 the Lombards were defeated by Pepin the Frank who captured Ravenna, Pentapolis and several cities in Romagna and Spoleto, which he yielded to the pope, thus ending the temporal sovereignty of the Rom. Church. The conquest of the Lombards was completed by Charlemagne, Pepin's son, who deposed his father-in-law Desiderius, the last Lombard king, in 774 and was crowned emperor of the Romans in 800 by Pope Leo III.

The cities and Sicily still remained under the rule of the Frankish emperor, and were undisturbed by the Frankish conquest of the N. The Carolingian line ended in 858, with the deposition of Charles the Fat. The following seventy-four years was a

period of misrule and anarchy. Before the end of the ninth century, hordes of Saracens began to overrun Sicily, Calabria, and Apulia, while in the tenth century the plains of Lombardy were laid waste by the invasions of Magyars and Northmen. The Ger. King of Saxony, Otto the Great, was called in by the enemies of Berengar, who was forced to pay tribute and acknowledge Otto as his overlord. After this the Ger. king was more impotent than ever, and in 962 was deposed, being now considered as a first of the Ger. empire.

the gradually increasing power of the *commune*, a word first used in connection with Milan, the citizens of which city had united in a *parlamento*.

The Saxon policy of interference in the papal election was followed by Conrad's successor Henry III., who, finding three popes in Rome, abolished them all, and bestowed the see on a Ger. bishop of his own choosing. During the minority of his son Henry IV., who succeeded him in 1056, Archdeacon Hildebrand of Soana, afterwards Pope Gregory VII., threw his

LAKE ORTA IN PIEDMONT AND THE ISLAND OF S. GIULIO  
The church on the island was built in the fourth century.

About this time, when I was a divided country, governed by foreigners from a distance, the Lombard cities of Milan, Pavia, Genua, Venice, and Florence began to rise in power and to gain some degree of independence. The Saxon emperor encouraged this spirit of municipal independence which crushed the power of the turbulent counts. His son and grandson, Otto II and Otto III., however, had not his powers of discipline, and on the death of the latter in 1002 Arduin, Marquis of Ivrea, claimed the crown and was supported by Lombardy and Pavia. The Saxon dynasty, however, continued in Henry of Bavaria, who gained the alliance of Milan, and crushed her rival, Pavia. On Henry's death in 1024, Hrobert, archbishop of Milan, offered the crown to Conrad, the Franconian king of Germany. During this century there should be noted

the struggle into strengthening the power of the papacy. He determined to throw off the yoke of the Ger. Emperor and the Italian counts by enforcing the celibacy of the clergy, by abolishing the investiture of ecclesiastics by secular authority, and by vesting the papal election in the hands of the Rom. people under the guidance of the clergy. During the ensuing faction between pope and emperor, Gregory was supported by Robert Guiscard and his son Roger Norman adventurers who had occupied Apulia, Calabria, and Sicily, and had strengthened their hold on these dominions by obtaining papal investiture of lands which they agreed to hold as fiefs of the Holy See. In 1084, Henry IV. seized Rome, but, after his death (1106), the War of Investitures was continued by his successors, and ended in the Concordat of Worms (1122) whereby the emperor

abandoned his authority over papal elections.

During the ensuing three decades the N. cities were each a single republic; the bishops were superseded by consuls, who, assisted by a council of burghers, administered the law. Rome shook off for a time the sway of its bishop, and under Arnold of Brescia estab. a republic with a senate on the lines of ant. Rome. On the death of Conrad, his nephew Frederick, surnamed Barbarossa, was elected emperor. Under his rule the old feud between emperor and pope was renewed. He crossed the Alps in 1154, determined to exercise his imperial rights and to put an end to the warfare of the cities. Milan at once rose up in arms against him, but Frederick, after laying waste some smaller cities, marched on Rome and was crowned by Adrian IV. (Nicholas Breakspear), the only pope of Eng. birth. He marched upon Milan and forced it to surrender. But in 1159 Milan was again in revolt, and after a lengthy siege was laid waste (1161). Later, united in one league, called the League of Lombardy, against their foreign ruler, they built a new city, which they named Alessandria, after their staunch ally Pope Alexander III., whom Frederick had driven from Rome in 1167. Alessandria withstood a siege during 1174-75, and in 1176 the allied forces inflicted a crushing defeat upon Frederick at the battle of Legnano. In 1177 the emperor made terms with the pope for a six years' truce, and in 1183 a permanent peace was ratified by the treaty of Constance, which granted to the Lombard tns. the right of war and self-gov. During the short reign of Frederick's successor, Henry VI., the strife between Guelphs and Ghibellines broke out in I. In Germany it had stood for a quarrel between two rival dynasties, but in I. the Guelphs represented the papal party, i.e. Rome and the League of Lombardy, while the Ghibellines stood for the imperial party. On Frederick's death (1190), Henry laid claim to the whole of I. and the two Sicilies, his claim being acknowledged in 1191. During his son Frederick II.'s long minority, the power of the pope extended as far as Constantinople at the time of the fourth Crusade (1198-1204). The spoils of war were shared with Venice, who had volunteered her fleet for the transport of men. Thus Venice became estab. as one of the most powerful commercial cities of the Mediterranean. In 1220 Frederick II. was crowned king and emperor, the virtual ruler of Germany, I., the Sicilies, and Jerusalem. He made a determined effort to crush the league and subdue the pope, but the powers pitted against him were too strong. Pope Gregory IX. excommunicated him in 1227, and Innocent IV. declared him dethroned at the council of Lyons in 1245. The Swabian line ended in 1260 and in 1273 Rudolph of Hapsburg was crowned emperor by the pope, and five years later made a public recognition of the pope's temporal sovereignty in the papal states. The Guelph party was now supreme in the N., but lost much of their influence in the S. when Sicily rebelled against Charles of

Anjou and placed itself under Aragonese rule (1282). At the end of the century the Guelphs of Florence were divided into two factions—the Neri and the Bianchi. In 1300 Boniface VIII. called in Charles of Valois, who banished the latter faction and then undertook to manage the affairs of the republic. In 1309, the pope, Clement V., being a Frenchman, the seat of the papacy was transferred to Avignon, where it remained till 1377.

The period of nearly seventy years was marked by great commercial prosperity. The N. tns. still made war upon one another, but the burghers paid companies of adventurers, *condottieri*, to do the fighting. The rural counts lost their power and became citizens of the tns., and the office of *poderà* was now practically that of a judge. In many tns. his place was taken by a new functionary, the *captain of the people*, who was a leader of Guelphs or Ghibellines, whichever party was in the ascendant, and whose powers, being ill-defined, tended to become unlimited. In the N. the popes lost their prestige as it potentates by the removal of the Holy See to Avignon. Rome nominally obeyed her bishops, but the temper of the times was shown in the brief republic (1347-51) set up in the city by Rienzi on semi-classical, semi-feudal lines. The duchy of Milan was governed by the powerful Visconti dynasty till 1447. Under the powerful prelate Gian Visconti (d. 1354) the duchy conquered Genoa and a large portion of N. I. But in 1450 Filippo's son-in-law and general, Francesco Sforza, seized the Visconti's possessions with the aid of his Florentine ally, Cosimo de' Medici, and proved himself to be a wise and liberal-minded ruler. Until 1343 Florence had been subject to an adventurous foreigner, Walter of Brienne, Duke of Athens. For the following hundred years, with the exception of a short-lived revolution of artisans, the city was governed by an oligarchy headed by the Albizzi family. During this period Florence achieved the subjection of Pisa and extended her dominion in Tuscany. But the oligarchy was opposed to the wealthy and democratic family of Medici. In 1434 Cosimo de' Medici estab. a republic of which he assumed the presidency. He strengthened his position by making the alliance with Francesco Sforza mentioned above. The presidency maintained by Cosimo became a dictatorship under his grandson, Lorenzo the Magnificent. The hist. of Venice was very different from that of the other great I. states. In the eleventh century the administration lay in the hands of the popular representative, the doge. After a series of revolutions, however, the oligarchical principle was estab., and in 1311 the Council of Ten was formed. In the middle of the fourteenth century she began her struggle for maritime supremacy, which ended in victory (1381). In 1406 Venice added Verona, Vicenza, and Padua to her I. possessions, and during the long dogship of Francesco Foscari (1423-57) extended her dominions in the mainland. I. was now divided into a number of commonwealths. Every one of them was governed by an oligarchy or

an It. prince, but the individual enjoyed liberty, and every encouragement was given to literature and art.

Peace lasted till 1494, when a new age opened for I. Throughout the following century the country was a battlefield on which France and Spain fought out their quarrels and strove for new conquests. In 1494 Charles VIII. of France invaded I. at the request of Lodovico Sforza, who was anxious to become Duke of Milan. Charles, after having the Medici expelled from Florence, marched S. and was crowned in Naples. In the meantime Lodovico assassinated his nephew, Gian Galeazzo, and roused Lombardy against Charles, who with difficulty made good his retreat to France. The way was now opened to other invaders. In 1499 Louis XII., the successor of Charles, subdued Milan, and in 1504 invited the Emperor Maximilian to assist him in the conquest of Venice. In the confusion the papacy made a most determined and successful defence against the foreigners. In 1508 was formed the League of Cambrai with France, Spain, and Germany against Venice. But in 1512 the army under Gaston de Foix fought a fierce battle against the combined Fr., Venetian, and papal troops on the banks of the Ronco about 2 m. from Ravenna. The Fr. were victorious but Gaston fell in the act of pursuing the enemy. The Fr. returned in a few years. In 1515, their new king, Francis I., was victorious at the battle of Marignano, and entered Milan, but in 1524 was expelled by the troops of Emperor Charles V. The devastating war ended in the peace of Cambrai (1529), by which Charles V. was left in possession of I. In 1537 the Fr. took possession of the ters. of the dukes of Savoy, but these were ceded to Philip, the son of Charles V., by the treaty of Cateau-Cambrésis (1559). Venice, Genoa, Lucca, and San Marino were allowed to retain their independence.

Until the end of the eighteenth century it may be said that I. now ceased to have a hist. of her own. Wars in which she had no interest, but was the patient sufferer, continued to be fought on her soil. Venice regained some of her lost power by the conquest of the Peloponnese (1681), but this was recaptured by the Turks in 1715. Piedmont was ceded by Spain to Emmanuel Philibert, who regained Savoy and Nice. The War of the Sp. Succession (1701-13) led to a redistribution of It. land. By the treaty of Utrecht (1713) Austria succeeded to the Sp. dominions, and Sicily was given to Victor Amadeus, duke of Savoy, with the title of king. In 1720 he had to yield that is, to Austria in exchange for the kingdom of Sardinia. I. was subjected to a further redistribution at the end of the War of the Austrian Succession. By the treaty of Aix-la-Chapelle (1748), Milan, which had been captured by Austrians in 1714, was ceded with Tuscany to the House of Austria; the Bourbon, Charles III., was confined in his kingdom of the two Sicilies; his brother, Don Philip, was given the duchy of Parma; Piedmont and Sardinia remained in the hands of the House of Savoy; and

Modena and Genoa were placed under the protection of France, to whom the Genoese surrendered Corsica in 1755.

For forty-four years I. enjoyed peace. Tuscany was ruled by lieutenants until the death of Francis I. in 1765, when his second son, Peter Leopold, afterwards Emperor Leopold II. (1790), was made grand duke. His rule was characterised by its agric. improvements, suppression of the Inquisition, and wise reforms. He performed a lasting benefit to his subjects by draining the Val di Chiana. The rule of Maria Theresa in Lombardy was also remembered as a period of internal peace.

The chief event after the treaty of Aix-la-Chapelle was the invasion of I. by the Fr. Republican armies in 1796. In the following year the Emperor, Francis II., was forced to sign the treaty of Campo Formio, by which Venice and the ters. N. of the Adige were given to Austria, and the rest of N. and Central I. was divided up into republics, such as the Cisalpine, Tiberine, Ligurian, Capadane, and Parthenopæan republics. The great cities were filled with a wild hope of liberty, but they soon discovered that their freedom was but nominal under the presidency of Napoleon Bonaparte. In 1799 the Russian troops gained a victory at Trebia, and in 1800 Napoleon crossed the Alps and confirmed his previous victories at the battle of Marengo. The Cisalpine republic was declared the *Italian* republic in 1802, and Napoleon was crowned King of I. at Milan in 1805, and in the following year he made his brother Joseph king of Naples. But at the overthrow of Napoleon in Paris (1814) the kingdom of I. crumbled to pieces, and at the Congress of Vienna (1815) the allies redistributed the country among themselves, but the pope was left in possession of the Papal States.

The result of the Napoleonic invasion of I. was that the rule of the petty princes was more oppressive than ever, but national pride had been aroused and had given birth to a great hope for the future unity and self-gov. of the whole country. Secret societies, the most important of which was the Carbonari, flourished among the educated classes; risings broke out in the S. (1820); and in 1831 the fiery young patriot, Giuseppe Mazzini, organised a political society called *Giovane Italia* (Young Italy) for the emancipation of his country. Mazzini came to London, from which, by means of literature, he actively propagated his republican theories among his countrymen. The more moderate Liberals, as is shown in the writings of Leopardi and Foscolo, despaired of the future of I. In 1848, the year of revolutions, insurrections broke out in Lombardy, but the Austrians won the battle of Custoza, and placed the country under martial law. Pope Pius IX., who since 1846 had passed certain measures of reform, was torn between his desire to support its freedom and his fear of making war on Catholic Austria. His authority, in consequence, weakened daily; he was declared traitor, and fled in disguise to Gaeta. Mazzini hurried back to Rome, and a republic was set up with himself

and two others as triumvirs. In 1849 Charles Albert received a crushing defeat from the Austrians under Radetzky, and abdicated at Novara, leaving his son, Victor Emmanuel II., to make the terms of treaty. Lombardy reverted to Austria, and a part of the Piedmontese ter was also ceded. In the same year Leopold and Ferdinand, who had joined the pope at Gaeta, returned to take up the reins of gov. France decided to restore Rome to the pope and sent Gen. Oudinot to besiege the city. He was defeated at Civita Vecchia by Garibaldi recently returned

against Francis II., the son of Ferdinand, and was assisted by Garibaldi, who won victories at Calatimni and Melazzo. Assuming the title of dictator, he entered Naples in Sept. 1860, Francis having fled. The united troops of Garibaldi and Cavour defeated the Papal States at Castellidardo, and the Neapolitans at the Volturno. Sicily and Naples were annexed to Sardinia in Oct., and Garibaldi hailed Victor Emmanuel as 'King of Italy.' In 1861, at the assembly of the first It. parliament in Turin, Victor Emmanuel was decreed king of I., and Garibaldi resigned from his

from exile in S. America. The Neapolitans, augmented by Sp. soldiers, marched northwards, and were also defeated by Garibaldi at Palestrina and Velletri, but in spite of these successes the Fr. troops succeeded in entering Rome, and the pope returned in 1850.

At this time almost of despair, Cavour came into prominence as the champion of the national movement. In 1852 Victor Emmanuel appointed him prime minister. The Società Nazionale was formed, with the motto 'Unity, Independence and Victor Emmanuel.' The king and Cavour secretly encouraged the movement, though their only avowed aim was to expel the foreigner. In 1858 Cavour entered upon negotiations with Napoleon III. which resulted in the outbreak of a Franco-Austrian war (1859). In the same year the Austrians were defeated at Montebello, Palestro, Magenta, and Solferino, provisional govts. were estab. in Florence and Modena; and an insurrection broke out in the Papal States. S. Italy rebelled

dictatorship. In this same year Cavour died. Rome was still held by the pope and the Austrians were in possession of Venice. In 1862 Garibaldi raised troops to liberate Rome, but was defeated at Aspromonte, and Rom. Catholic opinion throughout Europe was opposed to the annexation of Rome to the new kingdom. Fr. troops had held that city since 1849. By the Franco-Italian Convention of 1864, the It. agreed to evacuate Rome within two years on condition that the Papal States were recognised and the cap. of I. was moved from Turin to Florence. In 1867, in spite of the agreement of 1864, Garibaldi made sev. attacks on Rome and consequently Louis Napoleon sent back his troops, who defeated the Garibaldians at Mentana. Rome continued to hold out until 1870, when, during the Franco-Prussian war, the It. army under Gen. Cadorna, after a brief resistance entered the city. In 1871 Rome was inaugurated as the cap. of the kingdom, but the pope, Pius IX., refused to abandon his temporal

sovereignty, and withdrew as a voluntary prisoner to his own domains, which were allowed the privilege of extraterritoriality.

The consolidation of I., since the formation of the kingdom, has been slow and difficult, owing to the great social differences between N. and S. In 1876 Victor Emmanuel died and was succeeded by Humbert I. (b. 1841); thus IX. being succeeded by Leo XIII. in the same year. Humbert's reign was characterised by electoral reform (1881) and foreign colonisation. Somaliland, along the N.E. coast of Africa, was acquired between 1880 and 1890, and the dependency of Eritrea was founded in 1882. I.'s claims to a protectorate over Abyssinia led to war, which ended in an It. defeat at Adowa (1896), and the restoration of all land to Abyssinia by the treaty of Addis Ababa (1896). In 1883 I. joined Germany and Austria, forming the Triple Alliance, largely owing to her distrust of France. In 1900 King Humbert was assassinated by an anarchist, and was succeeded by his only son, Victor Emmanuel III. At the beginning of the new century I. entered upon more friendly relations with France, the Triple Alliance being still maintained. In the dissensions in Morocco, in 1906-11 she gave her support to France against Germany while France acquiesced in It. ambitions in Tripoli. In Sept. 1911 war broke out between I. and Turkey in connection with the rights and privileges of It. subjects in Tripoli. In Nov. of the same year the It. gov. formally proclaimed the annexation of Tripoli and Cyrenaica, which was ratified by Turkey in the treaty of Onchi in Oct. 1912. The Ottoman Empire had hastened to conclude peace with I. as Turkish supremacy was threatened in the Balkans by the Balkan Alliance. The triumph of the allies in the Balkan Wars (q.v.) was a setback to Austro-Ger. policy, which favoured Turkey, but despite I.'s sympathy for the Balkan allies, I. was again drawn into the Triple Alliance with Germany and Austria for a further period, renewed on Dec. 7, 1912. Austria, however, disregarded the terms of her treaty with I. in pursuing her Balkan policy of aggression against Serbia. I. was unable to intervene, being occupied in 1914 with a revolutionary movement which expressed itself in strikes and rioting. These difficulties were encountered by Salandra, who became premier in March 1914 on the resignation of (Hollitt) (q.v.), who had been a virtual dictator for eleven years. After the declaration of war between the Entente and the Central Powers, I. maintained her neutrality, deeming herself not bound by the Triple Alliance, the terms of which Austria had broken by her sole action against Serbia. As the price of continued neutrality, I. demanded concessions from Austria in the Trentino, Istria, Dalmatia, and Albania. Although Germany favoured these claims, Austria rejected all but a small extension of the It. frontier. Baron Sonnino, It. Foreign Minister, then opened negotiations with the Entente, and finally on April 26, 1915, the treaty of London was signed, by which fulfilment of I.'s territorial claims was

promised together with an immediate loan of 250,000,000. (See also AUSTRIA-HUNGARY.) On May 23, 1915, I. declared war on Austria-Hungary. The It. army was poorly equipped, while for the main offensive launched on the Isonzo and for the operations in the Isonzo and for the operations in the Trentino only some 100,000 men were available. (See ISONZO; ITALIAN FRONT, FIRST WORLD WAR CAMPAIGN ON; WAR, FIRST WORLD.) Not until 1916 did I. become actively at war with Germany. As a result of Sonnino's foreign policy the unity and independence of Albania were proclaimed under the protection of I., while in April 1917 the Treaty of St. Jean-de-Maurienne was concluded with France and England, delimiting I.'s share in the partition of Asia Minor. The treaty was confirmed at an Allied Conference held in London in Aug., and, following discussions there, an offensive was started on the It. front which resulted in the disaster of Caporetto (q.v.) in Oct. This defeat stiffened It. resistance and in June, 1918 the reorganised It. army defeated the Austrians at the battle of the Piave, and in Oct. Austria sued for an armistice. At the end of the struggle the resources of I. were exhausted, her losses in men amounted to half a million, and her great effort had reduced the country to a worse state than that of her allies. The fact, however, that for I. the war ended with a military victory encouraged a Nationalist movement, opposed to more moderate opinion in favour of an entente between I. and the succession states. The Nationalists demanded Fiume as well as the territorial gains promised in the treaty of London. (See FIUME.) The Adriatic problem (see ADRIATIC QUESTION) was unsolved and It. dissatisfaction with the Peace Treaty caused the resignation of Orlando, who was succeeded by Nitti. Domestic unrest in I. was heightened by the feeling aroused over the Allied intervention in Fiume, following the *coup d'état* of D'Annunzio (q.v.) who on Sept. 12, 1919, occupied the city. The Adriatic Question was settled tentatively by the treaty of Rapallo (q.v.), whereby I. surrendered the Dalmatian coast but secured sovereignty over Zara (q.v.), while Fiume was made an independent state. It remained for Mussolini to reach a definitive settlement, known as the treaty of Rome, Jan. 1924, whereby Yugoslavia exercised control over Port Barco and the Delta and I. over Fiume. There also followed the Nettuno Commercial Agreements, but these were not ratified by the Yugo-Slav gov. until 1928.

Benito Mussolini (q.v.) came into power in 1922 from being the leader of the *Fasci di Combattimento*, first organised by him in 1919. (See FASCISM.) In the belief that I.'s ills were due to Socialist propaganda, the Fascist organisation was created for the purpose of suppressing socialism, and between it and the various Socialist organisations a ruthless struggle ensued, lasting a year. In Nov. 1921 the Fascists were reorganised into a political party and returned thirty members to Parliament, allying themselves with the

Nationalists. A conflict with the gov. became inevitable. In a speech on Sept. 29, Mussolini proclaimed his allegiance to the idea of monarchy, and the Fascist march on Rome was organised. The Fascist columns reached Rome on Oct. 30, the same day as Mussolini arrived from Milan in response to a royal summons. He at once formed a cabinet in which he combined the premiership with the Ministries of foreign affairs and the interior. Gen. Diaz became minister of war and Adm. Thaon di Revel of marine. At the elections held in April 1924 the Fascists gained a majority of 1,758,521 out of a total of some 7½ million votes. Mussolini retained the form of parl. gov., and there was, at first, an organised Opposition which hoped to oust Mussolini on the strength of the anti-Fascist feeling aroused by the murder of the Socialist, Matteotti. Mussolini remained proof against the Opposition, which combined rigid constitutionalists with anarchic anti-monarchists. In Rom. fashion the Opposition withdrew on to the Aventine, but this gesture was unavailing. There remained only the opposition of the three former premiers—Orlando who retired from active politics; Salandra, who was elevated to the Senate; and Giolitti, who died in July 1928. In domestic affairs the Fascist Gov. set the country to work, re-established the eight-hour day, and developed the policy of organising labour into syndicates, which were a species of trades unions, including both employers and workers, and under state supervision.

In foreign affairs, I. successfully encountered many difficulties—with Yugoslavia over Fiume (see above); with Greece over the murder of Gen. Tellini of the Albanian Frontier Commission, followed by the It. occupation of Corfu; with France over the treatment of It. minorities in France and Tunisia, with Turkey over Turkish fears of an It. annexation of Anatolia. These problems were eventually solved and concluded by a series of pacts—that with Greece on Sept. 23, 1928, with France on Dec. 3, 1927, and with Turkey June 1, 1928, while an Italo-Albanian alliance was concluded on Nov. 22, 1927, and a commercial treaty with Soviet Russia had been in existence since Feb. 1924. I. was also a signatory to the Locarno Treaties (q.r.).

A rapid increase in pop., coupled with a dearth of raw materials, led I. along the road of imperialism. Fascist policy tended to even greater aggressiveness, notably in rivalry with France, both in naval construction and in agitation for the revision of the Versailles Treaty. But partly owing to France's then dominating position in Europe and Mussolini's dispute with the Vatican over jurisdiction in the educational sphere, the dictator was obliged to play the rôle of protagonist in the movement for a limitation of armaments and European security. But five years later, Mussolini's aggressive policy towards Ethiopia sowed the seeds of a new European conflagration, besides menacing the whole existence of the League of Nations. Notwithstanding the existence

of various treaties and conventions guaranteeing the integrity of Abyssinia, Mussolini announced his intention of annexing the country and, by May, 1936, the It. forces were in occupation of the Abyssinian cap. (see ITALO-ABYSSINIAN WAR, 1935-36). Thus, in addition to the great ters. conquered in 1911, vast new regions were added in 1936; yet the number of Its. settled in E. Africa scarcely ever exceeded 30,000. The League of Nations considered collective action against I., but the idea was eventually abandoned. As a consequence the various European nations agreed to recognise officially the It. conquest of Abyssinia, and in 1938 as a prerequisite to recognition Great Britain entered into an agreement with I. designed to prevent It. aspiration in Africa and It. support of Gen. Franco in the Sp. Civil war (q.r.) from becoming a source of open contention between the two countries. The agreement was not, however, put into effect until after the Munich Pact when Mussolini's prestige rose as a result of his part in the settlement (see EUROPE—History during the Second World War). This event strengthened the ties between I. and Germany even though the tier. annexation of Austria earlier in 1938 had appeared to frustrate Mussolini's ambition of achieving a dominant position in S.E. Europe. I.'s acquiescence in the annexation nullified the Franco-It. Pact of 1935 which was designed not only to regulate relations in Africa but also to preserve the independence of Austria. Later in the year (1938) the pact was formally denounced as a hostile gesture towards France whilst It. claims were launched for Djibouti, Tunis, Corsica, and Nice. Mussolini's aggressive intentions became more manifest while at home his autocratic position was strengthened by the abolition of the Chamber of Deputies. In its place a Chamber of Fasci and Corporations was set up, having 800 members from the National Council of the Fascist Party and the National Council of Corporations, nominated by Mussolini. The gov. had the right to promulgate decrees with the force of law, which were then placed before the chamber. The chamber dealt with constitutional laws, budget estimates and also any matters previously authorised by Mussolini to be so dealt with. The real ruling authority was the *Gran Consiglio del Fascismo* (Fascist Grand Council), which was composed of the quadrumviri of the March to Rome, appointed for an indefinite period, a certain number of members (ministers and other high dignitaries) appointed for as long as they held their offices, and an indeterminate number of members appointed for three years by the head of the gov.

On April 7, 1939, It. troops invaded Albania. King Zog fled, and the country was occupied, King Victor Emmanuel III. becoming also king of Albania. At the same time as his Albanian adventure, Mussolini was at pains to allay Gk. fears. His endeavour was to attach the various Balkan countries to I. by diplomatic ties and to frustrate the possibility of Soviet

action of the Carpathians. The attempt to set up I as a Balkan protagonist was part of the policy of non belligerency which Mussolini adopted on the outbreak of the Second World War in 1939. He was accordingly thanked publicly by Hitler for his diplomatic and political support and released from military obligations. Nevertheless, the following year with the decline of allied fortunes in the W, Mussolini became convinced of Germany's victory and on June 10 declared war on France and Great Britain. This action was preceded by the breaking off of commercial relations and the rejection

Germany, however, succeeded in retrieving its fortunes in both N. Africa and the Balkans and the reflected prestige helped to maintain the Fascist regime in I which fell more and more under the control of Germany.

I was associated with Germany in the defeat of Yugoslavia and gained some territory on the Dalmatian coast. A new state of Croatia was formed with the It duke of Spalato as nominal king. I also provided an occupying force for Greece. By June 1 I was at war with Russia and by the end of the year with the U.S.A. I's economic situation deteriorated and her

NAPLES AND VESUVIUS

(Continued from page 666)

of Amer efforts towards peaceful intervention. The move was unpopular among the It people the more so as the collapse of France did not bring the war to an end. Economic conditions in I became increasingly more serious. In Oct I launched an attack on Greece but the stout resistance maintained by the Gks caused the campaign to linger on through the winter with little success for the Its. Moreover, the It navy was severely crippled by the attack which the R.A.F. made on the naval base of Taranto (Nov. 14, 1940). Other events parallel with the lack of success in Albania where an It army was routed by the Gks on March 9, 1941, were the loss of the prov. of Cyrenaica (see AFRICA NORTH SECOND WORLD WAR CAMPAIGNS IN), and the successful revolt of the Abyssinians which aided by Brit arms resulted in the loss of Eritrea (March 27) and the fall of Addis Ababa (April 5) (see ITALIAN EAST AFRICA, SECOND WORLD WAR CAMPAIGNS IN).

Industry was entirely tied to Germany's war machine. Inflation became a serious danger which Mussolini attempted to avert by drastic cuts in public expenditure. With Ger help efforts were made to strengthen the hold of the Fascist Party which withstood Mr. Churchill's appeal (Nov. 1942) for I to make peace with the Allies. The answer to this was a further agreement with Germany to intensify the collaboration of the two countries. At the end of the year I occupied Nice and Corsica at the same time as the Germans moved into S. France.

The year 1943 (see ITALIAN FRONT SECOND WORLD WAR CAMPAIGNS IN) saw the fall of Mussolini and an It surrender to the Allies. After the allied invasion of Sicily, Mussolini made a last bid to prepare the mainland of I against invasion and to ensure the loyalty of the Fascist Party by excluding several leading members from the gov., including Count Grandi. At this time also Count Ciano,

Mussolini's son-in-law, who had been Foreign Minister since 1936, was appointed to the lesser post of ambas. to the Vatican. Dissension within the Fascist Party, however, broke into open revolt when Mussolini, after two meetings with Hitler in July, was unable to obtain a promise of adequate Ger. support against the coming invasion. By order of the king Mussolini was arrested, and Marshal Badoglio was called upon to form a gov. He at once put out peace feelers while at the same time publicly proclaiming the continuation of the war. A secret armistice was agreed while the Gers., in anticipation of some such move, tightened their grip in N. I. and also occupied the Rome airfields. On Sept. 8 following the Allied landing at Salerno the armistice was declared. Badoglio set up his gov. in Brit. occupied ter. and on Oct. 11 I. declared war on Germany. The king was likewise maintained by allied authority. In the N., on the other hand, Mussolini having been rescued from allied hands by Hitler's emissaries attempted to set up a republican Fascist régime. He revenged himself on those of his former supporters who had betrayed him but were now in his power. Among them were Count Ciano and Marshal de Bono who were tried and shot.

In S. I. there was a movement against the monarchy headed by the Liberal leader Count Sforza and the aged philosopher Benedetto Croce, and this found expression at a meeting of the Council of National Liberation held at Bari in Jan. 1944. The king promised to retire as soon as the Ger. occupation of Rome was ended. In April Badoglio formed a new gov. to include Count Sforza, Croce, and the Communist leader, Signor Togliatti. In June the allied armies entered Rome amid a popular welcome, and on June 5 King Victor Emmanuel retired in favour of his son, Prince Umberto. He did not, however, abdicate. Badoglio resigned, and Signor Bonomi (q.v.) an elder statesman from the days before Fascism, formed a new gov. With an It. Gov. in Rome most of the occupied areas of S. I. were handed over to It. control, and the gov. was recognised diplomatically by the United Nations.

On April 27, 1945, Mussolini with twelve of his cabinet was shot by members of the Partisan Movement which was resisting the Fascists in N. I. A few days later, May 2, the Ger. army in I. surrendered, and the liberation of I. was completed (see ITALIAN FRONT, SECOND WORLD WAR CAMPAIGNS ON). Bonomi, who considered his interim task now at an end, resigned, and was succeeded by Signor Parri, a leader of the Partisans, who formed a coalition gov. with the Socialist leader, Nenni, and the Liberal leader, Brosio, as vice-premiers while Togliatti became minister of Justice. A consultative assembly was set up, and local elections were held at the end of the year. Parri resigned in Nov., and a new gov. combining six parties was formed by de Gasperi. By this time the Allied Military Gov. had handed over to the It. Gov. the

control of all ter. except Venezia Giulia and the Udine prov., while the economic situation was eased by supplies which reached I. from foreign sources through U.N.R.R.A.

On May 9, 1946, King Victor Emmanuel formally abdicated, a move which may have been designed to breathe new life into the monarchy. In spite of the fact that it had been decided to hold a nation-wide referendum on the subject of the monarchy in June, Prince Umberto, who had been acting as Lieutenant-General of the realm, was crowned king as Umberto II. A referendum was, however, held, and the result was a vote of 12,718,000 for a republic against 10,719,000 for the continuation of the monarchy. King Umberto at first disputed the decision, but on June 13 he left Rome. On June 18 the Court of Cassation upheld the result of the referendum, thus bringing to an end the reign of the House of Savoy.

Elections were held for the Constituent Assembly which resulted in a gain of 207 seats for the Christian Democratic Party, 115 for the Socialists, and 101 for the Communists out of a total of 556. The Constituent Assembly met on June 25 and proclaimed a republic, electing Enrico de Nicola as President. De Gasperi continued as premier of a reconstructed coalition gov., the first for twenty-five years to consist of deputies freely elected. Eight members of the gov. belonged to the Christian Democratic Party, four were Socialists, four Communists, two Republican, and one Liberal.

The first event which confronted the new republican gov. was the Peace Treaty with the Allies, the draft of which was pub. on June 30, 1946, as drawn up in Paris by the Council of Foreign Ministers, representing Great Britain, U.S.A., France, and Russia. The treaty was signed on Feb. 10 the following year, but the It. gov. at the time of signing registered a protest at the terms of the treaty while affirming they would be loyally met. The treaty was an occasion of national mourning, and the terms whereby Istria, Fiume, and ter. E. of the Isonzo were ceded to Yugoslavia (with the exception of the newly created Free Ter. of Trieste) were considered a sad blow to I. while they did not satisfy Yugoslav ambitions. The chief among other conditions were that the Tenda-Briga area in the Maritime Alps was ceded to France, and the Dodecanese Is. to Greece while I. also lost her colonies in Africa and agreed to respect the independence of Ethiopia. I. agreed to pay reparations over seven years, amounting to 100 million dollars to U.S.S.R., 125 million to Yugoslavia, 105 million to Greece, 25 million to Ethiopia, and 5 million to Albania. Provisions were also made for the demilitarisation of frontiers and of is. in the Mediterranean, and for the limitation of armed forces.

De Gasperi at the head of a new coalition gov. (Jan. 22, 1947) weathered the storm created by the peace treaty. An appeal for revision was, however, made to the United Nations. The gov. alliance

between the Catholics (Christian Democratic Party) and the Communists reflected the uneasy state of equilibrium maintained in the country two years after the end of the war. Shortage of raw materials and other economic difficulties were additional causes of unrest.

The withdrawal of left wing support overthrew the coalition gov. in May, but the following month de Gasperi formed a further gov. dependent mainly on the Christian Democrats. The Constituent Assembly, due to dissolve on June 21, prolonged its own life until the end of the year, thus automatically postponing further elections, and it was in conditions of considerable political uncertainty that the Assembly addressed itself to its prime task of framing a constitution. See *Constitution* above. While the communists still held a place in the gov. they tried for purposes of their own, to introduce members of their movement into the police force. Since they were manœuvred out of the gov. largely by De Gasperi, the communist element in the State's service has been fairly thoroughly weeded out. But at least nine out of every ten civil servants who lost their jobs because of their relations with fascism were reinstated. They were never expurgated in the strict sense of the term, because there was no hard and fast rule. Roughly, a distinction was drawn at the time between those civil servants who followed Mussolini into N. Italy after the liberation of Rome and those who stayed behind, but it was a distinction which could not be maintained for ever. The undoubted undertone of fascist sympathy, however, that prevailed in I was still sentimental rather than political and the small aggressive political party of the neo fascists, known as the Social Movement made only slow progress. All other right wing political groups were virtually eclipsed by the result of the elections of April (1948), when the Christian Democrats were given an overwhelming mandate. The Christian Democrats are not in the abstract, right wing though in the context of present day It. politics they were inescapably on the right as champions of the church and the property owner against the communists. The party officially demonstrated its liberal position by allying itself with the liberals on the right hand and with the republicans and independent socialists on the left. The communist opposition used the trade union movement as its main weapon against the gov. and since the small anti communist minority in the movement coalesced in 1949, to form its own so called free trade union, the main organisation was almost entirely in the hands of the communists.

I. has about 200,000 inhab. who have no love for I. These are the Ger. speaking people who live in the northernmost prov. of Bolzano, bordering on Swit. (land and Austria). Petitions demanding a severance of ties with I. were sent to the Paris conference of 1946. Some of the petitioners hoped for an independent Tyrolean State, others called for reunion with

Austria. In the result Grüber, the Austrian foreign minister and De Gasperi, the It. Prime Minister, signed an agreement between themselves, at Paris, Grüber acknowledging the Brenner frontier, De Gasperi, in return, promising local self gov. or autonomy within the frame work of the It. State for the prov. of Bolzano and the few mixed language com. in the S. prov. of Trento. This agreement was highly unpopular in both I. and Austria, both the signatories being accused of signing away a national birth right. Under the statute eventually drafted the new autonomous region was made to include Bolzano and the whole of the S. It. speaking prov. of Trento. Under this scheme the It. felt that, though the Ger. speaking elements would get a majority in Bolzano prov., they had ensured a safe It. speaking majority in the elected regional council. But both sides had reckoned without those inhab. of Trento who, although they speak I., are politically in sympathy with the Tyrolese and these influenced the result of the election (Nov. 28, 1948) which gave the Volkspartei, or party of the Ger. speaking people of Bolzano, and the Christian Democrats or prin. It. party seventeen seats each on the council.

*Language and Literature*—It is one of the Romance or Neo Lat. languages and is a sister tongue of Fr., Sp., Portuguese, Rumanian, and Provencal. It is naturally more closely connected than any of these with Lat., the language of the Romans. The influence of the written speech of Virgil, Cicero, and Horace lingering for long in the peninsula. Its grammar is a simplification of Lat. grammar, but the popular spoken Lat. of the rustic played a very important part in the evolution of the It. vocabulary. It is divided into very many dialects and the pronunciation of similar words differs very greatly throughout the country. The standard literary and political speech is the Tuscan dialect which came into prominence during the fourteenth century, when it was employed by Dante and his contemporaries. For a classification and study of the various It. dialects consult N. Carr, *Saggio sulla storia della lingua e dei dialetti d'Italia*, 1782; S. de L. Morandi, *La nua della lingua italiana* (3 vols.), 1883; L. 12, G. I. Ascoli, *Il nuovo glottologico italiano*, 1873 et seq.; R. Fornaciari, *Grammatica storica della lingua italiana*, 1922; P. Petrocchi, *Vocabolario della lingua italiana*, 1981 ff., which is wholly in It. the It.-Eng. Ling. It. Dictionary by A. H. Edgerton, 1902 and B. Migliorini, *Italiani contemporanei* (3rd ed.), 1943.

No very early documents of It. literature exist, for the tradition of writing in Lat. lingered long, and, moreover, Lat. did not differ so much from the vulgar speech as to be unintelligible. The influence of the Teutonic invaders upon the speech of the race they subjected does not appear to have been very great. A much more powerful and lasting influence was that of the Fr. and Provencal troubadours who wandered across the Alps as early as the eleventh century and sang their songs

of love and war throughout the peninsula. In the early thirteenth century there grew up round the court of Frederick II. (1194-1250) in Sicily an It. school of poets who closely imitated the Provençal lyrics both in style and matter. Chief among them were Frederick himself, and his son Enzo (d. 1272), Piero delle Vigne (d. 1219), and Giacomo da Lentini. But their art was wholly imitative, conventional artificial, and consequently short lived. In the latter part of the thirteenth century the Tuscan tongue came into prominence. Tuscany had this advantage over the rest that its *lingua volgare*, the familiar speech of the rustic, was more generally polished so as to resemble the poetic diction of other dialects. The Siculo-Provençal poetry was imitated by a small Tuscan school, which, with Guittone d'Arezzo (1215-91) at its head, included the humorists and satirists Folgore of San Gimignano, Cene della Chitarra, and Rustico di Filippo. Guittone abandoned the Provençal chivalric forms, and wrote political and didactic poems. His great pupil, Guido Guinicelli (d. 1276), wrote philosophical lyrics, which are intellectual rather than imaginative, but mark a great development in the hist. of It. poetry. A contemporary of his was Brunetto Latini (d. 1291), the friend and master of Dante. His *Treasure* was obviously influenced by the allegorical poems, such as *Le Roman de la Rose*. Under the same influence was Francesco da Barberino (1261-1343). In Umbria the development of poetry was largely due to the religious movement brought about by the estab. of the Franciscan and Dominican orders. To St. Francis of Assisi (1182-1226) has been attributed the *Cantico del Sole*, a hymn written in rhythmical prose. The greatest exponents of religious poetry at this time were Jacopo dei Benedetti da Todi and Raniero Fasani Fasani's *Laudi* and similar liturgical compositions are the earliest form of It. religious drama. The earliest specimen of It. prose dates from the middle of the thirteenth century. The *Cento Novelle Antiche* was probably written by a Florentine. It is a collection of short tales drawn from Oriental, Gk., Trojan, and medieval sources. Francesco Barberino included similar stories in his *Del Reggimento e dei costumi delle donne*. The letters of Fra Guittone d'Arezzo, on moral and religious subjects, are interesting specimens of the *lingua volgare*. In addition we have a number of trans. and adaptations of Fr. romances and Lat. historical ascetic treatises an original scientific work on astronomy and geography called *Composizione del mondo*, by Ristoro d'Arezzo; and treatises on government, *De regimine principum*, by Egidio Colonna who wrote in the Venetian dialect.

The fourteenth century, called *Trecento*, is the age of a mighty trio—Dante, Petrarch, and Boccaccio. Hitherto, poets and writers had experimented in various dialects, and Tuscan had been proved to surpass the others. The great writers of the fourteenth century were all Tuscans, and by their use of it made the

Tuscan dialect the acknowledged literary medium of speech in It. for all time. Dante's immediate predecessors in lyric poetry were Guido Cavalcanti, whose *Sulla natura d'amore* is a poem on the metaphysics of love, Cino da Pistoja, and Lapo Giammi. To this school belonged Dante Alighieri himself (1265-1321). His work culminated in the *Divina Commedia*, a transcendental poem of incomparable beauty (see DANTE). Francesco Petrarca (1304-71) was at the time regarded as the dictator of literature, and his love for Laura has remained as an inspiration to all succeeding poets of every nationality (see PETRARCH). But he must be studied not only as the writer of beautiful love-lyrics, but also as the first humanist in It., the forerunner of the revival distinguished by an enthusiastic study of ant. classic literature. Giovanni Boccaccio (1313-75) had the same zeal for research into the works of antiquity, as is testified by his encyclopaedic works in Lat. on diverse subjects—*De genealogia deorum*, *De casibus virorum illustrium*, *De claris mulieribus*, etc. His narrative poems, *Teseide*, *Filostrato*, and *Amorosa Fiama*, are far more successful than his lyrics, while his *Amorosa Fiama* shows the influence of Dante. His fame rests mainly on the *Decamerone*, a collection of a hundred novellas, which are arranged and told with the skill of an artist who is at the same time an observant and sympathetic man of the world (see BOCCACCIO).

These three great writers had many imitators. Among Dante's followers must be numbered Francesco Stabile, called Cecco d'Ascoli (1269-1327; *L'Acerba*), Fausto degli Uberti (*Dittamando*), Federigo Frezzi (*Quadrifoglio*), whose works are chiefly of historical interest to the student. Novel writing had already attained great popularity in France and other countries. The example set by Boccaccio was now closely followed by Giovanni Fiorentino (*Petrarche*, 1378), Franco Sacchetti (d. 1400), a moral writer on immoral subjects, and Giovanni Lercambi di Lucca (1347-1424). The prose literature of the time is chiefly represented by the tales and novels of these and other men, and chronicle is very important as being the first attempt at historical writing. The greatest historian of the time was undoubtedly Giovanni Villani, who wrote a chronicle of his native city, Florence, including a review of the world's hist. from the Tower of Babel down to 1348. Travel literature is represented by the *Travels of Marco Polo*, and the religious and mystic sentiment of the time is expressed in the letters of St. Catherine of Siena (1347-80) and in the *Fioretti*, a collection of the words and deeds of St. Francis. During the period succeeding the death of Dante, Petrarca, and Boccaccio, there was a dearth of great writers. This may be accounted for partly by the over estimation of ant. Gk. and Lat. writers and the consequent under estimation of works in the vulgar tongue. Among those who ventured still to write in It. rather than in Lat. must be numbered Leon Battista Alberti (1407-72), with his *Della Famiglia*, and Matteo

Palmieri (1406-75), with his *Della Vita Civile*. Works of a more popular kind were the prose romances *I reali di Francia* and *Guerino il Meschino* of Andrea Barberino (1372-1431), the burlesque topical sonetti *caudati* of the Florentine, Domenico di Giovanni (d. 1448), surnamed Il Burlesello, and the *rappresentazioni sacre*, or religious dramas, which corresponded in some ways to the miracle and mystery plays of England.

In the middle of the fifteenth century two great events occurred which were of vast importance in the literary hist. of every European country. One was the fall of Constantinople in 1453, which drove many Gk. scholars into W. Europe, the other was the invention of printing, which did not affect I. till 1464. In 1447 the erudite founder of the Vatican Library was made Pope Nicholas V, an election which gave great impetus to the study of antiquity. Another event which influenced lt. literary hist. was the foundation of the Rom. Academy and the Florentine Platonic Academy, the latter of which made the important declaration that I. was equal in literary merit to Lat. Moreover, in the great centres of literary activity there were growing up young men of genius who became zealous advocates of maintaining the literary traditions of the country. One of these was Lorenzo de' Medici (1448-92), prince, poet, and patron of literature. His works include *Ambra*, an Ovidian allegory; *La Caccia col Falcone*, *La Zeucia di Barberino*, the *Canti Carnascialeschi*, carnival songs of a somewhat licentious character, a number of elegant love poems, besides pastorals and satires. He not merely encouraged, by his personal example, the use of popular literary forms, but he infused into them the culture of the Renaissance. The most distinguished of the men of letters who frequented Lorenzo's court in Florence were Luigi Pulci (1431-97) and Angelo Ambrogini (1454-92), commonly known as Politian. To the former we are indebted for the *Morganke Maggore*, a humorous epic in ottava rima, which contains a curious mixture of flippant and irreverent buffoonery, lofty sentiment, and religious fervour. Politian, who was a brilliant classical scholar and philologist as well as a poet, wrote the lyric tragedy *Orfeo*, *Giostra*, a poem on the tournament, and some exquisite *Stanze per la giostra*. Other protégés of Lorenzo were Antonio Manetti (1423-97) and the famous (Giovanni) Savonarola (1452-98). The Renaissance of anc. culture was similarly fostered by Ferdinand I at Naples. Jacopo Sannazaro (1458-1530) was the first to show that excellent lt. prose could be written outside of Tuscany. His *Arcadia*, a pastoral romance, foreshadowed by Boccaccio's *Ambra*, is classical in its construction of sentences as well as in its setting. It set the fashion for writing in studied poetical prose, and prescribed the rule for all future pastoral romances. A fellow townsman of his was Giovanni Pontano (1426-1503), the founder and head of the Neapolitan Academy and the author of many graceful lyrics and lively satires,

which are unfortunately written in Lat. In Ferrara, the literary centre of the N., Matteo Maria Bolardo, Count of Scandiano (d. 1494), enjoyed great popularity as the author of an unfinished poem, *Orlando Innamorato*, which celebrates deeds famous in old Fr. cycles. The story is original, and though the incidents are ingenious the characters are real people, but the style and diction are lacking in refinement.

The romantic epic, thus for the first time handled with any success by Bolardo, was perfected by Lodovico Ariosto (1474-1533). See ARIOSTO. His *Orlando Furioso* is a sequel to the *Orlando Innamorato*. The works of Ariosto open a new period in the history of lt. literature, a glorious period called by Its. the *Quattrocento*, which is in many respects equal to that of Dante, Petrarch, and Boccaccio. Ariosto

LUDOVICO ARIOSTO

lacked the simple and pleasing naïveté of Bolardo, but possessed greater imaginative insight. Besides the epic he also wrote comedies, satires, lyrics, and some Lat. verse. Another epic writer of the second period of the Renaissance was Giovanni Giorgio Trissino (1478-1550), a native of Vicenza. His *Italia liberata da' Fr.* (pub. 1547-48) is of interest as the first attempt to write lt. epic poetry in blank verse, but it lacks inspiration and falls far behind his tragedy *Sophonisba* (1515). Both Bernardo Tasso (1493-1569) in his *Amadigi* and Luigi Alamanni in *Carone il Corsico* owed much to *Orlando Furioso*. The high seriousness of these poets is even more prominent in the didactic work of Giovanni Rucellai (1475-1525) and Erasmo da Valterasso (1523-93). Side by side with these didactic poets there developed a school of burlesque writers, the chief of whom were Francesco Berni (1497-1535) and Antonio Francesco Grazzini, surnamed Il Lasca (1503-84). The cynicism and lack of morality that

was characteristic of the time is prominent in the work of that crafty but far-sighted statesman, Niccolò Machiavelli (1469-1527). Second to him as a historian is Francesco Guicciardini (1483-1540), who, besides writing of the hist. and gov. of Florence, made a collection of aphorisms for statesmen called *Ricordi politici e civili*. The two chief novelists of the sixteenth century were Matteo Bandello and Anton Francesco Grazzini. Although the former was a Dominican friar, his works reflect the loose manners of the time as much as any of those of his contemporaries. The licentiousness of the It. court was embodied in the infamous Pietro Aretino (1492-1557), whose letters, pub. in Paris in 6 vols. (1609), are an index to the life of the times. His comedies are lively and satiric sketches of contemporary manners. Other comedy writers of high merit are Giovan Maria Cecchi, Machiavelli, and Ariosto, but the greater number of It. playwrights adopted the conventional methods employed by anti. writers of Lat. comedy. During the latter part of the Renaissance a literary controversy took place with regard to the introduction of dialect forms in literature. In the end the 'purists,' who maintained the Tuscan of the fourteenth century to be the literary tongue, prevailed. Chief among them was the erudite Cardinal Bembo (1470-1547) who came to be regarded as the dictator in all matters of literary taste. Other writers of pure and elegant prose were the Marturan Castiglione (1478-1529) and the Tuscan della Casa (1503-36).

The work of Torquato Tasso (1544-95) brings this period to a close, and forms a link between it and the next. His early writings included *Rinaldo* and *Aminta*, a beautiful pastoral play, but his life work was the *Gerusalemme Liberata*, a poem on a heroic scale, in which is expressed the profundity of his feeling and the deep melancholy of his soul.

The period of decadence which followed the glorious era of the Renaissance may be traced back to the middle of the sixteenth century. The writers of the *Seicentismo* were devoid of imagination, of passion or sentiment. The inspiration of the Revival of Letters left them cold and barren, and their work is distinguished by its exaggeration, bombast, and artificiality. The fashion for this rapid manner of writing was set by Giovan Battista Marino (1569-1625), who, in spite of his far-fetched conceits and extravagant metaphors, showed a vigorous imagination in his poem, *L'Adone*. His manner was mimicked by lesser men, and the style which came into vogue was called after him *Marinismo*. Another characteristic of the *Seicentismo* is seen in Gabriello Chiabrera of Savona (1552-1637) and his followers, Fulvio Testi of Ferrara (1598-1646), Francesco Redi of Arezzo (1626-88), and Alessandro Guidi, who imitated Pindaric and other classical metres, and showed themselves possessed of a real lyric gift. The pastoral drama, essentially an artificial production, became extremely popular, the chief examples of the kind being the *Pastor Fido* of Guarini (1587-1612),

and the *Dafne* of Rinuccini, which was set to music by Peri and Caccini. Vincenzo Filicaja (1612-1707) is noteworthy as being one of the few writers of this age with real sentiment. His songs have a true patriotic ring, but even they are expressed in an exaggerated form. A reaction against the extravagance of metaphor and the affectation of an exuberant, passionate style became evident, and took definite form in the establishment by Giovan Maria Crescimbeni and Gian Vincenzo Gravina of the 'Academy of Arcadia' (1690), which advocated a return to pastoral simplicity. The most noted of the 'Arcadians' were Innocenzo Frugoni, Felice Zappi, and Paolo Rolli. But these would-be reformers still escaped one affectation to fall into another: the effeminacy of their madrigals is no better than the hyperbole of Marino. A healthy sign of revolt against *Marinismo* and Arcadia is seen in the satires of Salvatore Rosa (1615-73), a Neapolitan artist and musician and a forerunner of the eighteenth-century patriot, and in the mock-epics of Alessandro Tassoni (1565-1634), the author of *La Secchia Rapida* and *Filippiche*. But the most durable work of the *Seicentismo* was done by scientists like Galileo Galilei and Eia Paolo Sarpi and thinkers like Giordano Bruno and Tommaso Campanella. The prose of Galileo is distinguished by its precision and vitality.

The *Risorgimento*, or Age of Revival, was also prepared by Giambattista Vico, who, in his *Scienza nuova* investigated the universal laws of hist. which had governed the progress of the human race. Lodovico Antonio Muratori, Scipione Mattei of Verona, and Apostolo Zeno applied themselves industriously to historical research, and Count Giovanni Maria Mazzuchelli of Brescia and Girolamo Tiraboschi showed an interest in the sources and development of literature. Independent criticism found a public platform in the reviews recently established on the model of the Eng. *Spectator* and *Fuller*. Chief of these were the  *Osservatore* and *Gazzetta veneta* of Gaspare Gozzi (1713-86) and the *Frustra letteraria*, in which Giuseppe Baretti of Turin (1718-89) gave vent to his satirical humour. Most conspicuous among the literary reformers of the *Risorgimento* was Giuseppe Palmi (1729-99), a Lombard poet, who ridiculed the frivolity and self-indulgence of the society of the time in *Del Giorno*. Carlo Goldoni (1707-93) may be regarded as the dramatic reformer of the eighteenth century. With Molière as his master, he studied the people living about him and supplanted the *commedia dell'arte* by comedies of character.

The educated classes in I. were at this time filled with a hope of freedom from the foreign yoke. The idea of liberty they found best expressed in the writings of anti. Gk. and Lat. writers on whose style they tried to model their own. Vittorio Alfieri (1749-1803) made a determined effort to establish a national drama. His tragedies, which are almost invariably based on incidents in Gk. or Rom. hist., may lack artistic finish, but they are inspired by a noble patriotic spirit. The

chief literary fighters for national liberty at this time followed Alfieri in a return to classic models. Ugo Foscolo (1778-1827) passionately advocated the political cause in *Letters to Jacopo Ortis*, *Sepulchri*, and *Ortis*, which are somewhat marred by his gargantuan rhetoric. Foscolo should also be noted as a literary critic of high merit. His most important work as such is *Dell'origine e dell'ufficio della letteratura*; he also wrote textual criticisms of Dante and Boccaccio. Other classicists of note are Vincenzo Monti (1754-1828), who attacked the Papacy in *Superstizione* and *Fanatismo*, and expressed his fears for his country in *Bassvilliana* and *Feromade*; Gian Battista B. Niccolini (1782-1861), who wrote tragedies on political subjects, as e.g. *Antonio Foscarini* and *Ludovico il Moro*; Ippolito Pindemonte (1773-1828), a dramatic poet and Leopardi (1798-1837) the greatest lyric since the Tricento. Indignation against Napoleon's aggressive policy roused Carlo Porta (1766-1837) to write a list of his country during the years 1789-1814. Other historians like him, distinguished by their patriotism and by their classic methods, are Cesare Balbo (1789-1853), and Gino Capponi (1792-1876).

The modern literature of I may be said to have arisen out of the romantic movement which started in Milan towards the end of the eighteenth century. The chief characteristics of the new movement were a renewed study in the *aurea trientista*, the classic writers of the fourteenth century, and in all medieval things, and a keen interest in the works of such men as Goethe and Byron, who represented a similar movement in Germany and England. The organ of the new school was the *Conciliatore*, a journal estab. in Milan in 1818, and its leader was Alessandro Manzoni (1785-1873), the author of a great historical novel, *Promessi Sposi*, which owes much to Sir Walter Scott. Domenico Guerrazzi (1804-74) and Massimo d'Azeglio (1798-1865) were successful exponents of the historical novel. Giuseppe Giusti (1809-50), a Tuscan, won great popularity with his clever epigrammatic satires. Among the political revolutionists, who were at the same time powerful literary advocates of the cause of liberty, should be noted Vincenzo Gioberti (1801-52), who is also known by his philosophical work, *Primato morale e civile degli Italiani*; Niccolò Tommaseo (1802-74), and Giuseppe Mazzini (1808-72).

Since 1850 politics have had less influence on Italian literature. The transition between the Age of Revival, which roughly speaking, covered the years 1750-1850, and the age of King Humbert is marked by the patriotic poems, *Storici politici*, of Francesco dall' Ongaro (1808-73). The traditions of the romantic school were maintained in the poems of Giovanni Prati (1816-84), but the greatest Italian poet of the post-Risorgimento, Giosuè Carducci, set on one side the outworn methods of the Romantics, and sought his inspiration in the national literature of an earlier time. The chief followers of his classical manner are Guido

Mazzoni and Giovanni Marradi. Other poets of distinction are Giovanni Pascoli, Arturo Graf, Gino Guerrini, and Enrico Panzachi. The drama, on the whole, became more realistic, the chief exponent of modern methods being Gerolamo Rovetta and Giuseppe Giacosa. Antonio Fogazzaro (1842-1910) won a great reputation as a writer of mystic and philosophical novels with an historical setting. The influence of the realistic movement is seen in the novels of Giovanni Verga. Edmondo de Amicis (1846-1908), known by his novels and travels, is one of the most popular of writers. The chief women novelists are Grazia Deledda and Matilde Serao, while Vittoria Aganoor, Annie Vivanti and Ada Negri are women poets of repute. Gabriele d'Annunzio (q.v.) is a brilliant and versatile writer—a dramatist, poet, novelist, and critic. His genius is undeniable but many critics complain of the licentiousness and pessimism of his thought. *Ser D'Annunzio*. Lutherism in literature was linked to that in painting, and indeed showed its influence. Its leader was Marinetti, together with Soffici Papini and Ungaretti in criticism and philosophy the outstanding figures are Benedetto Croce and Giovanni Gentile, while Pasquale Villari's books on Machiavelli and Savonarola have become classics. Croce's work has been the direct cause of the revival of aesthetic criticism throughout Europe, and he is also a philosopher and historian. With the dramatist, Bracco, he is one of the few prominent Italian authors who are out of sympathy with the latest ideas. But there is among younger people an inevitable reaction against Croce's characteristic optimism, a reaction which often takes the shape of *esistenzialismo* (Existentialism) and homage to Sartre. More specifically post-1918 literature shows a tendency to exploit its life and the local scene in novel and story—in, for instance, the Sardinian novel of Grazia Deledda, Nobel prizewinner in 1927, or in the satirical but humorous work of Ugo Oletti or of Panzini, Brocchi, Raffaello (alini), and Marino Moretti, who is also a poet of distinction. Other important writers are the novelist Zucca (q.v.), Riccardo Bacchelli whose long novel, *Il Diavolo al Pontelungo*, is descriptive of the Italian anarchist movement and Prof. Borgese (q.v.), who besides being a literary critic, has written a novel, *Lupe*, reflecting the decadence of life after the First World War. Bacchelli's work is linked in a personal and direct way with the traditions of the nineteenth century. He is the most complex and widely cultivated among contemporary Italian novelists. His *Il Piano del Fiume di Lusi* ('The Lament of the Son of Lusi') is an achievement equal if not superior to the work of Thomas Mann in that kind. Montanelli (q.v.) is interesting for having inaugurated a movement for abandoning the pure Italian classicism for an art more general and worldly. This is offset, however, by the enthusiastic Roman revival, encouraged by Fascism and finding expression in such a work as Corradini's drama, *Giulio Cesare*, acted in the

Gk. theatre at Taormina in 1928. With the possible exception of Croce, the Italian writer of the greatest European importance is Luigi Pirandello (q.v.), who exploits a psychological world of half-reality. He is a prolific short-story writer as well as play-wright, and in fact with him the two mediums are not widely dissociated. The Fascist régime, while not seriously deflecting the careers of the older established writers such as Pirandello or Panzini, did not produce any notable literature of its own. The best writing was produced in exile, and the It. socialist, Ignazio Silone, gained European fame with his novel *Fontamara* in 1930. He also wrote a *History of Fascism* in 1934. He returned to I. in 1945. Since the Second World War the only important books of verse have been Eugenio Montale's *Primo verso* (1946), and the complete ed. of Umberto Saba's poetry (1946). These are the major It. poets to-day. Ungaretti, who has recently issued a trans. of Shakespeare's sonnets, is the most notable poet of the previous generation. Alberto Moravia seems to be the It. novelist best known outside his own country. *Agostino*, reputed to be his best book, relates to the disturbance and anxiety with which the discovery of sex afflicts the adolescent — a hackneyed theme which, however, Moravia treats with a kind of lucidity. Equally ruthless is Guido Piovene's *Pietà contro Pietà* ('Pity against Pity') (1946), a novel of contemporary life, crude and subjective, but penetrating. Corrado Alvaro, author of *L'Età Breve* ('The Brief Age') (1947) is a Calabrian novelist who is well known in I. Among contemporary short-story writers the best known are Vitalino Brancati, whose *Il vecchio cogn. strali* ('The Old Man with the Boots') (1911) is a description of prov. Sicilian life under the Fascists; Carlo Cassola and Guglielmo Petroni. The It. Resistance movement, unlike that in France, did not result in any typical literature, though mention may be made of the novel *Uomini e no* ('Men and Not Men') by Elio Vittorini (1945), whose later work, however, has reverted to the manner of Saroyan, and of the autobiographical sketch, *Il Mio granello* ('My Grain of Sand') (1946) by Luciano Boris. Among the many new literary reviews may be mentioned *Angela* (Florence) devoted to English studies, *Mercurio*, and *Il Ponte* — all being post-1945 productions. *Piera Letteraria* is still regarded as the best literary weekly publication. In another sphere It. writing to-day shows intense vigour: historical research, philosophy, art criticism, and philology are flourishing, and works of this kind are the chief merit of It. culture to-day.

**Music** — For early developments connected with Rome as seat of the Christian Church, see the article MUSIC. The important movement known as *Ars nova*, which during the fourteenth century replaced the medieval organum by a polyphonic style with a much wider harmonic and rhythmic range, was largely It. (Florentine) in origin; but the composers

who developed it into a great art were Flemish. It was a Fleming, Adrian Willaert (c. 1480–1562), who, appointed to St. Mark's Cathedral in 1527, founded the important Venetian school of composers. For two centuries Italy had been distinguished more for secular than sacred music, particularly in the field of the popular part-song. This took sev. forms, the *frottola* (Venetian), *villanella*, *ballata* (Eng. ballet), and the canonic *caccia* (Eng. catch), all characterised by harmonic simplicity, lightness of mood and concentration of melody, always a strong feature of It. music. Verse and music were closely integrated, sometimes dancing and instrumental accompaniment were added. The *Laudi Spirituali*, popular hymns influenced by plainsong, originated at Florence in the fourteenth century and later became an important element in oratorio. The union of It. secular song and Flemish polyphony produced a valuable art form in the madrigal, whose style, imitative rather than contrapuntal, was founded on a perfect balance between words and music. Its earliest masters were Flemish, notably Willaert and Lassus, but it was soon taken up by native composers and reached its height in the work of Marenzio (1533–99), Gesualdo (c. 1560–1615) and Monteverdi (1567–1643). A severer method, influenced less by popular song and more by the motet, was cultivated at Rome, first by Costanzo Festa (1490–1545), later by Palestrina (1525–94). Charged by the Pope with the purification of church music, Palestrina evolved a style, compounded of It. lyricism and the solid contrapuntal achievements of the Flemings, that crowns the whole polyphonic period.

The leaders of instrumental music were the Venetians. Venice, the centre of music printing, became in the sixteenth century the hub of European musical life. The earliest surviving lute books, consisting of transcriptions, dances and fantasias, date from 1507–09. The *canzona* and *ricercare*, originating in transcriptions of the Flemish motet, were cultivated by Andrea Gabrieli (c. 1510–86) and developed by Claudio Merulo (1533–1604) and Giovanni Gabrieli (1557–1612) into independent compositions for organ. Another new instrumental form was the *toccata*, in which a genuine keyboard technique became apparent. Among Giovanni Gabrieli's innovations was the use of voices and instruments in antiphonal groups; this arose from the shape of St. Mark's Cathedral, which required the div. of the choir into two parts, each with its own organ. With Frescobaldi (1583–1643) the *ricercare* developed into the modern fugue.

About 1600 Italy produced two new large-scale forms, opera and oratorio. The earliest operas were the work of an aristocratic Florentine group known as the Camerata, chief among whom were Peri (1561–1633) and Caccini (c. 1565–1618). Endeavouring to revive the methods of Gk. tragedy they rejected polyphony and turned to recitative, a change that coincided with the introduction of the figured

bass. Another approach to the stage was through the madrigal; Orazio Vecchi (1550-1605) wrote an early dramatic work in the form of a string of madrigals, and Monteverdi, in whose madrigals the music had become more and more an emotional illustration of the text, turned to opera in 1607. He greatly enriched its orchestral element and range of harmonic expression, which he put to true dramatic use. The ancestor of the oratorio was the medieval morality play, as developed by St. Philip Neri (1515-95) at his oratory in Rome. The first oratorio proper, by Cavallieri (c. 1550-1602), was produced in 1600 with scenery, costumes and dancing. It differed from opera only in its ethical subject. During the seventeenth century both these forms, especially opera, spread throughout Europe, but the It. love of scenic and vocal display caused an increasing emphasis on virtuosity at the expense of dramatic truth and orchestral colour. The operas of Cavalli (1602-76) and Cesti (1623-69) saw the gradual separation of aria from recitative, a process standardised by Alessandro Scarlatti (1660-1723), a great melodist, who established the It. overture, *da capo* aria, *opera buffa* and the two kinds of recitative. He also ejected the chorus, whose part in oratorio however had been extended by Carissimi (1603-74). Another form, coeval with opera and oratorio, reshaped by Carissimi and soon popularised abroad, was the cantata, whether sacred (*da chiesa*) or secular (*da camera*). Opera in the It. style and language continued to dominate the stages of Europe throughout the eighteenth century, aided by the vogue of the male soprano or castrato. The librettos of Metastasio (1698-1782) imposed a still stricter formalism, but the quality of the music declined and the dramatic element all but vanished. Of many It. operatic composers Pergolesi (1710-36) is remembered for his success in *opera buffa*.

The leading It. keyboard composer after Frescobaldi was Pasquini (1637-1710). The great advances made in N. It. in the evolution of the violin family led to an extension of instrumental music parallel with that of opera. It was this age that gave to music many of its familiar It. terms. The *sonata*, originally any piece written for instruments (as opposed to *cantata*, a piece for voices) and more or less synonymous with *canzona* and *sinfonia*, developed like the cantata in two forms: *sonata da chiesa*, derived from the old polyphonic style, and *sonata da camera*, based on popular dance measures. Such works were at first written for sev. instruments, generally of the violin family, but in time were confined to one or two supported by a string bass and continuo (figured bass) on the harpsichord. The great composer of this period was Corelli (1653-1713), who late in life also perfected the *concerto grosso*, an orchestral work in which the main body of instruments was contrasted, after the old antiphonal principle of choral music, with a few (generally three) soloists. From this it was a short step to the solo concerto. Corelli's most important successors were

Geminiani (1687-1762), Vivaldi (c. 1675-1741), a many-sided composer who influenced Bach, and Tartini (1692-1770), who improved the technique of the violin. The pianoforte was invented about 1710 by an It. Bartolomimeo Cristofori (1655-1731), but did not at once become popular, and the greatest It. keyboard composer, Domenico Scarlatti (1685-1757), wrote for the harpsichord. His very varied one-movement sonatas have the greatest artistic and technical importance.

After 1750 It. music lost its hegemony. *Opera buffa* alone retained some vitality in the works of Paisiello (1740-1816) and Cimarosa (1749-1801). A spark of brilliance was supplied by Rossini (1792-1868), who however, like other Its. of his time, left Italy and essayed cosmopolitan romantic opera in Paris. Native melody and vocal virtuosity continued to find expression in the operas of Donizetti (1797-1848) and Bellini (1801-35) and in the early work of Verdi (1813-1901), a dramatic composer of rare genius, who in his later operas achieved a perfect balance between drama and music, thus at last reaching the standards set by Monteverdi. During the late eighties a new type of opera, based partly on Fr. and Ger. models and known as *verismo* from its attempt to reproduce the situations of everyday life, was initiated by Mascagni (1863-1915) and Leoncavallo (1858-1919). But their operas and those of Puccini (1858-1924) a composer of greater refinement, are marred by a search for effect that is too often neither musical nor truly dramatic but melodramatic.

Towards the end of the nineteenth century It. interest in instrumental music, dead for more than a century, was revived by Scaramatti (1841-1911) and Martucci (1856-1909), and their successors have cultivated all the possible forms, both vocal and instrumental. The most important composers are Respighi (1879-1936), best known for his rich orchestral works, Malipiero (b. 1882), Pizzetti (b. 1880), both of whom have adopted a more serious instrumental style, Casella (1883-1947), whose output is eclectic, and Dallapiccola (b. 1904). But Italy has not yet found an operatic successor to Puccini.

**ART:** see ITALIAN ART; ARCHITECTURE, Italian.

**Italy, British Army in (First World War).** The disastrous It. defeat at Caporetto (q.v.) occurred in Nov. 1917, but before the close of the year the Brit. Gov. sent out five divs. It is undoubted that these reinforcements were a vital moral influence in restoring what seemed a desperate situation. In March 1918 two of these divs. were, however, sent to France in view of the impending Ger. attack on the W. Front. When the Austrian offensive of May 1918 opened the Brit. forces, under the command of Gen. the Earl of Cavan, were disposed on the Asiago Plateau. While the It. were repulsing the enemy in the Adamello passes the Brit. repulsed them on the plateau and both allies took many prisoners and guns. On June 15 the Austrians launched a heavy offensive from Asiago to the sea with 600,000 men, crossing the Piave the same day at Montello and near the mouth. The Brit. forces, which included several battalions of the Royal Fusiliers, played an important part in hurrying the Austrians across the riv. again and involving them in the tremendous defeat of the early autumn, which ended in the armistice with them being signed on Nov. 4. The total number of Brit. forces employed in Italy was about 101,000 combatant and 44,000 non-combatant troops, the maximum strength at any one time being about 90,000 combatant troops. The casualties were, killed and died of wounds, 1057, missing and prisoners, 670, and wounded, 1971.

**Italy Star.** Brit. military decoration, instituted in 1915 for entry into operational service on land in Sicily or in Italy at any time during the campaign there from capture of Pantelleria on June 11, 1943, and until May 8, 1945. The ribbon is in It. colours, green, white, and red.

**Itch,** any irritating skin disease. The commonest form is scabies, a disease caused by the animal parasite, *sarcoptes scabiei*, which burrows under the skin and causes intense irritation leading to scratching on the part of the patient with resulting rawness, scabs, and eczematous conditions. It may occur on any part of the body, but rarely on the scalp and often between the fingers. The treatment is application of sulphur ointment. *Barber's itch* is caused by a fungus and affects the hair follicles, particularly those of the beard. The inflammation set up leads

to the formation of pustules at the root of each hair affected. *Caban itch*, an irritating skin disease introduced by soldiers from Cuba; it is supposed to be a mild variety of smallpox. *Coolie itch*, a skin-inflammation common amongst field-workers in Assam and other tropical countries. It is caused by the larvae of *uncinariæ duodenalis*, and the eruptions are confined to the surface of the lower extremities.

Itch-mite, name given to the species of Sarcoptine, a sub-family of arachnids which are parasitic on the skin of mammals, birds, and insects. *Notodres*, *Proscopodectes*, *Sarcoptes*, and *Ortiotes* are among the commonest genera. *S. scabiei* attacks the skin of man, and produces the disease known as scabies.

*Ithaea*: (1) Now called *Thiaki*, one of the Ionian Isles, and lies E. of Cephalonia. It has an area of about 37 sq. m., and is mountainous. Wine and olive oil are the chief productions. The chief tn. is Vathy (pop. about 3,200). This is noteworthy as having been the home of Ulysses. Pop. about 8,800. (2) tn., the cap. of Tompkins co., New York, U.S.A. on Cayuga Lake. Cornell Univ., the New York State Coll. of Agriculture, the Athena Conservatory of Music, and the Empire State School of Printing are situated here. Pop. 19,700.

*Ithome*, name of a fortress and mt. in Messenia, anc. Greece. The fortress played an important part in the Messenian war waged against Sparta during the seventh and eighth centuries B.C.

*Itinerary* (Lat. *itinerarium*, from O. Lat. *itiner*, a journey), name applied by the Romans to a list of the stopping-places, or halts, with the distances from one to another, between two places of importance. The I. was generally divided into two classes, one having the character of a book, and the other being a kind of travelling map. Of the former, the most important are the *Itineraria Antonine*, and the *It. Hieronymianum*. Of the latter only one great example remains, viz the famous *Tabula Peutingeriana*.

*Ito*, Prince Hirobumi (1838-1909), Jap. statesman. In 1863 he worked his way before the mast to London, and joined others of his nation who had come to Europe to study W. civilisation. He returned to Japan in 1865, and took an active part in the social and political reorganisation of the country. From being minister of public works he rose to the rank of Prime Minister in 1880, which office he held four times. He was selected by the Mikado to study the various forms of constitutional gov. in Europe, and was the author of the Jap. constitution of 1889, which in many respects was more liberal than that of several European countries. He was made Prince in 1907, and appointed resident-general of Korea after the Russo-Japanese War, meeting his death at the hands of a Korean at Kharbin.

*Itri*, small tn. of Littoria, Italy. It was the bp. of Fra Diavolo. As a result of the Second World War the tn. and its churches are in ruins. The central part of

the nave of the church of the Annunziata, the bell-tower of S. Maria, and the facade of St. Michele Arcangelo remained intact, but the church of S. Martino was completely wrecked.

*Itá*, or *Itú*, tn. in Brazil, on the R. Ité, 70 m. W.N.W. of São Paulo. It is the centre of a great cotton, sugar, and coffee producing dist., and has cotton factories, and iron and bronze foundries. Pop. 38,000.

*Iturbide*, Augustin de (1783-1824), for ten months emperor of Mexico, was a Creole by birth. In early life he much distinguished himself as a soldier in the royalist cause, which was then endangered by Hidalgo's and Morelos's rebellions. In 1822 he accepted from his devoted soldiers the title of Emperor Augustin I., for the Sp. Cortes refused to recognise the virtual independence of Mexico as set forth in the treaty of Cordova. After a compulsory abdication (1823), the result of his arrogance and despotism, he went into exile, and on returning was met and shot. See M. André, *La Fin de l'Empire espagnol de l'Amérique*, 1922.

*Iturea*, dist. in anc. Syria, lies between Damascus and the Lake of Tiberias in N.E. of Palestine.

*Itzehoe*, tn. of Germany, on the Stör, 44 m. N.W. of Hamburg, is the oldest town in Schleswig-Holstein. The castle of Ennsfleth, round which it was built, was erected by Charlemagne, 809. Pop. 20,000.

*Iuka*, tn. in Mississippi, U.S.A., county seat of Tishomingo co., is 22 m. S.E. of Corinth. Here the Federals under Gen. Rosencrans defeated the Confederates under Gen. Price in 1862. Pop. 1,400.

*Iulus*, see JULUS.

*Iulus*, see ASCANIUS.

*Ivan*, or *John*, name of six grand dukes of Moscow and tsars of Russia.

*Ivan I* (1301-41), surnamed 'Kalita,' or 'Money-Bag,' because of his strict economies, consolidated scattered Russian ters, conquered Moscow and Tver, and made the former city the metropolis and place of Vladimir.

*Ivan II*. (1326-59), son of the above, was a 'gentle and merciful prince,' but a weak ruler, who much diminished the grand duke's prestige. He began to reign in 1353.

*Ivan III*. (1440-1465), called 'the Great,' ascended the throne in 1462. His commander Svenigorod crushed the power of the invading hordes of Tartars (1481). I. introduced fire-arms and cannon into Russia (1475), and also forced the heretofore independent kingdom of Novgorod to acknowledge his suzerainty (1478). He disregarded his boyars, and ruled as an autocrat.

*Ivan IV*. (1530-84), called the 'Terrible,' grandson of the above, came to the throne in 1533. He was a great conqueror, subduing Kazan and Astrakhan and annexing Siberia to the Russian kingdom. Further he was a good legislator, and in 1550 made a code known as Soudbnik. But he was cruel and tyrannical by nature, and was responsible for a number of ruthless massacres.

**Ivan V.** (1666-1696), became tsar in 1682, and was associated in power with his half-brother, Peter. He was quite deficient in personality, and became the tool of stronger men.

**Ivan VI.** (1740-64) never reigned, but passed practically the whole of his life in solitary confinement till his murder in 1764.

**Ivan Gorod, see NARVA.**

**Ivanov, Nicholas** (c. 1858-1918), Russian soldier, son of a common soldier accidentally killed when I. was twelve years old at a military review in presence of Alexander II, who had I. admitted to a military school and helped his advancement. In the First World War he commanded one of the armies operating in Galicia; won much distinction, capturing Lemberg and Przemyśl. In 1915 after the Russian retreat, he resigned his command, but was retained at headquarters by the Tsar—who telegraphed to him when the revolution threatened. I. thereupon made a dash for the cap.; but when he learned that he would be totally unsupported there, he desisted. On Feb. 16, 1918, it was reported at Petrograd that I. had been killed in action at Kiev.

**Ivanovo** (or **Ivanovo-Voznesensk**), region and tn. of central Russia. The tn. was formerly in the gov. of Vladimir and is situated 60 m. N.N.E. of Vladimir. Sown grasses form an important part of the agric. economy in the I. region, which is also noted for dairy farming. I. is the Manchester of Russia—the centre of the cotton-spinning and weaving industry. There are also chemical works. Here is also one of the large regional peat-electric power stations of Russia. I. is connected by rail with Moscow, about 180 m. distant. Pop. (tn.) 285,000, (Region) 4,500,000.

**Ivagh, Edward Cecil Guinness, first Earl of** (1847-1927), Irish philanthropist; third son of Sir Benj. Lee G., M.P., first Bart. Educated at Trinity College, Dublin. From 1886 he was chairman of the limited company then formed to take over the business of G.'s brewery, but he retired from active work on the board in 1889. His first charitable donation was a quarter of a million to be spent in building homes for the poorest workmen of London and Dublin. This fund is now controlled by the London and Dublin Guinness Trusts for Housing the Poor. Guinness became a peer in 1891, and soon afterwards embarked on a scheme for clearing and re-planning seven acres of slum in Dublin city. Here he arranged for labourers' dwellings, a public pleasure garden, swimming baths, and a concert hall. Although a Unionist, he was offered the Lord-Mayorship of Dublin in 1909. In 1919 he was made an earl.

**Ken Wood Mansion**, together with its pictures and furniture, were bequeathed in 1928 by I., for the benefit of the public; together with an endowment fund of £50,000. He also bequeathed the grounds and park of some 74 ac. to the public. The grounds and park are controlled by the L.C.C.; the Mansion and its contents and

the endowment fund are controlled by trustees. There are 63 paintings, including representative pictures by Boucher, Crome, Cuypp, Gainsborough, Fraus Hals, Hoppner, Landseer, Lawrence, Morland, Van Ostade, Raaburn, Rembrandt, Reynolds, Romney, Rubens, Turner, Van Dyck, and Vermeer.

**Ivel**, tributary of the Great Ouse, flowing N.E. and N. through Bedfordshire, England. The confluence is at Tempsford. Length 30 m.

**Iverna, see HIBERNIA.**

**Ives, Frederic Eugene** (1856-1937), Amer. photographic inventor. At age of eighteen was put in charge of the photographic laboratory of Cornell Univ.; so remained till 1878, when he invented the first half-tone process; invented current process in 1886. He also invented in 1894 the photo-chromoscope a device by which a single positive image in natural colours is produced by a combination of three negative ones. The reader is referred to I.'s own publications for the best account of his work. These include *Isachromatic Photography* (1886), and *A New Principle in Heliochromy* (1889).

**Iveston**, vil. in the co. of Durham, England, situated about 9½ m. N.W. of Durham. Pop. about 6000.

**Ivinghoe**, vil. of Bucks., Eng., 9 m. from Aylesbury. It has a fine fifteenth-century church. I. Beacon (762 ft.) and Ring-hall or I. Common were acquired by the National Trust in 1926. I. mill, between I. and Pitstone, 3 m. N. of Tring, Herts, is probably one of the oldest remaining post-mills in Eng. It is preserved as a historic landmark.

**Iviza**: (1) One of the Balearic Isles, situated in the Mediterranean Sea, between 50 and 60 m. from the coast of Spain, to which country it belongs. This is. has a much indented coast and a mountainous and well-wooded interior. The chief productions are fruit of various kinds and salt. Pop. 23,500. (2) The cap. of the above is. It is a fortified tn., and was the see of a bishop. Pop. about 6500.

**Ivory**, term properly given only to the material which forms the tusks of elephants and is 'that modification of dentine, or tooth-substance, which in transverse sections or fractures shows lines of different colours, or striae, proceeding in the arc of a circle, and forming by their decussations minute curvilinear lozenge-shaped spaces' (Sir Richard Owen, *Lectures*, 1836). These tusks are sometimes of tremendous size, a single specimen occasionally weighing 200 lb., and are distinguished from the teeth of most animals in that they are imbedded in semi-solid vascular pulp, and continue to grow in size during the whole life of the elephant. The term ivory is often extended to a similar substance obtained from the walrus, narwhal, hippopotamus, etc. The I. from the African elephant is the most esteemed on account of its superior density and whiteness, but a certain amount is also obtained from India, Ceylon, Burma, and the is. of the E. Archipelago. In African elephants both the males and females have tusks, although those of the

males are larger, but in the Indian species the females are practically tuskless. The 'fossil' I. obtained from the extinct mammoth in Siberia is too brittle to be of much value. Antwerp is the chief market for I. I. is valued according to the size and soundness of the tusks. The natives have discovered the superior value of newly obtained tusks, and palm off a large quantity of 'dead' I., which has been buried for centuries, upon unwary traders. The special qualities of I., its beautiful texture and tints, its perfect elasticity and adaptability to the carver's tools, have been recognised from the earliest times,

seals, hunting-horns, knick-knacks, snuff-boxes, toilet combs, mirror cases, chessmen, and draughts. Prehistoric man used pieces of bone, horn, and ivory for his sketch book and scratched on it drawings of animals. The anc. Egyptians and Assyrians used ivory for domestic purposes and for the decoration of furniture, but Egyptian ivory statuettes have also been found. The Gks used ivory for the decorations on the trappings of their horses and for the bosses of their shields and for small boxes and caskets, but we possess few examples of Gk. ivories, especially of the early period. Of Rom.

*Ivory in Lotus Land by H. J. Ponsing*

#### JAPANESE IVORY CARVERS

and examples of carved I. dating from the time of Moses are still in existence. Vegetable I. is the name given to 'Corozo Nuts,' the hard white, potato-like endosperm contained in the seeds of the palm-like tree (*Phytelphus macrocarpa*) which grows in the low hot valleys of the Andes. It is valued at about £10 a ton, and is used for buttons, etc. For another substitute for I. see CELLULOID. See A. Maskell, *Ivories*, 1906.

**Ivory Carving** Since earliest times ivory has been used either alone or in conjunction with silver and bronze as a decorative material. Ivory has always been used considerably for the decoration of palaces and the Romans sent an ivory throne to Persia, while, in the nineteenth century, an Indian Prince sent one to Queen Victoria. Ivory has also been used a great deal for religious purposes in such things as crucifixes, the heads of pastoral staves, liturgical combs, and even altar-pieces. Secular works of art, in which ivory has been employed, include

ivories we have a great number of consular diptychs, often from writing tablets and plaques which are beautifully carved in relief. The subjects of these carvings were usually classical myths or pictures of Rom. gods. The earliest Christian ivories in existence date from the time of Constantine and among these we have paxes carved from ivory tusks, plaques, and book covers. Byzantine ivories are very numerous and beautiful, and if the figure of Christ, so often portrayed, is inclined to be stereotyped the decorative designs of these ivories are excellent. Up to the end of the fourteenth century, ivory carvings were usually of religious subjects, although often used for secular purposes, but after this date hunting scenes, deeds of chivalry and pictures of tournaments were depicted, the sculptures being influenced by the romantic literature of the period. In India, ivory has been much used for caskets, many of which are extremely beautiful and elaborate. Chinese ivories are often more clever

than beautiful, and consist chiefly of elaborately carved balls and models of villas. Jap. ivories are usually very small, but very well designed and finished. Most Jap. ivories are comparatively modern. In modern times ivory has been used for sculpture, either alone or in conjunction with bronze and jewels. One modern example of ivory sculpture that may be mentioned is the 'Lamia' by George Frampton. This piece is the bust of a woman. The face is life-size and carved out of ivory, while the head-dress and dress are of bronze.

**Ivory Coast, Fr. colony** on the W. coast of Africa, bounded on the S. by the gulf of Guinea, W. by Liberia and Fr. Guinea, N. by Upper Senegal and Niger, and E. by the Brit. colony of the Gold Coast. The low coastal plains extend inland about 40 m., beyond which the ground rises from a general height of about 1000 ft. to the plateau of the Koung ter. (4757 ft.), which is largely covered with almost impenetrable, primeval forest, interspersed with patches of savannah. The rivers are of little importance, and all drain into the gulf of Guinea. The chief products are maize, plantains, rice, bananas, pine-apples, limes, and other fruits, all of which are cultivated by the natives; and rubber, coco-nuts, coconuts, the production of which is fostered by the Fr. for the export trade. There are also mahogany forests. The exports, comprise chiefly palm kernels, palm oil, cacao, rubber, mahogany, cotton, and cocoa. The imports are chiefly tobacco, wines, and metal and cotton goods. The seat of administration, previously at Bingerville (native Adjame), with a European pop. of only about 100, has been transferred to Abidjan (pop. 26,000). The ports are Grand Bassam (in the neighbourhood of which some gold is found), Assinie and Grand Lahou; other chief tns. in the interior, Dimbokro, Abobo, Onagadougou (16,500), Bobo, Dioulisso (13,600) and Bouaké. From Abidjan a railway runs N. to the oil and rubber dist., as far as Tafré, a distance of 300 m., and it is now proposed to extend this to the Niger. There is a large network of roads suitable for motor traffic (11,000 m.). There are six wireless stations in the colony. The colony was estab. in 1899, the coast having been settled in 1843, and the 'hunterland' in 1883. In 1933 a part of Upper Volta was added to the I.C. Area approximately 180,000 sq. m. Pop. 4,056,000. (Europeans 3,800). See T. J. Clozel, *Déans à la Côte d'Ivoire*, 1906; R. Villanour and Richmond, *Notre Colombie de la Côte d'Ivoire*, 1903; and *La Côte d'Ivoire*, 1908; G. Hanotaux, *L'Empire colonial français*, 1929.

**Ivory, Vegetable**, see under IVORY.

**Ivrea, tn.** in the prov. of Aosta, Italy. It is situated about 38 m. by rail N.E. of Turin, on the Dora Baltea. This tn. possesses many interesting buildings, among which may be mentioned the cathedral and the old castle. The anct. tn. was in Rom. times a place of importance. The modern tn. has manu. of silk goods. Pop. (commune) 11,300.

**Ivry-la-Bataille, tn.** in the dept. of Eure,

France. It is noted as the scene of the victory of Henry IV. of Navarre over Mayenne in 1590. Pop. 1400.

**Ivry-sur-Seine, tn.** in the dept. of Seine, France. It is situated on the l. b. of the Seine, S.E. of the fortifications of Paris. It has breweries, earthenware and engineering works. Pop. 42,400.

**Ivy, or Hedera Helix**, one of three species in its genus, which belongs to the Araliaceae. It is an old-world plant, which climbs by means of its roots, bears

IVY

two forms of leaves, and has small flowers which secrete a great deal of honey and are therefore pollinated by insects. The ground-ivy, or *Nepeta Glechoma*, is a species of Labiatae unallied to the common I.

**Ivybridge**, small tn. of Devonshire, England. It is situated in the valley of the Erme, about 10 m. N.E. of Plymouth, and has paper mills. Pop. (1931) 1600.

**Ixelles (Flemish Elsene)**, tn. of Brabant, Belgium, and a suburb of Brussels, in the S.E. of the city. It has manu. of furniture, porcelain, pottery, organs and chemicals. On its ter. are the restored abbey of Ter Kameren, occupied now by the Belgian Cartographic Institute, and the modern building of the National Radio Institute. Pop. 90,700.

**Ixia**, genus of Iridaceous plants, consists of two dozen species, all of which are natives of S. Africa. Sev. are cultivated in Britain for the beauty of their flowers.

**Ixiolirion**, genus of amaryllidaceous plants, is indigenous to W. Asia. There are only two species, and of these *I. kolpukowskianum* is cultivated in Britain.

**Ixion** was, according to Gk. legend, king of Thessaly, son of Phlegyas, and husband of Dia. All men shunned him when he murdered his father-in-law, but Zeus in pity bore him to Olympus. I., however, abused the god's hospitality, and strove to seduce his wife. By embracing a cloud, which he believed to be Hera, he became father to the Centaurs. Zeus

punished his treachery by binding him in hell to a fiery wheel of perpetual motion.

**Ixmiquilpan**, tn. in Mexico, in the state of Hidalgo, is 80 m. N.W. of the city of Mexico. It has valuable silver mines. Pop. 13,000.

**Ixodides**, see TICKS.

**Ixora**, genus of rubiaceous plants found in tropical countries, and the species which number about one hundred, are evergreen shrubs.

**Iyar**, eighth month of the Jewish year (April-May).

**Izabal**: (1) dept. of Guatemala, Central America, on the Caribbean coast. It is low and unhealthy, with extensive forests. (2) The cap. of the above prov. situated on the S. shore of Lake Izabal. Pop. 5100.

**Izamal**, tn. of Yucatan, Mexico, 50 m. E. of Merida. It has many ant. ruins, which are visited by Indian pilgrims. Pop. 6000.

**Izard**, name of a chamois (*Rupicapra tragus*) indigenous only to the Pyrenees. It closely resembles the chamois of the

Alps, but is both smaller and ruddier in hue.

**Izdubar**, or **Gilgamesh**, the name of a hero in a Babylonian epic. See GILGAMESH EPIC.

**Izegem**, city in W. Flanders, Belgium, 20 m. S. of Bruges. Engaged in agriculture and manuf. of linen, footwear, woolen goods, lace, chicory, bristles, and chocolate. There is an active wholesale trade in flax. Pop. 16,700.

**Izhevsk**, or **Izhevsky**, tn. in the Udmurt Autonomous Republic of the R.S.F.S.R., 14 m. S.W. of Perm; it has iron works. Pop. 175,700.

**Izmail**, a region of the Ukrainian S.S.R.

**Izmir**, see SMYRNA.

**Iztaccihuatl** (Aztec, white woman) extinct volcano S.E. of Mexico City. It is joined by a ridge to Popocatepetl (*q.v.*).

**Izu-no-schichi-to** (the seven is. of Izu) lie S. of Tokyo Bay, Japan. They are volcanic is., three craters are active, and Izu-no-Oshima has a well known smoking volcano (Mihara, 2500 ft.) The is. have been used as convict settlements.

**J**, tenth letter of the Eng. alphabet, is one of the few permanent additions of the Middle Ages to the Semitic-Gk.-Lat. alphabet. In exact terms, it was not an addition, but a differentiation from an existing letter. *I* in Lat., besides being a vowel, had the consonant value of *y*, as in *inder* and *major*. The symbols *i* and *j*, a lengthened form of *i* with a curve to the left, were used in the early Middle Ages indifferently for both the consonant and the vowel sound, the sign *j* being used in hands current at this time. At a later stage, from the fourteenth century onwards, the symbol *j* was used for distinctive purposes, particularly when *i* had to be written initially or in conjunction with another *i*. The sound *j* (*dzh*) came into England through Fr., where it had changed in sound from *y* to *zh*, cf. Fr. *juge* which became Eng. 'judge,' but the Lat. value of *j* as *y* may still be found in words of Heb. or other origin, as *hallelujah*, *junker*, and so forth. In Fr. the sound *zh* was also represented by *g*. Consequently, such words, in passing into Eng., by analogy with words like 'judge,' have an alternative spelling of *g* and *j*. For example, M.E. *geste*, *Gives*; N.Eng. 'jest,' 'Jews.' This accounts for variations in the spelling of words like 'gaol' 'jail,' 'gibe' 'jibe,' 'Geoffrey' 'Jeffrey,' 'serjeant' 'sergeant,' and so forth.

**Jabal**, see **JURAL**.

**Jabalpur**, or **Jubbulpore**: (1) The most northerly div. of the Central Provs., India, and also a dist. Area 18,950 sq. m. Pop. 2,100,000. (2) The cap. of above div., 150 m. N.E. of Nagpur, near the Nerbudda R. Formerly the Great Indian Peninsular railway ended here, and the E. Indian railway system began; but between 1920 and 1930 the Great Indian Peninsular railway took over the railway between J and Allahabad and the junction of these lines is now at the latter tn. It is also a commercial city and manufactures cotton goods, tents, and carpets. Pop. 125,000.

**Jabary**, or **Javary**, riv. in S. America, a trib. of the Amazon, joining it near Tabatinga after a course of 400 m. It forms part of the boundary between Brazil and Peru, and is navigable for 300 m.

**Jabbok**, mt. stream of Gilead, E. Palestine, is one of the prin. tribs. of the Jordan. It rises in Jebel Hauran and enters the Jordan 30 m. above the Dead Sea. It has many scriptural associations, and is first mentioned in connection with the meeting of Jacob and Kean. It is now called Mahal-Zarka, from the fortress of Zarka which stands on its banks between Damascus and Mecca. Its length is 110 m.

**Jabes**, see **JAVEA**.

**Jabesh-Gilead**, city of Gilead in Palestine, E. of the Jordan, is important in religious hist. According to Josephus it

was the metropolis of the Gileadites. Here Saul and his three sons were buried. The site is now uncertain.

**Jabiru**, or **Mycteria**, genus of birds belonging to the Stork family (Ciconiidae). The Amer. J., which is found from the Argentine northward to Mexico, stands sometimes as much as 5 ft. high, has pure white plumage except for a black neck and head, and massive, slightly-upturned bill. Other species occur in India, Australia, and Africa.

**Jablonec nad Nisou** (Ger. Gablonz), tn. of Czechoslovakia, situated in the N. of Bohemia, about 7 m. S.E. of Reichenberg. It is famous for its trade in glass and artificial gems. It also has textile industries, paper mills, and printing establs. Pop. 34,000.

**Jablonica** (or **Jablonitz**) **Pass**, in the Carpathian Mts., due W. of Cernowit (Cernauti). During the First World War the Russian S. Army captured this important pass in Aug. 1916, a movement which had some influence upon Rumania's participation in the war on the side of the Entente. The pass is now in the Ukrainian S.S.R.

**Jabneel**, tn. in Palestine, between Joppa and Ashdod, 3 m. from the Mediterranean. was an anc. Philistine stronghold. It was taken by the Israelites and played an important part in Jewish hist. It was conquered by the Maccabees and became the centre of Jewish scholarship. The sittings of the Sanhedrin were held here after the destruction of Jerusalem. Near the modern vil., Yabna, built on the anc. site, are the remains of a fortress built by the Crusaders. The Jabneel mentioned in Joshua xxi, 13 is situated S.W. of the sea of Galilee.

**Jaborandi**, native Brazilian name for a number of drugs prepared from several rutaceous plants, but particularly from the leaflets of *Pilocarpus pennatifolius*. The leaflets, when dried, are valuable for their salagogue and diaphoretic actions. They contain two alkaloids, pilocarpine and jaborine, a volatile oil and a bitter substance. The effect of J. is to produce muscular relaxation, salivation, and perspiration.

**Jaca**, fort. tn. in Spain, in the prov. of Huesca, on the Aragón, 66 m. N.E. of Saragossa, with a famous old cathedral. Pop. 5000.

**Jacamar**, little-known species of birds, found in the dense tropical forests of S. America, E. of the Andes, and classed in the family of the Galbulidae. The golden, bronze, and steel lustre of their brilliant plumage, and the length and sharpness of their straight bills, are their chief characteristics. They are usually seen sitting motionless on trees and are therefore counted dull and stupid. The largest species is the *Jacamerops grandis*.

Jacana, or *Paridae*, family of birds whose most striking feature is the length of their toes and claws, which enables them to travel on the flat leaves of water-lilies and other riv. plants. Their eggs are a rich olive-brown, usually streaked with dark lines. The common J. (*Parra*

*jacana*) of Brazil is black with green plumage on the wings and a warm-brown neck. In habit it resembles a water hen. The *Hydrophasianus*, or pheasant-tailed J., frequents the marshes and lagoons of India and China and is the largest of all the genera.

Jacaranda tree, genus of Bignoniaceæ, found in tropical America, consists of about thirty species which are noted for their heavy, fragrant wood; these are also frequently known by the name of rose-wood. *J. ovalifolia*, the green ebony, and *J. mimosifolia*, a native of Brazil, are common species.

Jacchus, or *Hapale jacchus*, name of a species of Primates belonging to the family Hapalidæ or marmosetæ; they are small monkeys found in S. America; their fur is soft and their general appearance squirrel-like; the tail is ringed, longer than the rest of the body, and not prehensile. They are arboreal and feed on insects and fruits.

'J'Accuse': (1) title of a famous open letter, written by Emile Zola to the President of the Fr. republic and pub. in *L'Aurore*, in which he fiercely exposed the official attempts to burke the facts in the notorious Dreyfus affair (*q.v.*). The letter was pub. on Jan. 13, 1898, just after the acquittal of Esterhazy, and Zola was in consequence prosecuted; and though defended by Labori and Albert Clemenceau (brother of Georges Clemenceau), he was convicted and sentenced to a year's imprisonment. He subsequently took refuge in England for a time. (2) The title of a Ger. pamphlet by Dr. Richard Grelling, pub. at Lausanne in April, 1915. It

is a strong indictment of the Ger. ring-leaders who were accused of being responsible for bringing about the war, and is an illuminating commentary on Ger. mentality, placing in a dazzling light the responsibility for the general attack on European liberties. The pamphlet repeats Liebknecht's accusation (manifesto of Dec. 2, 1914) that the whole outbreak was a question of an avoidable war fomented by the war parties of Germany and Austria, and that Germany and Germany alone could have made Austria listen to the voice of reason. The book charges Bethmann-Hollweg with high treason for that on Aug. 14, 1914, he lied with effrontery to the Ger. people in proclaiming to the Reichstag that the war into which he was forcing it was a defensive war. It goes on to say that the prin. culprit was the Kaiser, on whose volte-face executed since 1910—when the Emperor seems to have been a friend of peace—it passes sentence of dishonour.

Jacinth, see HYACINTH.

Jackal (Turkish *chukill*, Persian *shagha*), name applied to many species of the genus *Canis*, but is properly restricted to *Canis aureus*, which is a wolfish, wild, dog-like animal found throughout S. Asia and E. Europe. In colour it is a grey-yellow, the back being darker than the belly. The tail is bushy; the teeth and round eye-pupils resemble the dog's, and its length is some 2 ft. or, with the tail, 3 ft. The shriek of a J. is even more dismal and hideous than a hyena's, and the Arabic name *Deeb* (howler) is certainly appropriate. The common food of Js. is poultry and small mammals, but as they are fond of marauding by night in packs of 200 or so, they sometimes carry off sheep and antelopes. Other species besides the common J. are the Egyptian wolf (*C. lupaster*), the striped J. (*C. lateralis*), and the J. wolf (*C. anthus*).

Jack-a-lantern, popular name of *Ignis fatuus* (*q.v.*).

Jackass, Laughing, name given to the species of *Dacelo*, a genus of coraciiform birds. See LAUGHING JACKASS.

Jackdaw, Daw, or *Corvus monedula*, species of crow. It is smaller than the rook and rarely exceeds 14 in. in length. The plumage is glossy black with purplish wings. Usually it lays five bluish-white eggs, mottled with tiny dark brown spots, and it invariably chooses a hole in which to keep them, often the hollow of a tree, a rabbit burrow, a belfry tower, or a castle turret. It is one of the best of the bird-architects, and has been known to pile a stack of loose sticks 12 ft. high. In disposition it is remarkable for its temerity, domesticity, and cunning. Snails, worms, and insects are its chief food, indeed farmers are indebted to Js. almost as much as to rooks for the destruction of pestiferous insects. Js. are common residents in most parts of the world, though they seem not to be known in America.

Jackson, Andrew (1767-1845), seventh and one of the greatest presidents of the U.S.A., and still to-day, with Thomas Jefferson, one of the patron saints of the Democratic party, b. in N. Carolina, near

the tn. of Monroe. Both his parents were emigrants from Ireland. Although only thirteen at the closing days of the Amer. War of Independence, he took his place in the fighting ranks. He lost his two brothers in this war, and his mother died from exposure while nursing Amer. soldiers. J., having fought his way to education and the law, migrated to what was then considered the W.—the future state of Tennessee. Here by turns he was public prosecutor, planter, storekeeper, judge, and member of Congress. When the young Amer. nation and Great Britain entered on war in 1812, the Creek Indians also made war on the Amers. J., in charge of Tennessee troops, led a punitive expedition, and defeated the Indians in two decisive battles. In the autumn of 1814 Great Britain sent Gen. Sir Edward Pakenham, with a fleet of fifty vessels and 16,000 veteran soldiers to take New Orleans. The Brit. easily sank the Amer. flotilla of gun-boats and landed troops. Unknown to both sides, Great Britain and America had signed a treaty of peace. Thus, a whole series of battles occurred while a ship was in mid-ocean bearing the good tidings. J. defeated the Brit. generals Pakenham and Gibbs, who were killed while gallantly leading their troops into action. J. became a national hero, and the country turned to him in 1818 when the Seminole Indians raided Amer. ter. from the safe jumping-off place of Florida, then still a Sp. possession. J. not only defeated the Seminoles, but, against orders, invaded Florida and as a result of his action Spain sold Florida to the U.S.A. and J. became its governor. In 1823 he was chosen U.S. States Senator for Tennessee. In 1825 he ran for the presidency as a Democrat, other candidates being John Quincy Adams, W. H. Crawford of Monroe's cabinet, and the famous orator, Senator Henry Clay. J. received the highest number of electoral votes, but the decision was thrown into the House of Representatives. Clay lent his influence to Adams, who thus became president. In 1824 J. had his revenge: Adams ran for re-election, with J. once more the Democratic nominee. J. obtained an enormous popular as well as electoral vote. He was the first genuine self-made man of the people to become president of the U.S.A. In 1832 he was re-elected. His second term was marked by his breaking the U.S. Bank. He held that it had too much power, and was a corrupting influence in Amer. political life. The bank's charter was rescinded. He retired at the end of his second term, dying a lonely old man at his residence, the Hermitage, near Nashville, Tennessee, on June 8, 1845. See life by J. S. Bassett, 1916, and A. M. Schlesinger, *The Age of Jackson*, 1945.

**Jackson, Sir Barry Vincent** (b. 1879), Eng. theatrical manager, b. at Birmingham; founder of the Pilgrim Players, 1907; founder and director of the Birmingham Repertory Theatre, 1913, which has produced hundreds of plays old and new. Provided the ana. productions at the Malvern Summer Festivals, 1929–

37. A Governor of the Old Vic, Sadler's Wells and of Stratford Festival Theatre; awarded Gold Medal of the Birmingham Civic Society, 1922. Pub.: *Fifiella* (with Basil Dean), 1911; *The Christmas Party*, 1913; *The Marriage of Figaro* (new adaptation), 1926; *Demos, King and Slave* (adaptation) 1931. Knighted, 1925. See T. C. Kemp, *The Birmingham Repertory Theatre: The Playhouse and the Man*, 1913, 1918.

**Jackson, Sir Francis Stanley** (1870–1917), Eng. politician, governor and cricketer, younger son of the first Lord Allerton, one-time chief secretary for Ireland. Educated at Harrow and Cambridge Univ. He had a distinguished parl. career, entering Parliament in 1915 as Conservative member for the Howden shire Div. of Yorkshire and reaching the chairmanship of the Unionist Party organisation in 1923. Was governor of Bengal, at the time of the Montagu-Chelmsford constitution, in 1927–32 during the height of the terrorist menace, but when he was succeeded by Sir John Anderson the difficult political situation had been mitigated by his firmness and courage. But it is as a cricketer that he will be best remembered. He was in the Cambridge eleven (captain, 1892–93), captain of the Yorkshire eleven, succeeding Lord Hawke as president of Yorkshire Cricket Club; and repeatedly played for Gentlemen v. Players and All-England test teams. Other activities prevented him from ever going to Australia, but his record against Australia in test matches in England more than anything revealed his talents as an all-round player of the first class. In all he played in twenty test matches, making 1412 runs with an average of 48 runs per innings. Yorkshire was champion cc. during his epoch in 1896, 1898, 1900, 1901–2 and 1905. In gentlemen v. Players matches at Lords, J. played 18 innings for an average of 34. In 1904, when he and S. M. J. Woods of Somersetshire bowled unchanged, the Players were dismissed twice, for 103 and 107, J. taking 12 wickets for 77 runs, the best performance of his cricketing career. Against Australia at Leeds he took 9 wickets for 42 runs. As a batsman of the quick-footed type he had no superior, but above all he supplemented his gifts of defence and clean hitting with a temperament admirably suited to any situation; and when he retired from first-class cricket after 1905 he was adjudged by some as perhaps the greatest cricketer in England.

**Jackson, Frederick George** (1860–1938), Brit. explorer. For some months he travelled in Australian deserts; and in 1893 he journeyed on a sledge in mid-winter across the frozen 'tundra' of Siberia, which lies between the Ob and the Pechora. *The Great Frozen Land* (1895) is the narrative of his adventures on this occasion; and in the same way *A Thousand Days in the Arctic* (1899) gives the results of the Jackson-Harsworth Polar Expedition to Franz Josef Land, which he commanded. Crossed Africa Beira to Banana Pt., 1923–26, and made journeys in remoter parts of Central Africa.

**Jackson, Helen Maria** (1831-85), Amer. authoress, was the daughter of a prof. at Amherst College, Massachusetts. Emerson expressed his admiration for her meditative *Verses*, which were pub. in 1870. Her best work of fiction is *Ramona* (1884), which contains an admirable appreciation of Indian character and life. In *A Century of Inshonour* (1881) Miss J. issued a spirited denunciation of the govts. dealings with the natives.

**Jackson, Holbrook** (1874-1948), Eng. writer and bookman, b. at Liverpool, self-educated. He started earning a livelihood in commerce at the age of fifteen. He had however determined on a writer's career and entered journalism in 1907, becoming joint-editor with A. W. Orago of the *New Age*. He also contributed as a freelance writer to most of the leading periodicals of the day. In 1910 he was associated with T. P. O'Connor in the latter's pub., and became editor of *T.P.'s Magazine* (1911-12) and of *T.P.'s Weekly* (1911-14). From 1917 to 1923 he was both owner and editor of a literary jour. *To-Day*. In addition to his interest in literature and book-collecting he was an acknowledged authority on various business matters, and from 1917 until his death he was editorial director of the National Trade Press Ltd. He was also chairman of the Brit. Colour Council. 1933-34, having interested himself in fashions in colour and their introduction. His first pub. book was an essay on Edward Fitzgerald with a bibliography (1899). He was the first to write a full-length study of Bernard Shaw (1907) and also wrote a biography of Wm. Morris (1908). His book *Eighteen Nineties* (1913) is a standard work on the period. An authority on book production, he collaborated in *A Brief Survey of Printing* (1923) and was author of *The Printing of Books* (1938). His vast knowledge, technical, literary, and antiquarian, his love and care of books were the resources out of which he wrote his *Anatomy of Bibliomania* (2 vols. 1930-31), a work modelled on Burton's *Anatomy of Melancholy*. His pub. vols. of essays include *Southward Ho!* (1914), *Oceanic* (1922), *Essays of To-day and Yesterday* (1928), and *Maxims of Books and Reading* (1934). His *Dreamers of Dreams* (1948) contains studies of a number of Eng. and Amer. writers of the nineteenth century.

**Jackson, John** (1769-1845), Eng. pugilist, son of a London boulder. Fought only three fights, defeating Fawcett, at Croydon, in 1788, in the presence of the Prince of Wales; defeated by Ingleston at Ingatestone, 1789, through breaking bones in a fall; defeated Mendoza at Hornchurch, 1795. Champion of England till retirement in 1803. Known as 'Gentleman Jackson.'

**Jackson, Sir Thomas Graham** (1835-1924), Eng. architect; b. at Hampstead; son of Hugh J., solicitor. At first intended to become painter; but entered Sir G. Gilbert Scott's office, 1858. Much of his work was restoration, and nearly all of it was devoted to scholastic or eccles. buildings. In Oxford he designed the new

Examination Schools, the new Radcliffe Library, and extensions to Brasenose, Corpus, and Balliol; in Cambridge, the Sedgwick Memorial Museum, the Law Library, and the Physiological Laboratory. He also designed new buildings for many public schools, including Eton, Rugby, and Harrow. Specimens of J.'s restorative skill may be seen in Great Malvern Priory, and in Winchester Cathedral (for which he received a baronetcy in 1913), and there is a new church of his at Aldershot. R.A., 1896. Books include: *Modern Gothic Architecture* (1873), *Reason in Architecture* (1906), *Gothic Architecture in France, England, and Italy* (1915), *The Renaissance of Roman Architecture* (1921-23).

**Jackson (Stonewall), or Jackson, Thomas Jonathan** (1821-63), Amer. Confederate general, b. in Harrison co., Virginia. Of mixed Scottish and Irish descent, he was essentially the type of man who formed the backbone of the people of the middle states of America. Educated at a small prov. school, he was severely handicapped when he entered W. Point Academy; but he overcame the limitations of his early schooling by pertinacity. He began his military career as an artillery lieutenant, and soon distinguished himself in the war against the Mexicans, serving in Magruder's Battery and being breveted captain for his gallantry at Contreras and at Churubusco (q.v.). But after this war he resigned his commission and took the post of prof. of military science and mathematics at the State Univ. of Virginia. His participation in the civil war is easily explained by his sturdy advocacy of State rights, involving the support of Virginia's slave laws and her right to secede from the Union. Hence, when the war broke out between the Federal and Confederate States, J. was given a command in the S. Army, and at once proved himself to be an efficient and enterprising officer. At the battle of Bull Run he commanded a brigade, and the dour defence made by him and his troops earned him the celebrated sobriquet of 'Stonewall' (1861). In the course of the famous Shenandoah Valley campaign (1862) he succeeded in defeating the three Federal detachments under Banks, Fremont, and McDowell, and later in inflicting a second defeat on Banks at Cedar Run, near Culpeper, Virginia. During the Maryland campaign he obliged 11,000 Federals to surrender in Harper's Ferry and his corps at the tough fight of Antietam rendered yeoman service to the embarrassed Lee. Fredericksburg and Chancellorsville (1863) were his last two battles. At the latter he was thrice wounded and shortly afterwards died. To his soldiers he was a very Napoleon, but with his rare gift for inspiring popularity was combined the intense religious fervour of Cromwell. *Stonewall Jackson, The Good Soldier*, by Allan Tate, 1930, is a critical study of his generalship.

**Jackson:** (1) City in U.S.A., co. seat of Jackson co., Michigan, is on the Grand R., 68 m. W. of Detroit. It is a railway centre, and coal is obtained close by. There are flour and paper mills, foundries,

and breweries. Soap, machinery and chemicals are the prin. manufs. Michigan State Prison is situated here. Pop. 49,600. (2) Co. seat of Madison co., Tennessee, 75 m. E. of Memphis, is on the Forked Deer R. It is the seat of the S.W. Baptist Univ., founded in 1871. It carries on an important cotton trade. Pop. 21,300. (3) The cap. of Mississippi, is on the Pearl R., 15 m. E. of Vicksburg. It contains fine public buildings, including the state house with its valuable library, and sev. charitable and technical institutions. Manufs. of machinery and agric. implements are carried on. Pop. 62,100. (4) The co. seat of Jackson co., Ohio, is 108 m. S.E. of Springfield. It is the centre of an iron and coal producing dist. Pop. 6200.

**Jackson, William** (1730-1803), Eng. musical composer, studied music under the organist of Exeter Cathedral and later under Travers, then organist of the Chapel Royal, London. His *Eleyses* and other part-songs, especially 'Time has not thinned my flowing hair', and the tender melodies in his opera, *The Lord of the Manor* (performed at Drury Lane in 1781), still delight music lovers.

**Jacksonville**: 1) Cap. of Duval co., Florida, U.S.A., and situated on the St. John's R. This city, which is an important railway centre, is well built, possessing many large buildings, while its streets are wide and shaded with trees. It is also a resort for winter visitors, and an important trading place, exporting and importing very largely. It has a natural harbour with a 30 ft. channel at low tide. It has numerous factories, iron foundries, and engineering works. It is a seat of a Confederate Soldiers' Home, and a National Marine Hospital. Pop. 173,100. (2) The cap. of Morgan co., Illinois, U.S.A., situated about 33 m. W. of Springfield. In this tn. are situated sev. educational institutions, among them the Illinois College (Dissecting), the State Conservatory of Music, and Illinois College for Women (Methodist). Pop. 19,800.

**Jaamel**, seaport of Haiti, situated on the S. coast, 30 m. S.W. of Port-au-Prince. The vessels here anchor about half a mile away from the shore. Exports coffee, cotton, and logwood. Pop. 8800.

**Jacob**, also called Israel, son of Isaac and Rebekah. He was one of the three great Heb. patriarchs whose histories are recounted in the Book of Genesis. His twelve sons are spoken of as the ancestors of the twelve tribes. J.'s death took place in Egypt whence he was carried to Hebron for burial. Cheyne considers his name to be that 'not of an individual, but of the imaginary ancestor of a tribe.'

**Jacob, Sir Claude William** (1803-1948), Brit. soldier, son of Major-Gen. Wm. J., educated at Sherborne School and R.M.C., Sandhurst. Entered the army in Worcestershire Regiment in 1882 and transferred to the Indian Army in 1884. Promoted Colonel, 1911. Major-General, 1916. Lieut.-Gen., 1917. Gen., 1920 and Field-Marshal, 1920. First experience of active service was with the Zhob Valley Expedition 1890. N.-W. Frontier campaign, 1901-

1902. At the outbreak of the First World War he went to France with the Meerut Div. and was the only Indian army officer of the Corps to rise to high command there. In 1915 he led the Dehra Dun Brigade at Neuve Chapelle and at Aubers Ridge. Commanded II Corps for the remainder of the war: during the Somme Battles, 1916, when he took Thiepval (q.v.) by a well-planned assault; at the Amiens operations and the pursuit of the Gers, to the Hindenburg Line, 1917, and at the third battle of Ypres; and in Flanders in the final Allied advance to victory in 1918. In 1920 he returned to India on his appointment as Chief of the general staff. In 1924 he was given the N. Command in India. From 1926 to 1930 he was military secretary at the India Office. In 1927 he was appointed Colonel of the Worcestershire Regt. From 1916 to 1933 he was Colonel of the 1st/4th Hazara Pioneers, which body he had formed in 1904 for work on the N.W. Frontier communications. His last official post was Constable of the Tower of London, 1937-43. High as he rose, he narrowly missed reaching the highest positions on two occasions: the first was during the First World War when, as a Corps commander, he was seriously considered as successor to Haig as Commander-in-chief on the W. Front; and in 1924 when the post of Commander-in-chief in India seemed likely to be offered to him, but the choice fell instead to Sir Wm. Birdwood. A soldier of much practical sense and high moral courage, with a great talent for commanding men. Among his many decorations he had the Amer. Distinguished Service Medal.

**Jacobabad**, tn. of Upper Sindh, India. It is situated 45 m. N.W. of Shikarpur, and has cantonments. It obtained its name from Gen. John Jacob, its founder. Pop. 10,000.

**Jacobean**, term applied to architecture and furniture of the reigns of the Stuarts (1603-88), though strictly only to those of the time of James I. J. furniture is generally of heavy oak, skilfully carved. Panelling is characteristic of the interior of the typical J. house.

**Jacobi, Friedrich Heinrich** (1743-1819), Ger. philosopher, b. at Dusseldorf, studied at Frankfurt and Geneva. In 1807 he was made president of the Academy of Sciences at Munich, where he d. His philosophical work was not original in nature, but consisted in keen criticism of the systems promulgated by others. He was largely responsible for drawing attention to the philosophy of Spinoza by his letters to Mendelssohn, *Ueber die Lehre des Spinoza* (1785), and compared Hume with Kant in his work *David Hume über den Glauben, oder Idealismus und Realismus* (1787). He also expounded Schelling's philosophy in *Von den göttlichen Dingen und ihre Offenbarung* (1811). Apart from these he wrote philosophical romances, *Woldemar* (1779), and *Allwill's Briefsammlung* (1799). His collected works were pub. at Leipzig in 1812-24 in six vols. See C. Zöppritsch, *Aus F. H. Jacobi's Nachlass*, 1869; R. Kuhnmann, *Die Erkenntnistheorie Jacobi's*, 1906; O. F.

Bollnow, *Die Lebensphilosophie Jacobsis*, 1933.

**Jacobi, Karl Gustav Jacob** (1804-51), Ger. mathematician, b. at Potsdam, and after completing his education was made prof. of mathematics at Königsberg, from which he retired in 1842, owing to ill-health. He is remembered as the discoverer of elliptic functions, and he helped to formulate the theory of determinants. His most important work is *Fundamenta Nova Theoriae Functionum Ellipticarum* (1829). His *Gesammelte Werke* were pub. 1881-91. See studies by L. Koeufberger, 1901, and A. Kowalewski, 1917.

**Jacobina**, tn in the state of Bahia, Brazil. It is situated in a fertile though mountainous region and has a cotton-growing and cattle industry. Pop. 10,000.

**Jacobins**, Fr. political society formed during the Fr. Revolution, of persons who aimed at constitutional reform of a reasonable kind. They were called J because they used to meet in a building in the rue St. Honoré, Paris, which belonged to the Dominican order, called in France the Jacobin. Afterwards the members grew more extremist and organised the reign of terror; but their power ended in 1794 with the execution of Robespierre. The word 'jacobin' was used in Britain and in Europe generally for the holders of extreme political opinions, and it was to check such views that the *Anti-Jacobin* (q.v.) was launched.

**Jacobites**, name given to the followers of the Stuart house after the revolution of 1688. The name is derived from the Lat. name Jacobus (James). James II had numerous followers in all the countries of the Brit. Isles, but the later Stuarts, the Old and Young Pretenders, received their main support from the Scots. In 1689 Graham of Claverhouse roused the Highlands for James, fought the battle of Killbuck, but died in the moment of victory. The Highlands were peaceful with the peace of devolution, after the massacre of Glencoe. In Ireland the Boyne had been fought in 1690 and the Irish defeated (see JAMES II.), and Ireland also was pacified at the risk of the sword. Ireland, however, was so thoroughly subdued that during the two subsequent rebellions she played no active part. The reign of Anne was one of constant intrigue between the leading statesmen and the Old Pretender, and the Jacobite plot at the end of the reign failed only because of the too sudden death of the queen. In 1715, the Hanoverians having just been estab. on the throne, a Jacobite rebellion took place both in Scotland and in the N. of England. The indecisive battle of Sheriffmuir, the surrender at Preston, and the somewhat depressing presence of the Old Pretender, all contributed to the overthrow of the rebellion. The prisoners taken were treated leniently, and the rebellion died a natural death. The attempts to rouse opposition to the Hanoverians by Alberoni met with no success, and it was not until the middle of the War of the Austrian Succession that the Young Pretender, 'Bonnie Prince Charlie,' landed

at Moldart with seven followers. He roused the Highlands at once, he swept away opposition at Prestonpans, and proclaimed his father James III. He invaded England and reached Derby, but there he commenced to fall back. His march had been conducted in a great arc over some 500 m. from Moldart to the outskirts of Derby, where the decision to turn back was taken at a point only 130 m. short of London. A rebellion on the defensive is of a necessity a failure, and Charles was finally overwhelmed at Culloden. After numerous adventures he managed to escape, and died on the Continent, a weak, broken, dissolute drunkard. His younger brother became a cardinal of the Rom. Church, and thus ended the Stuart line. Every great statesman of the time had intrigued with the Stuarts, from Sunderland and Marlborough down to Newcastle himself. In fact, when Charles reached Derby in 1746, Newcastle was undecided whether to declare for him or not. Many of the great names of the time can be written down as J., amongst them being Sancoft, Harley, Bolingbroke, Atterbury, and later, Samuel Johnson. See Sir C. Petrie, *The Jacobite Movement: First Phase, 1688-1716*, 1949.

**Jacobs, William Wymark** (1863-1943), Eng. author, b. in Wapping, E. London, son of Wm. Gage J., a wharf manager and, thus early familiar with the types of long-short man and sailors whose idiosyncrasies he explored with much success in his humorous stories. Educated at private schools, in the Savings Bank dept. of the Civil Service 1883-99. His earliest literary work was pub. in the *Idler* and *Today* both edited by Jerome K. Jerome, who soon recognised the merit of J.'s humour. Contributed to the *Strand Magazine*. His first vol. of short stories, *Many Carcasses*, was pub. in 1896. This success was followed by *The Skipper's Wooing* (1897); and after *Sea Urchins* (1898) he abandoned the Civil Service and thereafter lived entirely by his pen. J. pub. about twenty vols., chiefly collections of short stories, under such titles as *Light Freight* (1901), *At Sunrise Port* (1902), *The Lady of the Barge* (1902), *Odd Craft* (1903), *Dialstone Lane* (1904), *Captains All* (1905), *Short Cruises* (1907), *Sulthaven* (1908), *Sailors' Knots* (1909), *Ships' Company* (1911), *Night Watches* (1914), *The Castaways* (1918), *Deep Waters* (1919), and *Sea Whispers* (1926). He also wrote some one-act plays, such as *Establishing Relations* and *Dixon's Return*. His gruesome story *The Monkey's Paw* marked a departure from his humorous vein; this story and some others were dramatised in collaboration with Louis N. Parker and successfully played. He also collaborated in *Beauty and the Barge*, a three-act comedy (1906).

**Jacobsdal**, div. of the Orange Free State, S. Africa, and the cap. of that div., situated 25 m. S. of Kimberley. Sev. engagements occurred here during the Boer war (1899-1902). European pop. 400.

**Jacobsen, Jens Peter** (1847-85), Dan. novelist, b. at Thisted, Jutland. He began as a student of botany and later trans. Darwin into Dan. Among his works are

*Marie Grubbe* (1876), *Niels Lyhne* (1880), and a vol. of stories called *Mogens* (1872).

**Jacob's Ladder**, or *Polemonium coeruleum*, a species of *Polemoniaceae* found in temperate climates and of rare occurrence in Britain. It is a perennial herb which attains a height of 1 to 2 ft. and bears blue or white flowers. The popular name is given to the plant because of the ladder-like arrangement of the leaves.

JACOB'S LADDER

**Jacobstadt**, or **Jakabpils**, tn. on the R. Dwina in S.E. of Riga, Estonia. Fighting took place here in Sept. 1915, when the Gers. were endeavouring to break through to Moscow. They achieved some success with a large force of cavalry, but a Russian counter-attack restored the position. Further fighting took place here in March 1916, when the Russians took the offensive. In Sept. 1917, the Gers. crossed the Dwina just above J., and compelled the Russians to concentrate on that place. The Bolshevik Revolution brought fighting to a standstill. Taken by the Gers. in the Second World War, the Russians drove them out again in Aug. 1944.

**Jacobus**, gold coin struck in the reign of James I. of England (1603-25), and thus named after him, J. being the Lat. equivalent for 'James'. It was of the same value as twenty-five shillings sterling, but was put out of coinage at the conclusion of that reign.

**Jacopone da Todi** (1240-1306), It. religious poet, b. at Todi in the duchy of Spoleto. He was originally an advocate, but about 1268 turned a Franciscan, and wrote poems which display an extreme bent towards asceticism. He is an author of the 'laude', which play an important part in the development of It. drama. From 1298 to 1303, Todi was imprisoned for inveighing against and satirising Pope Boniface VIII., and siding with the Colonnes in their struggles against the Pope. On the death of Boniface he was released, after languishing for five years in a dungeon. The authorship of the *Stabat Mater*

has been ascribed to Todi, as also many beautiful Lat. hymns. An ed. of his works appeared at Florence in 1590. See lives by A. D'Ancona, 1884 and Evelyn Underhill, 1919.

**Jacotot, Jean Joseph** (1770-1840), Fr. educationist and inventor of the 'universal method' of education, b. at Dijon. He became successively soldier, military secretary, and holder of various professorial chairs. It was while at Louvain that he applied his method of 'universal instruction,' closely resembling that of Hamilton. The principle of his system is that the mental capacities of all men are equal, and he expounded his views in *Enseignement Universel* (1823). See the life by Guillard, 1860, and J. Tourrier's *Intellectual Emancipation. A Treatise on Jacotot's Method of Universal Instruction*, 1852.

**Jacquard, Joseph Marie** (1752-1834), Fr. mechanician, b. at Oullions, near Lyons. He invented the silk-weaving loom called after him (1801-08), a mechanical contrivance capable of being adjusted to any kind of loom, and doing away with the guidance by hand. The silk weavers offered violent opposition to his machine, and he narrowly escaped with his life on one occasion. His invention, however, revolutionised the art of weaving, and at his death his machine was in almost universal use. Napoleon rewarded him with a small pension.

**Jacquerie**, name given to a revolt of Fr. peasants in 1358, the designation arising from the contemptuous term 'Jacques Bonhomme,' by which the nobles described the peasants. Long continued oppression on the part of the nobles was the cause of the rebellion, which broke out in the neighbourhood of Paris, but extended as far as the banks of the Marne and Oise. Charles of Navarre led the nobles, and Meaux the peasant army, the latter being defeated with great slaughter on June 29, 1358; thus ended the insurrection.

**Jacitation** (Lat. *jacitator*, boaster). The suit *crassa jacitationis matrimonii* may be brought against one who maliciously gives out that he or she is married to the petitioner. The object of the remedy is to enjoin perpetual silence upon that matter against the jacitator, and apparently this suit is the only remedy available for such an injury. It is a remedy inherited by the Probate, Divorce, and Admiralty div. of the High Court from the old eccles. jurisdiction of the spiritual courts, and the statute conferring that jurisdiction in the Divorce Court is the Matrimonial Causes Act, 1857. Suits of J. are extremely rare, probably because the remedy is not adapted, or because at all events there are no precedents to show that it is adapted to establishing the validity of the petitioner's marriage with a third person. There is, however, a statutory remedy under the Legitimacy Declaration Act, 1858, for that purpose which is also the appropriate remedy to estab. the legitimacy of offspring.

**Jadar** (or **Yadar**), riv. of Yugoslavia, just S.W. of Belgrade. It was the scene of a brilliant Serbian victory over the

Austrians on Aug. 20-22, 1914. The battle was fought almost simultaneously with that of Shabatz (Aug. 17), the Serbs, under their crown prince, fighting the two battles in order to prevent two huge Austrian invading armies of 200,000 men in all, which were converging from N. and W. on the military dept. at Valievo, from effecting a junction and so 'squeezing out' the whole Serb army. In this the Serbs were entirely successful, winning first the battle of Shabatz and then that of the Jadar R., their casualties being about half those of the Austrians, who lost in the two defeats some 40,000 in killed, wounded, and prisoners, besides stores, and in addition being compelled to abandon the invasion.

Jade, ornamental stone, generally of green colour, belonging to two distinct species, viz. jadeite and nephrite, often wrongly confounded one with the other. Jadeite belongs to the pyroxene group, while nephrite is a variety of amphibole. J. is highly prized in the E., especially by the Chinese, and is found in China, Burma, and many parts of S. Asia. It was used by the prehistoric peoples of Mexico, Alaska, New Zealand, and other countries, for utensils and carvings, and on many prehistoric sites in Europe, as in the Swiss lake dwellings. J. objects have been frequently discovered. Consult Dr. G. F. Kunz, (ed.), *Investigations and Studies in Jade*, 1906, for a full and exhaustive description of the stone; also S. C. Nott, *Chinese Jade*, 1936.

Jadeite, mineral species related to the pyroxenes and differing markedly from true jade or nephrite. It is a monoclinic aluminium sodium silicate. White or 'carnphor' jade is the purest form, though usually specimens are coloured by the presence of metallic oxides, e.g. chromium causes brilliant green patches. Though the hardness of J. differs but little from that of jade, its sp. gr. is much higher (3.20 to 3.41). It is much more readily fusible. Although implements of J. have been found on many prehistoric sites in Europe, it is only recently that the raw material has been found *in situ* on this continent, viz. in the Alps. Large stores of it have been mined since remote times in S. Asia, etc.

Jaël, Jewish matron, wife of Heber, the Kenite (Judges iv.), who, after the battle on the Kishon, treacherously slew Sisera who, at her invitation, had taken refuge in her tent.

Jaén (1) Prov. of S. Spain, and one of the most fertile dists., being well watered by the Guadalquivir, Segura, and other rivers. It produces wine, oil, cereals, etc., and has lead mines. It was conquered by the Moors on their entrance into Spain and in 1246 fell into the hands of Ferdinand III. of Castile. Area 5200 sq. m. Pop. 809,400. (2) The cap. of the prov., situated on a trib. of the Guadalquivir, 50 m. N.W. of Granada, and 122 m. E.N.E. of Seville. It consists of an old and new tn. the former having remains of a Moorish wall flanked with towers, and irregular, winding streets. The cathedral, on the site of a mosque, is of special interest, and

there are sev. handsome churches. Weaving and milling industries are carried on, but the silk, for which it was at one time famous, is no longer manufactured. Pop. 55,100.

Jafarabad, feudatory state in India in the prov. of Kathiawar. The chief tn. is Jafarabad, 28 m. E.N.E. of Diu, on the estuary of the R. Ranai. Pop. about 5000.

Ja'far Pasha-el-Askeri (1880-1936), Iraqi statesman, b. at Bagdad. Educated: Constantinople and Germany. Entered Turkish army, 1902. Promoted captain in Balkan War, 1912. In the First World War he was chosen to organise the troops of the Sheikh-el-Senussi; and, attempting to invade Egypt, was captured by the Dorset Yeomanry at Agagia. Feb. 26, 1918. In an attempt to escape from Cairo citadel he injured himself; and, during incapacitation, he was converted (by his reading) to the Brit. side. Joined Hejaz army 1917, and was given the C.M.G. on the recommendation of Gen. Allenby. Governor of Aleppo, 1919. Minister of Defence in Iraq, 1920-22, and represented Iraq at Lausanne conference. Prime Minister, Iraq, 1923; diplomatic agent in London, 1925-26. Prime Minister and minister of foreign affairs, 1926-28. Minister in England, 1929-30 and also 1932-34, and called to the Eng. Bar. Iraqi Senator, 1934. Minister of Defence, 1935. Assassinated after a *coup d'état* in Oct. 1936.

Jaffa (anc. Japho; Gk. Joppa), second largest tn. in Palestine, its pop., is estimated at 70,000. It is 51 m. by rail from Jerusalem, of which it was the port in King David's time. The old parts of the tn. stand on a rock dominating the harbour. J. is the headquarters of the S. dist. and the port of Jerusalem. J. was known in the time of the Crusades as Japhe, and has a long hist., both recorded and legendary. It was the reputed scene of the rescue of Andromeda by Perseus and also of the swallowing of Jonah by the whale. Its name is to be found on the tower of Thotmes II at Karnak among the cities mentioned as being overwhelmed by Pharaoh. Later it became a Phoenician city, and then, for a thousand years, Palestine, during which time the logs for Solomon's Temple, after being floated down from the ports of Lebanon by Hiram, were landed. Under the Maccabees, J. became essentially Jewish. Then Pompey conquered it, and, having made of it a Rom. free city, gave it to Cleopatra as a love token. It afterwards became a pawn in the conflicts between the Rom. and Idumean rulers. It was in the house of Simon the Tanner in J. that St. Peter saw the vision recorded in the Acts iv. 43. In the Crusades, Baldwin I. signed the treaty of Jaffa with the Genoese, whence sprang much strife. The city then became a co.; but in 1187 it was captured and destroyed by the brother of Saladin, and then retaken by Richard Coeur de Lion. In 1267 it was again sacked, this time by Ilkars, and in 1799 it was stormed by Napoleon. The strike over Jewish immigration, fomented by the Arab political leaders,

which developed into grave disorders throughout Palestine in 1936, began in J. Though of such antiquity, J. is uninteresting to the visitor. Its streets are narrow and tortuous. N. of the old city is Tel Aviv, the cap. of the state of Israel considerably enlarged through the spur of Zionist development under the Brit. mandatory regime and, in contrast to Jaffa itself, strikingly modern. Oranges from inland are the chief export. There is rail connection with Jerusalem, Kantara, and Haifa over two lines, the junction of which is at Lydda. The port consists of a Customs House and jetty, and a short wharf where lighters land cargoes in smooth water.

**Jaffna**, or **Jaffnapatam**, seaport tn. on Jaffna Is., off the N. coast of Ceylon, 116 m. from Trincomali. It has a ruined Dutch fort, an old Dutch church, and temples. Palmyra timber, tobacco, fruit, rice, and curry-stuffs are yielded, and the Tamils also carry on fishing. Pop. 45,000.

**Jagadhri**, tn. of Ambala dist., Punjab, India, with manufs. of iron and copper, and a borax refinery. Pop. 12,000.

**Jagdalak**, see JAGDALAK.

**Jagellons**, or **Jagellones**, royal dynasty of Poland, descended from Gedimin of Lithuania (d. 1342), founded by Jagello (c. 1315-1341), afterwards Ladislaus II. This illustrious line ruled in Poland from 1386-1572, when, with Sigismund Augustus, the male line became extinct. Through his sister's descendants the J. continued on the throne till 1668. Rulers over Lithuania, Hungary, and Bohemia were also chosen from the J.

**Jagannath**, see JUGGERNAUT.

**Jagannath**, see PUUR.

**Jägerndorf**, see KENOV.

**Jagersfontein**, vil. of Fauresmith div., Orange Free State, S. Africa, 67 m. W.S.W. of Bloemfontein. The celebrated Klipfontein diamond mines nearby rank next to those of Kimberley. J. is on the railway from Cape Town to Pretoria. Pop. 4,500.

**Jagger**, Charles Sargeant (1885-1935), Eng. sculptor, b. near Sheffield. He trained at Sheffield School of Art and at the Royal College of Art, S. Kensington, where he went on a scholarship. Here he won a travelling scholarship and visited Rome and Venice. In 1914 he won the Rome Scholarship for Sculpture of the Brit. School at Rome. His best known work is the Royal Artillery Memorial Hyde Park Corner, London, but is not his best work, being a compromise through collaboration with architects and an organising committee. His most characteristic work is in the manner of the bronze gunners at the sides of this Memorial, the figure on the G.W.R. War Memorial and that of Sir Ernest Shackleton on the building of the Royal Geographical Society. Elected an associate of the Royal Academy, 1926, and a member of the Royal Mint Advisory Committee on Coins, Medals, etc. in 1932. His group in stone for Imperial Chemicals House, Millbank, won him, in 1935, the gold medal of the Royal Society of Brit. Sculptors.

**Jaggery** (Hindustani *shakkar*), coarse brown sugar of the East Indies, chemically the same as cane-sugar. It is made by incision from the sap of various palms, such as the J. coconut, Palmyra, and date-palms (*Phoenix dactylifera*). The Indian *Phoenix sylvestris* and *Caryota urens* also yield J., as do also the *Nipa fruticosa*, *Arnga saccharifera*, and others. The sap or juice by fermentation becomes palm-wine, from which arrack is distilled.

**Jago**, Richard (1715-81), Eng. clergyman and poet, studied at Oxford. He held various livings in Warwickshire from 1746, dying at Snitterfield. His *Poems*, *Moral and Descriptive* were pub. by Hylton in 1754. Among them are: 'The Black-birds'; 'Edgehill' or, the Rural Prospect delineated and moralised'; 'Labour and Genius, a Fable.' See W. Shenstone, *Works in Verse and Prose*, iii., 1777; A. Chalmers, *Works of the English Poets*, xvi., 1810; F. L. Colville, *Worthies of Warwickshire*, 1869; and C. H. Poole, *Warwickshire Poets*, 1914.

**Jagt**, or **Jaxt**, dist. and riv. of Württemberg-Haden, Germany. The dist. has an area of 2000 sq m and a pop. of over 400,000. Chief tn., Ellwangen. The riv. is a trib. of the Neckar.

**Jaguar** (*Felis onca*), large Amer. spotted cat of the order Felidae, found in countries ranging from Texas through Central and S. America to Patagonia. In form the J

JAGUAR

somewhat resembles the leopard, but is more thick set. Its skull resembles that of a lion or tiger. Its movements are rapid and it is very agile. It has a tawny yellow hide, spotted with black, and varies in length from 1 ft. to 6 ft. 9 in. It is generally found singly, and preys upon quadrupeds, such as horses, dogs, and cattle. It emits terrific roars and cries, particularly during the mating season. From two to four cubs are produced at birth towards the close of the year. In disposition the J. is ferocious and bloodthirsty, and after having tasted human

flesh, it occasionally becomes a confirmed 'man-eater.' It submits somewhat grudgingly to captivity, but may become subdued and even docile. It is usually hunted with dogs and poisoned arrows, though sometimes with the lasso, and the skins are imported into Europe in large numbers. The black-furred J. is sometimes regarded as a different species, but the characteristic markings can be detected in certain lights. Amer. naturalists divide the species into a number of forms regarded as distinct, but preferably ranked as sub-species.

Jahangir, Mogul emperor of India, succeeded his father, Akhbar, in 1605 and reigned till his death in 1627. When he ascended the throne his son, Khusrū tried to usurp power and to seize Lahore, whither J. had transferred the seat of gov. Insurrections marked his reign throughout. J. was strongly influenced by his favourite wife, Nūr Mahāl ('Light of the Harem'), and the currency was struck in her name, and court intrigues occupied her life. J. favoured the Jesuit missionaries, whose influence was evident in many seventeenth century buildings in Lahore. The Saman Burj and other parts of the old royal palace and various tombs date from J.'s reign. It was in his time that the Eng. first estab. themselves at Surat and appointed their first embassy to an Indian court. J. was succeeded by his son, Shah Jahān, the founder of Delhi, which city was known to Moslems as Jahānābād. In Jahān's reign the Mogul empire reached the peak of its magnificence. But his chief city of residence was Agra and his name will ever be associated with the glory of Indian architecture, the Taj Mahal, named after his wife, Mumtaz Mahāl, beside whom he lies buried.

Jahn, Friedrich Ludwig (1778-1852), father of gymnastics, or *Turnvater*, b. at Lantz in Prussia. First served in the Prussian army, and in 1811 started the first gymnasium in Berlin. His system did much to revive patriotism and attracted the Prussian youth, but in 1818 his gymnasia were closed on account of the political gatherings held there, which were of too liberal a nature to find favour in the eyes of the Prussian Gov. J. was arrested and imprisoned for six years (1819-25) as a demagogue. He wrote *Deutsche Volkstum* (1810) and *Die deutsche Turnkunst* (1816). See E. Neven-dorff, *Turnvater Jahn, sein Leben und Werk*, 1928 and F. Eckhard, *Friedrich Ludwig Jahn: Eine Würdigung seines Lebens und Wirkens* (2nd ed.) 1931.

Jahn, Otto (1813-69), Ger. archaeologist and classical editor, b. at Kiel. In 1839 he was appointed to the chair of archaeology at Leipzig, where he founded the Archaeological Society. His publs. include works on Gk. art, representations of auct. life on vases, a masterly life of Mozart, and essays on music. His letters were ed. by A. Michaelis, 1913.

Jahrum, tn. and dist. of Fars prov., Persia, 90 m. from Shiraz. The dist. is famous for its shāhān dates, other fruits and tobacco being also exported. Pop. 15,000.

Jahvist (J), or Yahwist, worshipper of Jahveh or Yahweh. The term is now generally applied to the writer or writers of the non-Deuteronomic portions of the Hexateuch, marked by the use of Jahveh, or Jehovah (the 'sacred tetragrammaton' of JHWH or IHUIH), not Elohim, as the name of God. A Jehovist (JE) is properly one who combined the work of Jahvists and Elohistas (E).

Jail Fever is now recognised as a severe form of typhus fever (q.v.). The disease raged in Eng. prisons from the sixteenth century breaking out at the Black Assize of Oxford in 1577. It was caught by many attending the assizes at the Old Bailey as late as 1750, but owing to the improvements in sanitation is now of rare occurrence. See J. Howard, *Account of the State of Prisons*, 1777.

Jainism, doctrine of the Jains, a wealthy and influential Hindu sect, mostly found in the W. dists. of Upper India. It is allied in many respects to Buddhism, but appears to have developed from Brahmanism at an earlier date than Buddhism did. Its origin is attributed to Vardhamana Mahāvira, who lived about the end of the sixth century B.C. The sect flourished greatly between the third and eighth centuries, but subsequently dwindled owing to persecution by the Brahmins. In 1901 the number was given as 1,335,000. The Jains, like the Buddhists, deny the divine origin of the Veda. They believe in the separate existence of the soul after death, even of animals, and this belief leads them to take great care of animal life. They brush seats before sitting, and drink only water that has been strained, never leaving it uncovered for fear that some insect may be drowned in it. They have to practise liberality, piety, gentleness, and penance, and must make a daily visit to the Jain temple. Their principle is to suppress the body by abstinence, continence, and silence. During certain seasons they abstain from honey, grapes, fruits, salt, tobacco, and other articles. The members of the religious order of the Jains are called Yatis, those of the secular order Śravakas, the rules for the former being stricter than those for the latter. The Jains are not divided into castes, except in S. India, but they have certain family groups between which marriage is not allowed. Formerly they advocated leaving the body naked, but this practice is now confined to meal times. Their creed is very detailed, and in many respects fantastic. They reverence deified saints, called Jinas, who give the sect its name. These saints are twenty-two in number, twenty-four each of the past, present, and future ages respectively, the earlier of them being of gigantic proportions who lived enormous lengths of time, while the most recent resemble ordinary humans in those respects. The J. are responsible for many beautiful temples, notably Mount Abu and Mount Parasnath. Their temples are usually constructed with pseudo-arch and dome, built in horizontal courses and with pointed section.

Consult E. Thomas, *Jainism, or the Early Faith of Asoka*, 1877; T. W. Rhys

David, *Hibbert Lectures*, 1881; Jacob, *Jaina Sutras* (vols. I. and II.), 1896; J. Burgess, *Buddhist and Jainist Caves* (2 vols.), 1881-83; J. Fergusson, *Cave Temples of India*, 1880; J. G. Bühler, *On the Indian Sect of the Jains*, 1904; H. von Glasenapp, *Der Jainismus*, 1925; O. J. Shah, *Jainism in North India*, 800 B.C.-526 A.D., 1932; W. Soluhring, *Die Lehre der Jains*, 1935; J. Jaini, *Outlines of Jainism*, 1910.

**Jaintia Hills**, mountainous dist. forming with Khasi a dist. of Assam, India. It lies S. of Brahmaputra valley, E. of the Khasi Hills. Area about 2000 sq. m. The inhab. call themselves Panars, but are known as Santengs (Syntengs) by the Khasis. Coal and limestone are found, and rice is grown.

**Jaipur**, or **Jeypore**: (1) State of Rajputana, India, covering an area of 15,579 sq. m. The central portion is a sandy tableland about 1500 ft. above sea-level, but in the N.W. the surface is broken by a spur of the Aravalli Mts. J. came under Brit. protection in 1818, and is one of the wealthiest and best administered of Indian states. The ruler is the head of the Kachhwaha clan of Rajputs. J. acceded to India in 1947. The minerals found are copper, cobalt, and iron, and large quantities of salt abound. Pop. 3,040,000. (2) Cap. of above state, 850 m. N.W. of Calcutta, and 84 m. N.W. of Ameer. It is a walled city, well built, with the maharajah's palace in the centre, and is the chief commercial centre of Rajputana. Buildings of note are a college school of art, industrial and economic museum, observatory, mint, hospital, and sev. mosques and temples. Fabrics, enamelled gold-ware, and marble sculptures are the prin. manufs. Pop. 145,000.

**Jaisalmer**, **Jalsalmer**, or **Jessulmer**, one of the Rajput states of India. Situated in the great Indian desert, in the W. of Rajputana, it is about 10,000 sq. m. in area. The tn., cap. of the fundatory state, was founded in 1156 by Raval Jaisal, and is 136 m. from Sukkar. There is a strong fort on the hill with many Jain temples. Trade in wool, camels, sheep, and cattle is carried on. Pop. of state 70,000; tn. 5000.

**Jaies**, anct. tn. of Bosnia, on a hill near the junction of the Pliva and Vrbas rvs. The tn. possesses an interesting fourteenth century citadel and a ruined church (fifteenth century), the legendary burial-place of St. Luke. Pop. about 4000.

**Jaipur**, or **Jaipore**, tn. of Bengal, India, 43 m. from Outback. It is a place of pilgrimage. Pop. 11,000 (mostly Hindus).

**Jakutsk**, see **YAKUTSK**.

**Jalalabad**, or **Jelalabad**, tn. of Afghanistan, on the route between Kabul and Peshawar, in a fertile plain near Kabul R., close to Khasia Pass. It is noted for the brave resistance made by the Brit. under Sale (1841-42) to the Afghans. Its defences were destroyed on the Brit. evacuation of Afghanistan, 1842. Pop. about 4000.

**Jalapur**, or **Julapur**: (1) Tn. of the W. Punjab, Pakistan, Gujarat dist., 78 m.

N.W. of Lahore, noted for shawls. Pop. 12,000. (2) Ruined tn. of Jehlam (Jherum) dist., W. Punjab, Pakistan, 68 m. S.S.E. of Rawalpindi. It is identified by Cunningham with Alexander's Bucocephala, built in memory of his famous horse.

**Jalandhar**, **Jullunder**, or **Julunder**, tn. and cantonment of the E. Punjab, India, cap. of Jalandhar dist., 47 m. E.S.E. of Amritsar. It is mentioned in the Mahabharata, and was once cap. of the Rajput kingdom of Katoch (fourth century B.C.). Pop. 75,000 (Moslems).

**Jalap**, well-known purgative medicine, consisting of the dried root of *Ipomoea purga*, a plant belonging to the Convolvulus family. It is a native of the E. slopes of the Mexican sierras, growing at an altitude of about 6000 ft., and is named from the tn. of Jalapa. Jalap-root contains starch, sugar, lignin, etc., but the active principle is a resin present to the extent of 10 per cent., which may be extracted with alcohol. J., which is administered either as a powder or in alcoholic solution, acts as a hydragogue cathartic, and is used in constipation, renal disease, dropsy, and cerebral affections. The ordinary dose of the powder is from 10 to 30 grains.

**Jalapa**: (1) Dept. of Guatemala, Central America. Cap. Jalapa. Chief productions are coffee, the sugar-cane, rice, and maize. Pop. 75,100. (2) Tn. in Mexico in the state of Vera Cruz, of which it is the cap., 60 m. by rail N.W. of Vera Cruz city. It is 4330 ft. above sea level and is situated in a picturesque and fertile dist. with a healthy and temperate climate. The medicinal plant 'jalap' here grows wild. J. is famed for the wide overhanging eaves of its white colonial homes and other buildings, and its red-tiled roofs showing picturesquely against the semi-tropic verdure. The cathedral is a massive structure, with strange low-placed cupolas and with floors which slope slightly towards the altar. The church of the Beaterio was originally a Franciscan convent; its buildings have been renovated and modernised. Another notable church is that of St. Joseph. The Gov. Building or Palacio de Gobierno, is a long, white edifice of colonial type with pillars and archways on the first floor. Paseo del Ayuntamiento (q.v.) is a fine broad paved street leading to the Parque Juárez, with its stairways and tall trees. There are other streets called by such names as Street of Jesus Helps You, Street of the Virgin, Street of John the Carbon Burner, Street of the Devil's Pocket, and Street of the Bellringer. Pop. 47,000.

**Jalapa**, tn. of the United Provs., India, 68 m. W.S.W. of Cawnpore. The surrounding swamps cause cholera and malarial fever. Grain, oil-seeds, and cotton are exported. Pop. 8000 (largely Hindus).

**Jalisco**, state of Mexico, on the Pacific, with a coast-line 280 m. long, and covering an area of 31,846 sq. m. The state is traversed by the Sierra Madre with its volcanic cones, Colima (12,750 ft.), and Nevado (14,100 ft.), being the highest.

The chief riv. is the Rio Grande de Santiago, flowing out of Lake Chapala, and draining the N. portion of the state. The chief industries are gold, silver, and copper mining, and agriculture. Cotton and woollen goods, paper and tobacco are manufactured. Guadalajara (q.v.) is the cap. Pop. 1,418,300.

Jalna, tn. in the state of Hyderabad, India, about 215 m. from Bombay. J. has ceased to be a cantonment since 1903. It is famous for its gardens, which grow large quantities of fruit. Pop. 18,000.

Jalpaiguri, Jalpigori, or Julpigoree, tn. and dist. of India. The tn. is on the R. Tista, about 300 m. from Calcutta. Pop. about 10,000. The dist. includes the W. Duars, and is situated S. of Darjeeling and Bhutan, and N. of Cooch Behar. Area 2960 sq. m. The dist. produces jute and tea, and lime is quarried in the lower Bhutan Hills. Pop. nearly 1,000,000.

Jalpan, tn. in Mexico, Queretaro state, situated about 85 m. from Guanajuato. Pop. 2000.

Jalut, or Jalut, one of the Marshall Is. in the Pacific. It is the administrative centre of the group.

Jam, name applied to the preserve formed from fruit boiled with an equal weight of sugar, which dissolves in the juice of the fruit as the latter is broken. The process of boiling sterilises the entire mixture, and causes the juice to develop the essential 'setting' properties due to the presence of 'pectin bodies' always present in ripe fruits. J., if carefully and well made, can be kept for sev. years, though the quality generally deteriorates after twelve or eighteen months, owing to the crystallisation of the sugar, etc. The time requisite for boiling J. varies according to the nature of the fruit used. It may be anything from ten minutes to one or two hours. The heating process should be carried on over a slow fire, in order not to do away with the aromatic and flavouring principles of the fruit. If the boiling is hurried, these are carried away by the steam, and for this reason home-made J. is superior to commercial, the latter usually being boiled for a shorter period than the former. When J. is made from oranges or lemons and such fruits, it is termed 'marmalade.' The peel of these contains a large proportion of aromatic and flavouring matter, and towards the end of the boiling process is added to the preserve in the form of shreds. In fruit jellies, the juice of the fruit only is used, not the pulp as well, this being removed by straining. It is then boiled with sugar until ready to 'jelly.' Fruits are 'preserved' by covering with water in suitable utensils and heating to a high temp., the vessels being closed while hot. In home-made preserves, the actual proportion of sugar averages about 20 per cent. in commercial, from 10 to 30 per cent. See also PRESERVING.

Jamaica, largest is. in the Brit. W. Indies, forming part of the Greater Antilles. It is situated in the Caribbean Sea, 90 m. S. of the E. end of Cuba. It is 144 m. long, its greatest breadth being 49 m. Area 4450 sq. m. The is. is

divided into three cos.: Cornwall in the W.; Surrey in the E., and Middlesex in the centre, each of which is divided into five parcs. J. is traversed by a mt. range, running E. and W., which culminates in the Blue Mt. Peak (7423 ft.) in the E. region. From this ridge flow numerous rivs., which promote luxuriant vegetation, but, with the exception of the Black R., are useless for navigation. Black R. is named for Maggoty Falls and is navigable for 25 m. The Salt R., and the Calaritta, are navigable for a few miles. Other notable rivs. are the Rio Cobre and the Rio Minho in the S., and the Rio Grande, Martha Brae, and Great Sp. R., in the N. Roaring R., with its beautiful falls in St. Ann's Par., and Rio Cobre, which empties into Kingston Harbour, are the most picturesque rivs. There are many excellent harbours—Port Morant, Falmouth, Old Harbour, Port Maria, etc., but the finest is Kingston in the S.E. It has a total area of about 16 sq. m., and a depth, over at least 7 sq. m., of from 7-10 fathoms. The harbour is protected by a long spit of sand called the Palisadoes 74 m. long, at the extremity of which is Port Royal. The soil is very rich and fertile. The climate of J. is, on the whole, very healthy. By the coast it is warm (mean temp. 80° all the year), but the heat is lessened by cool breezes. The atmosphere is very moist during the two rainy seasons in May and Oct. Inland and on the uplands the climate is delightfully mild. The is. is frequently visited by thunderstorms. Heavy rains and floods caused much damage in 1909 and 1910. There are many valuable plantations. The chief trees grown are mahogany, balata, ebony, cocunut, palm, lignum-vitæ, logwood, and cacti. There is a flourishing trade in fruit, chiefly oranges, bananas, pineapples, mangoes, and grapefruit. Very fine coffee is cultivated, especially in the dist. of the Blue Mts. Maize, Indian corn, Guinea grass, chinchona, tobacco, and ginger are among the products of the soil.

**Industries.**—In the old days sugar and rum were supreme, but in the early nineties of last century they were supplanted for the first time as the leading industries of J. by fruit, which has been steadily growing in importance since that time. The export of bananas has exceeded 25,000,000 bunches in a single year; the production of citrus fruit is also rapidly expanding, as also of coco-nuts. In recent years, however, the banana crops have been much diminished by leaf spot disease (see BANANA). In 1919 the dept. of agriculture produced a new variety of banana, which may supersede both the Gros Michel, which is the world accepted banana, and the Lacatan. The strain out of which the new commercial banana is expected is immune from Panama disease and is resistant to leafspot. J. is famous for its rum, which is still reputed to be the best in the world. Coco-nuts and copra are grown for export. J. is the chief source for the supply of pineapple, or allspice. Other industries include cattle, sheep, horse, and mule breeding,

and dairying. There are about 73,000 ac. under bananas and 40,000 under sugar-cane; 40,000 under coco-nuts, and 6000 under coffee (Ann. Report, 1938). Exports: coconuts, logwood, sugar, bananas, coffee, cocoa, ginger, cigars, oranges, and pimento. The prin. manufs. are rum, oils, mineral waters, and matches. There are cigar factories, distilleries, and breweries, etc. Trade in 1943 and 1944 aggregated between £11½ million and £13½ million. Total imports: 1943, £7,311,340; 1944, £8,971,683; 1945, £9,595,587. Total exports: 1943, £1,237,431; 1944, £4,479,630; 1945, £5,137,045. Imports from U.K.: 1943, £2,566,302; 1944, £1,325,783; 1945, £1,336,461; 1946, £2,451,671; 1947, £3,563,248. Exports to U.K.: 1943, £738,688; 1944, £917,455; 1945, £2,510,557. The large supply of cheap black and coloured labour, coupled with the steep fall in the world-price of sugar—which, as to W. Indian sugar, has to compete with beet-sugar—has resulted in lower wages and a reduced standard of living; and there were serious riots in 1938. These, following on riots in Trinidad, led to the sending out of a Royal Commission, under Lord Moyne (later Secretary of State for the Colonies) to investigate W. Indian Colonies generally and to the organisation of a scheme of small holdings or allotments. Much has been accomplished already to improve conditions in J. by grants and loans under the Colonial Development and Welfare Act, 1940. The assistance approved by way of grant and loan to J. to Jan. 31, 1945 reached £3,775,010 (of which total £3,021,440 was by way of grant).

**Communications.** The is. is intersected by good roads, and there are some 213 m. of railway. The J. Gov. railway (gauge 4 ft. 8½ in.) starts from Kingston, which it connects with Spanish Town (33 m.), Old Harbour, Portus, and Montego Bay. Another line runs from Spanish Town to Bog Walk and Port Antonio. From Bog Walk, Ewarton is reached by another branch line and another line opens up the Rio Minho valley and Upper Clarendon from May Pen. Kingston has a service of electric trams and motor omnibuses. There are telegraph stations and post-offices in every tn. and in many vils.

**Chief Towns.**—The chief tn. is Kingston, the seat of gov. and the largest port and tn. (pop. 109,000); the next in importance are Spanish Town (12,000), Montego Bay (11,500), and Port Antonio (5,500). Headquarters House, formerly Hibbert's House, where the Legislative Council has met since 1870 (when the seat of gov. was transferred from Spanish Town to Kingston), and the colonial secretary's offices are situated in one of the few buildings of note in Kingston which escaped the earthquake and fire in 1907. A notable institution of Kingston is the Institute of J., rebuilt, after the earthquake, in reinforced brick and concrete. It has a large library, especially rich in Jamaican and W. Indian literature. In its Hist. gallery are many notable treasures, including the original 'Shark Papers' exploited by Michael Scott (q.v.)

in his *Cruise of the Midge*; the bell of the old church of Port Royal; and two silver-gilt maces, formerly belonging to the Council and the House of Assembly. The Institute also has a museum containing zoological, geological, botanical, and archaeological specimens. King's House, the residence of the governor, is 4 m. from Kingston, in St. Andrew, on the Liguanea Plain. Port Royal, at the extremity of the Palisadoes, is of historic interest, having been the headquarters of the buccaneers, and the mart of their spoils. Prior to the earthquake of June 1692 it was reputed to be the finest tn. in the W. Indies. In Port Royal is Fort Charles, where Nelson commanded in 1779. The staircase to what is known as 'Nelson's Quarter Deck', a space on the ramparts by the admiral's old quarters, still stands. Port Royal used to be a notable naval station, but the dockyard was closed in 1905, after an existence of 2½ centuries. Spanish Town (13 m. from Kingston), the old St. Jago de la Vega or St. James of the Plain of the Sp. days, was formerly an important tn. and the well-built group of Gov. Buildings round its central square bears witness to its former grandeur. The most notable of these was the King's House, the former residence of the governors, of which little more than the facade remains. The N. side of the square is ornamented by a stately memorial to Adm. Rodney, victor of the battle of the Saints (q.v.). Near the Square is the Cathedral, dedicated to St. Catherine, whose red brick fabric is in pleasing contrast to the surrounding foliage. It is one of the three oldest eccles. buildings in the W. Indies (the others being the cathedrals at Havana and Cartagena). Bog Walk is a vil. close by a noted gorge of the Rio Corbe. Port Antonio, on the N. side of the is., 75 m. by train from the cap., is situated on the shore of a spacious harbour. Formerly a vil. of modest size, it rose to a position of prosperity through the banana industry, but suffered when the United Fruit Company moved their headquarters to Kingston. Montego Bay, second tn. of J. is 112 m. by rail from Kingston. When visited by Columbus it was a large Indian vil. and traces of Arawak life have been found in the neighbouring caves. Its par. church is one of the handsomest in the is. Savanna-la-Mar, the chief tn. of Westmoreland, is the port of a sugar, coffee etc., growing dist. Falmouth (106 m. from Port Antonio) was once a port of some note. Not far from Ewarton are the Roaring River Falls, the largest waterfalls in Jamaica. St. Ann's Par. is a favourite place of visit on account of the views from Mount Diablo. Mandeville is a favourite resort of winter visitors to J.

**Population.** The census taken in Jan. 1943 shows a total of 1,237,063 persons resident on the is. (598,267 males and 638,796 females). The estimated pop. in 1945 was 1,289,051, the natural increase being about 18 per thousand. The white pop. numbers about 15,000, the coloured about 200,000, Indian Asiatic, 30,000 and the rest blacks.

**Dependencies of Jamaica.** Under the

gov. of J. are Turks and Caicos Is., and Cayes Is. (see under their names).

**Constitution.**—The present Constitution of J. came into force in Nov. 1944. The position of J. was unique, because the colony was returning to a form of responsible, representative gov. after an interval of 78 years, and because the proposals for reform submitted to the spokesmen for organized public opinion were, to all intents and purposes, adopted in their entirety. A bicameral legislature was set up, consisting of a House of Representatives of 32 members elected on a basis of universal adult suffrage (women were enfranchised in 1919 but there was then a prohibitive property qualification) and a nominated Legislative Council of fifteen official and non-official members. The old Privy Council of J. disappeared from the Constitution, except for questions of prerogative, in favour of an Executive Council of ten, of whom five are elected by the House of Representatives, and three official and two unofficial members nominated by the governor from the Legislative Council. The governor himself is the Chairman with a casting, but not an original, vote. This new body is the prin. instrument of policy, with the duty of preparing the budget, and of having to approve Bills, by a majority, before their introduction in either House of the Legislature. It functions, in effect, as a Cabinet, and the five elected members are appointed Ministers in charge of depts. of administration. They are the leader of the House of Representatives, who acts as chairman of the Finance Committee of that Chamber, and the ministers of communications, agriculture, education, and social welfare, who preside as such over House committees concerned with their depts. The power of certification of measures which he considers essential but which have been rejected by the Legislature, is exercised by the governor in accordance with the advice of the Executive Council and he retains the power of veto, but, before refusing assent, must consult his ministers and, if they do not agree, the secretary of state. The Constitution is to be tried out for a full electoral period of five years, after which the position is to be reviewed. A general election, held in Dec. 1944, returned to the House of Representatives twenty-three Labour Members, four representing the People's National Party and five independents—these latter closely allied with the J. Labour Party led by Alexander Bustamante, minister of communications. Serious labour troubles occurred in 1946 leading to fatal casualties, Bustamante and the minister for social welfare being tried, but acquitted, on a charge of manslaughter.

**Education.**—The Imperial Gov., in 1946, decided, after consideration of the Report of the W. Indies Committee of the Commission on Higher Education in the Colonies to estab. a W. Indian Univ. College in J. In the first instance the college will be given the status of a univ. college and will prepare students for the degrees of London Univ. Eventually, it is hoped

that the college will, after a reasonable formative period, become a centre of teaching and research. It was also decided to estab. a permanent medical faculty as an integral part of the college. The univ. received its royal charter in 1949. A beginning has been made to erect permanent buildings for the univ., which, at present, is housed in huts outside Kingston.

#### BANANA HARVESTING IN JAMAICA

**History.**—J. was discovered on May 3, 1492, by Columbus, who called it *Sant Jago* but it has retained its Indian name *Xayinaxa* or *Xayinaca*, 'land of water'. There is much circumstantial evidence about his landing on the above date in the works of Herninder, Peter Martyr, an abbot of Jamaica during the Sp. occupation, and in the transcripts of the records by John Washington Irving's *Life of Columbus* tells us that Columbus landed in Puerto Bueno or the bay later called Dry Harbour but he has no authority for his supposition. There is no reliable evidence to identify the landing of Columbus in J. or the port or bay where he careened or repaired his battered caravel, the *Niña*, which had borne him southward from Juana or Cuba in quest of Santiago or Xayinaxa or Jamaica as it was variously called, or some such is, as he had been truly led to believe lay in that quarter and where he thought to find extravagant treasure in gold and precious stones. According to Frank Cundall, J.'s modern historian, the distinction of being the place of his landing appears to be about equally divided between St. Ann's Bay and Port Maria. It was not till nine years later, on his fourth and last voyage,

that Columbus again visited the is. Being caught in a violent storm, he ran his ship aground near St. Ann's Bay, on the N. coast. He came this time not as a Sp. viceroi but as a shipwrecked refugee, disappointed and broken by the persecution of his enemies. His crews being mutinous and the Arawaks or natives of the is. unwilling to bring him the supplies they had brought on his first visit, Columbus would have starved to death but for playing on the superstitions of the Indians by predicting an eclipse of the moon, a trick which many an explorer has used since in fact and in fiction. When Columbus died (1506) his son Diego inherited his property and went out to Hispaniola (now Haiti and Santo Domingo) as governor. On arriving there he found that J. had been partitioned between two Spaniards, and in order to establish his title, he sent Esquivel to found a settlement in J. under his direction. This settlement was founded on the N. side; but in 1531, because the S. coast was healthier and more suited to vessels sailing to and from Spain, the town of St. Jago de la Vega, now Spanish Town, was founded, and this soon became the chief town. In 1596 the is. was attacked by the Eng. under Sir John Shirley, who pillaged Spanish Town, and in 1643 Col. Jackson, with some 500 men, landed at Port Royal and exacted a ransom from the Spaniards. J., however, remained in Sp. hands for 161 years, and it was not until May 10, 1855 that it changed hands, when Adm. Penn and Gen. Venables, having been disastrously defeated on April 17 and 25 off Hispaniola, gave up the attempt on that is. and sailed for J. instead. Venables reached J. on May 10, and the chief town was occupied with next to no fighting and Governor Don Christoval Arnaldo Ysaasi was forced to capitulate on May 17. Venables' conduct of the campaign was unskilful to a degree; while Penn, father of the Quaker founder of Pennsylvania, seems to have done little else but quarrel with Venables. Later, under the auspices of the viceroi of Mexico and the governor of Cuba a formidable expedition was fitted out with which Don Ysaasi hoped to recover J. But the bravery of the Eng. soldiers dismayed the Sp. commanders at sea and they left the Sp. invading forces in J. to their fate and to the apathy of the Sp. colonists. After this we enter on the constitutional period of Jamaican hist. when civilian governors succeeded military men. The first Eng. governor was Col. D'Oyley, who may be regarded as the real conqueror of Jamaica. In 1661 D'Oyley's military command was changed into a civil governorship and his commission from Cromwell instructed him to govern with the advice of an elected council. The African slaves of the Spaniards, who had been brought into the is. after the virtual extermination of the Arawaks, and who were called Maroons, fled to the mt. fastnesses, and they were not finally pacified until the end of the eighteenth century when, following a rebellion, many of them were deported to Nova Scotia. The year 1760 was notable in Jamaican hist. for

the insurrection of the Coromantyns in Ballard's Valley under a leader called Tacky—certainly one of the most dangerous risings in Jamaican annals. In June 1670 the Brit. occupation of Jamaica was formally recognised by the treaty of Madrid. Colonisation went on and there was a large influx of soldiers and of undesirable refugees, neither of whom made good settlers. Other settlers came from Nevis and other W. Indian is. J. at this time became one of the hiding places of the buccaners, freebooters of all nationalities, who were opposed to the rule of Spain. One of the most famous was Henry Morgan, (q.v.) whose exploits are narrated by the Dutch buccaner, Esquemeling, who sailed with him (see John Esquemeling, *Buccaniers of America*, 1684). Morgan eventually became governor of J. as Sir Henry Morgan.

J.'s hist. from the late 17th to 1831 is the story of the anti-slavery struggle to eventual emancipation. Successive colonial secretaries sought to prevail on the Jamaican legislature to adopt orders in council for the betterment of the condition of the slaves, but the old House of Assembly always proved obstructive. Victor Hugues, the Fr. W. Indian revolutionary and friend of Robespierre, came to J. and tried to work up insurrection and bloodshed, and thus it was that led to the rebellion of the Trelawney tribe of Maroons in 1795. In the critical days of the early 1830's of J.'s hist. it was fortunate for the is. that it had as its governor the Earl of Mulgrave, later Lord Normanby, who was the ideal man to handle a turbulent House of Assembly, which was always disposed to dispute the authority of the Imperial Gov. and even the royal prerogative. It was largely through his conciliatory bearing and firmness that the Assembly was at length induced to accept the Bill for the abolition of slavery. Edward John Eyre, a most experienced colonial administrator, became governor of J. in 1861. The is. fell upon evil times through economic depression and the state of its finances necessitated new taxation. The resulting discontent led to a rising on Oct. 11, 1865, known as the outbreak at St. Thomas in the East. Martial law was proclaimed in the dist. and George Wm. Gordon, who was said to have incited the people, was taken from Kingston to Morant Bay, tried summarily, and hanged. Gordon was a coloured member of the Legislative Council and a considerably landowner but he was prone to inflammatory utterances. This may or may not have justified his apprehension; but, by transferring him from Kingston, where martial law had not been declared, to Morant Bay, where it had been committed, a technical blunder. Later an enquiry was begun in England by a hostile committee of which John Stuart Mill was chairman, but a rival committee under Thomas Carlyle and Charles Kingsley defended Eyre (see on this famous case E. B. Underhill, *The Tragedy of Morant Bay*, 1895)—a biased work by a man who played a conspicuous part in the transactions he records thirty years later; also

controversial, but on the other side is Lord Olivier's *The Myth of Governor Eyre* (1923) and see also the judicially minded work *The Sugar Colonies and Governor Eyre* (1936), by Wm. Law Mathieson. This reverberating event was followed in 1866 by a drastic change in the gov. of J. The one-time reconstituted Assembly, with its charter and large local rights exercised by a very small class, had become of small influence now that the large sugar planter, who, in 1803, numbered nearly 900 were reduced to 300 in 1865. Strong central gov. under the Crown was the only remedy and so J. was made a crown colony with a gov. and council appointed by the Imperial Government (see further under Government, above).

Cundall, *Studies in Jamaica History* 1900; H. G. de Lissac, *In Jamaica and Cuba: Lady Nugent's Journal*, privately pub., 1839; (new ed.), ed. by F. Cundall, West Indian Committee, London, 1934; M. G. Lewis (Monk Lewis), *Journal of a West India Proprietor, 1815-1817*, ed. by Mona Wilson, 1929; Lord Olivier, *Jamaica - the Blessed Island*, 1936; W. J. Brown, *Jamaican Journey*, 1949.

**Jamalpur:** (1) Tn. and municipality of Bengal, India, in the Mymensingh dist., 85 m. N.W. of Dacca. Pop. 26,000, of which about two thirds are Moslems. (2) Tn. and municipality of Bengal, India, 32 m. W. of Bhagalpur. It contains the iron workshops belonging to the E. India Railway Company. Pop. 25,000, the greater part being Hindus.

**Jambes**, tn. of Belgium and S. suburb of Namur, from which it is separated by the Meuse. It is engaged in agriculture and manufs. of glass, crystal, lamp-black, dynamite and asphalt. Pop. 9600.

**Jambi**, tn. in Sumatra, on the r. b. of the Jambi R., about 25 m. N.N.W. of Palembang. Many Hindu sculptures have been discovered in its vicinity.

**Jamblichus Chalcedenus**, see IAMBLICHIUS.

**Jamboree**, originally a drinking-bout or merry-making, but now applied by the Boy Scouts' Association to their national and world rallies. In euche (*q.v.*) it denotes a single hand containing the five high-cards.

**Jambu-dvipa**, one of the seven continents of the world, in the Mahabharata, embracing the gods' dwelling place and the mountain of Meru with its 'jambū' or 'rose-apple' tree. Mountains divide it into nine countries, Bharata (India) being the chief. Poetry and Buddhist works give the name to all India. Others apply it to the mt. dists. only (N.W.), and others to the whole of Asia.

**Jambul**, region of the Kazakh S.S.R. Pop. 62,700.

**Jambusar**, tn. and municipality of India in the Broach dist., Bombay, situated about 28 m. N.W. of Broach. Pop. 11,000.

**James**, name of three important figures in the Apostolic Church: (1) The

son of Zebedee and brother of John, one of the most important of the apostles according to the Synoptic accounts. He and his brother received from Jesus the surname 'Boanerges,' explained as meaning 'Sons of thunder.' In Acts i. 13 ff. he is mentioned among those who, after the Resurrection continued steadfast in prayer at Jerusalem. He was the first of the apostles to suffer martyrdom, being put to death in the year A.D. 44, by Herod Agrippa (Acts xii. 1 ff.). Legend speaks of his having made missionary journeys to Spain, of which country he is the patron saint. (2) The son of Alphaeus, was also an apostle. There has been much discussion as to whether he is to be identified with (4). Mark xv. 40 ff. speaks of his mother as a certain Mary, but little is known of him. (3) The 'brother' of Jesus, surnamed the Just, was, according to Epiphanius, the son of Joseph by a former marriage. Hegesippus (see Eusebius, *Historia Ecclesiastica*, ii. 23) gives a detailed description of his ascetic life of the kind that would appear ideal to an Ebionite, and Josephus (*Jnt.* ix. 9) also tells us that he suffered death by stoning in A.D. 62 under the high-priest Ananus. He was the head of the Jewish Church at Jerusalem and seems to have been the leader of the Judaizing party, eager for the observance of the law.

**James, Saint, The Epistle of**, is placed first among the Catholic epistles. Its title is short, 'James a servant of God and of the Lord Jesus Christ, to the twelve tribes which are scattered abroad.' The traditional view identifies this James with James the Just, Bishop of Jerusalem, and those who hold this view place the date of the epistle very early, before the epistle to the Hebrae, and probably before St. Paul's first missionary journey. The epistle is therefore not to be regarded as a polemical treatise against the Pauline view of faith, but as an independent address to Jewish Christians from a different point of view. Though the apparent antithesis between the insistence of Paul on justification by faith and the emphasis which James lays upon works is great, so much so indeed, that Luther characterised the epistle as 'an epistle of straw,' the two views are not contradictory. An almost entirely different opinion was held by the Tubingen school, now somewhat discredited. They placed the epistle very late. Schweigler and Hansrath ascribed it to the time of Trajan, Hilgenfeld to that of Domitian, being supported in this dating it by Holtzmann and Von Soden. Most of these critics consider the epistle to be the work of a member of the Rom. Church, writing in direct opposition to the Pauline propaganda, for the position of the Tubingen school depends largely on their assumption of an opposition throughout the N.T. between the Pauline theology and that of the older Jewish Christianity. The epistle deals, however, with life not with doctrine. There was some difficulty as to its admission into the Canon. See Zahn's *Introduction to the New Testament* i. (trans. 1909) and commentaries by Ewald, Mayor, and writers named in

article. See also J. Moffatt, *Introduction to the Literature of the New Testament*, 3rd ed. 1918.

**James I.** (1394-1437), king of Scotland, the son of Robert III., at an early age was sent to France by his father. He was, however, captured by Eng. sailors on his way there, and was imprisoned in England by Henry IV. (1406). In the same year and probably a month later than his capture, his father died and he became nominally king of Scotland. The gov. of Scotland was conducted by the duke of Albany, the king's uncle, who showed no desire to ransom his nephew. His education was by no means neglected, and he proved himself one of the best-educated princes of Europe. He was also very active and a good athlete. After accompanying Henry V. to France he was, in 1421, restored to Scotland, the Scots promising a huge ransom. He had married in the same year, Jane Beaufort, daughter of the duke of Somerset. He was crowned in 1424 and with his real accession begins constitutional monarchy in Scotland. He caused the overthrow of Murdoch, duke of Albany, and his son, and proved so powerful a king that he made many enemies. He crushed the violent nobility and was finally murdered by Graham. He was the author of two poems, *The Kingis Quair* and *Good Counsel*. See A. N. Mackenzie *The Rise of the Stuarts, 1329-1513*, 1933; B. Balfour-Melville, *James I.*, 1936.

**James II.** (1430-60), the only surviving son of James I. He was brought up during his minority under the care of his mother, the earl Douglas acting as regent, and after the second marriage of the queen he passed into the custody of Sir Alexander Livingstone. Almost continual civil war waged during the period of his minority, the prize of the victors being the custody of the king. In 1449 J. married and assumed the royal power. He immediately proved himself a strong king. He caused Livingstone to be executed and later stabbed Douglas with his own hands. He crushed the power of the great nobles, and was supported by the majority of them, and also by parliament. He sympathized with the Lollardian cause in England during the wars of the Roses, and after their defeat he attacked the Eng. possessions in the S. of Scotland. At the siege of Roxburgh he was killed by the bursting of a cannon. On the whole the gov. and justice were improved and reformed during his reign. See J. Balfour, *Annales, 1067-1652*, 1825.

**James III.** (1451-88), the eldest son of James II. He became king at the age of nine, and his minority was spent in the custody of Sir Alexander Boyd. In 1469 he married the daughter of the king of Denmark and assumed power himself. The nobles submitted to him, but his desire for peace and for a quiet life soon began to make him unpopular. His brothers plotted against him; both were arrested and one of them died in prison. The other fled to England and was recognised by Edward IV as king of Scotland. War broke out with England, and the

duke of Albany and Richard, duke of Gloucester (Richard III.) were, owing to the actions of the barons, able to march upon Edinburgh. Peace was made, but again Albany rebelled and finally died in 1485. The barons, unable to appreciate the peaceful policy of J. towards England, rebelled and defeated the king at Sauchieburn, where, according to tradition, after the battle he was slain by a soldier in the disguise of a priest who was called in to slay him. See A. Lang, *History of Scotland*, 1900-07.

**James IV.** (1475-1513), was the eldest son of James III., against whom nominally he fought at the battle of Sauchieburn. He was crowned immediately after his father's death, and at once took over the management of the affairs of the realm. He had little or no trouble with his nobles after the frustration of a plot formed at the beginning of his reign to hand him over to the Eng. king (Henry VII. Tudor), and he was intensely popular with the commons. He supported Perkin Warbeck against Henry VII., but the projected war with England came to nothing, and in 1503 the marriage between Margaret Tudor and J., which was to result in the union of the crowns, took place at Holyrood. He raised Scotland to the highest position she had yet attained in Europe, and during his reign the Scottish court was refined and enlightened. The accession of Henry VIII. led to continual bickerings between the two countries, and finally in 1513 J. declared war. He earned some successes at first, but was finally overthrown at Flodden. He died fighting bravely, and with him perished the flower of Scottish nobility. He was a man of generous nature, and an energetic king. See J. Skene, *Memorabilia Scotica*, 1877; 1912, 1923.

**James V.** (1513-42), king of Scotland, son of James IV., succeeded his father at the age of one year, and between the years 1513-28 the country was in a state of constant turmoil, owing to frequent collisions between the Fr. and the Eng. parties in Scotland. The queen, dowager was for a time regent, but finally Albany, at the head of the Fr. party, occupied that position. The king fell into the hands of the Douglasses, who kept him prisoner until the year 1528, when he escaped and began to rule personally. He put down disorder with a firm hand, and proved himself a very capable king, but he was unpopular with the nobles, since he restricted their power too much. He was highly popular with the commons, however, whose rights he preserved. He married in 1538 Mary of Guise. He supported the old form of faith in Scotland, principally because he relied on the clergy for support against the nobles, and refused to follow the lead given by his uncle, Henry VIII. This refusal to listen to the advice of Henry VIII. led to ill feeling between the two countries, which terminated in 1542 in the outbreak of war. The nobles revenged themselves by deserting their king and leaving him to be overwhelmed at Solway Moss. Shortly afterwards he died, leaving as he lay on his deathbed that a daughter had

been born to him—the later Mary Queen of Scots. See E. M. MacKerlie, *Mary of Guise-Lorraine, 1515-1560, 1931.*

James I. (1566-1625), king of Great Britain and Ireland (formerly James VI. of Scotland), the son and only child of Mary Queen of Scots and her second husband, Henry, Lord Darnley. He was born at Edinburgh Castle, and became king in 1567 when his mother was forced to abdicate. He was a boy of great weakness, and never became a strong man, although he lived for nearly sixty years. He was kept outside politics altogether up to the year 1578. He was brought up first of all under the care of the earl of Mar and his countess, for both of whom he seems to have had much affection. Later, on the death of Mar, Sir Alexander Erskine took him into his charge. His education was by no means neglected. George Buchanan being his principal tutor. The times made it necessary that he should be trained as a Protestant, and therefore the theological side of his education was pursued. It was not until 1583 that J. began actually to rule. His reign as James VI of Scotland was altogether for the good of that country. J. broke the power of the baronage and restored the power of the monarchy. He gained the favour of the people, and he was able even to curb the pretensions of the Presbyterian Church, and to introduce a form of episcopal gov. He had been brought up as a Presbyterian, but he never had any very great love for Presbyterianism. He believed above all in the divine right of kings, and held that the chief supporters of this theory—the bishops—were alone to be supported. In England, however, his career was otherwise. He was accepted by his Eng. subjects largely because the alternative to accepting him was civil war. But his pretensions, his intolerance, his personal appearance, and his manners did much to alienate his subjects. His claim of divine right, which he supported by pretence to powers of dispensation and suspension of the laws, quickly gained for him enemies in England. The failure of his foreign policy and his desire to pose as the arbiter of Europe were also points against his general popularity. He failed altogether to see the weakness of Spain, and his desire for a marriage alliance with that country weakened support in England. His reign from 1603 to 1625 may be regarded as one of the essential preliminary causes of the outbreak of civil war in 1642. Truly it has been said 'James sowed the wind, Charles reaped the whirlwind.' He has also been aptly described as the wisest fool in Christendom. He was certainly well educated and well read, but pedantic to a degree. His general reading and his intellectual interests show that he had great sympathy with the education of the time. Amongst writings of his may be mentioned, *Essays of a Prentise in the Divine Art of Poesie* (1584); *Counterblast to Tobacco* (1604). See H. G. Rosedale, *Spanish Match*, 1908; R. S. Rait, *James's Secret, Elizabeth and James VI.*, 1927; H. J. Lusk, *Political Ideas of James I.*,

1921; C. Williams, *James I.*, 1934; J. D. Mackie, *Cavalier and Puritan*, 1936.

James II. (1633-1701), king of Great Britain and Ireland, was the second surviving son of Charles I., and was created duke of York in 1633. During the Civil war he was captured by Fairfax, but escaped to Holland in 1648. During the twelve years which elapsed between this date and the Restoration, he proved himself an able soldier, and was commended both by Turenne and Condé. On the restoration he was appointed Lord High Admiral and Warden of the Cinque Ports. He proved himself an able officer and a wise administrator, and gained a great reputation both for ability and courage. His private life was, however, as immoral as that of his brother, the king. He married Anne Hyde in 1660, under exceedingly discreditable circumstances. By her he had issue Mary and Anne, who both ascended the throne. His second wife was Mary D'Este of Modena, who bore

JAMES II.

him a son, James Francis Edward, known as the Pretender, and a daughter, Mary Louisa, who died young. He avowed himself a Rom. Catholic in 1682, but after the passing of the Test Act, he was forced to give up his offices, and later the Popish Plot drove him to Holland. His exclusion from the throne was proposed by the Whigs, but after Charles's triumph he was able to return. He was first made High Commissioner for Scotland, where he instituted cruel persecutions of the Covenanters, and later he was again made Lord High Admiral. He succeeded in Feb. 1685 to the throne. He promised to defend the Church and the laws, and was received as king with some popularity. He, however, failed to recognise the strength of the Estab. Church. He introduced Catholics into the army and the univ., and assumed the right of dispensing with and suspending the laws of England. The Declaration of Indulgence and the refusal of the bishops to read it in the churches led to their trial for seditious

libel. They were acquitted amidst the applause of the nation and even of the army which J. had gathered at Hounslow to overawe London. The birth of a son to him destroyed Eng. hopes of a Protestant succession, and induced a group of Eng. nobles to send an invitation to Wm. of Orange, without which he would not come. J. was sublimely unconcerned, in spite of repeated warnings, of what was happening, but awoke to the danger after the arrival of Wm. of Orange in England. He attempted to retreat, and finally fled the country. His first attempt to escape failed, and he was brought back, but allowed to escape again. He crossed to France, and from there to Ireland, where he was defeated at the Boyne (1690). He seems to have lost his old courage, and behaved with great cowardice. Two other attempts to restore him (the battle of La Hogue (q.v.) and the Assassination Plot) failed, and after refusing the crown of Poland, J. died at St. Germain in France. He was narrow-minded, and failed to grasp the greatness of the issues against him. To these two causes his failures may be chiefly attributed. See lives by H. Bellin 1928; F. M. G. Higginham, 1934; A. C. Currier, 1914; also J. Marriott, *Crisis of English Liberty*, 1930; M. Hay, *Winston Churchill and James II.*, 1934.

**James, David** (1839-93), actor, whose real name was Belasco, b. in London. He made his first appearance at the Princess's Theatre under Charles Kean, but subsequently appeared at the Royalty in 1863, where he played in Burnand's burlesque of *Iolan*, and estab. his reputation in 1870 with his performance of Zerkel Homespun in the *Heir at Law*. He played at various theatres in many parts, but his most successful was Perkyw Middlewick in *Our Boys*. This piece was played over 1000 times, and was claimed as 'the longest run on record.'

**James Francis Edward Stuart**, see STUART, JAMES FRANCIS EDWARD.

**James, George Payne Rainsford** (1799-1860), Eng. novelist, b. in London. Taking to literature early, he attained some success as a writer of miscellaneous articles, and in 1822 produced a *Life of the Black Prince*, followed within the next thirty years by over a hundred books, mostly novels, the remainder hist., plays, and verse. Many of his tales are historical, *Richieu* (1829) being one of the best. They were very popular, having plenty of adventures told in good Eng., though the characters are mere lay-figures. His style is parodied by Thackeray in 'Barbasure' in *Novels by Eminent Hands*. Though J.'s histories are compilations of no great value, he was for some time historiographer-royal to Wm. IV. From 1850 to 1860 he was British consul successively in Massachusetts, Virginia, and finally Venice, where he died.

**James, Sir Henry** (1803-77), director-general of the Ordnance Survey of England and Wales, b. in Cornwall. He was appointed in 1827, and was made director-general in 1851. He was also director of

the topographical dept. of the War Office in 1857, and was knighted in 1880. He is famous for having applied photo-zincography to ordnance maps (1859), on which subject he pub. a book entitled *Photo-zincography and other Photographic Processes employed at the Ordnance Survey Office*.

**James, Henry, Lord (of Hereford)** (1828-1911), Eng. lawyer and statesman, b. at Hereford, and educated at Cheltenham. Called to the Bar in 1852 he became Q.C. in 1869, entering parliament the same year as Liberal member for Taunton, which seat he retained until 1885. In 1873 he was appointed first solicitor-general, afterwards attorney-general, and received a knighthood. Resuming office under Mr. Gladstone in 1880, he was offered the lord chancellorship in 1886, but declined to accept it, having broken away from his leader on the Home Rule question. Elected for Bury (Lancs.) in 1885, and re-elected in 1890 and 1892, he became a leading Unionist. At the holding of the Parnell Commission he appeared with Sir Richard Webster as counsel for *The Times*, and in 1895 took his seat in the Salisbury cabinet as chancellor of the Duchy of Lancaster with a peerage. A convinced free trader, he strongly opposed the Tariff Reform movement in 1903. During the latter years of his life he took great interest in the Imperial Institute. He was a good sportsman, and for some time president of the M.C.C.

**James, Henry** (1843-1916), Amer. author; b. in New York; son of Henry J., an eminent theological writer and lecturer. He and his brother Wm. (q.v.), were in their boyhood educated in England, France, and Switzerland, and afterwards at Harvard. Henry was intended for the law, but took to literature instead—encouraged by W. D. Howells, then editor of the *Atlantic Monthly*, in which J.'s first story appeared in 1865. For four years he remained in America writing stories in sketches; in 1869 he removed to England. Beginning with the novel *Hatch and Ward* (1871), he pub. a large number of vols.; including novels, collected stories, travel-sketches, criticism, and biography. In spite, or perhaps because, of the peculiar grace and distinction of his work he was rather long in 'arriving'—his first great success being the tale of *Daisy Miller* (1878). He afterwards won universal recognition as being first in his own particular school, a school so far removed from those of older masters of fiction that it has had to create its own circle of admirers. Intensely subtle and analytic in its portrayal of character, dealing little in incident; but probing the depths of individuality, of internal strife, of closely-woven intricacies of thought and feeling—it has nothing in common with romances like those of Scott and Dumas, or broad vigorous stories of everyday life as told by Dickens. Very characteristic and noteworthy specimens of J.'s work are *The Portrait of a Lady* (1881) and *The Golden Bowl* (1904). His novels (in the strict sense) are twenty-one in number. The last was: *The Outcry*, (1911).

*The Ivory Tower* (1917) and *The Sense of the Past* (1917) are unfinished. He lived at Ry, Sussex. He was enthusiastically for England on the beginning of the First World War, in July 1915 he became naturalised as a Brit. subject. He received O.M. in the year of his death. See P. Edgar, *Henry James, Man and Author*, 1927. Van Wyck Brooks, *Pilgrimage of Henry James*, 1928. E. O. Matthiessen and K. B. Murdock, *The Notebook of Henry James*, 1919. Janet Adam Smith (ed.) *Henry James and Robert Louis Stevenson: A Record of Friendship and Criticism*, 1948. F. W. Dupee (ed.) *The Question of Henry James*, 1918.

James, William (d. 1827), naval historian, practised in the Jamaica Supreme Court (1801-13). He was detained prisoner in the U.S.A. in 1812, but escaped to Nova Scotia in 1813. He pub. various pamphlets on the comparative merits of the Eng. and Amer. navies in 1816, but his great work is his *Naval History of Great Britain from the Declaration of War by France in 1793 to the Accession of George IV.* (1820). This appeared in 5 vols. in 1822-24, and was reprinted in 6 vols. in 1926.

James, William (1812-1910), Amer. philosopher, brother of Henry J. the novelist (q.v.), took his degree of M.D. at Harvard in 1870, and became lecturer there in anatomy and physiology in 1872. Inheriting from his father a love for subtle reasoning and mental research together with great power and freshness in expressing his theories, he became assistant prof. of philosophy (1880), prof. (1885), prof. of psychology (1885), and prof. of philosophy (1887-1907). His *Principles of Psychology* (1890) gave him a wide reputation and was reprinted in a condensed form in 1902; he wrote also *The Will to Believe* (1877), *Human Immortality* (1893), *Lectures to Teachers on Psychology and to Students on Life's Ideals* (1899), *The Varieties of Religious Experience* (1902), *Pragmatism* (1907), *A Pluralistic Universe* (1908), and *The Meaning of Truth* (1909). His home was at Cambridge, Massachusetts, but he visited Europe on several occasions, and was invited to deliver the Gifford lectures on natural religion at Edinburgh (1899-1901) and the Hibbert lectures at Manchester College, Oxford (1908). Honorary degrees were conferred on him by the univs. of Padua, Edinburgh, Princeton, Oxford, Durham, and Geneva.

James Bay, inlet in the S. part of Hudson Bay. It received its name from its explorer Capt. Thomas James. It is about 300 m. long and 150 m. wide and contains a number of islands. Moose Factory, at the mouth of the Moose R., is an important trading station of the Hudson's Bay Company.

Jameson, Anna Brownell, (1794-1860), Irish authoress and art critic, b. in Dublin. In 1831 she pub. her first important work, *Memoirs of Female Sovereigns*, followed by: *Characteristics of Women* (1832), *Beauties of the Court of Charles II.* (1833), *Winter Studies and Summer Rambles* (1835), the result of her visit to Canada. It was, however, as an art critic that she ex-

celled, and her writings on the subject of art include *Companions to the public and private picture galleries in London* (1832), *The House of Llanan* (1816), *Views of Early Italian Landscapes* (1815), *Legends of the Monastic Orders* (1830), *Legends of the Madonna* (1832). The work upon which her reputation chiefly rests, *Sacred and Legendary Art* (first part pub. in 1848), was completed, after Mrs. J.'s death, by Lady Eastlake under the title of *The History of Our Lord* (1864). See memoir by Mrs. Macpherson, 1873.

Jameson, Sir Leander Starr (1853-1917), British colonial statesman, b. in Edinburgh, and studied medicine in London (M.D. 1877). Breaking down from overwork in 1878 he went out to S. Africa, settling at Kimberley, where he was very successful, among his patients being President Kruger and Lobengula. He was intimate with Cecil Rhodes, and when the latter, assisted by J.'s influence with Lobengula, established the Brit. S. African Company, the doctor accompanied the first migrant column to Mashonaland in 1890. Next year, being appointed administrator, he succeeded in checking a Boer force of 1000 strong, organised to dispute the Brit. possession of the country. In 1893 a Matabele invasion brought on a war in which J. took a leading part, and ended in the conquest of Matabeleland. Returning home for a rest in 1894 he went out again in 1897, and on Dec. 31 led that disastrous raid into the Transvaal which heralded so many troubles. Captured by the Boers, he was sent home for trial and sentenced to fifteen months' imprisonment, but was loudly applauded in open court. Returning unofficially to Africa he became leader of the Progressive party after the war and Premier on their success in 1901. His measures were liberal, the capt. prisoners were liberated and shortly afterwards restored to the franchise, while strenuous efforts were made to develop the resources of the country, railways and education receiving special attention. In 1905 his party was defeated, and J. resigned office. He was made P.C. in 1907, and Bt. in 1911. See Col. H. Marshall Hol. *The Jameson Raid*, 1930.

James River, largest riv. in Virginia, U.S.A. It rises in the Alleghany Mts., and flows into Chesapeake Bay. It has a length of 160 m., and is navigable for steamboats of 130 tons as far as Richmond (i.e. 150 m. from its mouth). The chief tributaries are the Chickahominy and the Appomattox. Jamestown, the first permanent Eng. settlement, was located on this riv.

Jamestown (1) Cap. of St. Helena, situated on the N.W. coast of the is. It is a coaling station, and contains the residence of the governor of the is. Pop. 1,000. (2) A city in Chautauque co., New York, U.S.A., about 60 m. S.W. of Buffalo, situated on Lake Chautauque, and famous patronised as a summer resort. It has flour, lumber, and cotton mills and paper factories. Pop. 2,600. (3) Former settlement in James City co., Virginia, U.S.A., and was the first Eng. settlement in the U.S.A. founded in 1607. Only remains, however, of this settlement exist

at the present day, and are incorporated in Williamsburg, the first cap. of Virginia. (4) Tn. in the Lydenburg div., Transvaal, S. Africa, situated N. of Barberton in the Kaap goldfields dist. Pop. 3000.

**Jami, Nureddin Abdurrahman** (1414-92), last great Persian poet, b. at Jam in Khorassan. He wrote lyrical poems and odes, and his collection of romantic poems, *Haft Awrang*, contains two of his best known, 'Yusuf u Zuleikha' (trans. 1895 by Rogers) and 'Salaman u Absal' (trans. by FitzGerald, 1856). He also pub. a hist. of the Sufis and other prose works, his chief being *Baharistan*, which has also been trans.

**Jamieson, John** (1759-1838), Scottish scholar and antiquary, b. in Glasgow. After studying for the ministry he was ordained to the Anti-Burgher branch of the Secession Church at Forfar in 1781, and afterwards at Edinburgh in 1797. His chief work is *The Etymological Dictionary of the Scottish Language* (1808), supplement in 1827, and a new ed. in 1879-87. Among his pub. are ed. of Barbour's *Bruce*, and Blind Harry's *Sir William Wallace*.

**Jamkhandi**, cap. of the native state of Jamkhandi, <sup>Prin. J.</sup> India, situated about 37 m. S.W. of Bijapur. Pop. 12,000.

**Jammes, Francis** (1868-1938), French poet, born at Tournaix in the Perennes. In his earlier style there were the delicious *De l'Angelus de l'aube à l'Angelus du soir*, *Le Deuil des primerèrres* and in his later Catholic style *Les Georgiques chrétiennes*. Among his prose stories are *Clara d'Elleuse* (1899), *Almaide d'Etrémont* (1901), *Pomme d'Anis* (1904), *Le Poète rustique* (1920), and *Les Robinsons basques* (1925).

**Jammu, Jamu, or Jummoo**, cap. of the state of Jammu and Kashmir, India, and situated about 80 m. N. of Amritsar. It was once a seat of a Rajput dynasty, now the residence of the Maharajah of Kashmir. Pop. 32,000.

**Jamnagar**, see NAWANAGAR.

**Jamnoiri**, hot springs in Garhwal state, United Provs., India, situated near the source of the R. Jumna. Alt. 10,984 ft.

**Jamrud**, fort, N.W. Frontier Prov., Pakistan. It lies 10-12 m. to the W. of Peshawar at the entrance of the Khyber Pass. It played an important part in 1878-79 in the war with Afghanistan. A new railway line through the Khyber from J. to the frontier of Afghanistan was opened in 1925. Pop. about 6000.

**Jamshid**, the subject of many Persian poems and legends, is supposed to have belonged to the mythical 'Peshdadian' Dynasty, and to have built and reigned in Persepolis about 1000-800 B.C., and to have been dethroned by Zohak, the Arabian.

**Jamtlund**, lan or gov. of Sweden; chief tn., Östersund. Area 20,000 sq. in. Pop. 142,800.

**Jánáček, Leoš** (1854-1928), Czech composer, b. at Hukvaldy, Moravia, son of a vil. schoolmaster. Was a choir-boy at Erno (Brünn) and later choir-master in a monastery. Studied in Prague and Leipzig; settled in Erno as conductor and

composer. Produced a number of operas of strongly national character. His accepted masterpiece is *Jenufa* ('Her Stepdaughter') (1903), a drama of Moravian peasant life. *Katya Kabanova* (1921) is an adapted version of Ostrovsky's famous Russian play, *The Storm*. One of his earliest works was *Sarka* (1887). His other prin. operas are: the one-act *Beginning of a Novel* (1891); *Destiny* (never yet performed or printed, 1900); *Mr Brouček's Excursions* (1914), consisting of two fantastic dreams within a realistic framework; *The Adventures of the Cunning Viren* (1923), many of the characters of which are animals or birds, with a hint of underlying symbolism; *The Mikropoulos Affair* (1924) based on a well-known play by Capek; and *From the House of the Dead* (1928), which adapts for the operatic stage episodes from Dostoevsky's reminiscences of his imprisonment in Siberia. He also composed a considerable quantity of chamber, orchestral and choir music and a fine Slavonic folk mass. J. is one of the three or four great opera composers of the twentieth century and his music has a rich lyrical vein not unlike that of Dvořák or Smetana.

**Jane, Frederick T.** (1870-1916), Brit. naval officer and founder and first editor of the anns. *Jane's Fighting Ships* (from 1898) an authoritative description of the world's navies; and *All the World's Aircraft* (from 1910). Educated at Exeter school. Naval correspondent for the *Engineer, Scientific American, and Standard*. Other pub. include: *Blake of the 'Hullcane'* (1895), *The Port Guard Ship* (1899), *The Torpedo in Peace and War* (1893), *The Jane Naval War Game* (1898) and other works on the game, which he invented, *Heroes of Sea Power* (1906), and *The British Battle Fleet* (1912).

**Janeiro, Rio de**, see RIO DE JANEIRO.

**Janesville**, cap. of Rock co., Wisconsin, U.S.A., on the Rock R. about 70 m. S.W. of Milwaukee. It does a considerable trade in tobacco, and also manufactures cotton and woollen goods. It has much water power, and there are flour, cotton, and woollen mills. Wisconsin State School for the blind is situated here. Pop. 21,000.

**Janet, Paul** (1823-99), Fr. philosopher, b. in Paris. He was prof. of philosophy in Strasbourg Univ. in 1848, and in 1864 became prof. at the Sorbonne, and a member of the Academy of Moral and Political Sciences, receiving prizes from this institution in 1855 and 1858 for *La famille et Histoire de la Philosophie dans l'antiquité et dans les temps modernes*. He also wrote *Les Causes finales*, which has been translated; *Histoire de la philosophie*; *Philosophie de la Révolution Française*; and *Théorie de la morale*. He was a lucid if not original writer, and in philosophy was a follower of Cousin.

**Janet, Pierre Marie Felix** (b. 1839), Fr. psychologist, b. in Paris. Appointed prof. at the Sorbonne in 1898, and at the Collège de France in 1902. A psychologist and neurologist, he is known especially for his researches on hysteria and neurones. He wrote on psychology and psychotherapy.

**Jang, Bahadur** (1816-77), prime minister of Nepal, was a nephew of Mataber Sing, who was a high functionary in Bengal. In 1834 he was made commander-in-chief of the Nepalese army, and in 1846 made himself prime minister when the former holder of the title was murdered. He kept on good terms with the Eng., visiting England in 1850 and rendered much assistance in Oudh in the mutiny of 1857.

**Janiculum**, hill opposite to the city of Rome. It was one of the portions beyond the Tiber included in the fortifications of Aurelius (A. D. 270-275).

**Janin, Jules Gabriel** (1804-74), French critic and novelist, b. at St. Etienne. He made his reputation by his dramatic criticisms in the *Journal des Débats*. His *L'Âne mort et la Femme guillotinée* (1829), was a clever parody of Victor Hugo. This was followed in 1831 by *Barnave* (his best novel), which gives a striking picture of the first Fr. Revolution. He was elected to the Fr. Academy in 1870.

**Janina, Yannina, or Yanina**, cap. of the prefecture of Janina, Greece, is situated in a picturesque position, about 20 m. from the shore opposite the is. of Corfu. It is the seat of a Gk. archbishop, and possesses many mosques and churches. Gold and silver embroidery are still produced in the city; it was the stronghold of Ali Pasha, the tyrant of Epirus, from 1788-1818; was besieged and captured by the Gks. during the Balkan war, 1913. Pop. (prefecture) 159,000 (tn.) 21,000.

**Janizaries**, renowned force of Turkish soldiery estab. in the fourteenth century. Down to about 1800 they were composed of forced levies of Christian youths, to whom were added young captives taken in war. Trained under a discipline both military and monastic, they were taught to look upon the corps as their only home and for centuries they were the flower of the Ottoman troops. Receiving no pay except during the war, they were allowed to work at trades and to act as police. They frequently mutined, and at length in 1826 a final revolt at Constantinople resulted in their annihilation.

**Janjira**, coastal state of the Konkan div. of Bombay, India, having an area of 324 sq. m. The cap. is Murud, and the fort of Janjira lies on an is. at the entrance of Rajpuri Creek. Pop. about 85,000.

**Jan Mayen Island**, the 'Devil's Island,' lies about 300 m. N. of Iceland, in the Arctic Ocean between Greenland and Norway. It is a craggy, volcanic is., whose mossy cliffs are the haunt of millions of seabirds, and whose desolate slopes, when the winter snow recedes, become alive with Arctic plants and an unexpected fauna of insects and spiders, and other small animals. Scattered throughout the is. are the craters of extinct volcanoes, many of recent origin. At one precipitous point, on Egg Bluff, steam still rises from the depths of the is.; nearby, dominating the whole is., the mighty white Boorenberg rises nearly 8000 ft., directly above the surf. From the ice-cap of this volcanic mt. which is about 30 m. round the base and one of the biggest volcanic cones in the world, some fifteen

glaciers drop towards the sea. The is. is economically useless; but it is conveniently situated for the estab. of a meteorological station for the recording of Arctic storms. It was once a vital factory site in the centre of the Arctic whaling grounds. The whales have gone, but traces of the hunt and the hunters were found in 1947 by the Oxford Univ. expedition on every lonely beach. The earliest hist. of J. M. I. is lost even to the Norsemen's legends, but it is agreed that it was discovered long before the whalers made it their summer home. A little over three centuries ago mariners from various nations 'discovered' J. M. I. One of the first of these was the Dutchman Jan May, who landed on the is. in 1614 and whose name it now bears. It was probably discovered first by Henry Hudson in 1607, though others, besides Jan May, since his time have claimed to have discovered it. Fr. whalers called it the Isle de l'Ichelle; in the early days of their whale hunting the Dutch seem to have named it St. Maurice, while their greatest fishing rivals, the Eng. called it Trinity or St. Thomas Smith's Is. The diaries of early voyagers, however, all comment on the stark barrenness of J. M., including that of Robert Fotherby, the Eng. captain who visited the is. in 1615, and reported that in the lowlands 'all the stones were like unto a smith's anvil, both in colour and forme, the sand is generally mixed with a corne like amber.' The Oxford expedition have confirmed that this 'amber' is formed of pretty yellow green olivine crystals which shine from the black laval sand of the beaches. The flora of lichens and mosses clings precariously to the crumbling lava. The sea at times is covered with fulmar, petrels, kittiwakes, little auks, gullenots, and puffins. The Oxford Expedition found the is. uninhabited except for the personnel of a meteorological station maintained by the Norwegian Gov. In damp places under the cliffs vegetation is lush and varied, comprising such familiar things as dandelions, bilberries, anemones and flowering saxifrages. But at altitudes of 7000 ft., and 5000 ft. above the snow line may be found mosses and orange lichens projecting through the snow. (See 'Oxford Goes Exploring,' by A. J. Marshall, leader of the Oxford Univ. Expedition, *The Times*, Nov. 21-25, 1947.)

**Jannes and Jambres**, legendary names of the two wizards who 'withstood Moses' (Ex vii 2; 2 Tim iii. 8). According to some traditions they were the 'two youths' (It V. 'servants') who accompanied Balaam when he went up to curse Israel (Targum i.; Num. xxii 22). They were the subject of many legends, and a book *Pantheia Jannis et Jambres* is referred to among the apocryphal books by Origen. See Schurer, *Gesch.* iii. 203 *et seq.* (1886 '90).

**Jannings, Emil** (b. 1887), Ger. stage and film actor, b. at Rorschach, Switzerland, of Ger.-Amer. parents. He appeared with Max Reinhardt's company in Berlin. His first appearance as a film actor was in an Ernst Lubitch film (1916) and he also

worked for the Amer screen (1925-29). He returned to the stage in 1932. See also CINEMAJOGRAPH, *Development of the Film and Film Acting*.

Jan of Mabuse, see MABUSE

Jansen, Cornelius (1585-1638), a Dutch divine, founder of the school of theology known as Jansenism. He studied at Louvain and Paris, returning to Louvain as a prof in 1617. He lectured on Scripture at the Univ for nearly twenty years and was the leader of the Univ in a bitter controversy with the Jesuits. In 1626, he led a deputation to Spain to plead the cause of the Univ against the Jesuits, and was successful in getting their authorization to teach the humanities and philosophy withdrawn by the Court of Madrid

CORNELIUS JANSEN

(1626). Meanwhile he was working on his great theological treatise, the *Augustinus*, designed to restore the teachings of Augustine to their true place in Christian teaching. In 1636 on the recommendation of Philip IV, he was made bishop of Ypres in 1636 but died soon after in an epidemic in 1638. He had never had a conflict with Rome and in his last will and testament declared that he died an obedient son to that church in which I have lived to my dying hour. Two years after his death the *Augustinus* was published and it immediately appeared that J had favoured the opinions of Banez, an earlier chancellor of Louvain Univ who had taught a doctrine of grace with resemblances to Calvinism. The *Augustinus* had an immense success, and was defended by the friends of J headed by Arnauld (q.v.). For the subsequent history of his doctrine, see JANSENISM.

Jansenism. After the death of the Dutch divine Jansen in 1638 most of his works and letters were published, particularly the *Augustinus* in three vols in 1640. Although Jansen had been strongly anti-Protestant, some of his tenets resembled Calvinism, so that five of them were condemned by the Vatican in 1643. Some of Jansen's friends, especially the fathers of Port Royal, headed by Arnauld, defended these same propositions, and though in

1653 they were declared heretical, Arnauld would not give way. In 1666 he was degraded and exiled, and in 1661 his adherents were ordered to sign a renunciation of his teaching on pain of imprisonment. A truce was established in 1669, and for thirty years the Jansenists, protected by some powerful friends, maintained a precarious footing in France. In 1703 Louis XIV, under Jesuit instigation, began a fierce attack on J., and in 1713 Clement XII issued the bull *Unigenitus*, condemning the *Propositions* of Quesnel, Arnauld's successor. This decree had a very mixed reception in France, though the Catholic party provided the stronger. The leading Jansenists withdrew to Holland, where they formed a church. Jansen had intended to restore the teaching of Augustine to what he conceived to be its proper place in the church, and to prove how much it had been perverted by the schoolmen. In the first vol of the *Augustinus* he defines the distinctive tenets of the Pelagians and semi-Pelagians. The second vol assigns limits to human reason and adjusts the claims of authority with particular reference to the authoritative teaching of Augustine. Reversing the principle of the schoolmen, J affirmed that philosophy and theology were entirely unconnected with each other. Original sin is not mere imputation of sin, it is a deprivation of nature and concupiscence is a taint of sin in body and soul. The third vol treats of the Grace of Christ, and concludes with an attempt to identify the teachings of the Jesuit Molina with those of the semi-Pelagians. The fear of God and of eternal punishment cannot remove evil from the heart. Fear is a self-worth of the feeble soul, there is nothing of God in it, and later in the same context Jansen attacks the scholastic notion of attrition. The fundamental opposition of J's teaching to the Catholic Church lay in his disregarding the distinction between the natural and supernatural order. For him all supernatural gifts were not gratuitous but were simply man's due. In moral questions the Jansenists called the Jesuits laxist, while the Jesuits called their opponents 'rigorist'. In 1653 Innocent X declared various propositions of Jansen to be either heretical, irreligious, or injurious to God. Anthony Arnauld (q.v.), joining issue with the pope, argued that though the views as stated by the pope were censurable they were not to be found in Jansen's work. This reply provoked a long drawn dispute over papal infallibility, the nature of which incidentally Jansen had defended in a doctoral thesis in 1611. Among the most ardent supporters of J in France were the inmates of a nunnery, called Port Royal in the Fields, whose abbess, known later as Maria Angelica de S. Magdalena, was the sister of Arnauld. One of the most famous adherents of J was Pascal the author of the inimitable *Lettres Provinciales*, in which the casuistry of certain Jesuit fathers is brilliantly ridiculed. Louis XIV., at the instigation of the Jesuits, had the nunnery demolished. There was further persecution after the issue of the Papal

bell, *Unigenitus*, which condemned the work *Moral Observations on the New Testament* by the Jansenist, Pasquier (quinet) (q v). But persecution merely had the effect of provoking fanaticism. Marvellous cures and other miracles were attributed to Jansenists, and there arose the Convulsionaries and Flagellants. On the death of Louis XIV, indeed, J showed a bold and defiant front. The Sorbonne, which in his reign was Molinist, became Jansenist in the regency, and by the middle of the century, J was sensibly felt in the Fr Parliament, and its principles were openly professed by men of high political position. The Fr Revolution did much to weaken their hold but did not extinguish them altogether, and the influence of their teachings was felt in the Fr Church throughout the nineteenth century. To day as a separate Church they exist mainly in Holland where they are said to number about 6000. See G. Gribon, *Histoire de Jansenisme* 1700; *Dictionary of Sects, Heresies, Ecclesiastical Parties* 1874; E. Pasquier, *Le Jansenisme (étude doctrinale d'après les sources)* 1909; R. Rapin, *Histoire du Jansenisme depuis son origine jusqu'en 1644*, 1901 and N. Abercrombie, *The Origins of Jansenism* 1936.

Janssen, Cornelius (c 1510-1615) Dutch painter, b probably at Amsterdam. He came to England in 1614 and was taken into the service of James I, whose portrait he painted sev times. His chief pictures are a portrait of Sir George Villiers, father of the famous duke of Buckingham, portrait of Charles I (in Chatsworth House) and Wm Harvey (in the Royal College of Physicians).

Janssen, Peter Johann Theodor (1814-1908), Ger historical and portrait painter, b at Düsseldorf. He was awarded the gold medal in Berlin in 1893 and in 1897 became director of the academy at Düsseldorf. His chief work is 'Walther Dodge and the Peasants of Berg before the Battle of Warrington 1288'.

Janssen, Pierre Jules César (1824-1907), Fr astronomer, b in Paris. He made a study of mathematics and physics, and in 1857 went to Peru in order to determine the magnetic equator. In 1877 he was appointed director of the now astronomical observatory at Meudon, and interested himself in solar photography his results being pub in *Atlas de photographies solaires* (1904).

Janssens, Victor Honorius (1664-1739) Flemish painter, b in Brussels. He was appointed painter to the duke of Holstein, and later, in 1718, became painter to the Emperor of Germany in Vienna. Some of his pictures are 'St Roch curing the Diseased', 'The Sacrifice of Aeneas', 'Dido ordering the building of Carthage'.

Janssens van Nuyssen, Abraham (c 1567-1632), Flemish painter, pupil of Smalftink and rival of Rubens. He was a good colourist and master of chiaroscuro, his touchless scenes being especially fine. Among his best works are 'Resurrection of Lazarus', 'Descent from the Cross', and 'Ecce Homo' (Ghent), 'Entombment' (Antwerp); 'Scaldis', 'Day and Night'.

Janthana, see IANTHINA

Januarius, St., or San Gennaro (d A.D. 305) martyr and the patron saint of Naples. Legend relates that he was bishop of Benevento under Diocletian and that he suffered martyrdom, accompanied by most atrocious tortures, during that emperor's persecutions of the Christians. His body is preserved at Naples and two phials which are said to contain his blood are shown when the phenomenon of the liquefaction of the blood occurs. See *Acta sanctorum* (September), vi 761 891.

January first month of the modern year containing thirty-one days. The name is derived from the Rom. two faced god Janus, to whom it was dedicated. The Angles and Saxons called the month 'Wulfmanuth', because cold and hunger induced the wolves to enter the vills at that season. It was formally adopted by all European nations as the first month of the year in the eighteenth century.

Janus, one of the oldest of the Lat gods. His name is probably derived from the same root as *janua* a gate, although some authorities regard it as the masculine form of Dianus (Janus). He was considered 'the spirit of opening' and is generally represented with two heads which look both ways. He was invoked at the beginning of any enterprise before any other of the gods, and he was invoked as the patron of all openings both concrete, as the gates of public or private buildings, and abstract as the beginning of the day, of the month, of the year, in which capacity the fifth month of the year was dedicated to him. The only priest of his worship was the *Februarium* the king in his capacity as ruler, as head of the state, but every head of a household was in reality regarded as his flamen. His worship was probably introduced by Romulus and Numa built him an archway (erroneously called a temple) which was always kept open in times of war and shut in times of peace. See J. S. Speyer, *Le Dieu romain Janus*, 1832; Warde Fowler's *Roman Festivals*, 1904 and *Gifford Lectures*, 1910.

Jaura, native state of Malwa Central India having an area of 581 sq m. The town of the same name is situated about 20 m N of Ratlam. The state is now part of the Malwa Division officially known as Madhya Pradesh. The state produces millet, cotton, maize and popples. Pop (stat) 90,000. (tn) 21,000.

Japan, or Nippon (origin of the sun) long chain of is off the E coast of Asia, divided from the continent by the Jap Sea and washed by the Pacific Ocean on its E shores, lying between long 156° 31' E and 119° 18' W, and between lat 20° 30' N and 0° 30' N. The former Jap Empire had a total area of 263,051 sq m and a pop of 10,226,101 (census of Oct 1, 1910). J now consists only of the is which were formerly known as 'Japan Proper' by way of distinguishing between the homeland and the whole Empire including Formosa, Korea, leased and mandated ter, all of which have now been lost. The homeland, or 'Japan Proper' consists of Honshu (or Mainland) 88,919 sq

m., Hokkaido (which before 1911 included the Kurile Is. as the prov. of Chishima), 14,276 sq. m., Kyushu, 16,247, Shikoku, 9,248 and Ryukyu or Luchu Is., 920 sq. m., with a total pop. of 78,627,000 (estimated) 78,090,361 (actually registered) at Oct. 1, 1947. After J's defeat in the Second World War she was forced to surrender her other seized lands, including Manchuria (Manchukuo) with an area of 404,428 sq. m. and a pop. of 41,233,954, the Kuriles, or the 'Myriad Isles' - Formosa, or Taiwan, ceded to J. by China in 1895; the peninsula of Korea, or Chosen

1325 sq. m., and is studded with beautiful little is. Four narrow waterways connect it with the Pacific Ocean and the Sea of J., on the W. Shimonoseki Strait, on the S. Miyamoto Strait, and on the N. the straits of Yura and Naruto. On the W. shore of Kyushu lie three promontories, Nomo, Shimabara, and Kizaki, enclosing a bay on whose shores stand Nagasaki and the (pre-1945) naval port of Sasebo. On the S. of Kyushu lie the bay of Kagoshima, further N. the inlet of Wakasa-wan carrying the harbour of Isuruga, and the (pre-1945) naval port of Maizuru.

FUJI YAMA, or FUJI-SAN

E N A

(84,102 sq. m.), annexed by J. in 1910, the S. half of Sakhalin Is., called Karafuto by the Jap. (area 13,114 sq. m.) and ceded by Russia in 1905, and the Marshall, Caroline, Ladrone (excepting Guam), and Pelew Is., former Ger. possessions in the N. Pacific, which were placed under Jap. mandate under the treaty of Versailles (1919) and were renamed Nanuo, comprising a total area of 830 sq. m. with a pop. (1937) of 121,128. The coastline, which exceeds 17,000 m. is long in proportion to the area, with the exception of Honshu, and is deeply indented, especially on the E. shores. There are only two large bays on the E. coast, those of Sendai and Matsushima, but there are hundreds of smaller indentations. Further S. lie Tokyo Bay, the gulf of Sagami, and the bays of Suruga and Ise. The famous inland sea that separates Shikoku from Kyushu is one of the loveliest sheets of water in the world. It measures about

The Is. are traversed from end to end by ranges of mts., many being volcanic, some few of which are still active. The most famous mt., both for its height (12,397 ft.) and for its singular beauty of form and setting, is Fuji-yama, or Fuji-san, it lies a short distance from the great port of Yokohama in Honshu, the slopes are cultivated as far up as 1,000 ft., then moorland and forest stretch up to the summit, which is crowned with ashes and scoriae. The volcano appears to be extinct, having been dormant since 1707, but the hist. of other volcanoes forbids the people to trust wholly its present peaceful appearance. It possesses a wonderfully perfect shape, and Jap. artists have made its picture familiar by constant reproductions; eight lakes lie at the foot of Fuji-san and add greatly to the beauty of the scenery. Among the highest mts. after the Fuji range are those in the prov. of Hida and Etchui, six of these rise to 9000 ft.; they

are known as the Jap. Alps. The Nikko Mts. are another range famous for their beautiful vegetation and countless waterfalls. The highest peaks of all are Niitakayama (14,270 ft.) and Mt. Sylvia, both in Formosa. These are only a few of the multitude of ranges which exist through all the is. The mt. scenery is not rugged, but soft and beautiful; the vegetation of the hill-sides is exceedingly brilliant; the highest peaks do not carry snow all the year round. One famous mt. on the boundary of Hiuga, known as Kirishimayama (5538 ft.), is especially sacred to the Jap. because the god Ninigi descended on its E. peak and introduced the first Jap. emperor, Jimmu. Many of the volcanoes have after long intervals of silence suddenly become active, such as Bandai-san (6037 ft.) which burst into terrible activity in 1888 and destroyed utterly seven prosperous vils. and hundreds of people, or Asamayama, 90 m. S.W. of Tokyo, which was in eruption in May 1912, and caused widespread damage. The volcanic character of the country has given J. one great gift in the shape of numberless hot springs, widely reputed for their medicinal value. Though very mountainous the country has sev. extensive plains; that of Kwantō, which is very fertile, holds the cap., Tokyo, and the tn. of Yokohama. None of the rvs. are of any considerable size, though probably no country is so well watered by a network of streams and lakes. The longest riv. is the Tshikarigawa (275 m.), and one of the most important is the Tone gawa (177 m. long). Its mouth being Shimoso. The Shinano (216 m.) waters the plain of Echigo, flows into the sea of J., and is navigable for about 90 m. Most of the rvs. are short, rapid, and shallow, gaining depth when the snows are melting; they are freely used for electric purposes and whenever possible for transport. The lakes of J. are numerous. They are very beautiful, the largest being Biwa in the centre of Honshū, about 180 m. in circumference; it possesses eight views of wonderful beauty and is much loved by the Jap. Lake Suwa in Shinano is also celebrated for its beauty. The eight lakes at the foot of the slopes of Fuji-yama are popular resorts for both foreigners and Jap.

The geological basis of the is. consists of granite, syenite, and diorite, granite everywhere predominating; the granite is not always pure, e.g. in the valleys of Nikko a granite-porphyr is found with crystals, felspar, and quartz, etc. The soil is usually workable and prolific, and along the banks of the rvs. fertile and well adapted for the cultivation of rice. The climate necessarily varies in different parts of the empire owing to the long extension of the is. Its general characteristics are heat and moisture through the short, bright summer, followed by long, cold, fine winters. There are three wet seasons, the first from the middle of April to the beginning of May, the second from the middle of June to the beginning of July, and the third from Sept. to early in Oct. In the more mountainous dists. of the is. the snowfall during the winter is very deep. J. is, rather a wet country, and although

the brilliant sunshine assists in making a healthy climate, bad fogs are prevalent even during the summer. The typhoon, or great wind, is a terrible visitor, especially during Sept., though few months escape one exhibition of its force. The equivalent of nearly £3,000,000 sterling has been expended in one year for damages caused by the typhoon, including the destruction of ships, vils., roads, embankments, and bridges, etc. The is. also suffer from frequent earthquakes, accompanied by tidal waves which claim thousands of human victims. In 1923 a terrible earthquake occurred in which nearly 150,000 people were killed in Tokyo and Yokohama, and the damage done was estimated to cost about five billion yen. This was followed on May 21, 1925, by an earthquake at Kiohe in which numbers of people were killed, and shocks were also experienced in 1929 (see under EARTHQUAKE). An earthquake which, accompanied by a 7 ft. tidal wave, struck central J. and the is. of Shikoku on Dec. 21, 1946, was almost as severe as the earthquake of 1923, but the casualties were only 680 dead, and 4819 houses were destroyed.

*Flora.*—J. has a great and beautiful variety of vegetation, the colours of the foliage in spring and autumn being unsurpassed in richness and range of shades. Many Eng. gardens have gained in beauty by the brilliantly coloured shrubs brought from J. Oaks, laurels, conifers, walnuts, birch, chestnut, cypriped trees, and especially the weeping willow and maple grow freely, while everywhere the bamboo is seen growing in beautiful clumps. Among the queens of the flowering trees the plum must come first, so graceful in its growth and in its profusion of beautiful blossom and so wonderful in its richly coloured foliage. The cherry tree is even more beloved by the natives, who stand among the world's greatest and most artistic gardeners. The peach tree also blooms with amazing profusion, but all these three, the plum, the cherry, and the peach, bear only blossoms and no fruit worth mentioning. The Jap. pyrus, or pear tree, and the malus, or apple tree, have become familiar to Eng. gardeners, and are much prized for their gay colouring and cloud of blossoms; among the apple varieties the *Floribunda* is especially hardy and beautiful. The magnolia blooms in great perfection, also the azalea, chrysanthemum, peonies, iris, hydrangea, camellia, gum cistus, etc. We owe many of our most graceful and brightly coloured shrubs and flowers to Jap. gardeners. As a race they love the art of gardening, and at no time is the country devoid of blossoms of some kind. Their landscape and water-gardens are creations of beauty, and the miniature, or toy gardens, are an astonishing example of patient care and study. In fascinating little places a perfect tree such as a cedar may be a hundred years old yet dwarfed to attain only a few in. in height, though perfectly complete in its proportions. Lilies grow wild in great variety, and the lotus lily during the summer months covers the lakes and rvs. with its delicate

blooms. Ferns are found everywhere in great quantities; there are over 150 different species. The chief fruits are the orange, grape, pear, apple, loquat, peach, raspberry, and persimmon; they are, however, often rather tasteless and inclined to be tough. Vegetables are well cultivated, and many curious and palatable roots have been introduced from J. to Europe during recent years.

**Fauna.**—There are sev. kinds of wild animals. The black bear is found in Hondo and the brown bear in Yezo, the ice bear is an occasional visitor, carried down by the Arctic current. Badgers and foxes are numerous and are credited with

are a very few turtles (highly valued when caught), many tortoises, ten varieties of snakes, only one being venomous; lizards, frogs, toads, and newts are plentiful, and the giant salamander, which has been said to attain a length of 5 ft. Fish forms a very large part of the food of the Jap.; it is wonderfully plentiful both in the sea and the rivers and lakes. Among the chief are the broom, perch, mullet, mackerel, haddock, and salmon. The gold carp and the gold-fish, so prized for their beauty, are very numerous. J. is rich in beautiful insect life, the golden and the jewel beetle, and the many kinds of brilliant butterflies of tropical beauty; there are seven kinds

YOKOHAMA

Canadian Pacific

supernatural powers; monkeys abound all over the is., there are no rabbits, but hares are plentiful. Wild boars and stags, also antelopes, exist in the mountainous dists., otters and sea otters are numerous and much valued for their fur. The squirrel and the rat are very common, but there are no mice. The bird life carries a large variety, water fowl is very plentiful, wild geese, ducks, teal, and herons, especially the silver heron (beloved by Japanese artists), are seen in large numbers, also the kite, falcon, and sparrow hawk. Among the game birds the commonest are the ptarmigan, snipe, plover, quail, woodcock, and pheasant; there are two varieties of the latter, one known as the copper pheasant, being remarkable for its beautiful plumage. Eagles have been found but recently in small quantities. The crane is a sacred bird, being honoured as an emblem of longevity. Among the smaller birds the *Uguisu* comes first, a species of nightingale gifted with a very beautiful song. The cuckoo, lark, hoopoe, blue-bird, starling, wren, kingfisher, and various finches, etc., are all inhab. of the is. Among the thirty species of reptiles

of silk moths and from the cocoon of the moth *Bombyx Mori*, fishing lines are manufactured. The singing cricket and the cicada are common everywhere, also beautiful dragon flies. Spiders abound and attain gigantic proportions. In the lakes and rivers live many kinds of fresh water crabs and myriads of shrimps which are largely used for food.

The population, according to the census of Oct. 1, 1940, was 103,226,101 for the Jap. Empire and 75,114,303 for J. proper. By Aug. 1, 1917 repatriations and an increased birthrate had brought the pop. to 78,220,840. There are six ins. with a pop. of over 900,000: the cap., Tokyo (formerly Yedo) had in 1940 a pop. of 6,778,804 which by May 1947 had fallen to 4,797,230; Osaka (Honshu) 3,252,340 in 1910; Kyoto (Honshu, anc. cap.) 1,089,726; Nagoya (Honshu) 1,328,084; Yokohama (Honshu) 968,091; Kobe (Honshu) 967,234. Other important cities with 1940 pop. are: Fukuoka (Kyushu) 306,700; Yawata (Kyushu) 261,300; Kure (Honshu) 231,000; Sendai (Honshu) 220,000; Hakodate (Hokkaido) 207,000; Kagoshima (Kyushu) 182,000; Kokura

(Kynshu) 173,650, Otaru (Hokkaido) 154,000, Nikkato (Honsu) 135,000 Shimonoseki (Honsu) 133,000 Moji (Kyushu) 122,000, there are sixteen other towns with a pop of over 100,000.

Yokohama and Kobe are the chief ports and centres of foreign trade. The present pop of J consists of two distinct races the Ainus (or Ainu), and the Jap. The Ainu are probably the original race of the nation in Honshu. Evidence of another primitive people has been found so called pit dwellers who dug pits in the earth and roofed them over to live in. The Jap of the present day do not differ physically very much from the Korean and Chinese. The main part of the race is short of stature and very muscular but many types are distinguishable, the most important being an element of the Malay then follow the Manchukuo type the Mongol and lastly the Ainu. In the S. the people are more refined in appearance and the women (according to W. H. Hensley) are frequently beautiful while further N the tendency to prominent cheekbones and flat noses becomes more obvious. They are straight haired and usually very dark. As a race they are an exceedingly happy light hearted people. Children occupy an important place in every family. J has been called rightly the paradise of children. The present condition of women is based upon the principle of equality of sexes. As a wife and mother the Jap woman enjoys a position of freedom and respect. If single she may and often does, adopt children and becomes 'house head' of her legal family. The general character of the Jap woman is especially worthy of mention. They are unselfish, modest, kind hearted and patient, obedient as daughters faithful as wives, and devoted as mothers. Both men and women are by nature frugal and industrious and share in a passionate love of their country.

**Religion**—There is absolute religious freedom in J. The original religion of J is Shinto (the divine way) a mixture of nature worship and ancestor worship. It regards human people as naturally virtuous being descended from the gods and assumes that an individual's conscience is his true guide. The dead are ghosts inhabiting a world of darkness with the power of bringing sorrow or joy into the lives of the living. There are numerous gods and goddesses with very beautiful and charming legends attached to them. The prime divinity is Amaterasu the goddess of the sun. Her shrine at Ise is visited by crowds of pilgrims. There appears to be no definite idea of what kind of life continues after death, but the cult expects natural purity of life without promises of reward. Buddhism reached J. (552 A.D.) through Korea and the two religions became so intermixed it was difficult to disentangle them. Buddhism however, gradually absorbed the greater part of Shinto, though divided into various sects. In 1940 there were 3081 Christian preachers in J, and 2104 Christian churches belonging to various denominations. The Roman Catholic Church was recognised in

1941. Until the outbreak of war in that year there were 7 Brit and Jap and 3 Amer Protestant Episcopal bishops. The Jap usually adapt whatever creed they follow to their own requirements.

**Industries**—The industrial progress of the country made rapid strides up to the outbreak of war (1941). Labour is always cheap and plentiful. Machinery had been largely introduced. The principal manufactures are silk and cotton woven goods, cotton yarn, lacquered ware, chemicals and fertilisers, matches, earthenware, straw hats, matting, glass, cement, leatherware, brushes, woollen fabrics, knitted goods, porcelain, rubber goods, soap, vegetable oil, tools, bamboo ware, etc. Since the war the output of many of the chief manufactures has increased enormously. Before the First World War sugar refining was a growing industry. Before 1941 J had the most advanced industries such as mining, lacquer, and porcelain remained unchanged. The country produces enough coal for its own use. Lignite 37,700,000 metric tons in 1935. The production of iron is insufficient and was supplemented from China and Korea before the war. Gold is found and has been worked but not in great quantities. In 1935 the output was 22,198,000 grammes. Copper occurs in larger quantities and is a fairly valuable asset. The output in 1936 was 77,973,000 kilogrammes. The zinc output in 1936 was 39,066,000 kilograms. Non-ferrous metals 1,751,000 metric tons. Lead 8,883,000 kilograms. Pig iron 33,000 metric tons and steel 291,000 metric tons. Seventy per cent of the whole area is covered with forest. The forest area in 1935 was 1,531,000 ac. of which 19,000,000 ac. belonged to the State and some 3,000,000 ac. to the Imperial Household. From these forests a quantity of good timber is obtained. Large quantities of bamboo furnish material for building, ornamental work, and tools etc. The forests contain also cryptomeria japonica, Z. kowa, kiku, Pinus massoniana and Lawsonia imperialis which is used for fancy boxes, etc. Another smaller industry furnished by the forests is the cultivation of mushrooms. These are dried and exported to China and India. Camellia is another valuable gift from the forests though the industry is now chiefly in Manchuria where large camellia forests are found. The fishing industry is of very great importance. The value of it to the country annually naturally varies but roughly it has reached 227,292,000 yen for raw marine produce and 181,204,000 yen for manufactured. The industry of salt refining is of some importance.

**Agriculture**—Over 40 per cent of the pop are engaged in agriculture. It is J's most important industry but, owing to the mountainous nature of the country, not more than one sixth of its area is available for cultivation. Small holdings are the general rule, rarely exceeding 8 ac. (that is before 1941) but the break up of the large estates by the Amer in 1945-46 may have the effect of increasing the acreage of small holdings. The soil is not particularly fertile, and hard work and

hard living have made the rich rice fields what they are. Rice is, of course, the chief crop; it forms the prin. food of the people, and is also the basis of the national drink, *saki*. It is a summer crop, harvested in Sept.; the fields are flooded while the grain is young and then drained. The following are the chief products, the area under cultivation, and the production in metric tons, for 1938: rice, 3,248,000 hectares (9,633,000 metric tons); wheat, 731,000 hectares (1,388,000 metric tons); barley, 361,000 hectares (778,000 metric tons); rye, 418,000 hectares (782,000 metric tons); tobacco, 35,200 hectares (64,000 metric tons); and tea, 40,500 hectares (55,000 metric tons). Other important crops are millet, small red beans, buckwheat, rape seed, potato, sweet potatoes, indigo, hemp, sugar-cane, and peppermint, etc. The paper mulberry is extensively grown, its fibrous tissue being the chief material used for Jap. paper. Barley is grown with particular care as it provides the material for straw-plats, which is an important manuf. Stock-breeding is not extensive, pastureland being scarce. The growing liking for beef among the people before 1941 diminished the indigenous cat, but various foreign breeds were imported. Sheep and pigs were on the increase but the natives prefer beef. Goats are kept for their milk. The rearing of silk-worms is a very important asset to the small farmer. Jap. silk has long been famous. The chief silk-producing prefectures are Nagano, Gumma, Yamanashi, Fukushima, Aichi, and Saitama; thousands of families are engaged in its production and manuf. In 1940 the total number of cocoons obtained was 43,868,000 kwan, valued at 500,499,000 yen. The total raw silk produced in 1937 was 41,875 metric tons. The production of rayon in 1938 was 19,876,000 lbs. and exports of rayon yarn in 1938 were 21,984,000 lbs. valued at 17,845,000 yen.

**Railways and communications.**—Railways made rapid strides before the Second World War. There are now 15,254 m. of railroad, chiefly owned by the State. The first line ran between Yokohama and Tokyo, opened in 1872. After the war with Russia in 1901 the State nationalised the railways, and the growth and perfection of the system was still in evolution up to the war. It was decided, before the war, to make the standard gauge 4 ft. 8½ in. The work was expected to be completed in 1943, at a cost of 1108 million yen. Comprehensive plans were also made for the electrification of the State railways. The postal service is modelled on W. lines, and J. became a member of the international postal union in 1877. In 1938, 4,763,778,000 letters, postcards and newspapers and periodicals were sent and 80,520,000 parcels. There were 14,331 telegraph and post offices in 1938. Telegraphic communication commenced in 1867; much trouble occurred with the more ignorant section of the public who persisted in believing it was an evil thing. In 1884 J. joined the telegraphic union, and in 1938, 78,992,000 telegrams were sent. The telephone was adopted in

1877, a year after it was invented. Before the war there were 981,936 subscribers and 83,641 line m. Roads in J. are divided into three classes: state roads, prefectural roads, and vil. roads. They are generally well kept, and the gov. gave an ann. grant for assisting their upkeep and improvement. The first electric tramway was constructed in Kyoto in 1895. Before the war there were sev. electric railways and tramways running in the larger cities. Drainage improved rapidly, the usual W. methods of street scavenging being employed in all the tns. and cities. Cremation is encouraged with much success, and crematoria have been estab. in Tokyo and Osaka; other like places have been arranged all over the empire.

**Five Year Plan for Japan.**—Evidence of J.'s determination to restore her shattered economy was afforded by a five-year plan for national rehabilitation pub. in Sept. 1946 by the National Land Bureau of the ministry of the interior. The plan envisages the redistribution within J.'s reduced ter of a pop. estimated to reach 80,000,000 by 1950, the greater production of foodstuffs, the reorganisation and redistribution of industries, the reduction in the number of unemployed and the restoration of devastated cities. Of the estimated working pop. of 38,000,000, some 18½ million are to be engaged in agriculture and forestry, 600,000 in fishery, 6,300,000 in industry (making a reduction of 3,000,000 compared with the war years), 7,100,000 on building and road-making, and 5,000,000 in commerce. This leaves 2½ million unemployed, but they are expected to be absorbed as reconstruction progresses. J.'s urb. pop. is not to exceed 30,000,000. The remaining 50,000,000 are to be restricted to the farming, fishing, and mining vils. To support this pop. 27,000,000 koku of rice will be required on the basis of an ann. consumption of 1.08 koku per capita (one koku equals about 5 bushels). J.'s cultivated area, which in 1911 was about 6,000,000 chobu (one chobu equals 2½ acs.), is to be increased to 7,500,000 chobu by 1950. The land then under cultivation should produce 70,000,000 koku of rice, leaving 17,000,000 to be imported. No permanent industrial plan could be made pending the decision of the Allies on reparations and on the amount of industrial production to be permitted.

**Constitution and government.**—From the accession of the Emperor Jimmu in 660 B.C. until 1889, the country was ruled by an absolute monarchy, but in 1889 the emperor, after much study of the gov. of other countries, gave J. its pre-1945 (or Meiji) constitution. The emperor, called by foreigners the 'Mikado,' and by his subjects 'Tenno,' then possessed the rights of sovereignty and had executive power. He was assisted by Cabinet ministers chosen by himself. He was also advised on important state matters by a privy council, and exercised legislative power with the consent of the Imperial Diet, which consisted of two Houses, House of Peers and House of Representatives. The House of Peers consisted of

(1) male members of the Imperial family of full age, (2) princes and marquises over 30 years of age, (3) counts, viscounts and barons over 30 years of age, (4) persons over 30 years of age nominated by the emperor for meritorious services and erudition, (5) members of the Imperial Academy of Sciences and (6) representatives of the highest taxpayers nominated by their own class. General manhood suffrage came into force in 1925, under which, in principle, all male subjects over 25 years of age are electors, and those over 30 years are eligible for election. By a subsequent law, the number of the House of Representatives was fixed at 466. The 'Meiji Constitution' was superseded in 1946 by a new draft Constitution much more in harmony with the concepts of W. democracy. (See below under *History*.—*Japan's new epoch*.) Women suffrage had not come into being in J. before the war, but women were taking an increasing interest in social work and politics. Voting is by secret ballot. For local gov., J. is divided into prefectures, which are subdivided into municipalities. Modern jurisdiction has been introduced. There were (1941) 51 prisons and 104 detached prisons. The courts of justice are classed as: dist. courts, local courts, courts of appeal, and the court of cassation or supreme court.

**Commerce.**—Immediately before the Second World War J's shipping industry was well on the increase. Her exports grew in bulk annually, having increased fourfold in the last few years preceding 1941. The chief were silk, cotton, grain, and seeds, tea, and marine products, etc. The United States and China took the bulk of these, followed by Britain, while India bought two-thirds of the raw cotton. The export programme for 1946 permitted by the Supreme Allied Commander was to the value of 200,000,000 dollars, or about 25 per cent of the value of exports in the years 1934-1939. The chief imports were raw cotton from India, U.S.A., Egypt, and China; wheat from Canada, Australia, and U.S.A.; wool from Australia; rubber from Brit. Malaya; oil-cake from Kwantung Prov. and China; lumber from U.S.A., and piece goods, woollens, drugs, metals, rails, machinery, fertilizers, locomotives, etc. from the U.S.A. and Europe. Sugar is mainly imported from the Dutch E. Indies, Formosa and the Philippines; kerosene from America and the Dutch E. Indies, beans, peas, and pulse from China and Korea and rice from India, Fr. Indo-China, Korea, Thailand, and China. The chief exports are silk, cotton fabrics, cotton yarns, tea, knitted goods, camphor, straw plait, refined sugar, coal, porcelain, matches, earthenware, paper, glass and toys. The number of sailing ships engaged in trade before the war was 15,686 and the number of mercantile steamers was about 3600. Yokohama is the prin. commercial port, Kobe comes next in importance, then Osaka and Moji, among other ports are Shimonoseki, Tsunaga, Otaru, and Nagasaki (the last-named largely destroyed in the war).

**Education.**—Elementary education is free and compulsory for children from six to fourteen years of age. There were before the Second World War 25,840 elementary schools and a considerable number of high schools, army and navy schools, and departmental schools, which included the study of communications, marine industry, agriculture, and commerce. There are over 12,000,000 children in the elementary schools. High schools are also State-aided, and prepare for a three years' course at the Univs. There are high schools for girls, whose education is nearly as well looked after as that of the boys. There are also local

A STREET IN KYOTO

schools and private schools of general instruction, and higher schools and certain colleges for girls, both technical and industrial. There are kindergarten schools for the little children of three years of age, but these are not compulsory or part of the national system. There are six State Univs.—Tokyo (2), Kyoto, Tohoku (at Sendai), Hokkaido and Kiushu (at Fukuoka), besides five medical univs.

**Army.**—From the twelfth century till the great revolution of the middle of the nineteenth century the fighting power was restricted to a hereditary military caste, the *samurai* or *bushi*, whose list, rise, and fall, is sketched in the section *History* below. Their weapons were the bow, the single-edged curved sword, and spear. The armour was of a special type which lasted unchanged till 1871. A combination of metal plates and scales sewn on leather, often highly decorated with elaborate embroidery, damascening, etc., it hung like a loose screen over the body of the wearer rendering him in appearance bulky and unwieldy. The *samurai* served as feudal retainers of the great families. Finally the great Taira and Minamoto families predominated, and on the fall of the former the Minamotos became the chief military power. The abolition of the *samurai*, the introduction of firearms,

following on the disasters of foreign interference, brought about a remodelling of the citizen (*heimin*, commoner) army on W. lines. Partly attacked in 1862, the problem was solved in various stages, with military schools, with three years' service with the colours, and four in the reserve, and organisation in military dists. By 1876 the army on a war footing reached nearly 50,000, and in 1877 successfully met the Satsuma rebellion and defeated the old samurai. The evolution of the army progressed rapidly, and the Sino-Jap. War tested the capacities of the new force; in the Jap. expedition to Peking in 1900 valuable lessons were learned. The Russian War saw 800,000 troops in the field. Improvements followed, and by the Imperial ordinance of 1909 the military forces were to consist of the Active Army, liable to serve abroad, and the National Army, both in the reserves. There were militia forces in some of the is. Service was compulsory from seventeen till twenty. Two years' service in the active army, 'geni-ki,' was compulsory for the absolutely fit, five years four months in the reserve, 'yoti,' ten years in the second 'hon,' 'ohi,' and two years eight months in the home defence, 'kokumin.' The normal strength of the active army before the Second World War was 15,000 officers and 242,000 other ranks. The air personnel for the army numbered in 1938, 10,200 organised in 21 pursuit squadrons, 12 reconnaissance squadrons, 12 bombing squadrons and a balloon corps. The number of aeroplanes in service was 1500. For the war with China 7 classes of reserves were called up in 1938, giving the army a strength of 850,000 after making up losses. During the 1939 campaign more than 16 divs. (over 300,000 men) were engaged in S. China. The Jap. is. were divided into military dists. corresponding to the divs. of the army, and the dist. was the unit of administration as well as of territorial command. There were normally 17 divs., 4 independent cavalry brigades, 2 independent regiments of mt. artillery, and 8 regiments of heavy field artillery. The military budget for 1941-42 amounted to 1,387,000,000 yen, exclusive of sev. appropriations for the war with China.

**Navy.**—In the early days, as we know from the dread of foreign invasion and the wars with Korea and Kublai Khan, J.'s navy was insignificant. In 1635 the policy of isolation led the Tokugawa gov. to forbid the building of any vessel capable of crossing the ocean, and the foreign aggression of the middle nineteenth century showed J. defenceless before foreign sea-power. The nucleus of the navy was formed with a gift of two war vessels from the Dutch and Queen Victoria, and two purchased from the Dutch. Gradually a small force was organised, trained by Brit. officers under Sir Archibald Douglas. The fleet played a part in the Satsuma rebellion, and later J. began herself to build. Her first ironclad was built in England, 1878. At the opening of the war with China, the navy consisted of 28 vessels,

and 29 torpedo-boats; there were no battleships, while the Chinese possessed two powerful armoured ships of the line. The naval victories resulted in immediate building on a large scale, chiefly in Europe, and the Russian War saw her with 6 battleships, 8 armoured cruisers, 44 other cruisers, and 100 destroyers and torpedo-boats. The crushing defeats of the Russian navy off Port Arthur, Togo's victory in the straits of Tsushima and the part the navy played in the First World War have proved the naval power of J. in the Pacific. The statistics for 1940 gave 10 battleships, 7 aircraft carriers, 35 cruisers, 5 coast defence ships, 103 destroyers, 12 torpedo boats and 65 submarines. Under the London Treaty, which precluded the replacement of cap. ships from 1931 to 1936, the then existing ships were to be modernised and by 1941, the existing cap. ships had mostly been modernised. Great secrecy had been practised concerning programmes of construction, with the result that little was known about the bigger warships being built immediately before the outbreak of the Second World War; but probably some 5 or 6 battleships of about 45,000 tons, armed with 16-inch guns were in hand in 1941. Four armoured ships of 15,000 tons with 12-in. guns were also under construction. Two large aircraft carriers, sev. cruisers, and a large number of destroyers and submarines were also being completed. The active personnel numbered 107,000. The gross amount of the naval estimates for 1941-42 was 1241 million yen.

**Finance.**—The ordinary revenue for the year 1944-45 was 14,083,000,000 yen and the extraordinary 36,884,000,000 yen; ordinary expenditure, 20,173,000,000 yen, extraordinary, 30,794,000,000 yen; total revenue and expenditure balanced at 50,967,000,000 yen. The internal debt (as at Feb. 28, 1944) was: Consolidated, 72,856,000,000 yen; floating, 1,909,000,000 yen; total, 74,765,000,000 yen. The external debt (March 31, 1943) was stated at 1,222,000,000 yen (the exchange value of the yen in London in 1941 averaged 1s. 2½d.). Prin. sources of the revenue before the war were income tax, land tax, liquor tax, business tax, sugar excise, and tax on consumption of textile fabrics. J. was a protected country and collected a large revenue from customs. In 1939, her imports amounted to 2,917,000,000 yen, and her exports to 3,576,000,000 yen.

**Dress, customs, etc.**—The costume of the country is picturesque and distinctive, though fast becoming Europeanised. The men wear a silk or cotton shirt with an under jacket in the winter, and a wadded outside gown (*kumomo*) or perhaps two in the coldest weather; a narrow sash is worn round the waist, and for ceremonial purposes wide trousers and a stiff coat are used; these clothes are usually made of silk, and are often in beautiful colours with handsome embroideries; the head is usually bare, though occasionally a large straw hat is used; socks and sandals cover the feet, and wooden clogs are worn in the wet weather. The women wear a silk

shirt and a *kimono*, kept in place by a narrow belt over which is worn the big sash or *obi*. The materials are usually costly and beautifully embroidered and are handed down from mother to daughter. Their hair is very carefully dressed and piled with combs and flowers. The children are gaily dressed in the same fashion as their parents. The chief food of the country is rice, and this is served at all three meals, cooked in various ways with fish, eggs, vegetables, and many kinds of pickles. Soups made of fish, vegetables, or chestnuts are popular. Chopsticks are used instead of knives and forks. The drink called *saki* made from fermented rice is a favourite beverage; large quantities of tea are drunk, and the ceremonies attending tea-parties, etc., are both ancient and interesting. The tea-ceremony is believed to have been introduced into J. from China, A.D. 805, and the drinking of tea appears to have started as a more or less religious institution among the Buddhist priests; about 1330 it was adopted by the Daimyos and wealthy nobles. At their famous tea-parties each guest had to guess where the tea they drank had been produced, and if they guessed right they were given one of the valuable presents which adorned the room where they were entertained. These gifts, often rare and beautiful, would afterwards be presented to the singing and dancing girls who entertained the tea-party. It became an exaggerated craze among the upper classes, and was carried to such an extraordinary length that even large fortunes were dissipated. The tea is made in many forms; in one, the leaves are reduced to a powder and the liquid appears as thick as soup; another thinner mixture is known as *usu-cha*. The drinking of tea is even to-day always formal and ceremonious, and each action and gesture is arranged by a code of rules. The usual method of getting about the tns. is in a *jinrikisha*, or little cart pulled by a man, who charges so much a m. Every one, men, women and children, bathes frequently, some sev. times a day. In the winter the hot baths help to keep the people warm, especially the children, who are accustomed to being bathed sometimes five or six times in one day. In Tokyo there are over 800 public baths. The geisha or singing girls are a class well known to the European both in literature and drama. They are usually apprenticed in their seventh year and can rarely reach independence unless they marry. At one time few Jap. social gatherings would have been considered complete without these pleasing entertainers, but the custom is now dying out under the influence of modern W. styles of entertainment.

**Language and Literature.**—With the exception of that of the Luchu Is., no other language claims relationship to the Jap. Some authorities include it in the 'Altaic group'; it is an agglutinative tongue. Many Chinese words are employed, especially for new words, such as 'bicycle.' It is exceedingly difficult to learn, and a great deal of Chinese must be understood as well. There are practically

three languages to learn, the ordinary, the polite, and the written, which all differ in an extraordinary degree. The literature of the country is frequently written in Chinese, and until the Chinese ideographs were known by the Jap. there was no written literature. Illiteracy is only ten per cent of the nation in J. proper. Eng. is the language of commerce and is compulsory in the high schools.

The earliest book we know of is the *Koiki* (Record of Anct. Matters), A.D. 712. It contains a story of the creation and the heavenly birth of the Jap. race, with a list of some of the early emperors, with sev. songs included; much of it is dull and crude. The next book, written A.D. 720, is the *Nihongi* (Chronicles of J.). It was written entirely in Chinese, and from that time most of the literature was pub. in Chinese. Another book about A.D. 760, is called the *Manyoshu*, or *Collection of the Myriad Leaves*, an anthology of the anct. poems. There are sev. lists, notably the *Nihon Gurashi*, a few law books, and a great deal of poetry. The classical romances are exceedingly charming, such as the fairy story entitled *Takatori Monogatari*, etc. Among the diaries is one called *Murasaki Shikibu Niki*, written by a Jap. authoress, and very difficult to read. Women have always largely influenced the literature of the country, and have added many works of merit and charm. During the time of peace under the rule of the Tokugawa Shoguns, philosophy was much studied, while popular romances and drama became common. They were, however, mainly influenced by the Chinese, and were often extravagant and horrible, but not a few were realistic and humorous. After the Restoration an enormous quantity of Eng. and Fr. works were trans. and pub., naturally influencing the literature of the time. Of the modern authors there are four who should be mentioned: Robun Koda, Futabai Hasegawa, Ogai Mori, a surgeon-general, and Ichijo Higuchi who borders on genius in her life-like tales; she died very young; her stories were filled with charm and true to real life.

Later writers of the twentieth century who may be mentioned are Mushakji, Arishima, Shiga, Nagayo, Nogami, and Nakajo; the naturalistic writers Oguri Tayo, Kosura Tagai, Yanagawa Shunyo, and Ozaki Koyo and Koyo and Kunikida Doppo (d. 1908), Tosan Masamune, Shimamura, Shinazaki, Iwana, and Tokida, who are all writers of the naturalistic school. There were, before the Second World War, sev. newspapers and journals, and some Jap. newspapers printed in Eng. Yokohama produced the first daily paper, 1871, also the first Eng. jour., *The Japan Mail*, 1866. The Jap. Press was unfortunately hampered by vigorous censorship. The No plays are the classical drama of J. Historical dramas and comedies of contemporary life are the most popular, and many European works have been trans. and adapted. Tsubouchi is a twentieth century dramatist of repute. For greater detail see DRAMA. Jap. music is at present in its infancy, and to the ears of Europeans seems neither pleasant nor melodious.

**Art.**—The architecture of the country has never attained the great or grand; small things are made perfectly in J., but not so often very large things. Quaint grace and wonderful curves may be met, but no wonderfully proportioned and impressive building greets the stranger; no domes or minarets, or massive structures, but lightly-built houses and temples of wood and thatch, or sometimes tiled roofs. Walls are scarce, the slides and diva, of houses being of opaque paper screens, replaced in winter by wooden doors that slide into their places. Even the great temples are composed of wood and uniting, the wood carving being wonderful and beautiful. The view of a tu. from a height appears extraordinarily flat and uniform, only an occasional pagoda rearing its beautiful head among the trees. The Jap. architect excels in beautiful detail. In rebuilding the cities that were destroyed by earthquakes J. is following, to a considerable extent, the W. form of architecture. The few concrete buildings that have been in existence in J. for some time have withstood shocks fairly well.

Jap. art is essentially realistic, almost impressionist. Studies from nature are perfect and accurate. The art of painting has existed in J. for twelve centuries. Since 1897, when national treasures became protected, and reproductions were pub., the real art of the nation has become better known. The oldest painting of whose existence we know is a mural decoration in the hall of the temple of Horyu, near Nara, attributed to a Korean priest named Doncho about the sixth century. It clearly shows the colouring and construction of a late example of Buddhist art. The first famous native artist of whom we know was a noble named Kos-no-Kansoka, at the court of the Emperor Seiwa, about A.D. 850; very few of his works have survived, and those that have are chiefly conventional in design, but most perfect in their blending of colours. His descendants who continued to the close of the fifteenth century were famous artists, and founded the native school of Wagwa-ryu; the followers of this particular branch of painting delighted in quaint animals and insects, such as grasshoppers, frogs, butterflies, and hobgoblins, etc., which they represented with extraordinary charm and vitality. During the fifteenth century two Buddhist priests became very famous, (ho Denshu and Josetsu. The former painted religious subjects, and the latter landscapes and figures. A little later came Kano Masa sobu, probably a follower of the Tosa or Yamato-ryu school and believed to be the pupil of Josetsu, who also instructed Shubun and Sesshu. These three became the leaders of three famous schools of painting. The Kano school has outlived the other two: it is still followed to-day, with its generous breadth of idea, its extreme simplicity, and its brilliant colour schemes.

A new development of art began with Hishikawa Moronobu (d. 1713): his pictures are filled with delicate work; he gave J. her first beautiful wood-engravings

and illustrated books. About 1775 Okyo became famous for his representations of animal life. Following the Kano school came Ogata Korin (d. 1718), a man who left his eccentric and vivid influence on the works of his many pupils; he also excelled in lacquer work. The year 1889 saw the last of the old schools; Kyosai, whose favourite themes were ghosts and skeletons, ended the anct. traditions. The W. style of painting is gaining influence in J. but so far no Jap. artist painting in this style has produced any work of outstanding merit.

Sculpture and carving in metal and wood have been a highly developed art in J. for twelve centuries; many of the temples are store-houses of fine examples, going back as far as the sixth century. Sacred images were not the only subjects for the glyptic art, bells, vases, candlesticks, lanterns, arms, and armour, all being objects for the artist's skill. Stone was never used to any extent, but bronze, ivory, and wood have always been employed from the earliest times. The most perfect anct. bronze is the image of Bhaisia diyaguru in the temple at Nara. One of the most famous of the country's sculptors was Hidari Jingoro (d. 1634). Some of his chief works were the gateway of the temple at Kyoto and the decorations of the mausoleum of Iyeyasu at Nikko. The elaborate metalwork of the sword hilts, when every noble and samurai carried a sword, was for over 400 years a wonderful work of art. Whole families became sword sculptors, and many of these were held in great esteem, while the swords themselves were handed down as family heirlooms. The art of inlaying with gold and silver became highly developed at a very early time. A great deal of their bronze work is very fine; one particular kind which colours to a golden yellow is remarkable to a degree, and the Jap. have excelled in this particular branch of metalwork. The common domestic flower vases, alcove ornaments, and incense burners are often of exceeding beauty of design and workmanship. The great Bronze Buddha at Nara, and the huge Amida at Kama-Kura, are a proof of their early skill in casting large objects. Another branch of art grew quickly with the use of tobacco, and this was the carving of *netuke*, or buttons employed to suspend the tobacco pouch from the girdle, also the bowl of the pipe and the pouch clasps. Following the *netuke* came the *okimono*, little ornaments, wonderful copies of crayfish, dragons, eagles, birds, and the like: some were of large size, but many of the most perfect are tiny little productions to delight either an artist or a child. Wood-carving has, from very anct. days, been one of J.'s greatest arts. The temples bear the records of centuries of exquisite work, but seldom the names of the artists. The smaller wooden figures of the Buddha, familiar to the European, gilded and carved with such placid faces, in folded drapery, with lotus petals carved for their canopy, are graceful examples of the work of the Jap. wood-carver. The art of the wood-cut was introduced into J. from China, and

was used for the printing of texts and pictures. The name of Hokusai Nakajima Tet-Sujiro (d. 1849) is well-known in this field; his thirty-six views of Mt. Fuji are of remarkable beauty. He illustrated numberless books, and represented both animal and vegetable life with accuracy and vividness. He was followed by Hiroshige (1797-1858), who depicted every aspect of his country in numerous sets of prints.

The art of lacquering was a gift from China at the beginning of the sixth century. Plain black lacquer was the first achievement, later mother-of-pearl and

feather, or feature makes their productions anything but impressionist. Their whole art, just as the real national character, stands out for perfection in one main object and disregard of all superfluities.

*History.*—The racial origin of the Jap. people is still a matter of dispute. The anct. chronicles of the country tell that the god Ninigi descended on an E. peak of the mt. Kirishimayama, on the Is. Kyushu, as the forerunner of their first emperor named Jimmu, about 660 B.C. Before this date they have no written hist. The Ainu, or Ainos, appear to have

ONE OF THE FAMOUS VIEWS OF MOUNT FUJI BY HOKUSAI

gold dust decorated the work, followed by conventional patterns, and still later by floral designs of great beauty. The interior of the temples and castles were adorned with the most elaborate lacquer work. In all the finer examples of this art gold predominates, and the effect is rich and soft. Enamelling is another development of the modern Jap. artist. Today vases, bowls, censers, etc. can be obtained in the finest cloisonné enamel work. The translucent enamels are wonderfully decorative, both in delicate design and exquisite colouring.

According to a survey carried out by Allied H.Q. only 38 of J.'s 5703 greatest national art objects were damaged or destroyed by air raids during the Second World War. Jap. art must always appear different from the art of other countries; in one sense it is impressionist by reason of its choice of subjects and want of detailed background; yet in another sense the perfect painting of every petal,

been the inhabs. of J. when the present people migrated from the adjacent continent, though which part they came from is not proved. The Ainu came from Siberia, and they appear to have found a primitive aboriginal tribe who dwelt in pits and who had been (if they were not then) cannibals. The Ainu drove these people N. and estab. themselves on the main part of the is., but there are not many left now. They were formerly a fierce race, but centuries of oppression have reduced them to degeneracy (see also *AINU*).

Of the coming of the Jap. and the first fierce fights for supremacy very little can be written. The real known hist. begins with the Emperor Jimmu Jemmu; the date ascribed to his accession is 660 B.C., but it was probably later; from him all the emperors of J. are descended. In A.D. 200 a warrior empress called Jingo invaded Korea, crossing from J. with a large fleet and successfully subduing a part of Korea. About A.D. 500 the inhab.

became properly one nation, a mixture of Ainu, Mongol, and Malay, ruled by one emperor. Down to 670 the records are so vague and steeped in legend that it is impossible to say accurately what occurred. About 670 the noble family of Fujiwara became prominent. They governed as agents of the emperor, spending his revenues and oppressing the people. It became customary for the empress to be chosen from their daughters; thus the early training of the royal children became one of the privileges of this powerful house which, in fact, though not in name, ruled the empire. They gave J. many scholars and statesmen, but being without soldiers or money, except for the imperial revenues, they were gradually ousted by the warrior families of Taira and Minamoto. These two families were at constant war with each other. The Taira were finally exterminated by the Minamoto, about A.D. 1180. For some years after this Yoritomo, the chief of the Minamoto, ruled the empire under the title of Sei-i-tai Shogun. He was merely a sacred personage during this time, and accordingly worshipped and flattered and given all he could desire, but without power. Yoritomo died in 1199, and the family of Hojo, who acted to the Shoguns in the same capacity that the Fujiwara had acted to the Imperial family, became the most powerful. The emperor of China, Kublai Khan, demanded that J. should recognise his suzerainty (1260); on their refusal a large fleet was sent which was destroyed off the coast of Kyushu in 1281, leaving J. free. The Hojo family became enfeebled by their luxury and indolence and an organised revolt succeeded in driving it out and restoring power to the Emperor (Go-Daigo, 1331, who, however, was obliged to abdicate, and fled to the S., pursued by the soldiers of Ashikaga Takauji. Much trouble and petty warfare ensued, and another branch of the Imperial family supplied a sovereign; the Ashikaga family held the Shogunate till 1565. But these internal struggles reduced the country to a wretched condition—aggravated by the rapacity of the great fortified monasteries of the Buddhist monks.

From 1565-1600 only the strongest warriors could hold any real power, and thus it came about that a low-born groom became the first man in the empire. This man, named Hideyoshi, was noted for his ugliness, his quick wit, and his courage. He is one of the national heroes of J., and artist and author have given him undying fame. One other man, Ieyasu, a common soldier, a rising young member of the Tokugawa family became powerful at the same time. These two men came to an agreement and between them overcame the remaining great warrior families. On the death of Hideyoshi, Ieyasu fought for the supremacy and finally gained it in the great battle of Sekigahara. Afterwards he claimed the title of Shogun, and thus founded the line of Tokugawa Shoguns, who ruled till 1868. Kyoto had formerly been the cap. but Ieyasu substituted Yedo. The military families

(known as Samurai) were now subject to the closest inspection; their estates and incomes were assessed by the Shogun's officials. The Daimyo or feudal chief generally held a castle occupying a commanding position. At this period the right of wearing a sword was the highest privilege, wealth was of little consideration, honour, courage, loyalty, and filial piety ranking first in the code of ethics followed by the Samurai. The relations of the Daimyo to the Samurai corresponded to those of the medieval European baron, knight, and squire. Ieyasu established a military rule of the empire. He stands among the greatest of J.'s statesmen, and his system of gov. assisted greatly to increase the wealth of the country.

Under the early rule of the Tokugawa Shoguns foreigners were welcomed and regular intercourse between Jap. and Europeans began in the sixteenth century. Commercial interest had commenced with the Portuguese about 1542, from whom the Jap. bought arquebuses.

The Rom. Catholic Church now sent a missionary expedition of Jesuits, headed by Francis Xavier, to J. The Jesuits were well received and made good progress with their converts, but their zeal and energy led at last to their being denounced as agitators. Some Franciscans arrived and quarrelled with the Jesuits, and following this the Dutch commenced trading with J.; they, being rigid Protestants were naturally unfriendly with both Sp. and Portuguese. The Jap., amazed at the unedifying spectacle of all the Europeans quarrelling violently among themselves, became alarmed, the creeds of the foreigners appearing to them merciless and fanatical. Therefore the simplest method of curing this condition was applied: the Spaniards were expelled in 1621, the Portuguese in 1639, and the native converts who refused to give up this foreign creed were exterminated. The final tragedy of these ill-fated persons took place at the castle of Hara, known as the revolt of the Shimabara. The Dutch traders were not expelled, but were subjected to severe and humiliating restrictions. No general dealings with foreigners were allowed. Ocean-going ships were no longer permitted to be built. The first Eng. man to reach J. was one Wm. Adams (d. 1620). He was pilot on a Dutch trading vessel, and stress of weather drove the ship *Charity* to the is. of Kyushu. He was summoned to Osaka, and Ieyasu, appreciating his knowledge of ship-building and ships, refused to allow him to return home. He was presented with an estate at Hemu near Yokosuka, married a Jap. wife, and became known and beloved as Anjin Sama. His memory is preserved by the name of a street in Yedo and an anniversary festival on June 15.

The country now enjoyed years of peace and increasing prosperity, and the Tokugawa Shoguns, following up the policy of Ieyasu, succeeded each other undisturbed. Slowly but inevitably, however, the more intellectual classes began to regard the absolute power of the Shoguns as reactionary and tyrannical. In

1853 the United States sent Commodore Perry with four ships of war to open diplomatic relations; a Russian ship arrived in the same year on the same errand. J now woke up to the folly of having isolated herself from the progress of other countries. Commodore Perry made his proposal and sailed away, purposing to return in a few months. J wildly flung all her energies into feverish attempts to build forts, collect troops, and build ocean going ships once more. Ultimately they agreed to Commodore Perry's demands for Amer. trade and safety for shipwrecked sailors. Perry showed them a model telegraph and a model railway, which delighted and amazed the Jap. The coming of Perry and the subsequent awakening of the country led to the downfall of the Shogunate. The Daimyos were culled together to advise, but they adopted the desperate attitude of resisting the foreigners by force. The Shogun understood the position only too clearly; he was a far sighted, able statesman. His decision was to sign the treaty with Perry and further treaties with Russia, England and the Netherlands. In signing these treaties the Shogun knew that he signed his own downfall. The Daimyos rose against him and expelled the foreigner, became the popular cry. The Daimyo of Hikone, who supported the Shogun, was murdered by the Daimyo of Mito. A Brit. subject named Richardson was murdered by the retainers of the Daimyo of Satsuma; vengeance was taken for his sake, the city of Kagoshima belonging to the Satsuma was bombarded and utterly destroyed. The Choshu chief who commanded the entrance to the inland sea at Shinonowaki fired upon foreign ships, the emperor having given him an edict without the knowledge of the Shogun. A squadron of Brit. men of war demolished the forts of the Choshu and destroyed his ships. A fine of 3,000,000 dollars was imposed upon the Choshu, his cap being in the hands of the invaders while he was in revolt against the Shogun who therefore could not collect the debt. Sir Harry Parkes, entrusted with Brit. interests in J., arranged that part of the debt should be remitted on the ratification of the treaties. This ended the power of the Shogun. A foreign fleet was anchored off the entrance to the sacred city of Kyoto, where the emperor resided. That monarch dismissed the officials whom the Shogun had appointed to carry out the negotiations, and the Shogun resigned in 1868, and was succeeded by Keiki the last of the Tokugawa rulers.

From this time on J. began to take her right place among progressive nations. The emperor became the head in fact and not in theory. In 1871 an imperial decree abolished local autonomy, the feudal system was to be a thing of the past. In 1878 the pensions of the Samurai were commuted and swords were forbidden to be worn. The Satsuma clan alone remained conservative and rose against the gov. (Jan.-Sept. 1877) in a short-lived revolt. This ended further trouble with the Samurai, many of these men, loyal

to their creed of honour, retired to the mts and died by their own hands, suicide under the name of *Hara-kiri* being an honourable death. This custom had always been followed by the Samurai in cases of hopeless trouble or from the wish to follow a dead superior. The wives of the feudal nobles and Samurai also occasionally despatched themselves when honour or loyalty demanded it of them.

The country now set herself the difficult task of thoroughly learning and practising the institutions of Europe and America. Some fifty-five men by no means all noble commenced the work of reconstruction. Many were murdered, some were executed and not a few broke down with overwork. Among the greatest names honoured evermore by their country are Prince Ito who framed the first constitution for J. and who died by the hand of a mad assassin in Korea, Saigo Takamori, Itagaki, Okubo, and Kido. The next period is known as the Meiji era. Englishmen were employed in the construction of railways, telegraphs, etc. and in the organisation of the navy; Amers supervised her system of postal service and her agricultural arrangements and her education. Japanese trained her soldiers in modern tactics and learnt the laws while Germans assisted with medical science and local gov. In 1899 the Emperor Mutsuhito gave J. her pre-war constitution.

The next difficulty the country had to face was the question of Korea, that peninsula was too close to the vital part of J. to be a comfortable home for another nation. China was not anxious to see Korea occupied by the Jap any more than the latter were to see it governed by China. Matters reached a crisis in July, 1894 and war was declared between the two countries. The struggle became a succession of victories for J. First a naval encounter took place between three Chinese battleships and three Jap. cruisers. One Chinese ship was taken, one shattered and rendered useless, and the third escaped badly damaged. The first land victory took place at Pyongyang. The Chinese lost 8,000 men and the Jap. only 700. Then came the naval battle off the mouth of the Yalu R. which proved a disastrous defeat for China. J. then seized the Chinese naval ports of Yalu Port, Arthur and Weihaiwei. The Chinese commander Adm. Ting, committed suicide unable to bear the taunted disgrace of defeat. This was the end of the war. The treaty of Shimonoseki (1895) declared Korea absolutely independent, ceded to J. part of Manchuria, Formosa and the Pescadores, compelling China to pay 200,000,000 taels indemnity. J. a victory was hard won, having cost 20,000 lives and £20,000,000. The interference of the European Powers and her own crippled condition compelled her to give back to China the ter. on the mainland, together with Port Arthur. In 1902 a defensive alliance was concluded with Great Britain. The gradual encroachment of Russia in Korea and the concessions granted to that country by

China were watched by J. with increasing anxiety. In 1904 matters came to the expected crisis, and J. declared war against Russia (see RUSSO-JAPANESE WAR). To the amazement of Europe, Russia was defeated, peace was concluded in 1905, and a treaty was signed at Portsmouth, New Hampshire, U.S.A. In 1905 the new Anglo-Jap. treaty was signed in London for the purpose of maintaining peace in E. Asia, ensuring the integrity and independence of China with the policy of the 'open door' for all nations, and for mutual defence of the territorial rights of the two contracting powers in the Far E. and India. In 1911 this was renewed for ten years with modifications. The integrity of China was the basis of agreements with Russia and France (1907), and a common policy in regard to Far E. and Pacific questions was formulated in identical notes between J. and the U.S.A. in 1908. In 1910, 1911 and 1912 agreements were signed with Russia in reference to China, Manchuria, and Mongolia.

The great Emperor Mutsuhito died in 1912; he had reigned for forty-five years. On his accession he had inherited a petty Oriental state in which he left his son an empire which had taken her place among the world's great nations. A pathetic incident of the Jap. characteristic loyalty and devotion marked the day of the emperor's funeral. General Nogi and his wife committed 'honourable suicide' according to the old estab. custom. The emperor's third son, Yoshito Harunomiya, thirty-three years of age, succeeded him, and became known as Emperor Taisho. At the beginning of his reign, the ministry of the Marquis Satomi came to an end, being split upon the decision of the war minister, Gen. Uchihara, to keep two army divs. in Korea, where there had been a conspiracy against the Jap. Governor, Count Terachi. The offer of Prince Katsuri to form a ministry was not accepted by the Lower House, and Katsuri thereupon formed a new party, called Rikken Doshi-Kai or the Constitutional Crusaders' Association, but in 1913 he died of cancer. In Feb. 1913 the Yamamoto ministry came into power, but soon after fell owing to the Naval Scandal, aroused by the fact that bribes had been accepted by Jap. officials from the Siemens-Schuckert Company over the building of a Jap. battleship. After an interval, in which Viscount Kiyoura tried in vain to form a Cabinet, Count Okuma came into power on April 11, 1911, with the assistance of the new Doshi-Kai party. Baron Kato was made foreign minister, and after the outbreak of the First World War in Aug. 1914, he enunciated the national policy that 'J. had no desire nor inclination to become involved in the present conflict, but she believed she owed it to herself to be faithful to the Alliance (i.e. with Great Britain) and to strengthen its foundations by ensuring permanent peace in the E. and protecting the special interests of the Allied Powers.' On Aug. 15, an ultimatum was issued to Germany demanding that all Ger. battleships should be withdrawn from Jap. and Chinese

waters, and that the whole of the leased ter. of Kiao-Chiau should be delivered up by Sept. 15 and ultimately restored to China. Having received no reply from Germany, J. declared war on Aug. 24. On Sept. 2 the Jap. army landed in Kiao-Chiau and, having been joined by a small Anglo-Indian force, commenced the siege of the forts, which, by Nov. 7, surrendered. On Nov. 16, the Allies occupied Tientsin (q.v.). Meanwhile the Jap. fleet was active in the Pacific, destroying the prestige there of the Ger. navy and capturing the Carolines (the Marshall, and the Marianne is.

On Jan. 18, 1915, J. surprised the world by issuing to China the unwarranted 'Twenty-One' demands (see also under CHINA). These were divided into five groups, of which the last aroused the most bitter controversy. Among other things it demanded that the Chinese should employ Jap. advisers in their affairs, that the Jap. should have the right to build hospitals, schools, etc., in the interior, that a jointly-administered Jap. and Chinese arsenal should be set up, and that the control of certain railways together with the right of construction should be in the hands of the Jap. Under protest this group was omitted, but a revised list together with an ultimatum of acceptance was presented to China in April. Bitter resentment against J. prevailed in China for some years over the 'Twenty-One Demands', they also brought J. into difficulties with the U.S.A., which were only ended by an agreement between the two countries signed on Nov. 2, 1917.

By the treaty of Versailles 1919, J. received, under mandate, the former Ger. colonies, the Caroline, Marshall, Marianne, and Pelow is., together with Kiao-Chiau. The difficulty with China, resulting from this latter award, was the subject of the Pacific section of the Washington Conference (q.v.). Kiao-Chiau, together with other former Ger. ter. in Shantung, was returned to China, while a treaty of Naval Disarmament between J., Great Britain, France, and the U.S.A. was concluded, and, in this, the former Anglo-Jap. Alliance was merged. In domestic affairs, both during and after the War, J. was undergoing extremely rapid industrial development but had not escaped war 'profiteering', and this, coupled with the increased cost of living, caused resentment and rioting. Before 1916 trade unions were practically unknown in J., but after that year they became increasingly powerful. Discontent among the workers found expression in strikes, of which there were 417 in 1917 and nearly 500 in 1918. The rice riots of that year brought about the downfall of Terauchi, who had succeeded Okuma as head of the gov. in 1915. A new gov. was formed with Takashi Hara, a commoner, at its head. Factory laws concerning women and children were passed, and welfare work was instituted. After the fall of the Russian Imperial gov., J. assisted the Allies in enabling the Czechoslovakian army to escape from Siberia; and when the Allied troops were withdrawn, the Jap. remained in Siberia for some time after the war. The Jap. in

Siberia suffered at the hands of the Bolsheviks, and it was not until 1923 that the Jap. commenced the evacuation of their troops.

At the Versailles Peace Conference, J sought to obtain the recognition of racial equality, but the required unanimous vote was not forthcoming. In 1923, the sympathy and help of the world were extended to J to repair the damage caused by the terrible earthquake of that year (see *supra* and under EARTHQUAKE). It may be mentioned here that the next serious earthquake in J. was that which struck central J. and the Is. of Shikoku on Dec. 21, 1946, causing damage over an area 400 m. by 150 m. or about five-sixths as severe as that of 1923. In Sept. 1923, a gov. was formed by Yamamoto, after an interval of unstable ministries following the assassination of Hara on Nov. 4, 1921. In Dec. of 1923, however, the attempted assassination of the Prince Regent caused Yamamoto to resign, and a new Cabinet was formed by Viscount Kiyoura. This gov. was unpopular, and fell the following year, owing to the resentment aroused in J. by the Amer. Immigration Law, passed in May 1924, forbidding Asiatics to enter the U.S.A. General elections were held in J. at this time, and Viscount Takaatsi Kato came into office with a gov. which was a Coalition between the *Seiyun-Kai*, or Constitutional Political Association, and the *Kenmei-Kai*, which party had arisen out of the *Doshu Kai*. The prin. achievement of this gov. was in granting universal suffrage to all men over the age of twenty-five. On the death of Kato, the premiership fell to Wakatsuki. On Dec. 25, 1926, the old Emperor Tai-sho died, and was succeeded by the Crown Prince, who had acted as Prince Regent since 1922, and now became the Emperor Hirohito. In the succeeding years, J. was mainly occupied with reconstruction at home and the rebuilding of Tokyo, and in foreign affairs with the problem of naval security. Much criticism was levelled at the foreign minister, Baron Shidehara, on the grounds that the ratios with regard to naval strength accepted at the London Conference were inadequate for the protection of J. (see LONDON CONFERENCE). In 1934 J. gave notice of termination of the Washington Treaty of 1922 (see WASHINGTON TREATY OF 1922), a step which, coupled with J.'s aggressive policy in Manchuria, excited grave apprehension (see also CHINA—History).

*Survival of Japanese feudal institutions*—After the middle of the nineteenth century, when the influence of W. science and technology began to infiltrate into the Iar E., J. made phenomenal progress in methods of modern industry and warfare. At the same time she attempted to carry out the so called continental policy, which contemplated the conquest of all China and, eventually of an unlimited portion of Asia. It is only against the background of J.'s social and political structure that her world outlook in the twentieth century can be understood. Centuries of geographical and mental isolation restricted that outlook and all J.

absorbed was the superficial aspects of Chinese and W. culture. Her feudal institutions survived to the period of the Second World War. Down to 1946 there was no social or political equality and the people were divided into strictly defined classes—the royal family, the aristocrats, the warriors, and the commoners. The foundation of modern or pre-1946 J. was laid during the Meiji Restoration which began in 1868. The authority of the royal family was greatly enhanced and the noble and warrior classes became the real governing classes controlling nearly all political, military, and economic power. The much extolled Meiji Restoration resulted in the oppression of the masses, whose psychology became a curious compound fashioned of modern industrialism and medieval feudalism, a complex essentially favourable to militarism from above. Military expansion followed naturally. Korea was overrun and there were easy victories over China and Russia in 1895 and 1905. After the unification of Germany under Bismarck, military training in J. was a slavish imitation of the Ger. system. The Meiji period also brought with it the rise of the *zaibatsu*, the modern Jap. financial oligarchy who, like the militarists, came from the aristocratic class and who generally co-operated with the militarists in exploiting the masses and in furthering the Jap. foreign policy of expansion. J.'s earliest modern industries were war industries. It was during the Sino Jap. wars that the notorious Mitsui and Mitsubishi combines developed their power, controlling practically all Man. huan enterprises and giving their support unconditionally to the all-dominant militarists. Political parties were organised in this period, but this too was a movement from above and not from the people. The founders of the parties, Taisuko Itagaki, Hirobumi Ito, and Taro Katsura came from the old aristocratic class. Such men had no sympathy with nor even understanding of democracy. Jap. parl. institutions were a sham and corruption and bribery at elections were rife. The financial oligarchy controlled the parliament, the military clique controlled the financiers and the people had no voice. No Jap. cabinet could be formed without the consent of the Army and the Navy. The war minister and the minister of the navy had to be, respectively, a general and an admiral on the active list, and although they were members of the cabinet they were independent of cabinet control and enjoyed direct access to the emperor.

*Japan's Manchurian adventure.*—J.'s policy towards China had openly abandoned conciliation in 1931 when the military party, swamping the Liberal gov., launched an armed adventure in Manchuria, which soon brought the entire prov. under Jap. control. J.'s intervention in Manchuria was little more than the obvious result of a fundamental conflict of economic and strategic interests with those of China. J. realised that Chinese development of railways and ports threatened her hard-won rights in

the S. Manchurian Railway. Relying on her privileged position in Manchuria, J. had invested great sums in mining and other primary resources of Manchuria—enterprises of vital importance to J.'s great home pop. Attempts to negotiate a settlement with China naturally proved abortive and the Jap. military leaders, without even consulting the Tokyo gov., hurled their forces against the whole zone of the railway. After the disarming of the garrison at Mukden and the capture of Kirin, the Jap. authorities held the hand, and the dispute was referred to the

League of Nations, her troops advanced into Jehol and soon flung the Chinese forces made suggestions for setting up a special régime in Manchuria, recognising Chinese sovereignty and, at the same time, safeguarding J.'s rights. But J. had already set up a puppet gov. and created a new State, which she called Manchukuo; and her reply to the League was that she was acting in self-defence and that, in any event, there was no central gov. in China able to carry out a settlement. J. now began to organise larger expeditionary forces and, having withdrawn from the League of Nations, her troops advanced into Jehol and soon flung the Chinese forces

League of Nations and the Chancellor of Tokyo and Washington. The League imposed a time-limit on J. to withdraw all troops within the treaty zone, which she did while insisting that the dispute could be settled only by direct Sino-Jap negotiations. An attempt by the Powers to find a way out through the Kellogg Pact (q.v.) was equally unsuccessful. The Jap. gov., adopting delaying tactics, steadily pursued their conquests, and their troops, crossing the Chinese E. Railway, took Chinchow, the headquarters of the Chinese commander-in-chief. By the end of the year (1931) they had overrun 200,000 sq. m., with no more than 20,000 troops against twentyfold that number of Chinese troops. Later, a large Jap. force was landed in Shanghai, where heavy fighting began early in 1932. Meanwhile (December 1931) the League appointed a commission of enquiry in Manchuria under Lord Lytton, whose report (Oct. 1932)

out of the whole of that prov. and S. of the Great Wall.

After the occupation of Manchukuo incidents of forward movement alternated with periods of relative calm. Every succeeding year saw a further milestone on J.'s road to empire. Thus, in 1933, it was the final looting of Jehol, with its old Chinese imperial palaces, its coal and strategic mt. passes, from the main body of China and its incorporation in Manchukuo. In 1935 came the elimination of the last vestige of the traditional Russian influence in N. Manchuria through the transfer by purchase of the Soviet share of ownership of the Chinese E. Railway to Manchukuo. The same year was also marked by manoeuvres on the part of the Jap. military authorities in China, intended to sap the authority of the Central Gov. at Nanjing over 75 million people in N. China. These 'fifth column' (q.v.) tactics culminated in the setting up, with

the connivance of the Jap. military authorities, of a puppet régime under Jung-keng in the W. dists. of N. China. Early in 1936 irregular forces, issuing from Manchukuo, drove the Chinese forces out of the prov. of Chahar, and estab. a pro-Jap. régime in that sparsely-populated ter. The Jap. foreign minister (Koki Hirota) now put forward three points as essential pre-requisites of Sino-Jap. understanding: co-operation in suppressing communism; recognition of Manchukuo by China; and the cessation by China of all unfriendly actions in relation to J. and to the policy of 'playing off a third Power against J.' The first and third were capable of the widest interpretation and could even justify J. asserting the right to supervise China's foreign relations and to send troops to any part of China where 'communist' forces might be operating.

In line with the policy of expansion on land was the denunciation by the Jap. gov. of the Washington Naval Treaty and its refusal to conclude any new naval agreement except on the basis of parity with Great Britain and the U.S.A. J. might be regarded, along with Germany and Italy at this time, as one of the three major dissatisfied or 'have-not' Powers of the world. There is abundant statistical evidence that J.'s economic position was, and is to-day, that of a proletarian nation. J. depended almost entirely on foreign sources for such vitally important raw materials as cotton, wool, rubber, and oil, which were the life-blood of many of its chief industries; and there is no mineral of any consequence which J. possessed or possesses in surplus quantities. It would be an over-simplification to suggest that the Jap. army 'staged' the seizure of Manchuria merely as a means of restoring its shaken prestige at home and driving liberalism and pacifism into the background. Other considerations were involved: the many unsettled economic disputes with the Chinese authorities; the desire to push back the reviving Russian influence in the Far E.; and the disposition of the Manchurian ruler to establish closer relations with the Nationalist régime in China. But that the Jap. army took full advantage of the strengthened position which it acquired as a result of the outbreak of hostilities in Manchuria is unmistakable. Behind the Jap. sweep towards empire at all costs were a whole complex of impelling forces. Pan-Asianism had its part. Outside J. pan-Asianism was a negligible factor until after the Second World War, when Nationalism among colonial races became active. But if the Jap. empire was to expand further, pan-Asianism, to a certain type of Jap. mind, might become a formidable slogan. J.'s sweep towards imperial expansion was by no means purely military and territorial in character. Goods with the 'made in Japan' mark won their victories and made their enemies, just as the Jap. soldiers on the battlefields of Manchuria and Jehol. J.'s advance to a commanding position on the Asiatic continent might at this time be graphically represented by three arrows, pointing in different quar-

ters: the first pointed N. to Manchukuo and the troubled frontiers with Russia; the second pointed W. to China, where the destiny of J. as an Imperial Power might well be settled either way; and the third pointed S. to the rich tropical lands of the European Powers and America, where J.'s activities had thus far been purely commercial in character.

*Japanese 'co-prosperity sphere'—The attack on Pearl Harbour.*—The collapse of Holland and France in 1940 at once led to extremist demands for Jap. intervention in the European War and for the occupation of Dutch and Fr. E. Indian possessions. To that end the very phrase 'East Asia,' coined by the Jap. with the political implications of an E. 'Monroe doctrine,' carried its obvious menace. J. now demanded that all supplies passing through Fr. Indo-China to the Chinese gov. at Chungking should cease and that all supplies going to Gen. Chiang-kai-shek through Burma and Hong Kong should also cease. At the same time Jap. troops were moved to the 25-m. frontier of Kowloon and a land blockade of the concession there was begun. These moves had their impulse in J.'s intense desire to settle what the Jap. gov. styled the 'China incident,' which every statement of Jap. policy admitted to be the gov.'s first pre-occupation. J.'s foreign minister, Arita, now outlined J.'s conception of a new order 'united under a single sphere' of Jap. hegemony which would cover 'East Asia' and the S. Seas. Thus the species of Jap. 'Monroe doctrine,' first expressed in 1934, was now widened so as to include a vast unspecified area which might embrace any land from Java to Tahiti. In fact, expansion southwards had long been the policy of an influential section of Jap. opinion, and J. had therefore steadily increased her share of the shipping in the S. Seas; while the war in China had, as we have seen, given a new significance to such expansion. The tone of the demands put forward in the middle of 1940 suggested that the collapse of France had encouraged the extremists and, through them, the Jap. gov. to new intemperance. But the Brit. fleet, strongly based on Singapore, was by no means a negligible factor, and behind the Brit. stood, if at this time somewhat equivocally, the Amer. fleet, which had not been materially weakened by the events of the preceding months. But though the Jap. gov. occupied Fr. Indo-China (q.v.) they found themselves fully occupied in China, where the Nationalist forces were slowly but certainly gaining strength and conducting, not unsuccessfully, an unremitting guerilla warfare. Yet by the end of 1941 J. had attempted no rash move, though the new gov. of Gen. Tojo entertained, in view of Russia's pre-occupation with the Ger. invasion, the most grandiose schemes—schemes which the Brit. Gov. realised might well affect India. J.'s occupation of Fr. Indo-China was in reality an attempt to outflank Brit. and Amer. defences in the Far E. as a first measure to secure dictatorial control of vast territories.

where democratic theories were taking root. The strengthening of the Allied line in the Middle E. had removed the immediate threat to India from the W., and the Jap. plan for creating a new order in Asia sought to eliminate the historically estab. rights of Great Britain, the U.S.A., and other W. Powers in that region and aimed at establishing a 'benevolent' political domination over China, the Philippines, Indo-China, Thailand, Malaya, the Netherlands E. Indies, Burma, India, and Ceylon. This project, growing out of J.'s partnership with the Axis Powers (see also BERLIN, PACT OF) was framed in such high-sounding assertions as that J. desired to see Asiatic peoples ruled by themselves; but it was also accompanied by a scheme of economic 'co-prosperity', which really meant that J. hoped to secure vast resources of raw materials in exchange for goods of her own manuf. These Jap. ambitions in Asia were, of course, closely modelled on Nazi ambitions in Europe, and were accompanied by the same cry for 'living space', the same imputation of encirclement, and the same declared intention to create a new economic system for 'liberated' peoples. Outwardly the Jap. aim was to prove that the W. Powers had no right to influence Asiatic life and culture; actually the intention was to enable J. to become overlord of the Orient under an economic polity which would have no place for the W. Powers, including even her own Axis partners. Meanwhile the Brit. authorities strengthened the defences in Malaya and the Brit. and Amer. Govs. applied economic sanctions to J. beginning in July, 1941, with the 'freezing' of Jap. assets in reply to the Jap. move against Fr. Indo-China, while the Dutch authorities made it clear that they would protect their interests in the event of further Jap. adventures.

It was evident, when Gen. Tojo, a professional soldier, replaced Prince Konoye as premier (Oct. 1941) that J. was contemplating further military activities on a scale in conformity with the principles outlined above. Tojo's gov. now began secretly to make naval and military dispositions on a most comprehensive plan, with the view of simultaneously attacking Brit. and Amer. Far E. possessions at a moment most convenient for ensuring at least initial success. Delay would mean, in fact, giving up their dreams of forcing J.'s will on the Pacific and E. Asia and furthermore, J.'s striking power was now at its peak. Besides these considerations, Hitler was forcing her hand in order to divert, if possible, the material aid which America was giving to the Russian armies with disastrous results on his Russian campaign. Tojo, therefore, sent a special envoy to Washington to join Adm. Nomura, Jap. ambassador, in order to conduct mock negotiations for a settlement of outstanding differences with the United States. In the course of these negotiations President Roosevelt sent a personal message to the emperor of J. in the vain hope of effecting an understanding; but the Jap. Gov., without any

formal declaration of war, suddenly, on Dec. 7, attacked Pearl Harbour and other Amer. bases in the Pacific and, after this outrage on conventional diplomatic procedure, announced that J. was at war with both Great Britain and the U.S., in the W. Pacific. Both these countries promptly declared war on J.

*The first two years of the war in the Pacific.*—Soon after the attack on Pearl Harbour Jap. planes bombed and sank the great Brit. warships *Prince of Wales* and *Republie*, thus gaining command of the seas in the S. Pacific. By the early days of 1942 they had swept through Thailand (Siam) to Burma and captured Penang, Hong Kong, and the greater part of the Brit. Malay peninsula and were landing fresh troops in the Philippines. Thus in the early period of the war in the Far E., Jap. arms carried all before them. Attempts by the Allies to hold fortresses and conduct campaigns without aircraft cover failed disastrously: Hong Kong, Malaya, and Singapore were inevitably lost in this way; and the Jap. conquered the Netherlands E. Indies, Borneo, the Philippines, the Andamans, and most of Burma and, by cutting the Burma Road (p. 724) they isolated China. Only as Britain and America increased their air-cover was Jap. expansion stopped eastward by the battle of the Coral Sea (May 1942) followed in the next month by the battle of Midway Is.; and westward by the defeat of air attacks on Ceylon. Throughout 1942, however, the Jap. war took second place in the eyes of Brit. and Amer. statesmen, who were bent on intensifying their effort against Germany as ordering by far the greater danger. But by pursuing an offensive in Papua the Jap. forces were now directly threatening the mainland of Australia and it was essential for the Allies to check any further advance. Hence in a strenuous campaign over jungle and mt. terrain Australian troops repelled the invaders and captured Buna and Buna, the Jap. base on the N. coast of New Guinea, exterminating their garrisons. While this war was in progress Amer. marines were landed on the large Is. of Guadalcanal (q.v.) in the Solomons and captured an aerodrome which the Jap. had recently constructed there. For long the Jap. fought hard to regain the aerodrome but by Feb. 1943 the Amers. had captured the Is. This provided the *point d'appui* for a long-drawn but effective process of 'island hopping', which gradually pierced the far-flung outer chain of strongholds covering J. from the Pacific, a process in which the over-growing air and naval superiority of the Amers. eventually asserted itself. For some time after the Jap. had been driven out of Guadalcanal no big land action was fought in the Pacific theatre, but the Amers. continued to bomb Jap. bases and, by combined sea and air operations, thwarted all Jap. efforts to reinforce their positions, especially in what is known as 'the battle of the Bismarck Sea' (March 1943) when J. lost ten warships, over one hundred aircraft, and 15,000 men. In the middle of 1943 the Amers. landed

forces on New Georgia, while the Australians made progress along the N. coast of New Guinea. Lae and Salamaua, the two chief Jap. bases on New Guinea, were taken by the Australians in Sept. 1943. Rabaul, the great Jap. base in New Britain, was overcome by the Amers. at the end of the year, who were enabled to gain control through the construction of distant airfields. The first tor. taken from J., which was not a mere recovery but had been in Jap. hands before the war, was the Marshall Is., which gave a base for bombing Truk, in the Carolines, the greatest of J.'s Pacific bases, and continuing their westward and northward advance the Amers. by the middle of 1944, reached the Marianas and captured the strongly fortified Is. of Saipan, where at last they had secured an air-base within long-distance bombing range of both the Philippines and of J. itself.

*The last two years of the war in the Pacific.*—The continual deterioration of the war situation, both for J. herself and for her ally, Germany, throughout the period of the Koiso cabinet brought that gov. down in April, 1945. Political developments within J. reflected events in the military and naval fields in 1944-45. Most serious of all, the Jap. navy was now definitely deprived of command of the sea even in those inner waters in which it was expected to have a great strategic advantage, so that J.'s shipping routes through the E. and S. China Seas, and even the coasts of J. herself, were laid open to attack. This meant the breakdown of J.'s original strategy, which relied on the bases in the Carolines, Marianas, Philippines, and Ryukyu Is. as 'unsinkable aircraft carriers' for covering J.'s maritime communications to the mainland of Asia and the Malay Archipelago and for preventing a close approach of the enemy by sea to the Jap. homeland. It meant also that J. was subjected to air attacks heavier than was expected; strong carrier-based air forces, as well as Super-Fortresses from Saipan now took part in raids, and after the Amer. capture of Iwojima in the Bonins land-based fighter aircraft were able to support the bombers and the relative invulnerability hitherto given to J. by her geographical remoteness from Allied bases was being rapidly discounted.

J.'s hope of using Burma as a spring-board for invading India had been finally destroyed by the failure of the Jap. thrust into Manipur in the spring of 1944 but Burma was still useful for defending the land approaches to Siam and Malaya and blocking the Burma Road supply route to China. Hence J. was prepared to fight stubbornly to hold it, and with the greater hope of success from the fact that the task of the Allied leader, Adm. Mountbatten, was made more difficult through the low priority for shipping and landing craft allotted to his S.E. Asia Command. During the winter of 1944-45 Adm. Mountbatten was restricted to an offensive campaign by land across densely forested mt. ranges between India and Burma, hampered by the most formidable difficulties of transport. But

these difficulties were overcome, largely by the aid of airborne supplies, and with the capture of Mandalay the Jap. hold on Upper Burma was broken. Again, the Allied success at Myittha had led to the prolongation of the road from Ledo to meet the old Burma Road, and it was possible once more to send lorries through to China.

In striking contrast to the ship-starved offensive of the S.E. Asia Command of Adm. Mountbatten, the Amer. invasion of the Philippines under Gen. MacArthur was carried out with an immense concentration of maritime transport and newly-built landing craft. Against this massive attack the Jap. had some 200,000 men in the Philippines, but they were scattered over many different Is. and the native pop. was either apathetic or hostile. Even in the inner waters of the archipelago movement by sea between the Is. was threatened by Amer. air attack. For J., therefore, everything depended on victory over the Amer. fleet without command of the sea, the dispersed Jap. land forces would be isolated in their various captured Is. It was the moment for J. to risk a naval battle and in Oct. 1944 the main strength of the Jap. navy was deployed in a determined attempt to crush the Amer. naval force which was covering the invasion of Leyte. The battle which ensued was a decisive defeat for the Jap. and it decided the fate of the Philippines. Strategically the Amer. reconquest of Manila with the naval harbour of Cavite meant that all Jap. shipping routes S. of Formosa and Hong Kong were now exposed to close naval and air attack. The vast ters. to W. and S. of the S. China Sea overrun by the Jap. since 1940 comprising Indo-China, Siam, Burma, Malaya, and the Dutch E. Indies, were now virtually cut off from J. by sea. Some slight compensation was provided for J. by the success of an offensive in S. China which opened a land corridor from the middle Yangtze to Indo-China, but this could be only of limited use for military movements. To all intents and purposes J. had now lost the resources of the S. lands and her garrisons remaining there were almost as effectively isolated as the by-passed forces still holding out in New Guinea, New Britain, Bougainville, and Truk. But the opening of through communications from Hankow S.-westward to Indo-China and southward to Canton yielded overland routes valuable for Jap. continental strategy, besides defeating and dispersing large Chinese armies in Kwangsi and Kwangtung and resulting in the capture of a number of airfields constructed at great expense by the Amers. for the use of their air forces in China. The Jap. commander-in-chief in China responsible for this successful campaign, Gen. Hata, was made a field-marshal and brought back to J. to be inspector-general of military training, and in 1945, he was appointed by the Suzuki Gov. one of the two commanders for the military defence of the Jap. homeland. The Jap. hold on China, however, despite this success of Gen. Hata, was now threatened

from a new direction—from the sea which the Jap. navy had formerly controlled, but controlled no longer. The Jap., now that Germany was beaten, had to prepare to defend Hong Kong, Canton, Amoy, and Shanghai against Allied seaborne invasion. They had also to prepare to defend Indo-China against attack from the sea now that the Amers. were estab. in the Philippines.

For the ordinary Jap., however, and indeed for his rulers, no theatre of war could compare with the homeland in importance. For the *shinkoku* or 'divine land' was now threatened with invasion from the sea. The loss of Saipan had brought down the Tojo cabinet and the tears aroused by this event were soon realised in 'Super-Fortress' raids on the industrial cities of central J., including Tokyo itself. Soon the premier, Koiso, had to admit the loss of Iwojima (March 21, 1945) and the Jap. navy, after its mauling in the Philippine waters, did not dare to go to the rescue of the garrison. Then Adm. Nimitz invaded Okinawa, an is. of the Ryukyu group commanding the sea approaches to Shanghai as well as to S.W. J. The air-raids by the great Amer. bombers reached a climax in March-June and with the promise of still worse to come. The gov. was petitioned to take more drastic action in the matter of shelters in Tokyo but was powerless to do more than advise everybody not needed in Tokyo to depart at once, huge areas of the cap. being now devastated.

The prospect in the spring of 1945 that Germany would be defeated confronted J. with a major problem which was at once political and strategic. For obviously with Germany out of the war, far greater forces would be available to concentrate on J. But whether to give up the outer zone of conquests from Burma to the Carolines and concentrate on the defence of the inner zone comprising J. itself, Korea, Manchuria and China, was a problem which brought extremists and moderates in sharp conflict with each other. Koiso told the Diet on March 23 that J. intended to take the offensive to retake Iwojima, Saipan, and Guadalcanal. Okinawa had not then fallen and it was a more serious loss even than that of the other is. Yet he was unable to explain how J. could effect such a miracle if her Navy dared not venture out of ichu waters. But the extremists, often composed of the more youthful officers, could not prevail against the general staffs and the Zaibatsu or great business houses whose minds had not, of course, been deluded by the fraudulent war-time Jap. propaganda. These knew, even before the end of 1944, that the tide of war had definitely turned against J. and that it would soon be a question of trying to get out of the war on terms falling far short of J.'s original ambitions. Thus, while as yet there was no question of unconditional surrender, it was essential to get rid of the ultra-extremists who would bar the way to any hope of peace negotiations. Therefore in April (1945) the industrial groups secured the appointment as Prime

Minister of Adm. Suzuki, former Grand Chamberlain, in place of Koiso. Yet even before this, statesmen behind the throne had been preparing the way for such an appointment and restraining the agitation of Col. Kingoro Hashimoto's fanatical followers for a 'regeneration' of the political structure. Koiso, though an extremist in foreign policy, was a conservative in domestic affairs, and therefore willing to co-operate with the elder statesmen against Hashimoto, whose group wanted to get rid of the Seijukai and substitute a large, unified, and disciplined Party State on the familiar fascist model. The Seijukai had, since 1942, been the only recognised political organisation, but it had never had any real political stamina and behind this facade the old-time politicians retained their party groupings and more or less supported the gov. of the day. But apart from these party difficulties, Koiso also found the same difficulty as his predecessor, Tojo, had in securing effective co-ordination between the gov. and the High Command. Tojo had been his own war minister and had ultimately made himself chief of the army general staff as well; Koiso deemed it imprudent to excite criticism by arrogating these posts to himself and therefore tried to co-ordinate their functions through the Cabinet secretary. But there were repeated changes in this office, one appointee after another being regarded as unsuitable—an indication more of the gravity of the administrative crisis facing the gov. than of the inherent importance of the office.

*Closing days of the war and surrender of Japan.*—The Jap. garrison of 100,000 men on Okinawa defended the is. with the utmost tenacity, as indeed had the garrison of 20,000 on Iwojima, but organised resistance on Okinawa ceased on June 21. The campaign in the Philippines ceased at the end of the month. On July 14 J. was bombarded by Amer. warships. Then, on Aug. 6, the first atomic bomb was dropped on J. at Hiroshima (q.v.); the second (and last) of the missiles on Nagasaki on the 9th. Thus did disasters accumulate and without hope of mitigation in any quarter. On the verge of surrender, J. now found herself confronted by a new and powerful enemy in Russia, which nation had not renewed the Neutrality Pact due to expire in April 1946 unless expressly renewed, and now declared war on J. to wipe out the humiliation of past defeat and to restore the status quo of nearly half a century ago. On Aug. 9 the Red Army invaded Manchuria. Meanwhile Allied aircraft, operating from speedily-organised runways on Okinawa, destroyed in one day sixty more J. ships. This was the end. Though J. still had a great fighter air force it was to a great extent a grounded force. The measure of Jap. losses was catastrophic. Thus in New Guinea, of an army of originally 120,000 men only 12,000 survived. Between the date of the attack on Pearl Harbour and Aug. 1945 some 320 Jap. warships had been sunk or put out of action, including 11 battleships,

17 heavy and 22 light cruisers, 7 aircraft carriers, 139 destroyers, and about the same number of submarines, 1 escort carrier and other craft. J's mercantile marine had practically disappeared. On land, sea, and in the air J was shattered and was now in fact faced with the prospect of speedy annihilation from further atomic bombs. Hence on Aug. 14 J accepted the Allied demand for unconditional surrender addressed from Potsdam (see POTSDAM CONFERENCE) in the names of Mr. Churchill, President Truman, and

half-century J., as has been shown, had pursued an uninterrupted policy of expansion. Her imperialistic aims had dominated the mind of the ruling class which moulded the outlook of the Japanese people in a manner to which history affords no parallel. On the basis of unquestioning loyalty to the Imperial Throne, the whole nation was taught to face any hardships which might be entailed in following the national destiny. The throne itself was exalted from a temporal to a quasi-divine institution and like the Herring

THE EMPEROR HIROHITO IN ECHELON 1916

Gen. Chiang Kai-shek. Amer. forces began landing in J. on Aug. 29 and the instrument of unconditional surrender of J. was signed on board the Amer. battleship *Missouri* in Tokyo Bay on Sept. 2. Within the ensuing days of the month the Jap forces in Luzon (Philippines) and throughout the S.W. Pacific also surrendered while the surrender in S.E. Asia was received by Adm. Mountbatten on Sept. 2. That of the Jap forces in China was signed at Nanking by Gen. Okamura on Sept. 9. For details of the war in the Far E., see PACIFIC CAMPAIGNS OF FAR EASTERN FRONT IN SECOND WORLD WAR, BURMA, SECOND WORLD WAR CAMPAIGNS IN MALAYA, BRITISH JAPANESE INVASION OF (1941-42), NAVAL OPERATIONS IN SECOND WORLD WAR. *Japan's new epoch.*—The surrender of J. marked the opening of a new epoch in the hist. of the Far E. For the preceding

or to many, the servants of the throne down to the humblest private soldier were encouraged to regard themselves as a race apart from the rest of mankind, participating in the God-like characteristics of Emperor and nation. Naturally the governing class was apprehensive lest the surrender should have a disastrous effect on public morale and they exhorted the people to look upon the calamity as a merely temporary setback due to the atomic bomb. But when they realized that popular loyalty was unimpaired they made no further attempt to minimize the implications of surrender. But, immune now from the risk of invasion, Prince Konoye (former Prime Minister of J., and after the surrender again one of the Emperor's advisers, was the first important Jap since the surrender to declare to the world that both the China 'incident' and the war with the Allies could have

been averted and that the Jap. militarists were principally guilty for both. Some of the oldtime leaders sought safety in suicide. Field-Marshal Sugiyama, chief of the Jap. General Staff up to Feb. 1944 and later minister of war in the Koko Cabinet, committed suicide on Sept. 12, and Gen. Tojo tried to kill himself when Amer. officers went to arrest him. Gen. MacArthur, supreme commander of the allied forces of occupation, at once ordered the dissolution of the notorious R. Amur Society (sometimes called Black Dragon Society) originally founded to encourage the extension of the Jap. frontier to the Amur in Manchuria, the militarist secret organisation which for forty-five years, by assassination and other methods of coercion, ruled Jap. political life) and the arrest of its leaders. Among others arrested at this time was Adm. Shigetaro Shimadzu, who, as navy minister, planned the attack on Pearl Harbour. Gen. MacArthur found comparatively little difficulty in carrying out his instructions for the disarmament of J. and for the destruction of her war potential both in the moral and material sphere. The land forces were disarmed and disbanded and all aircraft were confiscated. The United Nations (U.N.) agreed to scuttle all surviving Jap. war vessels, except about 40 destroyers and some coast defence vessels. After the dissolution of the Imperial General Headquarters and the arrest of many prominent individuals preparatory to their indictment as war criminals came the entire control by Allied authorities of the commercial and industrial life of J.; the break up of large estates among peasant proprietors; and the diversion of productive capacity into a programme to provide the people with the necessities of life. All barriers to the gathering and dissemination of news were removed, censorship by the Jap. authorities was forbidden, and the whole foundation of the elaborate system of 'thought control' so effectively conducted for many years by the governing oligarchy was destroyed. The speed of social reform and, especially, the abolition of the *kenpo* or military security police, led to the reconstruction of the Jap. cabinet and Prince Higashikuni, who had succeeded Suzuki as premier, gave place to Baron Shidehara, whose administration gave an assurance that the political power of the military clique and of the bureaucrats of the old type had been broken, and that the aim of the administration was to inaugurate a régime in which policy would be determined by the will of the electorate.

A year after the surrender the House of Representatives in Tokyo adopted by an overwhelming majority a new draft constitution for J. superseding the Meiji Constitution of 1889. This new Constitution indicated a wish to depart entirely from traditional beliefs wherever they were in conflict with the concepts of W. democracy. Based largely upon Amer. ideas, the new constitution based the foundations of the state not upon divine mandate, but upon the will of the electorate; it restricted the functions of the

Emperor, who became a symbol of the State; it renounced warfare as an instrument of public policy, and banned the maintenance of any armed forces by which war could be waged. The adoption of this constitution was, perhaps, not surprising in view of the fact that defeat had destroyed the foundations of national life and left nothing in their place. All the old beliefs and traditions had gone. In place of an outburst of dangerous subversive activity by militarist leaders, such as had been confidently expected by experts in Far E. affairs, the Jap. people, now seemed engrossed in novel political developments on democratic lines; while the trials of war criminals, so far from investing leaders of the old type with the halo of martyrdom, merely completed their discredit in popular estimation and the Diet itself pressed for a more thoroughgoing 'purge' of officials than any upon which the Allied Command insisted. The Jap. people in fact desired neither revolution nor reaction; they were concerned principally with orderly development and the elections of April 1946, so far from representing a landslide in any direction, gave a small majority in the House to a coalition of Liberals and Progressives, the heirs of the former Seijukai and Minseitō groups, whose popularity, however, was then steadily declining, while that of the Socialist Party was sharply rising. Women voted for the first time in Jap. hist. and there were thirty-eight women among the candidates elected. The voting age for men had been reduced from twenty-five to twenty. Experience throughout 1946 showed that Gen. MacArthur could rely upon Jap. co-operation in the task of restoring normal social and economic conditions. His directives were issued to a ' Liaison ' dept., which was in effect the ministry of foreign affairs. Allied Military Gov. also existed, but its prin. functions were supervisory rather than actually administrative. Perhaps the greatest contrast with the Allied occupation of Germany was that, instead of being split up into administrative zones, J. was administered as a whole by the single controlling authority, the Supreme Commander's Headquarters, working through the Jap. Gov. and, in the process, through the Allied Military Gov., which, despite its name, was in fact entirely staffed by Amers.

The new constitution came into effect on May 3, 1947. The first election for the House of Councillors, the new upper House of the Diet replacing the old House of Peers, was held on April 20, and that for the Lower House on April 25. The Socialists gained more seats than any other single party, but the Communists polled only one per cent. of the total popular vote. The House of Representatives of the Diet elected (Feb. 21, 1948) as premier, Eisaku Ishida, Democratic party leader, to replace Seton Katayama, a Socialist and a Christian, who had come into power in May, 1947 and whose Cabinet now resigned (Feb. 10, 1948). Ishida's Cabinet (March 9, 1948) was made up of eight Socialists, six Democrats and two Peoples' Co-operatives. In Feb. of the

same year the eleven-nation Far E. Commission (the U.S.S.R. abstaining) ordered the early completion of disarmament. The future of the Spratly Islands occupied by J. on March 31, 1939 will be decided by the terms of the peace-treaty with J., but under the terms of the Yalta agreement J. has lost all her other colonial possessions and mandated is. No time-limit has been set for the allied occupation of J. but according to the Potsdam proclamation withdrawal would be made when the democratic objectives had been attained. Gen. MacArthur is publicly almost deified by the Jap. and any criticism there is reserved for his system. Industrial production in J. during the six months from April-Oct. 1948 rose from 50 per cent to 61 per cent of pre-war.

Through all the vicissitudes of total defeat, total demilitarisation and total occupation the Jap. succeeded in adhering to the three things essential to the future plans with which they are credited—the emperor system, the national structure of gov. and the close knit official bureaucratic machine. Under Gen. MacArthur, a 'model' new democratic constitution became law. A democratically elected Diet, fashioned partly on the Brit. Houses of Parliament and partly on the Amer. Congress, was actively functioning. A sweeping land reform was instituted; and trade unions were legalised after years of militaristic repression. Ultra-nationalists and militarists were purged from public offices. But it was objected by some observers that J.'s democratisation existed only on paper and that while, militarily, the occupation was smoothly successful, politically it achieved very little that would endure. Economically, J. was slowly recovering but still dependent upon America's bounty. Socially, as an instrument for inspiring feudalistic Jap. to become attracted to Westerners and their ideas, the occupation might well transpire to have failed. In the material sense J. was completely disarmed, a task in which the Brit. Commonwealth troops took an important part. Without Allied permission and assistance, J. could not recreate her military machine for many years. But there was no corresponding mental disarmament or change of heart.

Despite the democratisation of Jap. political and social institutions, both Allied headquarters and the Jap. Gov. felt increasing concern over the activities of the Jap. communist party, the leaders of which held their sixth ann. congress at the end of 1947. In his New Year message to the people, the former premier, Tetsu Katayama, pledged the Social Democratic party to a 'fight against Communism' to the last ditch. His Cabinet made known its intention to combat communist influence in labour unions so far as the Constitution permits. But the strength of the communist party seemed unimpaired. The hist. of the Jap. communist party *Nippon kyosanto*, as an independent party began in 1921, when the two men who now (1949) guide it, Kyufchi Tokuda and Sanzo Nosaka, attended the Far E. Communist Conference in Irkutsk, under the presi-

dency of Stalin. But their influence remained negligible until the party was formally reorganised in Dec. 1945. After that date, although claiming officially only 17,000 members (the unofficial figure was 100,000), the party became a powerful and aggressive minority group, supported by a large body of sympathisers and wielding through tireless activity an influence out of all proportion to its numbers. Their immediate aim was to win over the labour unions. Until Gen. MacArthur prohibited the general strike planned for Feb. 1, 1947, the National Congress of Industrial Organizations, with the aid of the Jap. Federation of Labour steadily endeavoured to stage mass demonstrations, strikes, and 'production control.' This evidently indicated that the infiltration tactics of communists had met with some success. Success in the big industrial centres during the so-called 'October offensives' of 1946 and 1947 and the control acquired in certain rural areas, coupled also with the work of the Young Communist League (*Seinen kyosai renmei*), were all indicative of the party's existing and potential strength.

**Japanese (War Criminals) Trial (1946-48).** The International Military Tribunal for the Far E., under the presidency of Sir Wm. Webb, met early in 1947 to try the Jap. war leaders. Hideki Tojo (g.v.) and his 24 co-defendants for conspiring to wage aggressive war for the purpose of securing military, naval, political, and economic domination of E. Asia and the Pacific and Indian Oceans ; for responsibility in 'conventional war crimes' (i.e., atrocities) practised by the Jap. army and navy ; for breaches of the laws and customs of war, and on many other counts. The trial lasted 417 days and adjourned on April 16, 1948, after hearing the prosecution's final reply to the summing up of the defence. Judgment being delivered on Nov. 12. There were 1191 witnesses, 72 prosecuting and 104 defending attorneys (25 Amer., 79 Jap.) and the cost of the trial reached sev. million dollars. The tribunal found all the defendants guilty and 7 of them were sentenced to death by hanging. Of the 7, all but Koki Hirota (foreign minister (1933-36), were military men. Those were Gen. Hideki Tojo, Kenji Doihara, Seishiro Itagaki, Iketaro Kimura, Iwane Matsui, and Akira Muto. All the other accused were condemned to imprisonment for life, except Mamoru Shigemitsu, foreign minister (April 1943-April 1945), who was sentenced to 7 years' imprisonment, and Shigenori Togo, foreign minister under Tojo, sentenced to 20 years' imprisonment. Marquess Koichi Kido, Lord Keeper of the Privy Seal and

one of the Jap. Emperor's closest advisers, was among those sentenced to life imprisonment. All the accused, except Matsui and Shigemitsu, were found guilty on the charge of conspiracy. Matsui was found guilty on only one count—of 'doing nothing to abate the horrors of wholesale massacres, individual murders, rape, looting, and arson' committed by Jap. soldiers under his command in Nanking in 1937. Shigemitsu was found innocent of conspiracy, but guilty of waging a war of aggression and of failing to investigate the question of the treatment of prisoners of war. Hirota was found guilty of formulating a policy of expansion in E. Asia and S. areas, promoting an aggressive policy towards the Soviet Union and supporting military operations in China. The Indian judge (Mr. Justice Pa) entered a dissenting judgment recommending a verdict of 'not guilty on all counts.' The members for France and the Netherlands also entered a dissenting judgment. The President, expressing an opinion differing in certain ways from the majority judgment, said that the crimes of the Jap. accused were far less heinous, widespread, and extensive than those of the G. accused at Nuremberg. He expatiated on the implications of the Jap. Emperor's responsibility. The authority of the Emperor (he stated) was proved beyond question when he ended the war on Aug. 14, 45. The outstanding part played by the Emperor in starting and ending the war was the subject of evidence led by the prosecution, yet the prosecution made clear that he would not be indicted. He thought that a Brit. court would, in passing sentence, not forget that 'the law in crime,' though available for trial, had been granted immunity and if, in a case, the court must by law impose punishment, the prerogative of mercy would probably be exercised to save lives of the condemned. On the charge of committing atrocities, the tribunal found that torture, murder, rape, and other cruelties 'of the most inhuman and barbarous character' were freely practised by the Jap. army and navy. Atrocities were committed in all theatres of war on a scale so vast and on so common a pattern that the only conclusion possible was that those atrocities were either fully ordered or wilfully permitted by Jap. gov. or by the leaders of the armed forces. The death rate among prisoners in Jap. hands was 27 per cent as against 4 per cent of allied prisoners taken by the Ger. and It. armies. Captured men were murdered in the hope that 'fate would discourage the allies from joining J.' At Balikpapan (Borneo), 10,000 white pop. was murdered because oil wells were not surrendered intact; some were killed by having their arms and legs chopped off by swords. Vivisection was practised on prisoners. Toward the end of the war cannibalism was practised. The evidence showed that of the massacre, were ordered commissioned officers, some of them gen. and admirals ; and early in the war had instructed commanders of prisons that they must

not be 'obsessed by mistaken ideas of humanitarianism' to all protests from the allies over the treatment of prisoners, the Jap gov returned only lying or evasive answers. When the end of the war was in sight a determined effort was made by the Jap gov to assist its criminals in avoiding punishment and orders were issued for the burning of all documents and permission given for persons who had maltreated prisoners 'to flee without trace'. The proceedings of the tribunal covering the activities of nearly a score of different cabinets reveal the unyielding determination with which the rulers of J endeavoured to safeguard that oligarchic system which they termed the national polity. It was clear to them that even if they were defeated the old J would be able to emerge again provided that the national polity was not destroyed—for them the pivot of the national polity was the maintenance of the imperial system.

The seven Jap leaders who were condemned to death at the trial were hanged on Dec 23. All but Tojo appealed against their conviction and sentence to the Supreme Court. Gen MacArthur had stayed the executions pending the appeals. The Supreme Court considered that it could not let the appeals nor interfere in the execution of the sentences, the ground of the decision being that the Tokyo Tribunal is not an American court.

**Japanning**, art of finishing in colours the surfaces of iron, wood etc the varnish being first hardened on in tins or hot chums. The process is so called from imitation of the elaborated lacquering often in which however, is far more brilliant and beautiful as well as durable. In ordinary japanning work the pigmented oil style of the work is black jay which consists of asphaltum mixed with turpentine and linseed oil. Several coats of the mixture being applied, allowed to dry separately, afterwards rubbed down with powdered pumice and then polished. After polishing a brilliant black is shown. Japanned works are usually of iron and tin has been boxes, trays, caskets, etc.

**Japan**, Sea of, bet the islands of Jap and from Korea and Siberia. It is almost tideless and lies about 600 m from E to W and 4 from N to S with an average depth 200 fathoms.

**Japheth**, one of the sons of Noah the youngest according to v 32, but the second according to iv 21. He is the father of one of the great divisions of the nations of the world (see ETHNOLOGY). Among his sons was Javan, the ancestor of Ionians. The name Japhetic has been loosely applied to peoples of European stock who are now classed as Aryan and Semitic.

**Japonica**, *Cydonia japonica*, well known shrub of the order Roso, indigenous to Japan and China. It was introduced to Britain by Lord J Petre in the eighteenth century. It is single and double white, red, orange flowers. Crowned as an ornamental plant.

**Jaque-Dalcroze**, Emile (1865), Austrian composer, b in Vienna. Studied under Kuchs and Bruckner in Vienna, and under Debussy in Paris. Prof of music, Geneva Conservatoire, 1892, where he evolved his educational method, the *Gymnastique rythmique*, a system of musical and gymnastic training which has won world wide fame. Institutions for teaching his system have been opened at Hildesheim, near Dresden, in Geneva (his headquarters), Paris, and London. He has written many delightful and original songs and compositions full of melody. His operas include *Sancho*, *L'œuvre de Bergame*, *Bonhomme Judis* and *Janus*; his songs are collected in *Chansons populaires* and in *Chansons et Jingles pour enfants*. He has written *Simphonies* (1912) and *La Musique et nous* (1915).

**Jargoon**, name applied to certain varieties of zircon which can be cut as gems, but are not of the reddish colour of the gemstone. Some are colourless and others are tinged with green yellow or red the lustre being very much that of a diamond.

**Jarnac**, tn in W France dept Charente on the left bank of the Charente 7 m S.E. of Cognac. Brandy wine and wine cellars manufactured. Louis Prince de Condé was killed here in the victory of the duke of Anjou over the Huguenots (March 13 1569). Pop 1000.

**Jarnach**, Philip (1852), composer of Spanish parentage b at Noy-sous-France. Studied at the Conservatoire. Educated at Noy and in music under Rasker for piano and under Lavignac for musicology but finally self taught. Taught at the Zurich Conservatoire 1918-21 and later, in Berlin. Disciple of Busoni and composer rather than national. Has composed birds and songs for piano and violin including *Winter Idylls*. *Le Jucy to a Townsman* and *Prelude for theuthus*.

**Järnefelt**, Armas (b 1863) a Finnish composer born at Viipuri (Viborg) studied under Busoni and Massenet in Berlin and Paris respectively. Became conductor of the opera and head of the conservatoire at Viipuri and then at Helsinki, becoming court conductor in Stockholm. His written orchestral and choral music.

**Jaro**, a tn of the prov of Hlolo. Philipine Is 4 m N.W. of the cap. Hlolo. It has a large trade in sugar and agricultural produce. Until 1908 it was part of the tn of Hlolo. Pop 11,000.

**Jaromer**, or Jaromierz, tn in Bohemia, Czechoslovakia on the R Elbe 68 m N.E. of Prague. There are remains of Roman and Jute. Pop 3,000.

**Jarosław**, see JAROSLAV.

**Jarosław**, tn in Galicia Poland, on the R San 60 m N.E. of Lvov and about 20 m N. of Przemyśl with which it is connected by rail. It has manufactures of confectionery, cloth, pottery and brandy. Pop 21,000.

**Jarrah**, or *Eucalyptus marginata*, also known as the mahogany gumtree. It is a species of Myrtaceae indigenous to S.W. Australia, and is much valued on account

of its wood, which is used in building and furniture making.

**Jarrow**, industrial tn and municipal bor in the co of Durham, England, situated on the Tyne about 6 m N of New castle and 1 m S of S Shields. St Paul's church, once the church of the monastery associated with Bede, contains part of the original building, and nearby are some monastic ruins. The tn is essentially part of industrial Tyneside and the present industries include sectional steel rolling, steel casting, special refined iron manuf., ship repairing, oil installation, slag crushing and preparation for road work, patent wagon axlebox manuf., light electrical accessory manuf., bakers' oven and ancillary equipment production, metal box manuf. and general engineering products.

Although it probably had a Roman occupation, J derives its name from the Saxon word *garra* or *gar* meaning a marsh or fen, the marsh being J slake (corruption for J Lake), an estuary of the Tyne on the E side of the tn. J, however, is much better known as the home of the Venerable Bede who entered the monastery founded by St Benedict Bishop (q.v.) at J. In consecration of the Abbey in AD 680 and remained there until his death in 735. The *Codex Bezae Cantabrigiae*, one of the finest mss of the Scriptures, was written by Bede at J. Bede earned also in the arts and sciences. Bede also taught the art of glass making and iron founding. Although despoiled by the Danes and others, parts of the monastery still stand in ruins adjacent to St Paul's church. Little is known of J from the time of Bede until the nineteenth century. In 1803 a colliery was started by Simon Temple, but it closed down (c. 1815) after three explosions. Contemporaneously the winning of salt by evaporation of huge pans of sea water was a flourishing industry in J. Coal from J was now brought to bunk at Boldon colliery. The ships and for which J was again to become famous, was started by Charles Wark Palmer (afterwards Sir C. M. Palmer and first Mayor of the bor.) and his brother George in 1822. In this shipyard the first practicable iron screw collier was launched (1842) and numerous warships of all classes were constructed, the first being H.M.S. *Terror* (1811 tons), the first ironclad with rolled plates, in 1856, and the largest H.M.S. *Queen Mary* (27,000 tons), which was lost in the battle of Jutland in 1916. The Palmer Works grew from the shipyard commenced in 1852 to a shipbuilding and iron works covering 140 ac. and employing up to 10,000 people. No fewer than 900 ships of a total displacement of 2,000,000 tons were launched from J. until 1933 when the works were closed. In 1934 the yard was sold subject to a restrictive covenant against shipbuilding therein for a period of 40 years, the object being to eliminate wasteful competition, but during the Second World War this covenant was waived in the national interest and ship repairing again commenced in the yard. The decade 1930 to 1940 was one of great

unemployment in J with three quarters of the working pop. unemployed, and strenuous efforts were made to bring back industry to the tn. Eventually J. was included first in the Special Area of Durham and Tyneside, and the site of the Palmer Works was purchased by the Special Area Commissioner and new industries began to be set up on the site, particularly through the efforts of Sir John Jarvis M.P., who turned his attention to the development of furniture-making, ship-breaking, manuf. of hot and cold rolled solid drawn tubing, the production of steel and alloy castings, and general engineering. In 1946 the Tyne Tunnel Bill was passed to authorise the construction of a tunnel of tunnels under the Tyne between J and Wallsend. Three tunnels are to be constructed—a 1230 ft long pedestrian tunnel with a twin tunnel alongside for vehicles, and a vehicular tunnel quite separate from the other two. Excavation began in 1947 and the N (Howdon) and S (Jarrow) workings were joined in 1949. In the 1911-18 War the Palmer Works were bombed in 24 different raids with some loss of life. In the Second World War the bor was bombed on sev. occasions with a death roll of 8,200 houses being destroyed. A development plan for the older part of the tn was adopted by the council in 1944. Pop. 26,500.

**Jasher** (i.e. Jashar), **Book of, or Book of the Upright**, one of the most important of the lost works of the Jews. It is twice quoted in the canonical books of the O.T., and it is noteworthy that each quotation is poetical in form. In Joshua 13, the passage telling how Joshua commanded him to sit and still over Gibeon and the moon over Ajalon is quoted from the B of J. So also is David's lament over Saul and Jonathan in 2 Sam. 18. From these it is deduced that the book in question was a collection of songs, more secular than religious, dealing with the exploits of Israelish heroes. Various Talmudic authorities have attempted to identify it with one or other of the early canonical books, but with no effect. It is a separate production of the post-Solomonic period, probably containing, however, many poems of earlier date which also occur in Exodus, Judges, Samuel, etc. During the later Middle Ages three Jewish works appeared claiming to be the lost B of J, and in 1751 there appeared an astounding forgery purporting to be a translation into Eng. by Akiba.

**Jashpur**, trib. state of the Central Prov. India. In the bed of the R. Bh. the most important riv. of the state, are found diamonds and gold. The state also produces iron, silk, lac and beeswax. The area is 1965 sq m. Pop. 132,000.

**Jasione**, genus of plants of the order Campanulaceae. Two species are found in Europe and in Mediterranean dists., one of them *J. montana*—Sheep's bit or scabious—being native to Britain. It grows in hedges and has blue flowers of fine shades.

**Jasmin**, **Jacques** (1798-1864), known as the 'Barber Poet of Agen', a Provençal whose real name was Jacques Boé. His

first vol. of poems, called *Papillotes* (Curl Papers), was pub. in 1825, containing some verse in Fr., but mostly in the Provençal 'patois.' These 'patois' poems are generally in the form of short epic narratives, both grave and gay, dealing with familiar scenes of the peasant-life in which he took part, and marked by spontaneity and simple grace of diction. J. is now generally considered the direct forerunner of Mistral, and the *Péti-brige*. Four successive vols. of the *Papillotes* were pub. during his life-time and contained the famous poems 'Charivari'; 'My Recollections'; 'Martha the Simple'; 'The Twin Brothers'; 'The Blind Girl of Castel-Cuillé' (trans. into Eng. by Longfellow, and set to music by Coleridge-Taylor, 1901); and 'Francoisette' (trans. into Eng. by J. D. Craig in his *Poets and Poetry of the South of France*, 1866). See L. Rabau, *Jasmin, sa Vie et ses Œuvres*, 1867; F. De Montroud, *Jasmin Poète* (2nd ed.), 1876; J. Andrien, *Jasmin et son Œuvre*, 1881; C. A. Sainte-Beuve, *Portraits contemporains*, 1870; J. Smiles, *Jasmin, Barber, Poet, Philanthropist*, 1891; X. Cardaillac, *Propos Gascons: Jasmin*, 1898; and P. Marieton, *Jacques Jasmin*, 1898.

Jasmine, or Jessamine, term applied to the various species of *Jasminum*, a genus of Oleaceae. There are between one and two hundred of these shrubs, most of which bear sweet-scented flowers followed by a fruit which is vertically divided in two. *J. officinale*, the common J., grows in Europe and Asia. Besides the true J. there are many very different plants to which the name is given. Thus *Gardenia florida*, a species of Rubiaceae, is known as Cape J.; *Gelsemium sempervirens*, a species of Loganiaceae, is the Carolina J.; *Plumeria rubra*, a species of Apocynaceae, is the jasmine-tree; *Calotropis procera*, an asclepiadaceous plant, is the Fr. J.

Jason: In Gk. mythology, the leader of the Argonauts, was a son of Æson, king of Iolcus. His half-brother, Pelias, drove him from the kingdom, and he was educated by the Centaur Chiron. Pelias was warned by oracle against the man with one sandal. When J. came to claim his kingdom, he entered the mkt.-place with one sandal, and Pelias, recognising the omen, sent him in search of the golden fleece. J., by the help of Medea, secured the fleece and returned with her in the *Argo*. Medea, pretending to restore youth to Pelias, persuaded his daughters to dismember him and place the member in a cauldron. J. and Medea were expelled. Finally J. forsook Medea for Glauce, and Medea in revenge slew the new bride and her own children by J. For a graceful popular account, see Charles Kingsley's *Heroes* ('The Argonauts').

Jason, name of Gk. origin in common use among the Jews. J. was a favourite equivalent of Heb. Joshua. There are sev. J.'s mentioned in the Apocrypha, and one in the N.T.: (1) Of Cyrene, a Hellenistic Jew who probably lived in the second half of the second century B.C., and was the author of a hist. of the times of the Maccabees down to the victory over Nicanor

(175-161). (2) The second son of Simon II. By means of a bribe to Antiochus Epiphanes he managed to usurp the high priesthood of his brother, Onias III. (Antioch II.). Another bribe enabled him to set up a gymnasium in Jerusalem to enrol the inhabs. of Jerusalem as 'citizens of Antioch.' He subsequently died in exile (see 2 Macc. iv., v.). (3) The son of Kleazar, sent by Judas to Rome (1 Macc. viii. 17). He is probably the J. who is mentioned as the father of Antipater (1 Macc. xii. 16). (4) Of Thessalonica, was the host of St. Paul in that city and his surety with the magistrates (Acts xvii. 1), and, according to tradition, bishop of Tarsus. He may be identical with the J. of Roms. xvi. 21, Paul's 'kinsman.'

Jaspar, Henri (1870-1939), Belgian statesman and premier from 1926-31. A member of the Catholic Party he was intimately associated with the post-war reconstruction of Belgium as minister of economic affairs. Subsequently became foreign minister and then Premier. In 1929 he became permanent president of the Reparations Commission.

Jasper, crypto-crystalline form of silica, usually opaque, though contained argillaceous matter. It is related to flint, chert, and chalcedony, and is found in veins and cavities in igneous rocks from which it is derived by decomposition. Through the admixture of oxides and silicates of iron its colours vary from red, brown, yellow, to green. The Jasper of antiquity was apparently a brilliant green translucent form, and the name was evidently applied to forms of chalcedony. The ribbon J. of Siberia has well-marked red and green stripes. Egyptian J. usually occurs in brown nodules in the Nile valley and Libyan desert. A rather rare form of the mineral is termed porcelain J., and it is distinguished by minute holes and a multiplicity of cracks; it has evidently been so altered by being baked *in situ*.

Jasper Park, largest national park in the world, situated in N. Alberta, Canada, has an area of 4,521 sq. m. It was estab. in 1907. It is connected by road with Banff national park over the Columbia Icefield Highway and glaciers come right down alongside. The park is reached from Edmonton by train on the main line of the Canadian National Railways. A curious point in relation to the hist. of the park is that it was named after a yellow-headed if otherwise obscure young fur-trader from Missouri.

Jaspers, Karl (b. 1863), Ger. philosopher and psychiatrist, b. at Oldenburg, son of Karl J. a bank director. He was educated at the Humanistisches Gymnasium, Oldenburg. He became a *Privatdozent* at Heidelberg in 1913 and prof. there in 1916. He has been Prof. of philosophy Basel Univ. since 1948. During the Second World War J. never made the slightest concession to the Nazis and courageously upheld the great traditions of W. civilisation, symbolised for him by such names as Goethe, Jacob Burckhardt, Kierkegaard and Nietzsche. The address which J. delivered on the occasion of his

being awarded the Goethe Prize of the city of Frankfurt (Aug. 1947) indicates his unequivocal search for truth and his profound understanding of the spiritual and moral needs of our age. This is exemplified in his book *Von der Wahrheit*. As an existentialist philosopher he shows much more balanced and responsible thought than Heidegger and sev. other existentialist philosophers. His pub. works include *Psychopathologie* (1913, 1916), *Psychologie der Weltanschauung* (1919, 1926), *Philosophie* (1932), and *Von der Wahrheit*, 1948. See E. L. Allen, *The*

Group under Gen. Malinovsky attacked the strong positions covering J. These positions were based on two riv. lines defended by a network of intricate strong points, with a reserve line in the wooded heights behind J. But the impetus of the Russian attack carried all before it, and though there was street fighting after the Russians entered the tn. it fell to them on Aug. 22 after a three day battle which broke the Axis line to a width of 75 m. and a depth of nearly 40 m. between the Serezh and Pruthi. Pop. 109,000. Jastrowie, (Ger. Jastrow), tn. in Poland,

Canadian Government

## MALIGNE LAKE, JASPER NATIONAL PARK

*Self and its Hazards. An Introduction to the Thought of Karl Jaspers*, 1949.

Jassy (Jasi, Yassy), chief tn. of Prut, Rumania, 5 m. W. of the R. Pruth and the Russian frontier. It was nearly destroyed by fire in 1822, but was rebuilt on a modern plan. It is the seat of the Gk. Orthodox metropolitan of Moldavia and of a Rom. Catholic archbishop, and has a univ. (founded 1864). J. has a trade in petroleum, salt, metals, timber, cereals, fruit, wine, and cattle. Here was concluded the peace between Turkey and Russia in 1792. From 1564 to 1879 J. was the cap. of Moldavia. In the First World War, when much of Rumania fell to the Central Powers, the Rumanian Court remained at J. throughout the period of these reverses. In the Second World War, in the course of the Russian offensive against Ger and Rumanian forces launched on Aug. 20, 1944, the second Ukrainian

52 m. W N.W. of Bromberg (Bridgo+cz). The chief industries are spinning and weaving. Pop. 5900.

Jaszapati, tn. of the co. Jasz, Hungary, 52 m. E. of Budapest. The chief industries are agriculture and horse-breeding. Pop. 11,000.

Jaszbereny, tn. of the co. Jasz, Hungary, 10 m. E. of Budapest. It has manuf. of wine and cloth. Pop. 26,500.

Jasz-Nagykun-Szolnok, co. in Hungary, watered by the Tisza (Theiss). The chief tn. is Szolnok. Area 2074 sq. m. Pop. (co) 251,000.

Játaka, name used to designate the legends which recount the 550 incarnations of Buddha. These fables are widely disseminated throughout India, and occur in various disguises in the folklores of nearly all European countries. See V. Fausboll (ed.) and T. Rhys Davids (trans.) *The Jataka, with its Commentary*,

1877-91; and *Buddhist Birth Stories*, 1880; E. B. Cowell, *The Jataka*, 1895; J. J. Meyer, *Twice Told Tales*, 1903.

**Jath**, India, native state in the Deccan div. of Bombay. With the small state of Daphlapur, it forms the Bijapur agency, covering an area of 980 sq. m. The prin. industries are agriculture and cattle-rearing. Pop. 75,000. The tn. of Jath has a pop. of 8000.

**Jativa** (nuct. *Sesetabis*), city, prov. of Valencia, Spain. In Rom. times it was famous for its linen. It is picturesquely situated on the R. Albaida. Its chief products are fruit, rice, oil, and wine. Pop. 12,767.

**Jatropha**, genus of Euphorbiaceae, occurs in tropical and sub-tropical countries, but is found most frequently in America. There are seventy species in all, sev. of which yield a valuable oil. *J. podagrica* is a curious species with a thick swollen stem, and is often cultivated in greenhouses.

**Jats**, people of N.W. India, and Pakistan. They form a considerable portion of the pop. of E. Punjab, Rajputana, and the adjacent dists. of the United Provs. Two states of Rajputana—Bharatpur and Dholpur—are under Jat rulers. Hindu legends seem to point to a pre-historic occupation of the Indus valley by this people. The J. are mainly agriculturists and cattle breeders. They are very dark in colour, and have regular features. In religion they mostly follow the Sikh or Mohammedan faith.

**Jawer** (Polish *Jawor*), tn. of S.W. Poland 35 m. W. of Wrocław. Before the Second World War it produced saw-ages and grain and manufactured machinery, carpets, leather, etc. There are interesting old churches and a palace of the former princes of J. Pop. 12,700.

**Jauja**, or *Atanajaja*, tn. on the riv. of the same name, in the dept. of Juam, Peru, 115 m. N.E. of Lima. Silver mines occur in the prov. Pop. 3100.

**Jaumave**, tn. and com. in the prov. of Tlaxcala, Mexico, about 30 m. S.W. of Ciudad Victoria. Large quantities of textile fibre are grown in the J. valley. Pop. 10,000.

**Jaundice**, symptom of disorders of the system, rather than a disease, and is caused by the presence of the colouring matter of bile in the blood. It causes the skin and the conjunctiva of the eye to become yellow hence its name, from Fr. *jaune*, yellow. The urine becomes very dark, varying from saffron to porter in colour, and the faeces become of a drab or slate-grey hue. Sometimes in addition to this there is extreme itching of the skin. J. may be caused in two ways, (1) the most common being when the bile duct is obstructed, and (2) when there is no obstruction. The first is known as hepatogenous, and the second as hematogenous J. In the first the biliary mechanism, and in the second the blood, is at fault. The first may be caused by the presence of gall-stones in the bile duct (see CALCULUS), by catarrh and swelling of the lining membrane or of the duodenum or by the pressure of growths of neigh-

bouring parts of the pregnant uterus, or of accumulations of feces in the bowels. This causes the bile to be retained and absorbed in the blood, and so the coloration arises. The second class of J. may be caused by severe mental emotions, like anger and fright, by certain snake and other poison, and by certain diseases like pyæmia, typhus fever, and in particular by yellow fever. The cause of yellow fever is a virus whose presence allows the bile pigments to continue to circulate in the blood. In cases of obstruction by gall-stones, catarrhal J., and by pressure of the pregnant uterus or of feces in the bowel, or congestion of the liver, recovery is comparatively certain. It is more serious when resulting from cirrhosis of the liver and tumour of the liver; and when it results from acute diseases or from poisoning, it is a very serious symptom.

*Weil's disease*.—J. is a common sign of this spirochetal infection. The spirochaetes are excreted in the urine of rats and penetrate the skin of workers in sewers and people in similar occupations.

*Malignant jaundice*.—A rare form of non-obstructive J. which accompanies yellow atrophy of the liver, in which the liver shrinks greatly and the liver cells disintegrate rapidly, resulting in a very speedy death.

**Jaunpur**, cap. of a dist. in the United Prov., India, and is situated on the R. Guntl. It was originally the cap. of a Muslim kingdom, and contains certain mosques, the remains of the fort, and other similar structures. The riv. here is crossed by a bridge built in the sixteenth century. Pop. 330,000.

**Jauréguerry, Jean Bernard** (1815-87), Fr. admiral who served with distinction in the Franco-Ger. War. He was b. at Bayonne, entered the navy (1831), and subsequently served in the Crimea and in China. He was minister of marine from 1879-80, and from 1882-83.

**Jaurégu y Aguilar, Juan de, Chevalier de Calatrava** (c. 1570 c. 1649), Sp. poet and painter. He visited Rome (1607), and produced a verse trans. of Tasso's *Aminta*. His *Rimas* appeared 1614, the *Discurso poetico* (1623), assailing the Gongoristic movement, yet Gongora's style influenced his *Orfeo* (1621), and especially his trans. of Lucan's epic, *Pharsalia* (1645). See H. Ticknor, *History of Spanish Literature* (1849); F. Quillet, *Des poètes espagnols*, 1816; L. de Sedano, *Parnaso español*, I., 1768-73; M. Rivadeneyra (pub.) *Biblioteca de autores españoles*, xlii. 1849.

**Jaurès, Jean Léon** (1859-1914), Fr. socialist statesman and man of letters, b. at Castres in the dept. of Tarn. In 1883 he was appointed to the chair of philosophy at the univ. of Toulouse; but he resigned his professorship on his election in 1885 to the Chamber of Deputies. He embraced the cause of the employees in the Carmaux strike. He became the recognised Socialist leader in the Chamber in 1893, and was one of the chief champions of Dreyfus. In 1902 J. became vice-president of the Chamber. His chief

work in the *Histoire Socialiste 1799-1900*, pub in 1901. He was in England the best known of the socialists. On July 16, 1914, he proposed the resolution carried at a socialist conference in Paris, in favour of a general strike to prevent war. He was assassinated in the Rue du Croissant by shooting July 31, on account of his efforts for peace. See C. Rappoport, *Jean Jaurès*, *L'Homme le Penseur le Socialiste* 1915. L. Lévy Bruhl *Quelques Pages sur Jean Jaurès* 1921 and *Jaurès* by G. Lévy 1915, L. Soulé 1921. L. Lévy Bruhl 1924 and J. Jackson 1943.

**Java** one of the larger is of the Dutch E. Indies in that portion of the Malay Archipelago known as the Sunda Is. Its extreme length is about 600 m. breadth 120 m. and it covers an area (with Madura a small is. off the N.E. coast) of 51,030 sq. m. It is washed on the N. by the Sea of J. on the E. by the Strait of Bali on the S. by the Indian Ocean and on the W. by Sunda Strait. The coast line is little developed and from end to end of the I. there is a mt. chain called Gunung Kendang. Alluvial plains extend along the N. coast and towards the S. Java falls steeply towards the sea. Many of the volcanoes in the mts. are still active and the highly volcanic character of the country helps to explain the great fertility of the soil. In 1913 there was a severe eruption of the Merapi volcano, some 700 persons being killed. Numerous rivers flow from the N. and S. sides affording supplies to artificial water courses and carrying fertility with them, only two, however, are navigable for large boats. The climate is rather hot and unhealthy on the coast but salubrious and pleasant in the hills; the more elevated regions being remarkably healthy. The days are, as a rule, hot, but moderated by land and sea breezes. The rainy season lasts from Nov. to March. The range of J.'s vegetation follows that of its temp. and is one of astonishing fertility. The coast is fringed with coconut trees and the ground behind them to the foot of the mt. chain is well cultivated. There are large rice fields and sugar plantations and cotton, cinnamon and tobacco are freely grown and many parts of the coast are fringed with mangrove. Further inland are found palms, tree ferns and screw pines. In the forest region the trees are richly clad with ferns and enormous fungi, and consist mainly of teak. The most noted Javanese plant is the heftik or upas, the famed poison tree. Many of the loftiest trees are crowned with blossoms, and shrubs and herbaceous plants give brilliant effects at the edge of the forest and the sides of the highways. Rhododendrons, magnolias, myrtles, orchids, pitcher plants etc. abound and it is estimated that the total number of species of Javanese plants is over 5000. J. is not so rich in fauna—lions, rhinoceros deer and wild swine are the chief of the quadrupeds. Few species of crocodiles and serpents are found, and of birds there are only a few conspicuous for their plumage and none distinguished by their song. Insects cover the ground and plants in

countless numbers. The pop. of J. is almost entirely agric. and is distributed over the is. in villages each governed by a native chief of its own choosing. Scattered all over the is. are many agric. estates chiefly owned by European and Chinese agric. companies, but the greater part of the soil of J. belongs to and is cultivated by the natives. Rice forms the staple food of the natives and is raised in large quantities; coffee and sugar also form staples of the is. Other native cultivated crops are maize, cassava, sweet potatoes, groundnuts and soyab. beans, and cotton in large quantities; pepper, tobacco, tea, coconuts and cinnamon are likewise cultivated with varying success. The natives consist of the Javaneses proper, the

E.A.A.

## JAVA A PADDY FIELD

Indonesians and the Madurese and the pop. is 43,000,000, of whom less than 14,000 are Europeans. It is one of the most densely populated countries in the world. The Javaneses are small in size, of a yellowish hue, with brown or black eyes and long, dark, coarse hair. Their lips are thick and teeth naturally white. They are a sober, patient race and easily led in most matters. J. is ruled by a governor general or vice roy, who has command both of army and navy in all the Dutch provinces of the Indian Archipelago. Batavia is the seat of govt. where there is a high court of appeal. The governor general is assisted by an advisory council of four to six members, of an advisory character. The members of the Council, however, have no share in the executive. The governor general and the members of the Council are nominated by the Sovereign of the Netherlands. In 1918 a Volksraad

was installed to discuss the budget and advise the gov. of which in 1923 the Dutch E. Indies were granted a measure. The 'Volksraad' and the governor-general share the legislative powers between them. In 1940, when Holland was overrun by the Germans, the Dutch E. Indies became the seat of the Dutch Govt. in conjunction with representatives in London, and it was for J. and the other colonial possessions that the Dutch carried on the war against Japan for a short time; but eventually the Jap. gained complete control of all the Dutch E. Indies. The natives are under native tribunals, superintended by Europeans in certain instances, and schools for primary instruction have been estab. at Batavia and other prin. tns. There are also public secondary schools in connection with the primary schools, and High Schools for Technology, Law, and Medicine.

Mohammedanism is now the prevailing religion in J.; but before its introduction at the end of the fourteenth century Brahmanism and Buddhism had prevailed. Among the Buddhistic ruins is the famous temple ruin of Borobudur built about A.D. 750. The art of J. was chiefly developed under Hindu influence and the early drama strongly suggests Indian origin. J. exports chiefly sugar, coffee, tea, rubber, quinine, and tapioca, mattan and petroleum products. Rice is grown extensively but does not suffice for local consumption. In 1937, the total exports from J. and Madura were valued at over 1,000,000,000 guilders. Imports were valued at half that figure. There was before the Second World War, a weekly mail service by luxurious Dutch boats to and from Holland; and regular steamship connection with Singapore and other neighbouring ports, as well as with Australia, China, Japan, and Brit. India. The railway system of J. is highly developed and covers practically the whole of the is. There were regular air services between Batavia, Sumarang, and Surabaya, and also between Batavia and Medan.

*History during and after the Second World War.*—Following the Jap. naval victory of Feb. 27, 1942, in the battle of the J. Sea, J. was occupied by the Japs. Palembang was raided by allied aircraft at times but otherwise J. was not the scene of any fighting in the war. After the Jap. surrender in Aug. 1945 the Dutch, having no ships or troops to spare were unable to resume possession of the is. and the internal situation was complicated by a widespread Indonesian revolt against the small allied forces which tried to enter on behalf of the Dutch. Before the war there was a Nationalist movement in the E. Indies as in other regions of Asia ruled by the W. Powers. During the war the Indonesian Nationalist leaders took office under the Japs. in various Jap. sponsored organisations. Late in 1944 Japan made a formal promise of independence to the Indonesian nationalist leader, Dr. Soekarno and, after the Jap. surrender, Dr. Soekarno publicly announced that Indonesia was a sovereign independent

republic. When the Japs. saw that they were to lose the war they gave every encouragement to the independent movement in order to complicate the position for the allies, and to that end they gave much of their military equipment to the Indonesians. The latter, seeing the difficulties of the allies, made the most of their opportunities and by the time the first allied troops were ashore, they had gathered nearly all the reins of power into their hands, besides drawing up a republican constitution with Soekarno as President. In the meantime the Dutch were dependent on the Brit. The original purpose of the despatch of Brit. forces to J. was to arrange on behalf of the United Nations for the disarming of the large Jap. garrison and for the safety of the Dutch and Eurasian prisoners of war and internees. But these tasks were greatly complicated by the action of the Japs. in handing over stores of arms to the Indonesian 'youth' movements and encouraging Indonesian nationalists to occupy the administrative posts which they themselves had to relinquish on their surrender. Thus inevitably the Brit. forces became involved in local politics, with the unenviable task of trying to reconcile two incompatible responsibilities—respect for the position of their Dutch allies and respect for a nationalist movement of the very type for which Britain was making provision by the announcement of a new policy in India, Burma and Malaya. Queen Wilhelmina's policy, outlined in Dec. 1942, provided for an imperial conference after the war, to settle the future relationship between the component parts of the Dutch empire; but the Netherlands gov. failed to appreciate the hold which the Nationalist movement had gained in J. and the initial negotiations were prejudiced by the reluctance of the Hague to deal with men rather hastily discounted as 'quintings.' By the time a new Indonesian cabinet had been formed from men who had a good record of resistance to the Japs. and the Dutch proposals were advanced in a more conciliatory spirit, the temper of the Nationalist leaders had hardened and, by the late autumn of 1945, there was but little hope of inducing the main parties to come to the conference table.

Fighting in Surabaya between Brit. troops—chiefly Mahratta and Rajputana infantry—commanded by Brig. A. W. F. Mallaby, and the Indonesian extremists broke out at the end of October, following the announcement by allied leaflets that a military gov. was to be instituted. This outbreak postponed indefinitely the political talks which had been arranged to take place in Batavia between Dr. van Mook and the Nationalist leaders. Towards the end of Nov. there were two divs. of Brit. troops in J. and their difficulties arose less from the resistance of the extremists, which was both unskillful and fanatic, than from a desire to spare Indonesian lives and to avoid the development of a racial war. Brig. Mallaby the Brit. commander in Surabaya was murdered on Oct. 30 when discussing

with local Indonesian leaders the details of a cease-fire agreement. Gen. Sir Phillip Christison, the allied commander in the Netherlands E. Indies, then broadcast a warning that unless the Indonesians who had broken the truce surrendered he would bring the whole weight of his forces against them. Brit. destroyers arrived at Surabaya, in and around which in there were some 15,000 armed Indonesians, in order to evacuate Dutch women and children. Soekarno expressed regret at the murder of Brig. Mallaby but the murder by extremists over whom he had shown he had but slight control was the worst set-back yet suffered by the independence movement. Troops of the 5th Indian Div. then arrived in force in J. from Singapore and some battalions, with armoured units, were posted to Surabaya.

The political situation was further complicated at this time by the announcement from the Hague that Dr. van Mook, the Dutch political and administrative head in J., was negotiating with Soekarno against the instructions of the Netherlands Gov. But on Nov. 6 van Mook announced the main points of a declaration of policy, making provision for an Indonesian Commonwealth. But with war in progress and the Dutch thinking in terms of war, such a declaration which might have been effective earlier, now signified next to nothing and indeed Soekarno, who now feared trouble if the Dutch regained control, rejected the local gov.'s terms. Many Indonesians were killed in tactical charges against Brit. tanks in Surabaya manned by Mahatta troops. Indonesian-manned Jap. tanks fired at the 5th Indian divisional headquarters but were soon silenced. Various Indonesian headquarters were bombed and demolished. There was now evidently disunity among the Indonesians; for a new group of Nationalist leaders, headed by Sjahrir and Amu Sjarifudin announced that they would meet Brit. but not Dutch representatives. But fighting continued in Surabaya, Semarang, and other places. Rocket-firing aircraft of the R.A.F. put out of action the wireless stations at Surakarta and Jogyakarta, which had been used for violent propaganda against the Dutch, the Brit., and the more moderate Indonesians. Indonesian terrorists attacked a camp for interned persons at Ambarawa killing women and children. There was fierce fighting (Nov. 26) near Ambarawa between Gurkhas and Indonesians. Meanwhile the national convention of the republican movement continued its leisurely and academic deliberations and soon the main centre of troubles shifted to Bandung. Rocket-firing Mosquitos and dive-bombing Thunderbolts were used against the Indonesians in S. Bandung. In April of the next year Lord Inverchapel arrived as mediator and, as a result Indonesian envoys and Dr. van Mook the governor-general, went to the Hague for negotiations. It was agreed that an Indonesian republic should be formed as part of the Commonwealth of the Dutch E. Indies within the circle of the whole Dutch

realm. This was based on the charter proclaimed by Queen Wilhelmina in Dec. 1942 to give equal status and equal rights of citizenship to all parts of the Dutch realm. The Dutch would not, however, agree that the projected republic should extend beyond J. to include Sumatra, the Celebes, Moluccas, and other is., until the wishes of the natives were known. Dr. Sjahrir then went off to lay the Hague agreement before Soekarno, and returned, after a long time, with counter proposals which rejected everything agreed at The Hague and demanded the formation of an entirely independent Indonesian Republic, to include all the Dutch E. Indies, thus repudiating all thought of a federative scheme. In view of Soekarno's bad record in the war, it was not surprising that negotiation was difficult if not impossible. Soekarno had hastened to collaborate with the Japs. . he was president of their puppet gov. in J. and was decorated by them. A fiery orator, with no constructive ability, the Dutch naturally refused to have any dealing with him. All through the year fighting had never ceased and there was continual guerrilla sniping by Soekarno's followers. Meanwhile there were still over 30,000 internees—Dutch women and children, Eurasians and Javanese Christians in the extremist's hands, all of them weak and emaciated to the edge of starvation and subjected to the loss of all self-respect. Yet the men who could thus treat their fellow-creatures (some of them their fellow-countrymen) claimed the right to rule 40 millions of Javanese. The next important development was the draft agreement signed by Dutch and Indonesian delegates at Cheribon (Nov. 18, 1946), by which the Dutch Gov. recognised the gov. of the republic of Indonesia as exercising *de facto* authority over J., Madoera, and Sumatra. The areas then occupied by allied or Dutch forces were to be included gradually through mutual co-operation in Republican ter. and measures were to be taken at once to ensure that this inclusion was completed by Jan. 1, 1949. The Indonesian question, however, was by no means so near settlement as that agreement implied. Indeed the final cease-fire was not jointly ordered by the Dutch and Republican Govs. until Aug. 1949. This order followed the winding up of the 'preliminary conference' of Dutch and Republican representatives held at Batavia before the ensuing round-table conference at the Hague. At the same time an inter-Indonesian conference, held to settle the principles of the constitution of the 'Republic of United Indonesia' as the new state was to be called, reached agreement on controversial issues concerning the inner cabinet and the senate. (See also INDONESIA).

**Javary**, see **JABARY**.

**Java Sparrow**, see **RICE BIRD**.

**Java Sea**, sometimes called the **Sunda Sea**, situated between Java and Borneo, and stretches from the W. of Celebes to the E. of Sumatra.

**Javae**, or **Jabea** (anct. *Xidea*), fn., 45 m. N.E. of Alicante, Spain. Its products are wines, lemons, mandarin oranges, and muscatel raisins. Pop. 6600.

**Javolenus Priscus**, eminent Rom. jurist, b. about the beginning of the reign of Vespasian (A.D. 79). His master was Caelius Sabinus, and he became a leader of the Sabinian or Cassian school. Priscus was a member of the council of Antoninus Pius. See *Pliny the Younger, Ep.*, vi., 15.

**Jaw**, bones forming the framework of the mouth. In man the upper J. is termed the superior maxilla; the lower J. the inferior maxilla or mandible. The latter, the largest bone of the face, consists of a horizontal portion and two upright portions, called the rami. Both Js. bear teeth (q.v.). The closing and opening of the J. is effected by four pairs of muscles, two attached to the outer, and two to the inner side of the ramus of the lower J.

**Jawhar**, state of the Konkan div. of Bombay Prov., India. Area 310 sq. m. Prin. products, teak and rice. The chief vil. is J. Pop. 50,000.

**Jawor**, see **JACER**.

**Jaworow**, tn. of Ukrainian S.S.R. Its chief industries are brewing, distilling, and pottery making. In the famous li. gardens is the castle which was the residence of King John Sobieski, of Poland. Szko near by is known for its sulphur springs. Pop. 15,000.

**Jaworzno**, tn. of Ukrainian S.S.R., 30 m. W.N.W. of Cracow. There are petroleum wells, coal mines, and zinc-smelting works. Pop. about 13,000.

**Jaxi**, see **JACSR**.

**Jay**, or *Garrulus glandarius*, species of the sub-family Garrulinae and of the crow family (Corvidae), and is a native of Europe, while other species of the same genus are found in India and other parts of Asia and in Japan. In the New World the blue Js. (*Cyanocitta*) are found in N. America and *Cyanocorax* in Central and S. America, these latter birds being more blue than the common J. In England the common J. has become rare owing to persecution, and this is the case in Scotland and in some parts of Ireland. It is characterised by a crest of black and white feathers, a black tail, and white and black bars on the wing coverts, its body being a brownish colour on the upper surface and lighter underneath. It has also patches of blue. The Js. are shy and retiring in their habits, and have a screeching cry with the power to vary it by mimicking other birds. They feed chiefly on snails, insects, worms, and nuts. They hide their nests in trees with thick foliage and lay about six or seven eggs at a time.

**Jay, Harriett** (1863-1932), Scottish author and actress, was brought up by Robert Buchanan, the Scottish poet and writer, who married her elder sister. She collaborated with Buchanan in sev. of his works, e.g. *The Shopwalker* and *Two Little Maids from School*, and pub. independently: *The Queen of Connaught* (1875), *Madge Dunraen* (1879), *Two Men and a Maid* (1881), *A Marriage of Convenience*, (1883) and *The Life of Robert Buchanan* (1903). As an actress she also won great distinction.

**Jay, John** (1754-1829), Amer. politician and lawyer, b. at New York. He drew up the constitution of New York State in 1777, and was appointed judge. He became president of the Congress in 1778. In 1789 he was made chief justice of the Supreme Court. In 1791 he drew up a treaty, called the Jay Treaty, whereby the inland trade between the United States and Brit. N. America was properly organised in the interests of both countries. J. became governor of New York in 1795. He was a very able politician, especially in the field of international politics. Lives have been pub. by W. Jay, 1833; W. Whitelocke, 1887; and G. Fellow, 1890.

**Jay, William** (1769-1853), Eng. Non-conformist minister, b. at Tisbury, Wiltshire, England. Early in life he worked as a mason. Cornelius Winter provided for him to be educated as a minister. His devotional writings had a vast circulation in England and America. See G. Redford and J. A. James (ed.), *Autobiography of William Jay*, 1854.

**Jay, William** (1789-1858), Amer. abolitionist, b. in New York. He became a judge in 1818. He founded the Amer. Bible Society (1815), but the greater part of his energies were devoted to anti-slavery interests. The Anti-Slavery Society had in J. one of its most fervent and eloquent members. In 1833 he pub. the *Life and Writings of John Jay*. See B. Tuckerman, *Jay and the Constitutional Movement for Abolition*, 1893.

**Jayadeva**, Hindu poet, best known as the author of the mystic poem, *Gita-govinda*. His date is disputed; Lassen believes he fl. in the twelfth century. He is considered the finest lyric poet of India. See Sir W. Jones, *Poems, consisting chiefly of Translations from the Asiatic Languages*, 1777; Sir E. Arnold, *The Indian Song of Songs from the Gita Govinda of Jayadeva*, 1875; and *Indian poetry*, 1881.

**Jazyges**, Sarmatian tribe, who lived N. of the Sea of Azov. In the first century A.D. some of them settled in Hungary, others N. of the Carpathians.

**Jazz**, name given to the development after the First World War of dance music, a musical idiom deriving in mood, it is claimed, from negro folk-song and based technically on the device of syncopation, that is, on delayed or misplaced accent. The term is often misapplied to what may more accurately be called 'ragtime,' a crude attempt to give vitality to dance music which was practised in England during and immediately after the First World War, and which was remarkable only for

its sterility. J., or, as it has also been called, symphonic syncopation, was introduced into England from America in 1924, when Paul Whiteman's band made a tour of the country. Since then it has developed very rapidly, though only remarkably in the instrumental virtuosity of its exponents. The early jazz musicians, like the early medieval choirs, improvised a rudimentary counterpoint while listening to the melody. But now their tunes are elaborately and variously scored, and the quality of present-day dance bands is to be judged chiefly by the harmonic and rhythmical resources of the orchestrator. Although J. has still to win the approval of serious musicians, it will undoubtedly be part of the social hist. of the early twentieth century. Mr. T. S. Eliot has suggested the effect the internal-combustion engine has had on our perception of rhythms. Something of the sort seems responsible for the popularity of J., combining, as it does, an easily repeated formula of melancholy, very welcome to the emotionally bankrupt or wasteful, with the comforting reliability of a precise engine beat. 'A hypnotised abandonment of self, it has been shrewdly defined, to the exact rhythms of machinery.' See A. Casella, *Il Jazz and Della Musica Necessaria* in 'L'Italia Letteraria,' and reprinted in '21 + 26' (Rome), 1931 and W. Hobson, *American Jazz Music*, 1940.

**Jeanne d'Albret** (1528-72), queen of Navarre, the daughter of Henry, king of Navarre, duke of Albret and peer of France, and Margaret, sister of the Fr. king, Francis I. She married Anthony de Bourbon, duke of Vendôme, and their son Henry became Henry IV., king of France.

**Jeanne d'Arc**, see **JOVN OF ARC**.

**Jeanneer**, Charles Edward, see **LE CORBUSIER**.

**Jeanette**, bor. of Westmoreland co., Pennsylvania, U.S.A., 23 m. S.E. of Pittsburgh. It has a supply of natural gas. Pop. 16,200.

**Jeanes**, Sir James Hopwood (1877-1916). Eng. mathematician, b. at Southport, son of W. T. Jeanes, a parl. journalist. Educated Merchant Taylors' School; Trinity College, Cambridge; 2nd wrangler, 1898; Smith's prizeman, 1900. Fellow of Trinity, 1901; univ. lecturer in mathematics, 1901. Prof., applied mathematics, Princeton Univ., 1905-09. Stokes lecturer in applied mathematics, Cambridge, 1910-12. Awarded Adams Prize in 1917 for essay *Problems of Cosmogony and Stellar Dynamics*. Secretary to Royal Society, 1919-20. Research associate, Mt. Wilson Observatory, 1923. President, Royal Astronomical Society, 1925-27. Knighted, 1928. O.M., 1939. President, Brit. Association, 1934. One of his first scientific investigations was that resulting in the proof of Maxwell's law governing the distribution of velocities among molecules, his studies in this field being pub. in 1904 as *The Dynamical Theory of Gases*. At Princeton in 1906 he pub. his *Elementary Treatise on Theoretical Mathematics*, and, two years later, his *Mathematical Theory of Electricity and Magnetism*, the various eds. of which afford an indication

of the development of the Quantum Theory, on which latter, in 1914, he made a report to the Physical Society entitled *Radiation and the Quantum Theory*. But his most impressive work was that which he accomplished in the sphere of cosmogony, on which he pub., besides the essay above, *Astronomy and Cosmogony* (1928). In this field his most striking achievement was his explanation, following Chamberlin and Moulton, of planets and their satellites as being due to tidal forces raised in a star by the close passage of another star. The completeness of these mathematical investigations destroyed the nebular hypothesis of Kant and Laplace. He also threw some light on the conjectural source of stellar radiation and energy. His popular expositions of science enjoyed phenomenal sales—less surprising in view of the attractive style of his treatises, the non-mathematical sections of which may be enjoyed even by the layman. These popular books also include J.'s contentious philosophical deductions from modern science. He stressed the part played by mathematics in science to a degree scarcely equalled since Pythagoras. Other works: *Atomistic and Quanta* (1926), *Eos, or the Wider Aspects of Cosmogony* (1928), *The Mysterious Universe* (1930), *The Universe Around Us* (1930); *The New Background of Science* (1933), and *The Growth of Physical Science* (pub. in 1947).

**Jebail**, or **Jebel** (1 anc. *Byblos*), tn. on the coast of Syria, near Mt. Lebanon, and 18 m. N.N.E. of Beirut. It has old walls, a fine citadel, a castle dating from the crusades, and an interesting mediaeval church. Many sarcophagi were found here during excavations. The old walls are 1½ m. in circumference. Pop. 350.

**Jebavy**, Václav, Czech poet, writing as 'Otakar Brežný,' b. 1865 at Počátky, S. Bohemia. Vols. of poems: *Secret Distances* (1895), *Dancing in the West* (1898), *Polar Winds* (1897), *Temple Builders* (1899), *The Hands* (1901). Fr. agy: *The Music of the Springs* (1903). Eng. trans. of his poetry have been made by Percy Paul Selverin: *Anthology of Modern Slavonic Literature* (1919), and *Otáka Brežný* (1921).

**Jebb**, Sir Richard Claverhouse (1811-1905), Scottish classical scholar and writer, b. at Dundee. He was senior classic at Cambridge in 1832. In 1837 he was made prof. of Gk. at Glasgow Univ., and in 1839 was appointed regius prof. of Gk. at Cambridge. He was chief promoter of the inter-collegiate classical lectures at Cambridge, and helped to organise the Cambridge Philological Society. He was also one of the founders of the famous Brit. School of Archaeology at Athens. In 1891 he became Unionist M.P. for Cambridge Univ. J. brought out some of the finest eds. of the Gk. classics. His best works are perhaps his ed. of and commentary on *The Attic Orators from Antiphon to Isaeus* (1876), and his ed. of the works of Sophocles with trans. and commentary in 7 vols. His other works include: *The Characters of Theophrastus* (1870), *A Primer of Greek Literature* (1877), *Modern*

Greece (1880) *Introduction to Homer* (1887), *Growth and Influence of Greek Poetry* (1893) and *Bacchylides* (1905) See Lady Caroline Jebb *Life and Letters of Sir Richard Claverhouse Jebb*, 1907

RICHARD JEFFERIES

Plaster cast from a bust by Margaret Thomas

with the wonders of nature and taught him to use his powers of observation In deed it is said that he really owed his first work of any value, *The Gamekeeper at Home* (1878) to what he had learned from his close friendship with the Burdorp keeper whom he used to help as a youth by keeping down vermin on his pheasant preserves He began life as a journalist on the staff of the *North Wilts Herald* of which he was editor during 1866-67 His letter to the *Times* (1872) on 'The Wilts shire Labourer' brought him into public notice and thereafter he wrote for the *Pall Mall Gazette*, in which appeared his

*Gamekeeper at Home and Wild Life in a Southern County* (1879) both afterwards repub. Both these works are full of minute observation and vivid description of country life. They were followed by *The Amateur Poacher* (1880), by some considered his best work; *Wood Magic* (1881); *Round about a Great Estate* (1881); *The Open Air* (1885) (with a Brighton and Beachy Head background) and others on similar subjects. Among his novels are *Revis* (1882) in which he draws on his own childish memories and which has been described as the best boys' book in the language; and *After London, or Wild England* (1885), a romance of the future when London has ceased to exist. *The Story of my Heart* (1883) is an idealised picture of his inner life. *Life of the Fields* (1884) includes one of his best essays—*Clematis Lane*. Other works are: *Hodge and his Masters* (1880), *Nature near London* (1883), and *Amaryllis at the Fair* (1887). J. died after a painful illness, which lasted for six years. In his own line, that of depicting with an intimate knowledge of nature, all the elements of country life and wild life, plant and animal, surviving in the face of modern civilisation, he has had few equals. *Piccolino and Hodge* was pub. after his death (1889). See lives by E. Thomas, 1909; C. J. Massack, 1913; A. F. Thom, 1920, and R. Arkell, 1933. See also S. J. Looker (ed.), *Jefferson's England*, 1937; M. Elwin, *The Essential Richard Jefferies*, 1938; S. J. Looker (ed.), *The Nature Diaries and Note-books of Richard Jefferies*, 1938.

**Jefferson, Thomas** (1743–1826), third, and one of the greatest Presidents of the U.S.A., b. at Shadwell, Albemarle co., Virginia, the son of a planter. He was of Welsh origin. A member of the second Continental Congress of the thirteen Amer. colonies, he sprang into fame in America's pantheon by writing the Declaration of Independence, which was adopted with but a few slight changes. He was made governor of Virginia in 1779, and narrowly escaped capture by Tarleton. He succeeded Benjamin Franklin as the Amer. envoy to France, and later when Washington became President of the U.S.A. he made J. secretary of state. It was largely due to J. that the cap. of the U.S.A. was estab. on the banks of the Potomac R., in what is now the city of Washington, and he himself afterwards was the first President inaugurated there. In 1796 Hamilton was the natural leader of the Federalist party, but John Adams was nominated for the Presidency. J., as the leader of the Republican, which afterwards became the historic Democratic party, ran against him. Adams was elected President, and J. Vice-President. In 1800 J. once more ran for the Presidency with Aaron Burr as his party's candidate for Vice-President. Jefferson's party won, but both J. and Burr had received an equal vote. J., however, was chosen by the House of Representatives on the advice of his old antagonist Hamilton. In 1804 J. was re-elected by an overwhelming majority. The greatest and most far-reaching act of his Presidency was the Louisiana purchase, where-

by the U.S.A. secured a vast ter. W. of the Mississippi R. some 1,171,931 sq. m. in extent. This purchase completely changed the future hist. of the U.S.A. It paved the way for continental expansion. It made the Mississippi entirely an Amer. owned riv. During J.'s term also the U.S.A. sent an expedition against the Tripoli pirates and stopped their raids, considerably reduced the national debt, and issued the famous embargo act prohibiting the sailing of Amer. vessels for foreign ports while the Brit. and Fr. navies were chasing each other on the high seas. At the close of his second term, the legislatures of eight states asked him to run for a third term, but he declined, thereby setting the precedent that no President shall serve for more than two terms—a precedent set aside for the first time in 1940 when President Franklin Roosevelt became President for his third term.

J. was a statesman of compromises; for J. the philosopher, in the eighteenth century sense, was rather a different man from J. as manager of his own large properties and as office-holder. Thus, while he hated slavery and tried to suppress the traffic he remained the owner of 200 negroes; he was always suspicious of bankers, yet he turned to London for the funds needed for the Louisiana purchase; and he hated political chicanery, yet he must have been aware that a bargain was being struck between his supporters and those of Alexander Hamilton to obtain his election as president. Such compromises, however, are the price of political pre-eminence. Nevertheless the positive and outstanding achievements of J. were very great: in his own state of Virginia, the termination of feudal land tenure, separation of Church and State, the foundation of a programme of free education; in the United States, the public land system, the Bill of Rights, and the Louisiana purchase—besides considerable contributions to the theory of checks and balances among the executive, legislative and judicial branches of the federal constitution.

J. retired to his home, Monticello, in Virginia, and in his old age founded the Univ. of Virginia near Charlottesville. A curious thing about J. is the epitaph he wrote for his own tomb. He, who had held so many high offices at the hands of his countrymen, wrote this: 'Here was buried Thomas Jefferson, author of the Declaration of American Independence, of the Statute of Virginia for Religious Freedom, and Father of the university of Virginia.' He died on July 4. A memorial tablet was unveiled to J. in 1933 at Glyncorrwg, N. Wales, of which vil. his father was a native. He made an important contribution to the Revolutionary cause in *A Summary View of the Rights of British America* (1774). See M. Beloff, *Thomas Jefferson and American Democracy*, 1948; J. Dewey, *Jefferson*, 1913; D. Malone, *Jefferson the Virginian*, 1949.

**Jefferson City**, cap. of Cole co. and of the state of Missouri, situated about 110 m. W. of St. Louis. There are flour mills, foundries, and machine shops and shoe,

clothing, harness, motors and other factories. Coal and limestone are found in the dist. It contains the state house, court house of Lincoln Univ., and sev. other institutions. Pop. 21,200.

**Jefferson River**, riv. of the U.S.A. It rises in S.W. Montana and finally joins the Madison and Gallatin rvs., the three streams forming the Missouri. It is about 150 m. long.

**Jeffersonville**, city of Indiana, U.S.A., co. seat of Clark co. It stands in a rich farming dist. on the Ohio, opposite Louisville, Kentucky. The city possesses railway works, machine shops, and iron foundries. Pop. 11,400.

**Jeffries, Ellis** (1872-1943), Eng. actress, b. at Colombo, Ceylon. Associated with Cyril Maude at the Haymarket, where one of her greatest successes was in W. H. Davies's comedy *Cousin Kate*. She began her career at seventeen in the chorus of the Savoy Opera and played in pantomime and light opera. Sang most of the female parts in *La Cigale* at the Lyric Theatre. She then took part in comedy with Charles Wyndham at the Criterion, in *The Bauble Shop* and other plays by Henry Arthur Jones, with John Hare at the Garrick, in America in *The Notorious Mrs. Ebb Smith*, and at the Duke of York's in *The Marriage of Kitty*. Tall, graceful, with a clear, incisive utterance, she was a true comedian, but was not deficient in the dramatic force required for such rôles as those of Zicka in *Diplomacy* and Olga in *Fedora*. Began a film career in 1930, appearing in *Eliza Comes to Stay*, *The Return of a Stranger*, and other pictures. Twice married, her first husband being the Hon. Frederick Curzon, son of Earl Howe, their son being well known on the stage as George Curzon.

**Jeffrey, Francis Jeffrey, Lord** (1773-1850), Scottish judge and critic, educated at Edinburgh, Glasgow, and Oxford. Meeting for years with little success, either as lawyer or journalist, his opportunity came in 1802, with the founding of the *Edinburgh Review*. Sidney Smith was first editor, but when he removed to London in 1803 J. was placed in charge. Retaining control for twenty-six years, he raised the *Edinburgh* to the highest rank. In 1806 J. went to London, where he had his famous duel with Moore, so satirised by Byron. In 1830 he was made Lord Advocate, and entered parliament. In 1834 he accepted a judgeship and a peerage. Among his critical works are *Samuel Richardson* (1853) and *Jonathan Swift* (1853). See *Hives* by Lord Cockburn, 1852; T. Carlyle, 1881; J. Taylor, 1892; and R. Bald, 1925.

**Jeffreys of Wem, George Jeffreys, Lord** (1648-89), Lord High Chancellor of England, b. at Acton, Denbighshire. In 1668 he was called to the Bar, and in 1683 became Lord Chief Justice. As the records of J.'s life are derived from hostile sources his reputation for injustice and cruelty must be accepted with some reserve. His conduct of the trial of Algernon Sidney is considered to have been fair in general. The action for which J. is most notorious is his presidency of the Bloody Assize

(1685), whereby over 300 victims were drawn and quartered, and a thousand sent as slaves to the W. Indian plantations. In opposition to the Long Parliament the Court of High Commission was revived and J. placed at its head (1686). In 1688 J. was the king's chief instrument in securing the committal to the Tower of the seven bishops. But the fall of James II. drew in its train the fall of J.; he fled, was arrested, and died miserably in the Tower. See H. B. Irving, *Life of Jeffreys*, 1898, and H. Montgomery Hyde, *Judge Jeffreys*, 1940, 1948.

**Jegni Pangola**, see **TOVI**.

**Jehangir**, or **Salim Nureddin Mohammed** (1569-1627), became king of Delhi and Agra in 1605, succeeding his father Akbar. Previously to his accession to the throne he had rebelled against his father and had attempted to seize Agra. The most important events of his reign were the wars in the Deccan and Udaipur, and the loss of Kandahar. During the last decade of his reign, his captains rose in insurrection, and his sons entered into a conspiracy against him. J. has left a vol. of memoirs entitled *Jehangiri*, full of delightful self-revelations and side-lights on court life in India. Capt. Hawkes visited the king at Delhi, and has also left an entertaining vol. of memoirs descriptive of this reckless ruler.

**Jehlam**, see **JHELUM**.

**Jehoash**, see **JEASH**.

**Jehoiachin**, called **Jeconiah**, king of Judah, succeeded his father, Jehoiakim, in 597 B.C. He only reigned for three months, being dethroned by Nebuchadnezzar and carried into captivity at Babylon. But in the thirty-seventh year of his captivity Evil-merodach, king of Babylon, released him, and granted him an allowance for the rest of his life (see 2 Kings xxiv. 6-16; xxv. 27).

**Jehoiada**, high priest of Judah, during the reigns of Ahaziah, Athaliah, and Joash. When Athaliah, the mother of Ahaziah, sought to destroy all the seed royal, J. protected Joash, the young son of Ahaziah, in the temple, and subsequently anointed him king while the guard slew Athaliah, the usurping queen, on his instructions. J. then destroyed the house of Baal, instituted a public fund for the repair of the temple, and executed the work of restoration (see 2 Kings xi. and xii. and 2 Chron. xxiii., xxiv.).

**Jehoiakim**, or **Eliahim**, king of Judah (608-597 B.C.), son of King Josiah and Zebudah, the daughter of Pedaiiah, received the throne as a vassal of Pharaoh-nechoh. But Nebuchadnezzar, king of Babylon, sacked Jerusalem, and J. became his vassal for three years (c. 605-602 B.C.). His revolt from allegiance to Babylon roused an attack on Jerusalem by the Chaldeans and Syrians. Jerusalem was sacked and the king slain (see 2 Kings xxiii. 34 ff., xxiv. 1-5; 2 Chron. xxxvi. 4-8).

**Jehol**: (1) Prov. of China. Area, 74,278 sq. m. Pop. 6,110,000. (2) or **Changteh**, cap. of J. prov., 115 m. N.E. of Peiping. It was the summer resort of the last emperor of China.

**Jehoshaphat** (c. 876-851 B.C.), king of Judah, succeeded his father Ashal, and commenced his reign as an able and wise ruler, rooting out idolatry, and building strongholds throughout the land. But the prosperity of his reign was reversed when he sought affinity with Ahab, king of Israel. Ahab, seduced by false prophets and in opposition to the warning of Micaiah, set forth on an expedition against Ramoth-gilead, and persuaded J. to join him. Ahab succumbed to a wound received in the battle, and J. only just escaped with his life. J. returned to Jerusalem and reformed the judges and priests, and carried out a successful campaign against Moab and Ammon. But ruin awaited a mercantile expedition to Tarshish sent by J. in conjunction with Ahaziah, king of Israel (see 1 Kings xv. 24; 2 Kings iii.; 2 Chron. xvii.-xx.).

**Jehoshaphat, Valley of**, mentioned in Joel iii. 2 as the place where the Lord shall pronounce His judgments against the enemies of His people. The valley has been identified with the valley of Berachah where Jehoshaphat triumphed over Ammon and Moab (2 Chron. xx. 26), but the probable site of the valley is the gorge situated between the Mt. of Olives and the Mt. of the Temple.

**Jehovah**, prin. name for God in the O.T., appearing nearly 7000 times. It is now felt that there is no authority for such a pronunciation, which is founded on a misapprehension. The original word, known as the Tetragrammaton, consists of the letters JHVH, or better, YHWH. This name came to be considered too ineffable to pronounce, and hence the vowels of the word *Adonai* (lord) were inserted, as a direction to the reader to replace it by this word. Thus we have the form Yehovah, of JelloVail—hort e taking the place of short a. If the Tetragrammaton is preceded by the word Adonai, the vowels of *Elohim* (God) are inserted, giving the form Yehovahi. There has been much controversy both as to the original form of the word and also as to its origin and meaning. The early theory is now almost abandoned, there being general agreement in the acceptance of Ewald's suggestion that the true form is Yahweh. The forms Yahu and Yah also occur, both separately and as a component part in proper names. The question as to the origin of the title is more difficult. Exodus iii. 13 and vi. 3 imply that it was first revealed to Moses, but it had already been used earlier (e.g. Gen. iv. 26). The use of the name, indeed, formed the chief means by which the composite authorship of Genesis was discovered (see HETATEUCH). Some have held that it was borrowed from the Kenites who inhabited the region around Sinai, and that the Mosiac revelation was only one of meaning and application. The meaning is given in Exodus iii. 14, by God himself, as 'I am that I am,' and later simply 'I am,' and according to this interpretation, which is generally accepted, the word is the third person singular imperfect of the archaic stem HWH (to be). Many scholars, however, have

regarded the idea as too abstract for so early a period, and have sought for a more concrete explanation.

**Jehu**, son of Jehoshaphat, and grandson of Nimri, was king of Israel during the latter part of the ninth century B.C. He was general under Jehoram, and during the illness of that prince at Jezreel he seized the throne, and proceeded to secure it by wholesale slaughter (see 2 Kings ix. ff.). He justified his cruel actions by the words of Elijah and the prophets. Eli-ha seems to have supported him as a useful substitute for Jehoram, from whom little action could have been expected. J. is mentioned in a tablet of Shalmaneser II. (842 B.C.) as paying tribute to Assyria. J. was noted for his reckless chariot driving: hence the modern application of the name to reckless drivers.

**Jeisk**, or **Yeisk**, tn., in the Kuban Valley, Caucasia, Russia, on the S. shore of the gulf of Taganrog in the Sea of Azov. Its exports include corn, flax, and wool. Pop. 60,000.

**Jejunum**, meaning empty, one of the three arbitrary divs. of the small intestine (q.v.). It is about 1½ in. wide, and 8 ft. long, and is the connecting portion lying between the duodenum and the ileum. In general, its structure resembles that of the duodenum.

**Jelalabad**, see JALALABAD.

**Jelal-ud-din**, or Rumi, famous Sufi poet of Persia, b. at Balkh in Khorasan. In memory of his son Ala-uddin, and his instructor Sufi Shams-uddin, both killed in a mob riot, he founded the order of Maulawi dervishes. This order is characterized by the mystic dance (Sema), symbolical of the movement of the spheres and of the soul. His most famous works are his odes, mainly composed in honour of the Maulawi dervishes, and his great poem the *Mithnawi*.

**Jelenia Cora**, see HINSBERG.

**Jelgava**, **Mitau**, or **Mitava** (Lat. Mit-tavia, Lettish *Felgava*), tn. in the Latvian S.S.R., on the Aa. 25 m. S.W. of Riga. It was formerly the cap. of Courland and the residence of the dukes in the sixteenth century. There are tanneries, flax and saw mills, and oilcloth works, etc. In the Second World War J. was in Ger. occupation until 1944, the Russians recapturing the tn. on July 31 of that year. Pop. 31,000.

**Jellaichio**, **Joseph**, Baron von (1801-59), Austrian general and administrator, b. at Peterwardin. He gained the confidence of the Croats, and was appointed Ban of Croatia (1848). He took the chief part in suppressing the Magyar Revolt (1848-1849), and commanded his troops against Montenegro (1853). He wrote and pub. poems.

**Jellicoe**, **John** Rushworth Jellicoe, first Earl (1859-1935), Brit. admiral; b. at Southampton; younger son of Capt. John H. Jellicoe, commodore of the Royal Mail Steam Packet Co.; and great-grandson of Adm. Patton, Second Sea Lord at the time of the battle of Trafalgar. After some schooling at Rottingdean, J. passed the preliminary examination for the navy

at the age of twelve and entered the training-ship *Britannia*. Became sub-lieutenant, 1878; lieutenant, 1880, with three first-class certificates. In 1881 he was appointed to H.M.S. *Agincourt*; he was present at the bombardment of Alexandria, July 1882; and he accompanied the naval brigade that marched with Wolseley to Cairo and fought at Tel-el-Kebir. Returning home, he won an £80 prize for 'gunnery-lieutenants,' 1883. His next ship was H.M.S. *Monarch*; from her, in May 1886, J. performed a life-saving feat for which he received the Board of Trade medal. He was for a while gunnery-lieutenant on H.M.S. *Colossus*; then junior staff-officer on H.M.S. *Excellent*; then first lieutenant on H.M.S. *Sans Pareil*. He was for three years assistant to Capt. (afterwards Lord) Fisher, director of naval ordnance. J. became commander in 1891, and was on board H.M.S. *Victoria* when she went down in the Mediterranean, June 22, 1893. He

LORD JELICOE

E.N.A.

next served in H.M.S. *Ramillies*; then, becoming captain in Jan. 1897, he became flag-captain on H.M.S. *Centurion*, and was chief of staff to Vice-Adm. Sir E. Seymour during the attempted relief of the Peking legations, 1900; severely wounded at Peltzang. He was naval assistant to the controller of the Navy 1902-03, and was then appointed to command of H.M.S. *Drake*. Director of Naval Ordnance, 1905-07; he greatly improved the shooting abilities of the navy. He was made rear-admiral, Feb., and K.C.V.O., Aug.

1907; was rear-admiral in Atlantic Fleet, 1907-08; lord commander and controller of the Navy, 1908-10; vice-admiral, 1910; in command of the Atlantic Fleet, 1910-11. He commanded the second division home fleet, 1911-12; and was Second Sea Lord, 1912-14. In 1913, for a while, he left his shore duties to command the 'Red' Fleet in manœuvres. On the outbreak of the First World War, J. was given command of the Grand Fleet. He became full admiral, March 1915; and thenceforward till near the end of 1916 the fleet's hist. is his—especially the battle of Jutland, May 31, 1916; wherein his flag flew on H.M.S. *Iron Duke*, and after which the Ger. fleet kept in harbour until its time for surrender. At the end of Nov. 1916, J. was made First Sea Lord, and relinquished command of the fleet to Sir David Beatty. He became chief of the Naval Staff, 1917. Suddenly ceased to be First Sea Lord at the end of that year, being succeeded by Sir Rosslyn Wemyss. No official explanation was given of the abrupt dismissal. He was elevated to the peerage as Viscount J. of Scapa, and, later, received the thanks of Parliament together with a grant of £50,000. After the Armistice, he toured the Dominions in H.M.S. *New Zealand*, to prepare for reorganisation of Empire navies. Governor of New Zealand, 1920-23. He retired from the service in 1924, and in 1925 was made Earl J. and Viscount Brocas of Southampton for his part in the battle of Jutland, see JUTLAND, BATTLE OF. He pub.: *The Grand Fleet, 1914-16, its Creation, Development and Work* (1919), *The Crisis of the Naval War* (1920) (which narrates the chief features of his work in the critical year of 1917), *The Submarine Peril* (1934, on the peril of 1917 and its lessons for the future). See life by R. H. S. Bacon, 1936.

Jelly, solid state of matter produced by the addition to a liquid of some colloid substance, e.g., gelatine. A distinguishing feature of J. is its elasticity. Js. are much used as an article of food, and are eaten as sweets or savouries. The best J. is made from calves feet, and is very strengthening. Ox-foot J. is also an excellent dish for invalids. Gelatine is much used in the making of sweetmeats, e.g. in gums and pastilles. Of vegetable Js. agar-agar is well known, and is useful as a media in bacteriology. Of the inorganic Js. that produced from a solution of silicic acid is best known. See also PRESERVING.

Jelly-fish, bell-shaped or disc-shaped marine hydrozoa, embracing Medusae, Ctenophora, and Siphonophora. In the Medusae the body is shaped like a bell or a parachute. The body is bordered by a fringe of writhing tentacles, supposed to resemble the snake-locks of the gorgon Medusa—hence the name. The animal normally swims with its subumbrellar surface downwards. The distinguishing feature of the J. is the mesoglea, a diaphanous and gelatinous secretion layer, situated between the ectoderm and the endoderm, and developed in great quantity. On the subumbrellar surface is the mouth, bordered by four lips which bear stinging threads.

The muscular system is arranged in a circular formation on the under surface of the umbrella. The muscles contract and the water is thereby pumped from the sub umbrella, and the animal is jerked upward. This is the only means of locomotion. Medusae seize their prey by their

JELLY FISH

tentacles, the victim becomes paralysed and is drawn into the mouth. The *Ctenophora* are a species of J which have both radial and bilateral symmetry. They are bell shaped the mouth being situated at the broader end. They have eight meridians of iridescent paddles. Locomotion is effected by strokes of the paddle.

Jemappes, industrial tn in the prov of Hainaut, Belgium, 13 m W of Mons. Here the fr under Dumouriez defeated the Austrians and became masters of Belgium (1792). There are rich coal mines, glass, porcelain, crystal, iron and chemical works. Pop 12,300.

Jemeppe, Belgium tn, 13 m S W of the city of Liège on the Meuse. It has coal mines, freestone and marble quarries. Its chief industries are iron, glass and oil. Pop 13,700.

Jena, tn in Thuringia, Germany. It is situated on the left bank of the Saale, about 12 m S E of Weimar and is surrounded by lime stone hills. It is an old tn and contains among its buildings of interest the Luchs Turm, the Black Bear Inn, the place visited by Luther when fleeing from Wartburg, and most notable of all the buildings of the univ. founded in 1527. Schiller, Fichte, and Hegel being among its professors. On the same day, Oct. 14, 1806, two victories were won near the tn of J by Pr troops over the Prussians, the collective name for both being the Battle of Jena. In the second World War the Amer Third Army advanced through the Thuringian forest early in April 1945 and J was cleared by the 13th by the 4th Armoured Div which was soon at the outskirts of Chemnitz. Pop 53,000.

Jenghiz Khan (1162-1227), Mogul conqueror and emperor, son of a petty Tartar chief. By skill and ruthlessness during he gradually subdued all Mongolia, changing his original name of Temuchin to Jenghiz (perfect warrior). In 1212-14 he conquered N China. Four years later an insult offered to his envoys in Turkestan led to his invading that country with an immense host. In the first battle the Turks lost 160,000 men and for seven years the war raged with terrible cruelty, many cities being totally destroyed and their inhabitants massacred. J swept through Afghanistan into the Punjab, which he devastated returning afterwards to Turkistan. Another Mogul army penetrated to Russia as far as the Dnieper carrying off immense spoils. In 1225 J again attacked China (a turning point) and proved with frightful carnage, but died in return from the campaign. It is said that he intended exterminating the Chinese by turning their country into prairie, but was dissuaded by one of his councillors. His war are computed to have cost six million lives. Their greatest result was the opening into Asia Minor of various Turkic tribes who afterwards founded the Ottoman empire and invaded Europe. The empire founded by J soon broke up, much of it falling to Kublai Khan. See I. H. Hart *Great Captains*, Unwin 1927, and lives by F. Rashid al Din 1898, F. Krause 1922, and H. Lamb 1925.

Jenkin, Henry Charles Fleeming (1833-1885) Eng engineer. In 1853 he with Lord Kelvin made experiments in the manufacture and use of cables. His researches on gutta serena were of the utmost value. He was elected F.R.S. and was appointed prof. of engineering at Univ. College, London, in 1867, and at Edinburgh Univ. in 1868. He pub. a valuable text book on *Magnetism and Electricity* (1873). He invented telegraphy, an electric automatic system for transporting goods. See I. L. Stevenson's *Essays*, *Tall and Talkers*. Jenkin is Cock-shot.

Jenkins, Robert Fitz merchant sea captain of the W. Indies. He appeared before the House of Commons with one of his cars in cotton alleging that the Spaniards had boarded his vessel, accused him of smuggling, and cut off his car. This provoked war between England and Spain and led to the latter's downfall (1742).

Jenkinson, Anthony (d. 1611) Eng. merchant and sea captain. He visited Asia Minor and N. Africa (1546) and in 1557 was appointed agent of the Muscovy Company. He travelled to Bokhara (1558-59) and was commissioned to trade with Persia. By his efforts his company obtained the monopoly of the White Sea trade. See *Early Voyages and Travels in Russia and Persia* (Hakluyt Society, 1886), and biographical introduction by L. D. Morgan.

Jenkinson, Robert Banks see LIVERPOOL LARKS.

Jenne, tn, an important centre of commerce in Upper Senegal (Fr.), on the R. Niger 250 m S S W of Fimbuktu. Once the cap. of the Songhai empire.

Jenner, Edward (1749-1823), Eng. physician and originator of vaccination, b. at Berkeley, Gloucestershire. Left an orphan at six years old, he was brought up by his eldest brother, the Rev. Stephen J., and educated for the medical profession. In 1770 he became a pupil of the famous John Hunter, with whom he remained two years. Declining offers of advancement in London, he returned to estab. a practice in Berkeley, wishing to be near his brother. J. never passed a musical examination, such examinations not being compulsory in his time. He bought the degree of Doctor of Medicine from a Scottish univ. and later applied to Oxford univ. to grant him their honorary degree of M.D. and received it. He took great interest in the natural hist. of his dist. founded a local medical association, and was a general favourite in society. In 1788 he married Miss Kingscote. As a child J. had himself suffered the risk associated with the inoculation of smallpox matter,

EDWARD JENNER

After a print engraved and coloured by  
I. R. Smith

and from his apprenticeship days with Hunter he was curious about the popular belief in Gloucestershire that persons who contracted cow-pox were thenceforth immune from smallpox. J. mentioned to various people, including Hunter, his interest in the matter, but he got no encouragement in his researches. But years later, the popular belief became estab. as a conviction in his mind and he saw that, if it were possible to transmit the cowpox virus from one individual to another (by inoculating persons successively by the arm-to-arm method) the result would be an available source of cowpox lymph which would be independent of the existence or otherwise of the natural disease in

cows at any given time. If this could be done, he saw that another difficulty might arise: after transmission through many individuals the virus might lose its immunising power. J., having collected material to confirm his conviction concerning cowpox as a protective virus set out, in 1798, to investigate the above two propositions. After a number of experiments he pub. his results in his celebrated work, *An Inquiry into the Causes and Effects of the Variolæ Vaccinæ, a disease discovered in some of the Western Counties of England . . . and known by the name of the Cow-Pox* (1798). In the first ed. of the *Inquiry*, J. adopted the attitude that efficiently performed vaccination carried out with lymph taken at the right stage of the pock would give complete and permanent protection against smallpox, a view he maintained all his life. This was unfortunate because it was not true, though those who did contract smallpox suffered only from mild attacks. J. was the first to have the conception which is expounded in his *Inquiry* and the first to have the courage to test his doctrines. After him no one else attempted to extend the province of artificial immunity until Pasteur in 1880 introduced the inoculation of fowls for fowl cholera. All modern methods of preventing certain infectious diseases by immunological methods trace their ancestry back ultimately to the substitution by J. in 1798 of vaccination—which became an estab. fact by 1800. At first he met with great opposition, yet he secured a hearing from many influential persons including the royal family. Vaccination spread through England. Attempting in 1798 to introduce a system of vaccination in London, he met with great opposition, but nevertheless secured a hearing from many influential persons, including the royal family. Vaccination spread through England and other countries with such results that in 1802 parliament voted J. a grant of £10,000 (raised a few years later to £20,000), and on the Continent he was elected a member of most of the great scientific societies. At home, however, the jealousy of his professional colleagues led to much bickering and irritation; he was worn with incessant work, and the death of his wife in 1815 affected him greatly. He retired from public life, but continued his investigations until struck down by apoplexy.

Jenner, Sir William, Bart. (1815-98), Eng. physician, b. at Chatham, educated at Univ. College, London. In 1814 he became M.D., and in 1847 began a course of investigation by which he eventually proved the distinction between typhus and typhoid. He became prof. of medicine at Univ. College, physician to sev. great hospitals, and medical adviser to the royal family, attending the Prince of Wales in his attack of typhoid. Receiving a baronetcy in 1868, he was in 1881 elected president of the College of Physicians. Rather autocratic in manner, but kind and considerate, he was in such request as a consultant that he left a fortune of £300,000. His writings include important works on fever and diphtheria.

**Jennings, Sarah** (1660-1744), see **MARLBOROUGH**.

**Jenolan Caves, or Fish River Caves**, beautiful stalactite caves situated on the W. side of the Illue Mts., 113 m. W. of Sydney, New S. Wales.

**Jensen, Johannes Vilhelm, Dan.** novelist; b. 1873 at Farsø. A student at Viborg, 1893; studied philosophy and medicine. His first book appears to have been *Danskere*, a tale pub. (1896). His most important works are:—*Himmerland's Historier* (1898-1910), *Kongens Fald* (hist. novel of sixteenth century, 1899-1902), *Madame d'Ora* (1901), *Skovene* (1904), *Eksotiske Noveller* (1907-25), and a series of six novels together called *Den lange Rejse*, and descriptive of the progress of the Nordic race throughout ages. Other pub.:—*Det Blivende* (1934), *Dr. Renanilla Fjeldtser* (1935), *Gudrun* (1936), *Durduse* (play, 1937), and numerous short stories. Awarded Nobel Prize, 1911.

**Jensen, Peter Christian Albrecht** (b. 1861), one of the greatest authorities of the day on Assyriology. J. was born at Bordeaux, studied Hittite and Semitic archaeology, subsequently became prof. of Semitic philology at Marburg Univ. (1892). His works are: *Hittiter und Armenier*, (1898), *Assyrisch-babylonische Mythen*, (1900-01), section 'Hittites' in Hilprecht's *Explorations in Bible Lands* (1903), and *Das Gilgamesch Epos in der Weltliteratur* (1906), etc.; *Gilgamesch Epos, jüdische National sagen, Ithas und Odyssee* (1924).

**Jenson, Nicholas** (or Nicol) (1420-81), Master of the Mint at Tours in the reign of Charles VII. of France and, according to some, a Walloon by descent. The king, hearing of Gutenberg's printing experiments, sent J. to Mainz to obtain Gutenberg's secret. J. learned the trade, but subsequently migrated to Venice. It is believed, however, that in the years 1462-1470 he was associated with Sweynheim and Pannartz, two Ger. printers who had estab. themselves in a Benedictine monastery at Subiaco near Rome. At all events, he began printing at Venice about the year 1470, and there designed a rom. type of much beauty and merit that has been classic to the present time. He is mentioned in the *Cologne Chronicle* of 1498 as a printer to whom some had erroneously given credit of being the first inventor of the art. Extant portraits of him appear to be imaginary. See M. W. Haynes, *The Student's History of Printing*, 1930.

**Jephthah**, according to the narrative in Judges xi. 1 ff., was an illegitimate son of Gilead, after whose death he was driven out by his brethren. He became the leader of a band of freebooters, until he was recalled by the elders of Gilead to lead them against the Ammonites. This he refused to do unless he was afterwards made their judge, and this position was promised to him. He collected a large army and made a vow that if he was successful he would offer as a burnt-offering to Jehovah the first thing that came forth from his doors on his return. This vow led to the sacrifice of his daughter, which some tried to soften into a dedication of

her perpetual virginity. J.'s later exploits were against the Ephraimites. It has been suggested that two persons, Jair and J., are confused in this account.

**Jeppesen, Knud** (b. 1892), Dan. musicologist and composer, a pupil of Carl Nielsen (1865-1931). He occupies an eminent position in Dan. musical life as composer, educator and musicologist. After taking his musical degree, he continued his studies in Vienna with Guido Adler and Robert Lach, obtaining his doctorate of philosophy with his thesis 'The style of Palestrina and the Dissonance,' a detailed study of Palestrina's harmonic system. This work has been pub. in Dan., Ger., and Eng. As administrator and lecturer J. has held high posts at Copenhagen Conservatoire and Copenhagen and Aarhus Univs. He has written many works on music and ed. *Acta musicologica*, a quarterly concerned with musical science. Though not prolific as a composer, he has written a number of songs and motets and choral works, of which 'Lave og Jon' and a 'Cantata in celebration of the Reformation of 1536' are well known. His 'Te Deum Danicum' however, is probably his finest work, written for four soloists, two choirs and orchestra, the words being 'after the old version of the Ambrosian Hymn.'

**Jerablus**, see **CARCHEMISH**.

**Jerash**, see **GERASA**.

**Jerba, or Girba** (anc. Meninx), is. of Tunis in the gulf of Cabes, off Africa, has an area of 125 sq. m. It is separated from the mainland by a fordable channel formerly crossed by a Rom. viaduct. There are many Rom. remains, including a triumphal arch and two castles. It is very fertile; olives, dates, and oranges grow there. The inhabs. are occupied in sponge fishing. The chief tn. is Haumtes-Snk. Pop. of tn. about 3000; of is. 35,000.

JERBOA

**Jerboa**, name popularly given to members of the Dipodidae, a family of myomorphous rodents remarkable for their powers

of leaping. They are terrestrial animals, inhabiting the sandy or grassy plains in Asia, E. Europe, and N. Africa. *Dipus*, the typical genus, is from 6 to 8 in. in length, with a long tail and naked ears: the fore-limbs are very short and have five fingers, while the curiously elongated hind-limbs have only three toes. It is by means of these enormous legs that they are able to leap when in danger, but when undisturbed they walk on them in an ordinary way. The Js. are also burrowing animals, using their strong incisors for that purpose: their habits are nocturnal, and they feed on roots, seeds, insects, birds' eggs, etc., and occasionally do great damage to grain-crops. They are sometimes eaten by the Arabs. *D. hirtipes* is a well-known species; *Alactaga* is common on the Siberian steppes, *A. jaculus* being known as the jumping rabbit; *Platycercus* is distinguished by a flattened, lancet-shaped tail; *Zapus* is the so-called jumping-mouse of the U.S.A., and the genus *Sminthus*, whose legs are short and nearly equal, may be regarded as approaching most nearly to ancestral form.

Jeremiah, called also Jeremias and Jeremy, one of the greatest of the Heb. prophets, is described in the first verse of the book which bears his name as the son of Hilkiah, whom some have identified with the Hilkiah mentioned in 2 Kings xxii. He belonged to a priestly family of Anathoth, which he later quitted for Jerusalem. The vision by which he was inspired to take up the prophetic work is given in the first chapter. This took place in the thirteenth year of the reign of King Josiah (c. 627 B.C.). Five years later occurred the famous discovery of the Book of the Law by Josiah, which led to that prince's great attempt at reform. In this J. does not figure at all, though there is no reason to suppose but that he was in full sympathy with it. But it was not long before the prophet began to feel that no great or deep reformation could be carried out by the secular arm, and it was this that led him to take up the individualistic attitude which marks him off from the other prophets. His prophecies were spread over the reigns of Jehoahaz, Jehoiakim, Jeconiah, Zedekiah, and part of the period of exile. The book of J., which is interspersed with accounts of historical incidents relating to general events and the life of J. himself added by a later hand, is tender and sad throughout. The prophet insists that the spiritual well-being of the chosen people is not bound up with their prosperity as a nation, and that only through defeat and oppression can the remnant be saved. He insists on the necessity of a spiritual religion and warns the readers that the possession of the temple of the Lord God will not secure them from defeat. He insists that the work of the Chaldean will be accomplished not by succouring but by oppressing Israel. On account of the pessimism and, as was thought, lack of patriotism shown in his prophecies, J. was extremely unpopular and had to submit to much persecution. His book, which he had prepared with the

aid of his friend Baruch, was cut to pieces and burnt, and he himself had to submit to frequent imprisonment under the most revolting conditions. After the capture of the city he received permission to dwell where he wished, and so attached himself to Gedaliah, the Babylonian governor. On the death of Gedaliah, he retired to Egypt, where tradition says that he met his death by stoning at the city of Tahpanes. See expositions by G. Ewald, A. Graf, T. Cheyne, C. Ball, L. Elliott-Blinns, 1919; G. A. Smith, 1929; see also W. H. Bonnett, *The Book of Jeremiah* (Chaps. xxi.-lxi.), 1891; and J. McAdyen, *Jeremiah in Modern Speech*, 1919.

Jérémie, seaport in the is. and republic of Haiti, 119 m. W. of Port-au-Prince, has important trade in cocoa, coffee, and logwood. The father of Dumas, the Fr. novelist, was b. here. Pop. 7000.

Jerez de la Frontera (formerly Xeres), tn. of S. Spain in the prov. of Cadiz, situated on a vine-covered plain 12 m. N.N.E. of Cadiz. The tn. is chiefly famous for its vines from which sherry is manufactured. Indeed, the wine lodges are a characteristic feature of J., but there are other buildings of note, the fifteenth-century church of San Miguel, a tn. hall dating back to the seventeenth century, etc. Under the walls of J. the battle of Guadalete, which delivered Spain into the hands of the Moors, was fought in 711, and parts of the old walls still remain. The tn. was taken from the Moors by Alfonso X. in 1265. Pop. 90,600.

Jerez de los Caballeros, tn. of Estremadura, 40 m. S.E. of Badajoz, Spain, is the centre of an agric. dist. producing grain, fruit, vegetables, and cork. The main wealth of the people consists of herds of swine and mules. Pop. 12,000.

Jerfalcon, Gyrfalcon, or *Falco gyrfalco*, name of a species of falcon (*q.v.*) belonging to the Falconidae; it is found in W. Russia, Scandinavia, Greenland, and Arctic America, and its colour varies from grey to white.

Jerichau, Jens Adolf (1816-83), Dan. sculptor, was a pupil of Thorvaldsen. He was commissioned to carve a trioso for the royal palace of Christiansborg, near Copenhagen, and this piece of work, which was finely executed, estab. him in high repute. Among his best classical studies are: 'Heracles and Hebe,' 'Penelope,' and the 'Wedding of Alexander.' His religious subjects include 'The Resurrection,' 'Adam and Eve,' and a figure of Christ. J. also made a portrait statue of Ernest.

Jericho, once an important city of Palestine in the Jordan Valley, 15 m. N. E. of Jerusalem. The site of the old city was in the midst of a fertile dist. where palms, rose trees, rainns, and balsams grew in profusion. According to the Bible narrative and other accepted authorities, the tn. was captured by the Israelites on their entry into Canaan, re-fortified by Hiel the Bethelite, destroyed under Vespasian, and rebuilt under Hadrian. Antony is said to have given its groves to Cleopatra, and Herod the Great dwelt there. In ant. times J. held

a fairly important position strategically, dominating the chief trade routes of antiquity from Jerusalem towards the E. But it was too isolated to be able to rely in an emergency on the help of friendly cities, and consequently it was, from a very remote age, surrounded by defensive walls; and both hist. and archaeology agree that the city was frequently destroyed. Early in this century, Ger. excavators discovered the defensive ramparts of the old city of J., and their evidence, including the traces of destruction and of fire, seemed to corroborate the Biblical story. Further investigation in

the wall are found burned to the ground, their roofs fallen upon the domestic pottery within.' All these facts give strong support to the Bible narrative, making it probable that the fallen walls of the Late Bronze Age are actually those of the city which is said to have been taken and burnt by the Israelites under Joshua. See Sir Charles Marston, *New Knowledge about the Old Testament*, 1933.

Jericho, Rose of, or *Anastatica hierochuntina*, species of Cruciferae, which also alone forms a genus. It occurs in Palestine and N. Africa, and is able to live for a long period without water.

IN THE WINE CELLARS OF JEREZ DE LA FRONTERA

1920 showed that the stone rampart was of the Middle Bronze Age (c. 1800 B.C.), but the date of the inner wall was left to be estab. by Sir Charles Marston's expedition under Dr. John Garstang, Prof. of Archaeology at Liverpool Univ. which proved that the inner wall belonged mainly to the Late Bronze Age, the period of Joshua. Cuttings made by Dr. Garstang, in June 1930, in the mound of old J.—the ruins of the walls are situated near the modern vil. El Riha (Arabic form of Jericho), on a low mound at the foot of the W. plateau—revealed that the fortifications of J. represent an almost continuous occupation, twice broken by invasion between 2000 and 1600 B.C.: at which latter date the walls were reconstructed upon the brink of the mound, and these in their turn perished in some conflagration. The W. side of the defences showed continuous signs of destruction and conflagration, the outer rampart (which is 6 ft. thick) suffering most, its remains falling down the slope. The most arresting fact disclosed by Dr. Garstang is the traces of intense fire including reddened masses of brick, cracked stones, charred timbers, and ashes. Houses alongside

Jeritz, Maria, Austrian soprano, b. at Brno, 1894. Studied piano, violin, cello, and harp. Cultivated voice when fourteen under Prof. Auspitzer of Brno. Made début as Elsa in *Lohengrin* at Olmutz, Austria, 1909. Member of Imperial and Royal Opera, Vienna, 1913. Metropolitan Opera Co., New York, 1921—Amer. début as Marietta in *Die Tote Stadt*. Successful as concert singer. First Class of the Order for Meritorious Service, Austria, 1935. An Eng. trans. of her reminiscences, entitled *Sunlight and Song*, appeared in 1924.

Jeroboam I., son of Nebat, was the first king of Israel after its separation from Judah on the death of Solomon. He was made Solomon's tax-gatherer in his own dist. of Ephraim, but the suspicion that he was about to raise a rebellion caused him to make a hasty flight into Egypt. On Solomon's death he returned and headed the embassy to Rehoboam, asking for a lightening of the taxation. On the young king's refusal, he led the revolt of the ten tribes, and was made their king (see ISRAEL). His erection of golden calves for worship at Bethel and Dan led to his name becoming a byword in

In the nineteenth century, ship-building, sea-faring, and overseas trading—and in earlier days, privateering—were the is.'s mainstay. These activities have disappeared and the is. is now dependent upon agriculture, mainly for export, and upon seasonal tourist traffic. Import trade is substantial and is done almost entirely with the United Kingdom.

Early potatoes and tomatoes, both grown outdoors and often in succession in one season, are the main export crops. Pre-war annual exports, entirely to the United Kingdom, averaged about 60,000 tons of potatoes and 25,000 tons of tomatoes, and 53,000 tons of granite, of an aggregate value of about £2 millions. Tomato exports to the United Kingdom in 1947 reached a record of 44,550 tons valued at £2½ millions. Some 1000 head of cattle are exported each year, mainly to the United Kingdom and the U.S.A., also to Australia and New Zealand. The normal cattle pop. of the is. numbers about 10,000. The J. breed of cattle is remarkably free from disease and the high yield of milk and its high butter fat content is unsurpassed. Breeding standards are maintained by the breeders' organizations. The animals lose some of their peculiar characteristics after four or five generations have been bred overseas, and this ensures a recurring demand for cattle from the is.

J. has some peculiarities of fauna, also much archaeological interest, notably megalithic tombs, the finest being La Hougue Bie. See A. Saunders, *Jersey, 1642-1900*, 1930-33; Ward, Lock, and Co. (pub.) *Guide to the Channel Isles*, 1934; G. R. Bailleine, *A Bibliographical Dictionary of Jersey*, 1948.

**Jersey Breed**, see under CATTLE.

**Jersey City**, co. seat of Hudson co., New Jersey, U.S.A. At the N. the Hudson and Hackensack Rr. make it almost an is., whilst southward it is flanked by New York and Newark bays. It is separated from New York by 1 m. of riv., and connected with it by sev. lines of ferries, the Hudson R. tunnels, and recently by the vehicular tunnel which was opened in 1928. It is the E. terminus of many railways, and has spacious docks along its 12 m. of water frontage. Possesses many tobacco, rubber, and sugar-refining factories, crucible works, foundries, boiler works, and factories making rolling stock, motor cars, and wireless apparatus. It has large stock-yards, and enormous numbers of sheep and cattle are slaughtered for New York and other mkt.s. It has a free library with more than 100,000 books. Education is well provided for in many public schools, the Haskins Institute, St. Peter's College, St. Dominic's Academy and St. Mary's Academy. Paulus Hook occupied the site till 1820, when the city of Jersey was incorporated. The pop. has increased rapidly and reached 301,300 in 1940.

**Jersey Shore**, settlement on the W. fork of the Susquehanna R. in the Lycoming co. of Pennsylvania, U.S.A. There are silk mills, cigar factories, foundries, etc. The dist. is agric. Pop. 5400.

**Jerusalem**, city of Judaea, and cap. of Palestine, of which country it constitutes a separate div. for purposes of administration, situated 31° 46' N. lat., and 35° 13' E. long. It stands on a plateau formed of two hills, and bounded both E. and W. by valleys, that on the E. being the brook Kidron referred to in the N.T. To the N. there are also two valleys. The generally exact idea of the geography and geology of J. is due to a succession of investigations which commenced in 1833. After that time the work continued under various investigators, of whom the most prominent were De Vogüé (1860-63), Capt. Wilson, R.E. (1866), Capt. Warren, R.E. (1867-70), and Lieut. Conder, R.E. (1872-75). Still more results have been obtained by the Palestine Exploration Fund, which commenced operations in 1894, and a great impetus was given to the work after the First World War, especially through the activities of the Brit. School of Archaeology in J. In the period 1910-30 the chief excavations in the vicinity of J. were those of Parker in 1911, Well in 1913 and 1923, Macalister and Duncan in 1923-25 and by Crowfoot in 1927-28, all of Ophel, the hill to the S.E. of the city, and the topographical data from these excavations are of value as establishing the position of the City of David, and also as indicating, though not finally proving, that some of the rock-cut caves may formerly have been used for royal tombs. Excavations at the Citadel at the Jaffa Gate, so conspicuous a feature of the Walled City, have proved that the massive tower commonly called the Tower of David is really the Tower of Phasael, one of the three erected by King Herod about 25 B.C. as defences for his citadel and palace, and that it was inserted in a pre-Herodian wall on the N.W. corner of the anc. city, a large section of which has been uncovered running across the Courtyard of the present Mameluke Citadel. Excavations in 1916 tend to confirm doubts which had arisen as to previously accepted beliefs about the extent of the first J. estab. In the time of the Heb. monarchy about 1000 B.C. to 587 B.C. The hill on which the Citadel stands is traditionally known as Mt. Zion, but the excavations do not support the theory that a part of the 'Stronghold of Zion,' the City of David and his successors, was located on that hill. Researches at the Walling Wall go to show that the boundaries of this celebrated relic coincide with those of the platform of the temple of Solomon, of which courses of stone are supposed to be in existence below the surface. Each of the two hills which form the site of the city is a natural fortress, for the two are divided by a deep valley (the Tyropoeon), and it is probable that from the earliest times they were so used. The lack of water must, however, have proved a serious disadvantage. The 'Virgin's Spring' in the Kidron valley, and just outside the old city wall, is the only spring near the city, and there is but one important well within. The water in the Pool of Siloam is brought from the Virgin's

Spring by a rock-cut aqueduct, running through the old Ophel wall. The Temple (comprising the dist. now known as the Haram) was built on the E. hill. On the W. hill was built the upper city.

The chief monuments of interest to visitors are the Church of the Holy Sepulchre (q.v.), with remains of the basilica of Constantine, the Walling or W. Wall; the Mt. of Olives, the Tomb of David (Cenaculum); the Crusaders' Church of St. Anne; the Jewish Tombs in the Valley of Jehoshaphat, the Armenian Cathedral;

the Ger. Catholic Church outside the Zion Gate; the It. Hospital, designed like a Florentine palace; the Lutheran Church of the Muristan, and the fine Heb. Univ. (modern) with superb sculptures by Eric Gill. The walled city of J. is entered by seven gates: the Jaffa ('Gate of the Friend'), New, near Allenby Square; Damascus ('Gate of the Column'), N. wall, Herod's ('Gate of Flowers'), N. wall, St. Stephen's ('Gate of Our Lady Mary' or 'Gate of the Tribes'), E. wall, Dung ('Gate of the Moors'), S. wall

JERUSALEM AND THE MOSQUE OF OMAR.

Paul Popper

the Ecce Homo arch, the Church of the Tomb of the Virgin, and the Garden of Gethsemane. 'The old city within the walls, that city 'compact together' with its vaulted *souqs* (bazaars) and narrow streets, that have undergone no change for centuries, with its steep alleys flanked in many cases by masterpieces of Saracenic architecture, may well, however, be regarded as the greatest monument of all, unique in its compactness, in its appearance of hoary antiquity, and in that homogeneity which it is the aim of its present administrators (then the British mandatory gov.) jealously to preserve (H. C. Luke and E. Keith Roach, *Handbook of Palestine and Transjordan*, 2nd ed. 1930). Of new buildings some of the most striking are the Anglican Cathedral and Close of St. George, built by George Jeffrey, the Franciscan Basilica in Gethsemane,

and Zion ('Gate of the Prophet David'), S. wall, on Mt. Zion. The Golden Gate, built in the fifth century on the Hasm. enclosure, was walled up by the Turks soon after they occupied Jerusalem in the sixteenth century.

J. has greatly altered in appearance since the First World War, and continued to develop throughout the Brit. mandatory régime. Some of the suburbs have the aspect of bustling towns. In the W. States of America; while new streets are being made and new districts opened up. There are also electric tramway and motor bus services. There are big banks and commercial houses, and new premises on a far more modern plan than those of even a few years before have replaced the latter. It is estimated that more than two-thirds of the pop. of J. dwell outside the walls of the city, though later than the middle

of last century there was not one building outside the eight gates of the city walls. But to-day hotels, large stores, and commercial buildings generally have been opened up outside the city proper, and with this development have come the garden cities. This greater J. has now spread half-way to Bethlehem to the S., to Mt. Scopus to the N. (the site of the Brit. cemetery), and to the W. nearly to Ain Karim, the bp. of John the Baptist. Extension eastward is impossible, because there the land falls steeply into the Kidron Valley. Altogether more than seventy-five streets have been laid out in these new suburbs, with such names as Isalah St., John the Baptist St., Herod's Way, Hezekiah St., and so forth, all of course being drawn from Biblical hist. Development has been on sound tn.-planning lines. The municipality has control over all building operations, and from the outset (1914) it was recognised that J. demanded specialised treatment, so that W. European architectural ideas should harmonise with an E. environment and E. conditions. The beauty of the buildings of J., considered apart from their sanctity, lies largely in the colour and texture of their stone, which, after centuries, has mellowed to a golden grey. It blends in a remarkable manner the walls and gateways of the Old City, the towers of its many churches and monasteries, the modern commercial buildings along Princess Mary Avenue, and the villas of Rehavia and Qatamon. One of the aims of the Palestine Gov.'s tn.-planning commission under the mandatory régime was to maintain this unity of character throughout the fast developing city by insisting on the use of stone for all buildings. The ubiquity of stone was threatened by the use of concrete, providing an instance of a W. technique, introduced by Jewish immigration, which conflicted with the traditional way of life. The account which Britain can give of her stewardship in respect of tn. planning in J. is one of which any administration might be proud. The successive measures of the Brit. planners during the thirty years of mandatory rule were directed to one or other of two objectives: the preservation of the Old City and the encouragement of high standards, hygienic, social, and æsthetic, in the modern city, which during those thirty years, had fast been growing up around it. A proclamation was made by Lord Allenby as military governor in 1918 forbidding the erection, demolition, or alteration of any building within a 2500 metre radius of the Damascus Gate without a written permit, and this was only granted for building with an approved purpose (which excluded industrial building) and was subject to control of height and building material. Four zones were defined: the Old City, which was to retain its medieval aspect and within which the traditional stone construction with vaulted roofs was advocated for any necessary rebuilding; the area immediately outside the city walls, where undesirable recent structures were to be demolished and new building pro-

hibited: the area to the N. and E. of the Old City where new building was to be strictly controlled; and the area to the W., where development was to be encouraged. The plan of future roads and open spaces in this zone was also indicated. The later development of J. to the W. was thus largely determined in those early days. In particular the present freedom from building in the Mt. of Olives region to the E. of the Old City which came within the third zone, is due first to the steps taken by the Brit. authorities and to the support of the Pro-Jerusalem Society. In 1930 the first complete tn.-planning scheme came into operation. An amplification of the Allenby provisions further safeguarded the Old City, and for the new tn., which covered an area nearly twenty times as large, detailed road plans were made and use-zones proposed for the areas to the N., W., and S.W.; and restrictions were placed on the permissible built-up area in order to secure some form of density control. An archaeological area was defined, within which all building work had to conform to an Antiquities Ordinance. Certain defects of zoning and density in the 1930 scheme were remedied in 1941. This amended version of the scheme dealt with communications and instituted a classified road system, including an arterial ring road, besides dealing with overcrowded areas and open spaces. All these measures were codified in the Tn. and Country Planning and Building Ordinance, 1947.

The building of Greater J. extends nearly as far as the Well of the Magi. Here the residences (and also those at Bethlehem itself) are especially handsome many of them having been built by native craftsmen who had learned their trade in the U.S.A. and returned to Palestine as wealthy men. It is estimated that some 23,000,000 was spent between 1925-30 on the erection of private dwellings in Greater J., while over 2250,000 was spent upon the handsome King David Hotel. On July 22, 1946, an entire corner of the hotel was destroyed by bombs of Jewish terrorists. Military headquarters in Palestine and the prin. secretariat office, with the exception of that of the High Commissioner, were located in the building and over fifty persons were killed, including several senior Gov. officials. The most attractive of the garden cities are Janine and Beth-Hakerem, while the new Arab colony of Tahlivah, S.W. of the city, has replaced what a few years ago was a waste, bearing a few olive trees. The largest and best known of the garden cities is the Talpith, lying S. of the city on the Bethlehem road, which has been developed by the Palestine Land Development Company, and contains besides hundreds of stone dwellings—all detached and conspicuous for their balconies, arched windows, large verandas, striking roofs, and fine gardens—a tn. hall, baths, synagogue, theatre, and indeed all the amenities of an independent tn. community. Some of the most important public or commercial buildings completed in recent years in J. or outside the old city are the

Heb. Univ., opened by Lord Balfour in 1925, the new library on Mt. Scopus, containing the largest collection of Heb. books and papers in the world, the Pontifical Biblical Institute, the College of Jerra Santa, the Rothschild (Ifadassah) Univ. Hospital on Mt. Scopus (designed by Eric Mendelsohn), the General Post Office (designed by Austin Harrison who designed Nuffield College), a good blend of W. functional ideas with E. motives, and the Anglo-Palestine Bank. J., being a Holy City for three Faiths, is the seat of a number of Prelates and religious bodies. There are three Christian Patriarchs, Orthodox, Lat., and Armenian having the style of 'Beatitude,' and, in addition to the Anglican Bishop in J., a Jacobite and a Coptic Bishop.

For long it was thought that the name of J. was given to the city after its conquest by David, but this judgment has been reversed by the discovery of the Amarna tablets (c. 1400 B.C.) in 1890. Here the name occurs in the form *Urusalim*, some 500 years before the time of David. The derivation has been variously derived from Heb. forms meaning 'the city of peace,' 'possession of peace,' 'foundation of peace,' 'city of the god Salim,' etc. In the Book of Joshua it is spoken of as *Jebus*, with the explanatory note 'which is Jer.' and an account is given of Joshua's assault on it. It soon fell back, however, into the hands of 'the stranger,' and it was not until the time of David that it was permanently captured and made the seat of the regal gov. (see *DAVID*). This occurred at the beginning of the tenth century B.C. For its hist. down to its destruction in the time of Zedekiah, see *ISRAEL*, where is also given an account of the attempts to rebuild it under Ezra and Nehemiah, of the various foreign powers under whose dominion it successively came, and of the factions with which the city was torn, until the time of its utter destruction by Titus, the Rom. general. It was not long, however, before the city was rebuilt, though on a smaller scale, by the Emperor Hadrian, and the new name of *Ælia Capitolina* was given to it. During the first few centuries it passed through a period of tranquillity, but it again came into prominence as the habit of pilgrimage to sacred places grew up, and as spot after spot associated with events in the life of Christ were identified by revelations made miraculously to individuals. Many great churches were erected, of which the first was Constantine's Church of the Anastasis (336) near the Holy Sepulchre. The Church of St. Stephen and many other eccles. buildings were erected by the Empress Eudocia from about 150 onward, and Justinian built the Church of St. Mary, which later formed part of the Mohammedan mosque el-Aksa. In 614 the city was taken by Chosroes, the Persian, and most of the churches were destroyed. It was recaptured by Heraclius in 627, but lost again nine years later, to remain in the hands of the Moslems until 1099. At the beginning of this period the mosque el-Aksa was erected

on the site of the Jewish temple. In 1099 the city was taken by Godfrey of Bouillon and his knights, thus returning once more into Christian hands. But the Lat. kingdom of J. was not long-lived, nor was it by any means stable during its continuance. It fell in 1244, after having been for a short time in the hands of the ex-communicate Frederick II., to whom it had been ceded by treaty in 1229 after having been captured by the Moslems. From 1244 until 1917 J. remained in Moslem hands, and during this period its hist. was comparatively peaceful and uneventful. It passed into Turkish hands in 1517, and remained under Turkish rule until the First World War of 1914-18, when it was taken by Gen. Allenby. Allenby advanced on J. in Oct. 1917. After cutting the Jaffa-Jerusalem railway at Ludd and el Karieh, he occupied Jaffa on Nov. 16 and then began a movement to surround J., advancing on it from N., S., and W. All the Turkish positions round the Holy City were carried by storm, and thereafter the city was surrendered, on Dec. 9, without further resistance, thereby ending the Turkish domination of seven centuries. The full story of the brilliant capture of J. will be found in the *Record of the Advance of the Egyptian Expeditionary Force*, compiled by Lt.-Col. H. Pirie-Gordon, 1919. On his official entry Allenby made it known by proclamation that 'every sacred building, monument, holy spot, shrine, traditional site, endowment, pious bequest, or customary place of prayer, of whatsoever form of the three religions, would be maintained and protected according to the existing customs and beliefs of those to whose faiths they were sacred.' The condition of the city in Dec. 1917 is difficult to imagine when it is seen to-day. There were no sanitary arrangements in the old city, and the water supply came from private rain-fed cisterns; but the Brit. military authorities not only placed ample sanitary services at the disposal of the Governorate, but patrolled the Via Dolorosa to keep it free from pollution, and ordered a piped water supply to be installed. The inhabs. were not slow to appreciate that, whereas the Turks had left the city as to its water supply somewhat worse than it was when they first occupied it in the sixteenth century, the Brit. had in a few months given the city a supply on modern lines, and largely independent of the weather. From 1920 onwards there were sporadic outbursts against the Jews on the part of the Arabs, especially in 1929—the Walling Wall riots—and from 1936-38, when underground Arab revolt against the Jewish immigration and the National Home, threatened the whole country (see further *UNDER PALESTINE; WALLING WALL*). The pop. which has greatly increased from immigration under the Mandatory régime, was 62,700 in 1922, 127,000 in 1939, and 155,000 at the end of 1944 and 161,440 (99,320 Jews) in Dec. 1946.

Towards the end of 1945 the Brit. gov. announced the setting up of a joint Anglo-Am. enquiry into the conditions of European and Palestinian Jewry. The

institution of this enquiry displeased the Zionists and was followed by terrorist outrages organised by Irgun Zvi Leumi, the 'Stern Gang,' and Haganah, although disowned by the Jewish Agency. Many outrages were perpetrated in J in 1946-47. With the ending of the Brit. mandatory régime in May 1948 war broke out in Palestine between the Arabs and Jews. It was hoped that a truce would protect J. and the holy places, but in fact the war actually began in J. itself, when the Arab Legion from Transjordan shelled the Jewish quarters of the city and the Jews occupied various institutions from which they fired on the Holy City and attacked

mediator, Count Bernadotte, in June; but in the meantime the Anglican Cathedral of St. George was severely damaged by shell fire (June 5). The roof was wrecked, the pulpit and most of the windows destroyed, and there was much interior damage. Two days later the main dome of the Church of the Holy Sepulchre was penetrated by a mortar-shell fired from a Jewish position outside the City wall.

According to the decision of the United Nations the City of J. with its surrounding towns and vills and all the Holy Places is to be part neither of the Arab nor the Jewish State, but is to be administered by an

J. generally. Churches, convents, and religious and humanitarian institutions were made targets for cannon and rifle fire, and some of these buildings were destroyed. Buildings occupied by the Jews included the Orthodox Gk. Convent of St. George, the convent of Notre Dame de France, the Fr. and It hospitals, etc.—all of which were occupied by Jewish forces on May 14-15, i.e. the date of the ending of Brit. rule. Shells were also fired into the Holy places from the Heb. Univ. and the Hadassah Hospital on Mt. Scopus. The convent of Notre Dame de France was largely destroyed. The Orthodox Armenian Convent received hundreds of shells fired by the Jews from the Benedictine Convent on Mt. Zion. According to a protest circulated by the Lat. Patriarch to the Union of Christian Communities in Palestine most of the shells falling on the Holy Sepulchre and other Christian institutions were Jewish. In the same statement it was declared that the Arabs had respected holy places, churches, convents, and Red Cross institutions. A truce was arranged in J. soon after the arrival of the United Nations

International Trusteeship system. A special committee of the United Nations has completed its draft of a constitution for the Holy City and its report has been submitted to the Trusteeship Council. But as late as the summer of 1949 the problem of the control of J. had not been settled though some progress had been made through the good offices of the committee of the Palestine Conciliation Commission of the United Nations. It then seemed to be agreed, unofficially between the Jews and the Arabs, that a partition plan which should be acceptable to the United Nations and the various religious faiths interested was the only practical solution. It was believed that the plan could be carried out without detaching J. either from Israel or the gov. which would eventually represent Arab-held Palestine. The plan, still in its early stage, was as follows: the city would be divided into two parts for the purposes of administration, although the frontier would run round the city rather than through it. The holy places would be controlled by the United Nations agency. Access to them would be guaranteed to all creeds and both govts.

would be responsible for their security and that of the pilgrims.

Keith-Roach, *The Handbook of Palestine*, 1934; E. L. Sukenik, and L. Mayer, *Third Wall of Jerusalem*, 1930; H.M.S.O., *Jerusalem city plan: preservation and development during British Mandate, 1914-18, 1948*.

**Jerusalem Artichoke**, or *Helianthus tuberosus*, well-known species of Compositae, closely allied to the sunflower, which is cultivated on account of its edible tubers. It is indigenous to Brazil, and its specific name is misleading, having arisen from the corruption of the It. word for a sunflower, *zucca girasole*.

**Jerusalem Chamber**, part of the deanery in Westminster Abbey, was originally the abbot's parlour, part of the abbot's house. It probably received its present name from the tapestries of the hist. of Jerusalem which formerly adorned it. The name is also noteworthy on account of its connection with the death of Henry IV., as narrated by Fabian the chronicler (cf. Shakespeare's *Henry IV.*, pt. 2, iv. 4). The chamber was restored in 1624, and here the Assembly of Divines met in 1643. In later times it was the scene of the labours of the revisers of the A.V. of the Bible (version of 1881). The crown is lodged here on the night before the coronation. The chamber is 36 ft. by 18 ft. and the panelling is of the time of Henry VIII.

**Jervaulx Abbey**, ruin of an anct. Cistercian monastery which was once a great centre of life for the hamlet of Jervaulx, in Yorkshire, England. What is left of the cruciform church, the cloistral court, chapter house, and refectory, etc., belongs to the Transitional Norman or Early Eng. period. The last abbot was hanged in 1537, because he was implicated in the Pilgrimage of Grace.

**Jervis, John** (1734-1823), admiral, fought in Keppel's action of 1778. He received the Order of the Bath after seizing the Fr. ship *Peyase* in 1782, and took part, during the same year, in the relief of Gibraltar by Lord Howe. In the course of the war with France at the time of the Revolution, he took possession of the W. Indian Is. of Martinique, Guadaloupe, and St. Lucia. In 1797 he ventured as admiral to close with the Sp. fleet off Cape St. Vincent in spite of tremendous odds; the result was a brilliant victory, in which Nelson participated. In the Addington ministry he served as First Lord of the Admiralty, but his somewhat drastic pro-

posals of reform and his rigid economies proved an unpopular policy.

**Jorvis Bay**, eighteen-year-old pleasure liner which was transformed during the Second World War into an armed merchant cruiser. She was unarmoured; her seven anct. 6-in. guns were kept there to guard convoys. She will live in naval annals for her gallant action on Nov. 12, 1940, against the powerful Ger. pocket battle-ship *Admiral Scheer*, in which she saved thirty-four of a convoy of thirty-eight ships when they were attacked without warning by the Ger. ship. The J. B. sailed out against the battleship alone. Her object was not the hopeless one of sinking the *Admiral Scheer*; there was no hope even of inflicting material damage. The object was to gain time to give the convoy a reasonable chance of escape. This the J. B. and its crew achieved after a two-hour's fight. Her death roll was 190. Some 65 survivors were rescued, the ship being sunk. Her captain, E. S. Fogarty Fegen, R.N., was awarded a posthumous V.C.

**Jeshurun**, 'a poetical name for the people of Israel' (Cheyne). The exact origin of the name is uncertain. It has also been suggested that it is used not for Israel only, but for righteousness, the ideal of Israel. It occurs in Is. xlv. 2; Deut. xxxii. 15, and xxxiii. 5 and 26.

Jesi, see IESI.

**Jesmond**, see under NEWCASTLE UPON TYNE.

**Jessamine**, see JASMINE.

**Jesse, John Heneage** (1815-71), Eng. historian, a clerk in the Admiralty, after endeavouring to write poetry, turned his talents to the field of historical memoirs. In 1840 he pub. *Memoirs of the Court of England during the Reigns of the Stuarts*, and, encouraged by the reception of this work, followed it with others of a like nature, the best of which dealt with the *Life and Reign of George III* (1862). His most valuable contribution to literature was *George Selwyn and his Contemporaries* (1843).

**Jessel, Sir George** (1821-93), Eng. judge, b. and d. in London, was of Jewish extraction. He was called to the Bar in 1847, made a Q.C. in 1855, and entered Parliament in 1868, as a Liberal. He became Solicitor-General, was knighted, and made privy councillor and Master of the Rolls in 1873.

**Jesse Window**, window, especially common in the Middle Ages, which had designed upon it the genealogical tree representing the genealogy of Christ from 'the root of Jesse' (Is. xi.), father of David. There are examples at Wells, Chartres, the choir of Dorchester Abbey, Oxfordshire, Downside Abbey, Leicestershire, and St. George's, Hanover Square, London.

**Jessore**, or **Jessor**: (1) Dist. in W. Bengal, India, has an area of 2925 sq. m. It is a well-watered, fertile plain, cultivated, and producing quantities of rice, sugar, oil seeds, jute, and tobacco. Pop. 750,000. (2) A tn. and cap. of the above dist., 66 m. N.E. of Calcutta; has manufs. of bricks, bamboo work, mats, and coarse textiles. Pop. 12,000.

Jessukmir, see JAYSALMIR.

**Jest-books.** There are two kinds of J. — compilations of witty sayings and practical jokes ascribed to some particular wit to ensure their sale and popularity, and collections of *facetiae* admittedly brought together from various sources. The monkish raconteurs of the Middle Ages doubtless brought and spread many tales from the E., but numbers of typical jests and practical jokes probably existed independently throughout all countries and races of mankind, allowing for slight local changes. Among famous J. may be mentioned: *Tarleton's Jestes: a Hundred Merry Talys* (c. 1525, first extant edition, 1611); *The Witty and Entertaining Exploits of George Buchanan, commonly called the King's Fool* (Buchanan long being famous rather as a humorist than a humanist); *Joe Miller's Jest-Book, or the Wit's Vade Mecum* (1739, really compiled by John

Mottley, 1692-1750). Other similar collections are the *Jests of Scogin*, by 'A. B. of Physicke Doctour,' 1613; *Tales and Quick Answers, very Merry and Pleasant to Read* (about 1535); John Taylor, *Wit and Mirth*, 1629, more original than most; and *Wit and Drollery*, 1661, by 'The most refined wits of the Age'; *Merry Drollery*, 1661; and *Westminster Drollery, or a choice collection of the newest Songs and Poems both at Courts and Theaters*, by 'A Person of Quality,' 1671 (reprinted by Roberts of Boston), of the Cavalier period. See CHAPBOOKS; FOLKLORE; GOTHAM, TALES OF THE MAD MEN OF. See W. Hazlitt, *Shakespeare Jest-Books*, 1875, *Studies in Jocular Literature*, 1890; *The Literature of Roguery* (in *Types of English Literature*), 1907; W. Jerrold, *Book of Famous Wits*, 1912; F. Kirkman *The Wits*, 1932.
